At the meeting of Council of the Pharmaceutical Society of Ireland on March 5th, the following business was transacted:—

Read, a letter from Dr. Jacob on behalf of the Irish Medical Association, drawing the attention of the Council to the recent action of the Prisons Board, Ireland, in dismissing the apothecaries, or other compounders, of the Irish prisons, and imposing the duties previously performed by them on the prison surgeons. The consideration of Dr. Jacob's letter was postponed to the next meeting of Council.

Letters were read from the Medical Registrar of Trinity College, Dublin; the Secretary of the Royal College of Science for Ireland; and the Registrar of the Carmichael College of Medicine and Surgery, acknowledging the receipt of letters informing them that their institutions had been included in the list of those at which candidates for the licence of this Society could take instruction in practical chemistry.

## The Vaccination (Ireland) Amendment Bill,

INTRODUCED a few days since by the Chief Secretary, is of much importance to Irish Poor-law medical officers. It is an emasculate edition of the Bill which was drafted 3 years ago by the Irish Medical Association, and has since been in the pigeon-hole at Dublin Castle. The Bill is principally intended to facilitate the reporting of vaccinations, the punishment of defaulters, and the taking of lymph; as drafted by the Association, contained a complete assimilation of the fees in Ireland to those in England, *i.e.*, an increase from 1s. to 2s. 6d. per case, and an award to the vaccinator for successful cases; but the Government have cut out the latter proviso altogether, and reduced the proposed fee to 1s. 6d.

This, we need hardly say, will be actively contested by the Irish Medical Association when the proper time comes, for there can be no reason whatever why an Irish doctor should receive less pay than a "Saxon," and as Mr. Sclater-Booth expressed his opinion last year that 2s. 6d. was a reasonable fee per case, there can be no justification for this change in the Bill. Nor is there any just reason why Irish vaccinators should not be rewarded for their efficiency as their English *confrères* are, especially as there is a much greater need to stimulate vaccination in Ireland than in England. The only effort of originality which the Government have displayed in their revision of the Bill is contained in the 7th section, which provides that a re-vaccination patient must return on the 8th day for inspection, and if he omits to do so he shall be liable to a fine of 2s. 6d., to be recovered by the Guardians by process of law. This section seems constructed in order to prevent copious re-vaccination, and to increase the law costs of Poor law Unions, but is probably not intended for that object. In any case, it would be entirely inoperative, for it would be rather a wild-goose chase for the Guardians to sue for a half-crown in each instance; and it is so complicated that, under any circumstances, it could not work.

We shall give a further analysis of the Bill next week. Meanwhile, we may say that if amended, so as to restore it to the condition in which the Chief Secretary received it, it would be a valuable and practicable measure.

## Killed in the Streets.

THE cruel indifference with which the loss of human life in the streets is viewed by magistrates and juries must certainly have the effect of rendering it quite unsafe for pedestrians to move about or cross a road in London. We very much regret to see that the person who wilfully ran over Mr. John Oakeshott, at the Northumberland Avenue, has been acquitted by the jury who tried him. He has thus escaped the hands of justice, whilst the widow and her nine children are left without the slightest redress for the grievous loss sustained at his hands.

The slaughter that goes on in the streets of the metropolis may be pretty tolerably gauged by a glance at a return lately moved for by Lord Templeton. This return

gives the number of persons killed in the streets, and the circumstances under which death took place. We have on several occasions called attention to the frequent and disastrous results of furious and careless driving in the streets of London, but few persons probably will be prepared to hear without astonishment that, according to the report of the Commissioner of Metropolitan Police, during the ten years ending December 31, 1877, the number of persons killed and injured by vehicles in the metropolitan thoroughfares reached a total of 25,538, of whom 1,159 came under the former and 23,379 under the latter category. The terrible significance of 1,159 unoffending pedestrians being killed and 23,379 more or less maimed—many of them for life—within the metropolis, is at first sight difficult of realisation; but a still worse feature in the matter is that these so-called "accidents," instead of diminishing, exhibit an alarming tendency to increase. Thus, while in 1868 there were 1,348 of these "accidents,' causing the death of 83 persons, in 1877 the number had risen to to 2,956, of which 150 were fatal. It is obvious that vigorous measures should at once be adopted to put an end to such wholesale sacrifice of the lives and limbs of peaceable citizens. Certainly, the mere publication of such casualties will not have the desired effect. The police should be instructed to take into custody every person who drives beyond a moderate pace, and the fellows who indulge in the pastime of racing in the streets of London should be sentenced to long terms of imprisonment with hard labour. It may be taken for granted that drastic measures of this description would have a surprising effect in diminishing the terrible evil of which we have only too good reason to complain, and which is too often altogether condoned by the inconvenience and loss of a day's work from having to appear in a police or coroner's court.

## Kew Gardens.

In reference to the recent discussion on this subject in the House of Commons, Mr. Colman writes to the *Echo*, to say that "the promoters of the movement have every reason to be well satisfied with the result of the first real discussion of this question in Parliament. Probably such a minority as 94 in such a case is unexpected on a first division, against not only the Government, but all official influence." We also are very sanguine as to the ultimate success of the agitation in favour of the early opening of these gardens, but perhaps the promoters of the scheme would be pursuing a wiser course were they to confine their demands to the free opening of the gardens for three days in the week only.

In the principal foreign cities the death-rates, according to the most recent weekly returns were in Calcutta 34, Bombay 30, Madras 38; Paris 28; Geneva 19; Brussels 31; Amsterdam 29; Rotterdam 30; The Hague 22; Copenhagen 23; Stockholm 22; Christiania 18; St. Petersburgh 48; Berlin 26, Hamburg 30, Dresden 30, Breslau 28, Munich 34; Vienna 31, Buda-Pesth 38; Rome 29, Turin 27, Venice 30; Alexandria 39; Brooklyn 20, Philadelphia 20, and Baltimore 23. Small-pox caused 56, and fever 49 deaths tn St. Petersburgh. There were 29 deaths in Paris from typhoid fever.

The death-rates last week from the seven principal zymotic diseases averaged 2·7 per 1,000 in the large towns, and ranged from 0·6 and 0·7 in Brighton and Plymouth, to 6·3 and 7·1 in Wolverhampton and Newcastle-upon-Tyne. The fatal cases of scarlet fever were proportionally most numerous in Salford, Sheffield, Nottingham, Sunderland, and Newcastle-upon-Tyne; those of whooping-cough in Manchester and Leeds. Measles showed excessive fatality in Wolverhampton, Leicester, and Newcastle-upon-Tyne. There were 681 deaths in London from diseases of respiratory organs, the highest this winter. Four deaths were referred to diphtheria in Oldham. Small-pox caused 17 more deaths in London, 11 in Dublin, but not one in any of the other large towns.

The joint committee of the College of Physicians and the Society of Arts have recommended that the award of the Cup and Coin, in conformity with the provisions of the late Dr. Swiney, be made in favour of Dr. Norman Chivers, author of "A Manual of Medical Jurisprudence for India." The prize, which consists of a silver goblet, value £100, containing gold coin to the same amount, is presented every fifth anniversary of Dr. Swiney's death to the author of the best published work on Medical Jurisprudence.

In the principal cities and large towns of the United Kingdom the rates of mortality per 1,000 last week were —Plymouth 19, Norwich 20, Bristol 21, Birmingham 21, Glasgow 21, Portsmouth 25, Brighton 27, Bradford 27, Sunderland 29, London 29, Sheffield 29, Liverpool 30, Leeds 31, Salford 31, Newcastle-upon-Tyne 31, Hull 31, Manchester 33, Wolverhampton 35, Nottingham 35, Dublin 36, Leicester 37, and the highest rate 43 in Oldham.

The annual meeting of the Dental Hospital of London, was held on Thursday last under the presidency of Mr. R. C. L. Bevan, the treasurer. In she report, which was unanimously adobted, the managing committee were enabled to speak satisfactorily of the progress of the institution, as regards the funds, which showed a considerable increase in the income compared with that of last year.

A Steam Laundry Company has been started in London for the purpose of providing the metropolis and the provinces with establishments for washing, purifying, and laundry purposes, so much needed at the present time. Contagious diseases are undoubtedly frequently spread through the absence of sanitary supervision, and this danger the new company promises to remove.

A telegram received from General Loris Melikoff, dated Astrachan, 15th March, relative to the plague, states that in consequence of the favourable result of the inspection of the inhabitants of Wetlianka by the physicians, the quarantine at that place has been raised, and is now only maintained at the village of Selitrenoje.

The Grand Jury of the co. Kildare have appointed several police constables stationed in different parts of the county to carry out the 13th section of the 38 and 39 Vic., cap. 63 (The Food and Drugs Act.)

# Scotland.

(FROM OUR NORTHERN CORRESPONDENT.)

GLASGOW DEATH-RATE.—The mortality of Glasgow during the week ending 8th March, was at the rate of 22 per 1,000 per annum, against 29 in the preceding week, and 26, 34, and 27, in the corresponding periods of 1879, '77, and '76, respectively.

THE PRODUCTION OF ARTIFICIAL DEAFNESS.—At a meeting of the Glasgow Medico-Chirurgical Society held in the Faculty Hall, St. Vincent Street, on the 7th March, Dr. J. Patterson Cassells read a paper "On the Production of Artificial Deafness—an experiment in Physiological Acoustics and its bearing on the Ætiology and Evolution of the Diseases of the Ear, and on Aural Therapeutics," &c., &c. Dr. Cassells having described the equality of atmospheric pressure on both sides of the membrana tympani, and the degree of tension of that membrane necessary to perfect hearing, proceeded to show how he could produce three pathological symptoms—viz., deafness, tinnitus, and congestion, by altering the equality of the atmospheric pressure. The experiment, by means of which this was accomplished, the lecturer connected with the name of Maissiat, and which seemed to consist in the act of swallowing with shut nostrils, exhausting the air in the tympanum, the membrane of which collapses, and developes the symptoms. For obvious reasons, the experiment was not carried further, but Dr. Cassells believes that if allowed to remain the result would be inflammation, swelling, suppuration, perforation, otorrhœa, polypus, caries, necrosis, and ultimately death! The collapse of the membrane was easily seen, and the act itself capable of demonstration by means of a mercurial manometer, which first showed a rapid fall, and on the continuance of the experiment caused the mercury to disappear entirely from the tube, to be afterwards found in the external meatus. This remarkable phenomenon was afterwards alluded to by several speakers, but as the diameter of the manometer tube could not be given by Dr. Cassells the statement could not be gainsaid. Dr. Cassells also related how the ear experimented on heard the sound of a watch, having a normal distance of 6 feet, at 9 or 10 feet, but was deaf to articulate speech, a peculiarity of which, however, Dr. Cassells could give no explanation; how in cases of cleft palate with ear disease, the latter immediately disappeared of itself when the deformity was rectified; and how if the sound of a watch pressed on the cranial bones be inaudible, it may be decided with certainty that the patient is over 60 years of age. With Valsalva's experiment the pathological symptoms were also produced, but in a less degree, and in reply to a question Dr. Cassells could give no satisfactory reason why the same symptoms can be obtained by the different methods. —The Medico-Chirurgical Society meets now once a fortnight, and it was anticipated by the older members that by so frequent a tapping the nectar of science would degenerate into very "small beer" indeed. The impression is rather confirmed, than being removed, by such papers as have recently been read.

THE ETIQUETTE OF FEES IN AURAL PRACTICE.—Is it the practice among regular practitioners in London to demand enormous fees *before* undertaking the treatment of a case?

HAS MUSIC CHARMS TO SOOTHE THE SAVAGE BREAST? —On Friday, the 7th inst., a large body of the students of the University of Glasgow, had evidently resolved on a saturnalia, commencing the same at the Italian Opera, Prince of Wales Theatre, much to the annoyance and disgust of the remaining portion of the audience. Their conduct has been described by the daily press as barbarous and disgraceful, and more becoming Zulus than young men with any pretensions to the tastes or feelings of gentlemen. At a public meeting the other evening, the chairman, in apologising for the absence of a well-known clergyman, and reading with difficulty the characteristically bad caligraphy of ministers, remarked "The Rev. Mr. B. expresses great regret at his inability to be with us to-night, having invited for this evening about a score of *gentlemen* (*students* rather) to supper." It is a relief to be able to state that, at the Police Court held on the following morning, as the moral and social reprobation of all decent and well-disposed individuals seems to have no influence on the ruffianism of Gilmore Hill, several of the "young gentlemen" were fined in three guineas with the alternative of thirty days' imprisonment. The cure for all this, it humbly appears to us, lies with the University authorities—rustication for a session, or complete expulsion would, no doubt, have a salutary influence; if, indeed, the charge freely made just now does not hold good, like teacher, like pupil; the one assisting at a sleight-of-hand demonstration for 25 per cent. of the profits, and the other outraging public decency with the unbridled wantonness of the pronounced cad.

THE BOARD OF SUPERVISION AND THE INSPECTION OF DAIRIES.—The Secretary of the Board of Supervision has addressed a circular to the local authorities throughout the country enclosing the order of the Privy Council relating to dairies, cow sheds, and milk shops. The circular says:—"It is now an ascertained fact that disease is largely disseminated from dairies and milk shops in which any person is suffering from an infectious disorder. The important effect which this order, if duly executed, will have upon public health is therefore obvious. The Board apprehend that the order in Council cannot be enforced by the local authority under the Public Health Act; but the local authority should instruct their sanitary inspectors and medical officers to direct their special attention from time to time to those premises within their district to which the order applies, and to report all contraventions of the order to the local authority under the Contagious Diseases (Animals) Act, of the county or burgh, as the case may be—who are responsible for the execution of the order—as well as to themselves. In burghs which return, or contribute to return, a member of Parliament, the magistrates and town council are the local authority under the Contagious Diseases (Animals) Act, and should be addressed through the town clerk. In counties, excluding such burghs, there is a separate local authority under that Act, and they should be addressed through the clerk of supply.

STILL THEY COME—MORE "CURES."—The therapeutic triumphs achieved in Glasgow must surely excite the admiration and wonder of the scientific world. In addition to the list of formidable diseases mentioned in our last issue, as having yielded to treatment in the North, it is now our pleasing duty to add that of another grave malady to the list. Dr. Robert Bell, of Glasgow, well-known by his invention of a uterine douche, and his successful "curing" of diphtheria, has now the gratification to record, in the *Lancet*, the "cure" of three cases of uterine fibroids by ergotine suppositories. What has Braxton Hicks, or Barnes, to say to this? "Cures" of this nature are very apt to impale their recorder on the horns of an ugly dilemma.

COLOUR-BLINDNESS.—At a meeting of the Glasgow Philosophical Society, held on the 5th inst., Dr. Fergus presiding, Dr. J. R. Wolfe read a learned paper "On Colour-Vision and Colour-Blindness." Dr. Wolfe said that colour-blindness

had recently occupied the attention of the literary and scientific world, and he was desirous of ascertaining to what extent this defect existed among the rising generation. With this view he formed a commission, which, with the permission of the School Board, visited several schools, and examined upwards of 2,000 children. He proposed to submit the result of that examination to the Society. Dr. Wolfe referred to the history of colour-blindness, to the writings of Dalton, Goethe, Professor Wilson, Dr. Magnus of Breslau, and Mr. Gladstone's article in the *Nineteenth Century*, on the "Colour Sense of Homer." He referred to the discovery two years ago, by Professor Bell, of the existence of a red colouring principle in the retina, which is acted upon by the rays of light; and somewhat profanely remarked, "This photo-chemical process shows us that the images of objects are actually impressed on the retina, which the mind stores up; memory is the faculty of calling them forth when required. This demonstration brings us one step nearer to a comprehension of the intimacy which exists between mental operations and physical action." Referring to the theory of Magnus, that the primitive man was totally colour-blind, and that he acquired the knowledge of colour by successive stages of development, upon which Mr. Gladstone's views were founded, the author maintained that the Homeric text does not shut us up to such a conclusion. The Greek nation could not have been colour-blind, when they have adjectives for all the colours of the spectrum. Though these adjectives are not applied with precision, the same is the case with the modern poets. Dr. Wolfe then referred to the adjectives used by Homer, and was "prepared to support Homer against Mr. Gladstone." The author then referred to the Prophet Ezekiel—and here, being on his own ground, it would be dangerous to make comments—and said "it would appear that the Prophet Ezekiel was rather deficient in colour-sight, because he described the rainbow, 'I saw as it were the appearance of fire, and it had brightness round about, as the appearance of the bow that is in the cloud in the day of rain, so was the appearance of the brightness round about,' which, Mr. Gladstone thinks, 'cannot be explained but by supposing that for the eye of the prophet, red was the fundamental and exclusively prevailing colour of the rainbow.' Now," continues Dr. Wolfe, "if the Homeric argument applies to Ezekiel, it would prove the Jewish nation of that period to have been colour-blind; and yet it is curious to find that, 900 years before Ezekiel, Moses commanded the children of Israel to set the breast-plate of the high-priest with twelve stones, among which were carbuncle, emerald, sapphire, amethyst, &c., which represent all the colours of the spectrum." Naturally enough, Dr. Wolfe overlooks the weak point in his argument, viz., that here the Jews were dealing with "precious" stones, and that, however much the optical sense might be at fault in matters celestial and unattainable, neither it, nor the sense of touch, have ever failed this race in relation to the products of the earth. One thing may safely be asserted, that in their appreciation of the colour "yellow," in connection with the metallic form, they have never been eclipsed by any race or nation. "Neither must it be forgotten," says Dr. Wolfe, "that the mother of mankind saw the fruit of the forbidden tree, that 'it was beautiful to the eyes;' and we know that a colour-blind person cannot distinguish ripe cherries, strawberries, and apples from their leaves, except by their form." As to the "mother of mankind," most sensible people will regret rather, not that she was not colour-blind, but that she was not stone-blind! Dr. Wolfe is of opinion, as the result of his argument, that "Dr. Magnus, led away by the development theory, has entangled Mr. Gladstone in the meshes of a hypothesis, which, from a physiological as well as from a historico-critical point of view, cannot be seriously entertained." Judging from the record of Herodotus, Dr. Wolfe thinks that Homer was suffering from Egyptian ophthalmia, which he contracted at Ithaca at the age of 34, resulting in nebulous cornea. Colour-blindness is met with in cases of disease or injury of the brain, in hysteria, in habitual drunkards, or excessive smokers—it is hereditary, *transmitted from maternal uncles*. This accounts, doubtless, for the immunity from it, enjoyed by the "mother of mankind." The most likely cause of it, according to Dr. Wolfe, is intermarriage of first cousins, or other near relatives. When congenital, it is incurable. Dr. Wolfe then referred to his conclusions as drawn from the examination of 2,134 children. Government seems remiss in not directing attention to the subject in reference to railway officials. The paper will doubtless be separately published, and attention is therefore directed to it.

MILLER'S "LOCHIAL DISCHARGE."—This is one of the numerous reprints on which the reputation of Glasgow as a medical school is being at present based. We have to apologise to the author for the unavoidable delay in noticing it, owing to pressure on our space. It was originally published in the *Edinburgh Medical Journal*. The author was "indebted" to one of his students "for his kindness in supplying" the short-hand report of the lecture; the paper is thus an extempore production. Dr. Miller's lecture treats, in the first place, of the synonyms applied to the lochial discharge, the function of the womb during gestation, its expulsive force, and ultimate disintegration and absorption. Dr. Miller believes—but his proofs for so doing are of the slenderest description—that the material of the disintegrating uterus, on being absorbed into the blood, is transformed into fat, which ultimately appears in the milk elaborated by the mammary glands, and he sagely remarks, "the ultimate destination of the used-up tissue has afforded further proof to me that no unnecessary waste takes place in the human economy," a confirmation of the teleological argument quite worthy of a Bridgewater Treatise. "I have watched this matter since I directed the attention of the profession to it in 1870, and have found many additional proofs in corroboration of this theory." Attention is directed to circumstances which influence the discharge, and cases are narrated "as examples of the variation which the lochial discharge undergoes in different conditions of child birth." The appearance of the lochial discharge during three periods is thus described; and the following is the outcome of the author's "own investigations." "The ciliated *epithelium* were found both in healthy and diseased lochia. They have also been found in the discharge of non-pregnant women, and so may be considered as not a constant constituent peculiar to the discharge. Neither do they seem to affect the health of the patient, or to be an exciting cause of disease." It is, however, in the matter of treatment that the marked originality of the paper is made manifest. "I would advise you," says the author, "to adopt precautions pointing to the maintenance of a healthy discharge, and towards securing antiseptic protection" . . . . "We are working with a delicate organism, and although labour be a healthy process, the very delicacy of the structure makes a trifle, when in error, produce formidable results . . . In special cases, where I have deemed an antiseptic plan necessary, I have tried the carbolised gauze. I put two or three layers of it, extending from the navel down to the knees, to act as an apron, and over it I applied the binder in the usual way; otherwise the treatment consisted in the use of the gauze instead of napkins to receive the discharge." Robed

thus somewhat between the style of an Egyptian mummy and a village blacksmith, the patient is surely secure. The "apron"—shade of Nunneley!—is to prevent a *coup de main* on the part of the spores. There is nothing for it, but they must enter now at the knees, and what with carbolic to right of them, carbolic to left of them, and the length of the valley of death, the poor spores must have a hard time of it, and the interesting patient be necessarily safe. An error in the Latin prescription is doubtless due to the printer. We beg to direct attention to the paper.

# Medico-Parliamentary.

## HOUSE OF LORDS—March 11th.

### MEDICAL ACT (1858) AMENDMENT BILL.

On the motion for the second reading of this Bill, after some remarks by the Marquis of Ripon, the Duke of Richmond and Gordon said he had very lately an opportunity of expressing his views upon this subject in introducing the Bill. Therefore, but for the observations of his noble friend, he should not have thought it necessary to make any remarks upon the subject. He took this opportunity of thanking him for his support. It was of course impossible for him to say what would happen in the other House, but he believed it would be proposed in the other House in the course of this week to appoint a committee to inquire into the constitution of the Medical Council, and he hoped the reference would be sufficiently large to include all the points adverted to by his noble friend. In conclusion, he had only to propose that the committee on this Bill should be taken on Thursday, the 20th of this month.

The Bill was then read a second time.

## HOUSE OF COMMONS.—March 12th.

### MEDICAL ACT (1858) AMENDMENT BILL.

Dr. Lush, in moving the second reading of this Bill, expressed his regret that the Government had not referred the whole question to a Select Committee. He understood from the statement made the other day by the noble Lord, the Vice-President of the Council, that the only point which the Government would agree to refer to a Select Committee was the constitution of the Medical Council, and the mode in which the medical profession were represented upon it. Looking at the grave importance of this matter both to the public and the profession, it was to be regretted that the whole question could not be considered by a Committee of the House, and settled once for all. The Bill, of which he now moved the second reading, dealt with several points which were not affected by the Government Bill, and in particular it contained provisions for the prosecution of illegal practices and the signature of death certificates by unqualified practitioners. The constitution of the Medical Council was unsatisfactory. It no doubt consisted of very able men, but as a matter of fact, it had become a lesser Parliament, and practical work was sacrificed for ornate eloquence. He would suggest that the whole of the Bills now before Parliament on this subject should be referred to a Select Committee, so that the question might be considered and disposed of once for all.

Mr. Serjeant Simon, in moving the rejection of the Bill, said that there was no demand of the public for legislation on this subject. He ventured to protest against the principle of protection for any profession, and while he did not deny that it was the duty of Parliament to prescribe a standard of qualification, they ought not to protect any special interest or profession. The Bill was not brought in in the interest of the public or at the wish of the medical profession, but solely to meet the views of a narrow section of those who pursued this calling. While the State might require a certain standard of qualification, he objected to any other restriction in the profession. A few years ago there was a dead set made against those who pursued the practice of homœopathy, and attempts had been made to exclude homœopathic practitioners from the profession. The homœopathists had proved that those strong doses of purging medicine, which were given under the old system, were positively injurious, and the most eminent medical men were content to use drugs sparingly, and to leave nature mostly to effect the cure. If he objected to be dosed with mineral poison, and preferred to go to a herbalist, he wanted to know what right Parliament had to stand in the way. Suppose he broke a leg, or dislocated a limb, and he went to a bone setter who had done wonderful things, what right had Parliament to interfere? This was what this Bill asked Parliament to do. He had a right to call in a blacksmith if he thought proper, and Parliament had no right to prevent him. The hon. member for Morpeth was well aware that a large number of working men did not believe in medical men, but believed in herbalists. Experience in this matter was the only teacher, and many friendly societies deliberately employed herbalists rather than medical practitioners. He regarded this as a very mischievous Bill, and he begged, therefore, to move that it be read a second time this day six months.

Mr. Burt seconded the amendment. If they could pass a Bill which would exclude only incompetent persons from the profession, it would do a great deal of good; but this Bill would go much further than that. He knew a great number of herbalists, and they did a great deal of service to the community within a few yards of his own dwelling. In Newcastle there lived a man who had practised the system for twenty-five years, and this man was typical of hundreds and thousands of others. There was no pretence for saying that there was the slightest imposition on the part of such men, or that they practised under false pretences. They did not pretend to have the slightest medical education, or to have gone through college. They were employed, however, as club doctors by many friendly societies, and it would be very hard if they refused to allow them to certify the cause of death.

Sir J. M'Kenna said that his hon. friend who had charge of the Bill would be prepared to consider the objections taken to it in Committee. He hoped the House would read it a second time, and refer it to a Select Committee.

Mr. Errington supported the Bill on the ground that if it were referred to a Select Committee it would afford the means of making a complete inquiry into the subject. The Government seemed to have come to the conclusion erroneously that there was only one large question for them to consider, and that was the medical portion of the system, ignoring altogether the reconstitution of the Medical Council. He hoped the reference to Committee would be extended in its terms, so that the various Bills could be considered and their principle fully discussed.

Mr. Cowper-Temple thought the Medical Council had well discharged the task imposed upon them twenty years ago, and had materially raised the standard of professional competency; but the time had arrived when they might well consider whether there was not such a change in the matters entrusted to the Council as to make advisable a change in the constitution of that body. With reference to the pains and penalties inflicted on persons who might do injury to the public by their practice, he did not think the House would be prepared to prosecute herbalists, however much hon. members objected to homœopathy. The public must be left free to choose for themselves, and despotic power must not be given to even such a body as the Medical Council. He was glad it was proposed to appoint a Committee. The Bill from the other House which was coming down would afford them an opportunity of discussing details in Committee, and the proposed Select Committee would be enabled to consider the principles involved in the other Bills before the House.

Dr. Cameron said it was not the intention of the framers of the Bill to restrain freedom of action with respect to herbalists and chemists. All that was asked was that there should be the same protection as existed in connection with manufactures; they wanted something similar to the registration of trade marks. They wanted to secure that certificates of death should not be given by persons who did not understand anything about the diseases with reference to which the certificates were given. The Bill of the hon. member for Salisbury was the best which could be adopted, because it embodied all that was good in the Government Bill and the Bills of other members which had previously been brought before the House. The under-selling of medical degrees and the assumption by unqualified persons of titles were provided against; but by far the most important point dealt with was the reform of the Medical Council itself. The anomalous state of things which had rendered legislation necessary would never have existed if the Council had discharged its duties efficiently.

Dr. O'Leary said he could not agree in the details of the Bill now under consideration; but with its principle he fully concurred. It had been said by the hon. and learned gentle-

man (Mr. Serjeant Simon) that the measure struck at the herbalists; but he denied that it hit those gentlemen at all. It was very hard for the House to appreciate all the technical details which were bound up with joint schemes and joint examinations; and he therefore thought that in order that the whole question which the Bill only partially covered might be carefully considered—considered in a manner befitting its importance—the measure should be read a second time and then referred to a Select Committee.

Lord G. HAMILTON said that during the whole of the past year his noble friend, the President of the Council (the Duke of Richmond and Gordon), as well as himself, had been in constant communication with the different authorities on this subject; they had also received many communications upon it from the profession outside the Medical Council; and the general result and purport of those communications was in the direction of the proposals contained in the measure which was laid before the House of Lords a short time ago. There were also the Bills of his hon. friends, Dr. Lush and Mr. Arthur Mills, the former of which was now under discussion. These three Bills were almost identical in one respect, and that was in the proposals which they made for insuring greater uniformity in examinations, and more accurate registration of those who passed. But there was one subject which the measure of the Government did not take up that the Bill of his hon. friend proposed to deal with, and that was the reform of the Medical Council. On this matter the Government had always used the same language. That body was composed of most eminent men. In fact, it would be difficult to select gentlemen more widely known, both for their ability and their great practice, than those who held seats on that board; but there were, no doubt, many who thought that the Medical Council had sometimes been somewhat in error. There were, no doubt, those who thought that some of its members had not always been as active as they might have been; but, if that were so, he believed their inactivity would be found to be due to the difficult circumstances with which they had to contend. The Government had looked over the names of those who composed the Medical Council; and they did not feel justified in proposing in their Bill any alteration in the existing constitution of that body. Still, as there was a strong wish that that question should be considered this year the Lord President had no objection to the appointment of a Committee to investigate the subject, and to decide as to whether any measures were necessary for the reform of the Council.

Dr. PLAYFAIR said he had been an examiner for years; and he could testify, from personal experience, that, through its watchfulness and care, the Medical Council had exercised great influence in the promotion of medical study and in producing higher qualifications on the part of medical men. At the same time there could be no doubt that there was a general feeling that there should be more direct representation of the outside profession at that Board; and with this feeling he perfectly sympathised. He failed to discover, however, what reform or improvement would be effected under the plan of representation which the promoter of the present Bill proposed.

Mr. MOWBRAY joined in the remonstrance of the right hon. gentleman against the way in which it was proposed to deal with the Medical Council by the Bill, and said he trusted the hon. member would not attempt to force a division to-day. He altogether objected to the joining together of the Universities of Oxford, Cambridge and Durham for the purpose of electing a member on the Council. Oxford and Cambridge were only a short distance from London, and, as a matter of fact, the delegates from these were among the most regular and attentive members. Moreover, he thought there was a great advantage in having on the Council men who were not taken from the actual ranks of a busy profession, but who came from the Universities. If the hon. member proceeded with the Bill he should feel obliged to give his most strenuous opposition to those parts of it which dealt with the constitution of the Medical Council.

Mr. D. PLUNKET expressed a hope that the hon. member would accept the advice which had been given, and consent to the adjournment of the debate, otherwise he should certainly feel bound to oppose the Bill. The Bill was hastily drawn, and he pointed out several difficulties which would arise in carrying out its provisions in regard to Ireland.

Mr. M. HENRY also hoped the hon. member would consent to the adjournment, but, speaking of the Medical Council, he expressed his opinion that the improvement which had taken place in the profession was due to the pressure of public opinion, and not to the Council. This Council was an unwieldy and expensive body, and he thought when medical reform was seriously undertaken it would be decidedly changed in its constitution and character. The Council now involved an enormous tax on the profession. A small body would answer every purpose, and it would do away with the great waste of time which now took place in the general conversation which necessarily arose when members of a great profession were gathered from all parts of the kingdom. The time would then be devoted to the business before the Council.

Dr. LUSH acknowledged the courtesy with which his proposals had been received. He thought the suggestion that he should wait before proceeding with his Bill a fair one. He, however, trusted that the noble Lord would consent to enlarge the scope of the proposed Committee so as to include the question involved in his Bill.

Dr. BRADY then moved the adjournment of the debate, which was agreed to.

## GANT'S SURGERY. (a)

[SECOND NOTICE.]

THE second volume commences with the subject of excisional surgery of the joints. An explanation is given of the sub-periosteal operation. The operation consists essentially in detaching and reflecting the periosteal membrane by means of paring elevators. The denuded bone is then sawn off, and the membrane replaced, and by its preservation new bone is produced. The advantages of this operation are chiefly: first, that the length of the limb is, to a great extent, retained; and secondly, that tendons detached with the periosteum regain a far better attachment than by the ordinary method. In speaking of excision of the hip-joint, Mr. Gant refers to cases in which a large portion of the innominate bone around the acetabulum was removed, and the patients made a good recovery; showing clearly that, though it is advisable to leave this, unless there is caries within and around the acetabulum, yet it is often necessary to remove it in large quantity. The tables on the cases operated upon for this disease with the results are excellent, and the chapter contains otherwise much useful and practical instruction.

The chapter on injuries of the head is well-collected and worked out. All the information that can be obtained upon this subject is here to be found. Diseases of the eye and its appendages has been revised by Mr. Power, and the chapter contains all that is requisite for the general practitioner and for the public examinations. The various operations for entropion and ectropion are described and figured, but for the former operation, the crescentic excision, which is decidedly the preferable, is not depicted. In this operation the marginal incision is to be made close up to the lashes, and the convex incision as far away as may include in the judgment of the operator, the requisite amount of skin to obliterate the deformity. The marginal incision should be carried deeply, so that when the wound is brought together by sutures, the ciliary margin is, in fact, rotated, and the eye lashes made to turn away from the globe of the eye.

The chapter on diseases of the ear have been referred to Mr. Purves. It is short, and contains all that can be required by practitioners.

In referring to foreign bodies, in the external meatus, a few precise rules are laid down, and as so many mistakes have been made, followed by fatal results, it is advisable that they should be quoted.

(a) "The Science and Practice of Surgery." By F. G. Gant, F.R.C.S., and various authors, 2 vols. London: Baillière, Tindall, and Cox.

1. Be sure that the foreign body is *seen*. To attempt to extract a foreign body without first seeing it is highly dangerous.

2. Determine what the body is, and, if possible, obtain a sample of the body supposed to be in the ear.

3. Remember that a body which will not swell, and has no cutting edge, will generally remain without causing any urgent symptoms.

4. Seeing the body, determine with a probe if it be movable. If easily movable, concussion with a downward position of ear will often remove it.

5. Warm water injection is the best of all methods of removing foreign bodies.

6. If it be a vegetable substance, do not inject fluid unless you have time to extract the body either at one operation, or shortly afterwards.

7. Injection failing, which is very exceptional, a surgeon, with the necessary appliances, ought to be at once consulted, or should urgent symptoms arise from the irritation in the attempted extraction, the extraction by incisions, galvano-cautery, boring out by trephine or conical file the centre of substance, and so causing its collapse; or even detachment of the auricle may be necessary.

The chapter on the teeth, by Mr. Tomes, is a very useful addition to a work on surgery. The subject is limited to the information required by the practitioner, and many useful points are referred to respecting the removal of the temporary teeth, and of those teeth which overcrowd or deform the jaw. The dentigerous cyst is described, a tumor of simple character, on account of which many needless resections of the jaw have been performed.

To diseases of the bladder and prostate, a large space is allotted. The subject has received extra attention from Mr. Gant, an excellent monograph having been recently written by him—much of which has been embodied in the work on General Surgery before us. The chapter is illustrated by several beautifully executed diagrams on the surgical anatomy of the parts.

The whole work contains not less than other works upon the same subject, and in many respects, it is much superior, whilst its value is, as we have before said, greatly enhanced by the assistance rendered in many of the subjects by those who have paid particular attention to separate branches of professional study. Nor should we omit a word of praise to the publishers (Baillière, Tindall, and Cox) who have turned the work out in a most attractive and workmanlike manner; evidently sparing neither pains nor expense in order to give this honest piece of practical literary work the best possible chance of success.

## ROSCOE AND SCHORLEMMER'S CHEMISTRY. (*a*)

This is a second instalment of a work, the first volume of which we noticed some six months back, when we had occasion to express a high opinion of its contents. That volume, though nominally devoted to the non-metallic elements, contained a good deal of introductory matter on the general principles of chemistry, on the history of the science, on crystallography, and so forth, which not only rendered the book interesting to general readers, and gave opportunity for the authors to exhibit their powers, but also exposed a wide field for criticism. In comparison with its predecessor, Volume II. (The Metals) is lacking in diversity, and does not call for much remark. The study of the metals is not the most interesting subject among chemists of the present day; the number of novel scientific facts are proportionately smaller. Such as they are, however, they have not been overlooked, for foot references to papers only a few months old, show that the authors have done their best to render their accounts recent as well as thorough. On the theories of chemistry little is said in this volume; nothing, in fact, but what is absolutely essential for the comprehension of what comes after. Even the doctrine of "atomicity," which is usually found so convenient in classifying the elements and generalising on the constitution of their compounds, is abandoned for the metals, on the ground that reliable data are lacking for such metals as have no volatile compounds. It would seem, in fact, as if the authors have intentionally reduced the theoretical reasoning to the utmost, and employed all their strength in imparting information of a practical nature. The descriptions of the chemical industries are almost as full as in a work on technology, and touch on improvements in manufactnring processes, of which older works make no mention. Medical readers will not be expected to appreciate or estimate at their true value the minute accounts of the alkali trade, bleaching powder manufacture, glass and porcelain making, nor care much for the illustrations being drawn to scale; but these technicalities materially enhance the value of the work in the eyes of the student of applied chemistry.

The authors have apparently found it impossible to compress all the information concerning the metals into a volume no larger than the first, and have, therefore, divided Volume II. into two parts. We regret this, chiefly from the circumstances that it may have the effect of delaying the publication of the Chemistry of Organic Substances, of the most paramount interest to the medical student.

(*a*) "A Treatise on Chemistry." By H. E. Roscoe, F.R.S., and C. Schorlemmer, F.R.S., Professor's of Chemistry, Owens College, Manchester. Vol. II., Metals, Part I. London: Macmillan, and Co.

## SURGEON REYNOLDS.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—In common with all medical men who feel an interest and a pride in the brave and heroic deeds of a professional brethren, I will not hesitate to express through your columns how we should admire the unflinching bravery, under a heavy and constant fire from the Zulu enemy, of Surgeon James H. Reynolds, of the Army Medical Department, and then of the 2nd Battalion, 24th Regiment, at Rorke's Drift, South Africa. The brave and dauntless band to which Dr. Reynolds was attached consisted of only one hundred and thirty effective men, and to their immortal honour be it recorded that they gallantly repulsed an army of over three thousand Zulus, who, a short time before, were inflated by their victory at Isandula, where they slaughtered such a large number of our British soldiers. The following extract has already appeared in the military intelligence, and speaks volumes:—

"The following is the evidence of a wounded soldier at Rorke's Drift. 'After the negroes surrounded us we fought like tigers. I saw Dr. Reynolds (A.M.D.) blazing away at them, cheering us that were hit, running to the fellows, dressing their wounds, and then fighting away like a hero. He and the Hospital Corps men defended the hospital to the last moment. When the Zulus got in they charged through them and got into the laager behind waggons and mealie bags, where they all fought like true Britons until daylight. They made several sorties and drove them off splendidly.'" This statement was corroborated in the official despatch from the commanding officer on that trying occasion.

Having seen in one of the Dublin morning papers a few days ago that Lieutenants Chard and Bromhead were certain of having conferred on them the distinction of C.B.; as a medical man, and though not a military one, I must say I felt deeply that the name of Dr. Reynold's should be omitted from those on whom the highest honours should be conferred, and that if there be not awarded to him the same distinctions (independent of special promotion in his own department) that his brother officers who were engaged with him on that memorable occasion are sure to receive, I say there could be no more potent argument to account for discontent and dissatisfaction amongst medical men. It is already too truly proven by the few candidates for the Army Medical Service that that important branch of Her Majesty's service will not bear to be trifled with. The pages of Grecian history are emblazoned by the gallant defence by the Spartan King Leonidas and his little band of noble heroes against a powerful host of Persians, but the gallant defence at Rorke's Drift is not less worthy of a bright page in the history of England's warfare.

Dr. Reynolds is a graduate in Arts and Medicine of T.C.D. and

a Licentiate of R.C.S.I. He was, as a student, distinguished for his assiduity and great abilities. He entered the Army Medical Service in '68, after which he served in India, and subsequently went in charge of troops to the Cape. He is son of the late Alderman Reynolds, J.P., Dalystown House, co. Longford.

I am, yours, &c.,

FRANK.

[With pleasure we publish the above, and fully endorse the sentiments therein expressed. We consider it would be as ungracious as it would be unjust to withhold from Surgeon Reynolds the highest rewards that can be conferred on an officer who, with the prowess of a hero, faced a shower of bullets in his desire to afford aid to the wounded soldier, and actually fought with sword and rifle to enable him to reach the wounded. Such brave conduct could not fail to encourage those who stood by his side. We shall anxiously watch the opportunity, which we hope will be afforded us, to let our readers know the glorious honours that are awarded to a distinguished army surgeon.]

## TREATMENT OF ASIATIC CHOLERA AND SUNSTROKE.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

DEAR SIR,—Many years ago I communicated to the *British Medical Journal* a unique case of Asiatic Cholera, supervening to a very slight form of bilious diarrhœa, of which my patient had been the subject occasionally. It occurred in June, 1833, full twelve months prior to its appearance in the epidemic form in Macclesfield and the neighbourhood, and without any conceivable inter-communication with already infected districts. The disease pursued the ordinary course of bilious diarrhœa from the Monday to the Friday evening, when the case suddenly assumed the grave symptoms characteristic of Asiatic cholera, and terminated fatally on the Sunday following, seven days from the accession.

In the early part of August, 1872, I had an equally striking case of relapsing fever, in a healthy young woman, whose family had been patients of mine from the beginning. The complaint was altogether unknown in Macclesfield, the nearest affected locality being Manchester, and I have not heard of a similar case in this district since. Unfortunately I have lost the notes I made at the time, so that I can only report from memory. A smart febrile accession, of eight days' continuance, was followed by complete remission for three days more, my patient sitting up and taking food with ordinary zest. The secondary form of fever which then supervened was unusually severe, high temperature, quick full pulse, with headache, restlessness, and a high degree of delirious excitement, insomuch that it was with extreme difficulty she could be held down in bed. The application of a few leeches, with ice to the head, blisters behind the ears, and a brisk dose of black draught, comprised the active treatment, and on the fifteenth day of the relapse the fever subsided, and all went on favourably, so that in two or three weeks more she was able to resume her business as dressmaker.

My professional interest in the family had previously been awakened by the following coincidence. The father of the young woman, a man of about fifty-eight years, of florid complexion, nervous sanguine temperament, had been walking a few miles out of town on business as an insurance agent about a month before his daughter was taken ill, and as the day was hot, he took off his hat and walked on with his head exposed to the rays of the sun. When he got home he complained of great exhaustion and giddiness, the latter continuing from the Thursday onwards. On the Sunday morning I happened to meet with him as he was returning from his usual place of worship, when he mentioned the vertigo. His countenance was pale and inexpressive, skin cool, pulse slow and feeble. On the following day I called and found him complaining of headache; in other respects, as on the previous day. I ordered him to bed, prescribed a mustard pediluvium and leeches to the temples. On the following day there was much febrile reaction; hot skin, quickened full pulse, and as the head was unrelieved, eight leeches more were applied, which, as the symptoms were urgent, were followed on the evening of the same day by six more to the head and two to the nostrils, spirituous lotions and ice being kept constantly to the head. As the headache persisted, with perfect insomnolency, a high temperature, and a full bounding pulse, I took away twelve or fourteen ounces of blood from the arm. This relieved the active cerebral congestion; the restlessness subsided, and my patient gradually settled down by the aid of small doses of liq. morph. and liq. ant. tart. into a quiet refreshing sleep, and slowly recovered his former vigorous health, himself and daughter having been perfectly well to the present.

The cases are very suggestive (the cholera and the relapsing fever), pointing to the conclusion that, when a perfectly new epidemic disease obtains in a country, sporadic forms of the disease may occur which do not follow the usual laws of epidemic complaints; the morbific germ being altogether independent of its primary source.

The case of sun stroke indicates that a very serious cerebral condition may be masked for several consecutive days, by a train of comparatively slight symptoms.

Yours very respectfully,

J. BIRCHENALL,

Consulting Surgeon to the Macclesfield Infirmary.

Macclesfield, March 6th, 1879.

## A SERIOUS CHARGE.

THE following particulars of a very serious nature against a member of the profession came out in London at the Marlborough Street Police Court on Monday last. The defendant, Adam Addison, L.R.C.P. Ed., L.R.C.S. Ed., of Chelsea, was charged in conjunction with Mary Jane Boyce, of Fulham, with causing the death of an unmarried female named Robinson. The police stated that information reached headquarters that abortion was being practised by the defendants to a considerable extent, and in consequence a watch was set, ending in the arrest of the prisoners on the present charge. After hearing the evidence, the magistrate remanded both prisoners, and declined to admit either to bail. We regret that a member of the profession should be placed in so painful a position, but refrain from commenting on the case whilst *sub judice*.

THERE will be no course of scientific lectures delivered this year at the College of Physicians, Ireland; but it is probable they may be resumed in 1880.

## NOTICES TO CORRESPONDENTS.

☞ CORRESPONDENTS requiring a reply in this column are particularly requested to make use of a *distinctive signature or initials*, and avoid the practice of signing themselves "Reader," "Subscriber,' "Old Subscriber," &c. Much confusion will be spared by attention to this rule.

READING CASES.—Cloth board cases, gilt-lettered, containing 26 strings for holding each volume of the MEDICAL PRESS AND CIRCULAR, can now be had at either office of this Journal, price 2s. 6d. The postal regulations not allowing the Journal to be stitched, these cases will be found very useful to keep each weekly number intact, clean, and flat after it has passed through the post.

NOTICE TO SUBSCRIBERS.—Subscribers who have not already paid their subscriptions—£1 2s. 6d.—for last year, are reminded that they are now due, and should be sent to the publishers, who will be happy to acknowledge their receipt. Subscribers who pay in advance will oblige by remitting, at the reduced rate of One Guinea for 1879, during the present month.

LUNACY BOOK FOR GENERAL PRACTITIONERS.—Bucknill and Tuke's "Manual of Psychological Medicine," or Winslow's "Manual of Pharmacy," will best answer your purpose.

A CHEMICAL PRIZE.—The Berlin Academy renew an offer of a prize of about £46 for an investigation of the following questions (not yet replied to):—"In what combination does lime occur in the blood of mammals and of birds, and how does the chemical precipitation of its salts in the tissues, and especially in the bones, take place?" It is desired that these questions be answered by experimental researches on growl animals, in which especially the chemical state of the blood and the bones, after long feeding with substances containing phosphorus and (separately) plant-acid salts, is more exactly determined. Papers must be sent in before March 1, 1881.

### SOCIETY FOR THE TOTAL ABOLITION OF VIVISECTION.

*To the Editor of the* MEDICAL PRESS AND CIRCULAR.

SIR,—In regard to your leader of the 12th inst., on "Professor Owen and the Anti-Vivisectionists," will you permit me to say, as the founder and Hon. Sec. of the original Association for the Abolition of the practice of subjecting live Animals to Experiments for Scientific Purposes, that our Society never placarded the hoardings of London and Edinburgh with sensational and revolting illustrations, or inserted them in the *Police News*.

We publicly repudiated them in the *Times* and *Morning Post*. Neither

is the small periodical you mention "the organ" of our Society. It is, we believe, the trumpet of a person who desires to distinguish himself in the Lower House, and is the worst enemy our cause has had. The wish of our Society is to *argue* out the question, not to abuse our opponents, and we shall be happy to discuss the matter with Professor Owen on any real and definite case brought before the Royal Commission. Ours is the Society which obtained the appointment of that Commission, and the only one which gave evidence before it.

I remain, Sir, your obedient servant,

Henbury, Macclesfield. GEORGE R. JESSE.

THE COUNTER-PRESCRIBER AGAIN.—A small boy entering the shop of a Scotch druggist said, "My mither sent me for a bawbie's worth o' that stuff for the wind, she dis-na' mind the right name, but they ca't deevil's dirt." To which the Northern Knight of the pestle replied, "Rin hame and tell yer mither that I canna' disturb the deevil for less than a penny."

SOCIETY OF ARTS.—The Council ask for papers on "Our National Water Supply and Sewage" from medical men for the Conference to be held on May 15th and 16th.

ROYAL COLLEGE OF SURGEONS OF ENGLAND.—This day (Wednesday), and on Friday next, at 4 p.m., Prof. Flower, "On the Comparative Anatomy of Man."

ROYAL COLLEGE OF PHYSICIANS OF LONDON.—This day (Wednesday), and on Friday next, at 5 p.m., Croonian Lectures: Dr. W. H. Stone, "On some Applications of Physics to Medicine."

ASSOCIATION OF SURGEONS PRACTISING DENTAL SURGERY.—This evening, at 8½ o'clock, Mr. Francis Fox, "On Cysts of the Mouth."

HARVEIAN SOCIETY.—On Thursday next, at 8½ p.m., Dr. Broadbent: "Cases of Mitral Stenosis." Mr. Malcolm Morris, "On some of the rarer Affections of the Hair."

"INDIAN MEDICAL SERVICE," "Dispensary Statistics," "Homœopathy gone Mad," these communications are in type, but are unavoidably crowded out.

COMMUNICATIONS. Enclosures, &c., have been received from—Dr. Vallin, Paris. Dr. Joshua Chitwood, Connersville, Indiana. Dr. Knapp, Wyoming, Luzerne Co., America. Dr. Thorowgood, London. Dr. Kerr, Preston. Dr. Barrère, Paris. Dr. Waters, Chester. Dr. Smith, Dublin. Dr. Griffith, Pimlico. Dr. Patterson Cassells, Glasgow. Dr. Black, Glasgow. Dr. Octavius Sturges, London. Mr. B. W. Richardson, Dublin. Dr. Corley, Dublin. Dr. Fereol, Paris. Mr. Radcliffe, London. Dr. L. S. Forbes Winslow, London. Mr. Hemming, Bournemouth. Mr. Georges Clasen, Paris. Surgeon-Major Gore, Octacamund, India. The Secretary, Indian Medical Department. Dr. S. Mackenzie, London. Mr. Birchenall, Macclesfield. Dr. Day, London. Dr. O'Neill, Lincoln. Mr. Redman, Lincoln. Dr. McDowell, Baltinglass. Dr. Brereton, Oughterard. Mr. Crofton, Dublin. Dr. Mc. Jones, Cork. Mr. Field, London. Mr. Sewill, London. Dr. Tilt, London. Mr. T. Cooke, London. Mr. Crisp, Martham. Mr. W. Walker, Kentish Town. Dr. Yourelle, Dunboyne. Dr. Murray, Portsalon. Dr. Fawcett, Roscrea. Dr. Carey, Limerick. Dr. Kenny, Leek. Dr. Ormsby, Dublin. Dr. Kilgarriff, Dublin. Dr. Sale, Kilmeague. Dr. Barton, Dublin. Dr. Fisher, Portarlington. Dr. Hewetson, Clonmel. Dr. Sterling, Castlecomer. Dr. Madden, Ballycastle. Dr. O'Brien, Clarina. Dr. O'Reilly, Moville. Dr. Borthistle, Clonevan. Dr. McClury, Fintona. Dr. Dickson, Ballynahinch. Dr. Duke, Dublin. Dr. Campbell, Aldershot. Dr. Darley, Coolock. Dr. Henry, Brookboro'. The Registrar-General for Ireland. The Registrar-General for England, &c., &c.

## BOOKS AND PAMPHLETS RECEIVED.

The Treatment of Dropsy of the Gall-Bladder. By George Brown, M.R.C.S. London: Baillière, Tindall, & Cox.

The Moral and Religious Estimate of Vivisection.

Transations of the Obstetrical Society. Vol. XX. London: Longmans & Co.

Insanity and Lunacy Law. By William Wood, M.D. London: J. & A. Churchill.

Atlas of Histology. Part I. By Dr. Klein and Mr. Noble Smith. London: Smith, Elder, & Co.

Personal Appearances in Health and Disease. (Health Primer.)

A Digest of the Principles and Practice of Medicine. By R. N. Khory, M.D. London: Smith, Elder, & Co.

Inflammatory Fungoid Neoplasm. By L. A. Duhring, M.D.

Baths and Bathing. (Health Primer). London: Hardwicke & Bogue.

The Plague as it concerns England. London: Hardwicke & Bogue.

A Plea for Medical Missions.

The Practitioner for March.

The Veterinary Journal for March.

The Glasgow Medical Journal for March.

The Dublin Medical Journal for March.

## VACANCIES.

Bedminster Union.—Medical Officer for the 4th District. Salary, £40, with the usual extras. Applications to the Clerk to the Guardians, Flax Bourton, Near Bristol.

Bournemouth General Dispensary.—Resident Medical Officer. Salary, £120. Applications to Mr. J. Haggard, Pine Hurst, Bournemouth, before March 29.

Cancer Hospital, Brompton.—House Surgeon and Registrar. Salary, 100 guineas, with board, &c. Applications to the Chairman of the Board, at 167 Piccadilly, London, before March 22. (See Advt.)

Coleraine Union, Articlave Dispensary.—Medical Officer. Salary, £90, with fees, and £22 as Sanitary Officer. Election, April 3.

Coombe Lying-in Hospital, Dublin.—Apothecary and Registrar. Election, March 27.

Lisnaskea Union, Derrylin Dispensary.—Medical Officer. Salary, £100, with fees, and £15 as Sanitary Officer. Election, March 28.

Manchester, Owens College.—Demonstrator in Physiology. Salary, £150. Applications addressed to the Senate up to March 22.

Naas Union, Clane and Timahoe Dispensary.—Medical Officer. Salary, £125, with fees; and £15 as Medical Officer of Health. Election, March 24.

Stockport Infirmary.—Visiting Medical Officer. Salary commencing at £70, with board, &c. Applications to the Hon Sec. up to the 24th inst.

Tuam Union, Abbey Dispensary.—Medical Officer. Salary, £120, with fees, and £20 as Sanitary Officer. Election, March 24.

Wexford Union, Wexford Dispensary.—Medical Officer. Salary, £125, with fees, and £25 as Medical Officer of Health. Election, March 26.

Youghal Union, Killeagh Dispensary.—Medical Officer. Salary, £120, with fees, and an allowance as Sanitary Officer. Election, March 24.

## APPOINTMENTS.

CANNY, D. J., L.R.C.P.Ed., M.R.C.S.E., Medical Officer for the Teignmouth District of the Newton Abbot Union.

COLLINS, F. H., M.D., C.M., L.R.C.S.I, a Surgeon to the Hulme Dispensary, Manchester.

GADSBY, J. T., M.B. & B.S., M.R.C.S.E., House Surgeon to the Richmond Hospital, Surrey.

LOVELL, R. H., M.R.C.S., Resident Medical Officer at St. Mary's Hospital.

MURPHY, E., L.R.C.S.I., Medical Officer to the Dunfanaghy Dispensary, Dunfanaghy Union.

O'KELLY, T. E., L.R.C.S.I., Medical Officer to the Maynooth Dispensary, Celbridge Union.

O'ROURKE, C. T. J., L.K.Q.C.P.I. & L.M., L.R.C.S.I., Medical Officer and Medical Officer of Health for the Ballinrobe Dispensary District of the Ballinrobe Union.

PLAYFAIR, D. T., M.B., C.M., Assistant Medical Officer to the Royal Albert Asylum for Idiots and Imbeciles, Lancaster.

PROCTOR, R. F. S., M.B., C.M., Medical Officer and Public Vaccinator for the Parish of Belhelvie, Aberdeenshire.

REDMOND, J. M., L.K.Q.C.P.I. & L.M., L.R.C.S.I., Assistant Physician to the Mater Misericordiæ Hospital, Dublin, and Temporary Physician to Cork Street Hospital.

RICHARDSON, T. W., M.R.C.S.E., a Medical Officer to the Norwich Dispensary.

SAYER, P., M.R.C.S.E., Medical Officer for the No. 4 District of the Parish of St. Pancras.

SHEARER, G., M.D., L.R.C.S.Ed., an Assistant Physician to the Hospital for Consumption and Diseases of the Chest, Liverpool.

SHERIDAN, M. J., M.D., L.R.C.S.I., Medical Officer to the Wexford Union Workhouse.

STONEY, J. H. L., M.D., F.R.C.S.I., sole Lecturer on Anatomy at the Carmichael School of Medicine, Dublin.

URQUHART, A. R., M.D., Assistant Medical Officer to the Warwickshire Lunatic Asylum.

VACHER, F., F.R.C.S.Ed., Public Analyst for the Borough of Birkenhead.

ARMY MEDICAL DEPARTMENT.—Surgs-Major O'Brien, D. O'Donovan, and Surgeon F. G. Curran, have returned home to appear before a medical board.—Surgeon-Major Turner has resumed medical charge of the 1st Infantry Brigade.—Surgeon-Major W. Lougheed has assumed medical charge of the 2nd Brigade at Aldershot from the 3rd instant.—Surgeon-Major Elgee is *en route* for Natal in steamer *City of Venice*, in medical charge of 3rd and 4th Companies Army Service Corps.—Surgeon-Major Blake has taken up duty in the Cork District.—Surgeon Tobin embarked at Kingstown, 5th March, in H.M.S. *Assistance*, and assumed medical charge of the draft from 89th Foot for Portsmouth, *en route* for India.—Surgeons-Major Parr, Watling, and Chapman, and Surgeon Quill, sailed for India on Thursday in the troopship *Euphrates*.

NAVY MEDICAL DEPARTMENT.—Staff-Surgeon Henry N. M. Sedgwick (1869) has been promoted to the rank of Fleet Surgeon in Her Majesty's Fleet, with seniority of the 17th February, and to appear on the list as senior to Fleet Surgeon A. B. Johnson.—Staff-Surgeon Wm. Conolly, M.D. (1867), has been promoted to the rank of Fleet Surgeon in Her Majesty's Fleet, with seniority of the 1st of March.

# Birth.

HENRY.—On the 5th inst., at Lansdowne, Stewartstown, the wife of Robert Henry, M.D., of a son.

# Deaths.

BEEVOR.—On the 9th inst., at Bawtry, John Beevor, M.D., of Mansfield-Woodhouse, Notts.

BRIETZCKE.—On the 11th inst., at Portsea, Hants, Henry Brietzcke, F.R.C.S., L.R.C.P. Lond., Medical Officer to H.M. Convict Prison.

BRIMS.—On the 9th inst., at his residence, Mount Villa, Burnley, of acute pneumonia, James Brims, M.D., aged 43.

FURLONG.—At 17 George Street, Limerick, John J. Furlong, L.A.H.

JEFFREY.—On the 11th inst., at Jedburgh, John Jeffrey, M.D., of Ayton, aged 68.

JENKINS.—On the 12th inst., suddenly, at Copelands, Hereford, Hy. J. Jenkins, M.R.C.S.

JOHNSTON.—On the 4th inst., at Ballard Lodge, Alverstoke, Hants, J. B. Johnston, M.R.C.S.

JORDISON.—On the 10th inst., at Hornchurch, Essex, Robert Lloyd Jordison, M.R.C.S.E., aged 37.

LATHAM.—On the 9th inst., at Wigan, John Latham, L.R.C.P.Ed., M.R.C.S.E., L.S.A.L., aged 77.

LAWLESS.—On the 11th inst., at St. Patrick's Hospital, Dublin, Edward Lawless, M.R.C.S.E., Resident Medical Superintendent, aged 58.

MARKHEIM.—On the 11th inst., at Sorrento, Italy, Alfred J. H. G. Markheim, M.D.

SPARK.—On the 1st inst., at Millom, Cumberland, James S. Spark, L.F.P.S.G., aged 29.

TRAVERS.—On Dec. 13, killed by Natives while travelling from Queensland to the Northern territory, Wm. Travers, F.R.C.S., aged 29.

WALSH.—At Castlebar, co. Mayo, Charles J. Walsh, L.R.C.S.I.

### LECTURE III.

### TREATMENT OF ASTHMA.

By JOHN C. THOROWGOOD, M.D., F.R.C.P.,

Physician to Victoria Park Hospital for Diseases of the Chest, and to the West London Hospital.

(*Concluded from page* 199.)

THE chemical products resulting from the combustion of nitre paper have been examined by M. Vohl (see *Journal de Pharmacie et de Chimie*, 1866, p. 155,), and he found the nitrous fumes to contain watery vapour, traces of cyanogen, carbonic acid and nitrogen gases, ammonia, and nitrate of potash. To the ammonia and nitrate of potash, M. Vohl attributes the anti-spasmodic action of the nitrous fume. The constituents of the fume seem so closely allied to the adventitious impurities found in the air of smoky towns, that I went over Salter's table of his 223 asthmatics, to see if I could make out that those persons who are put down in the table as being notably relieved by the nitrous fume, were also those who were either much relieved, or quite cured by London air. I found that of the 22 who are reported to have obtained marked relief to their breath from the air of London, there were nine to whom the nitre paper was very valuable. Two, who are said to have been quite cured by London air, found the paper more serviceable than anything else they had tried. One, who suffered much in London, found nitre paper rather harmful than otherwise. It is to the ammonia and carbonic acid gas that I think we may attribute some of the anti-spasmodic action of the burning paper, for it has been shown by Trousseau and others that often ammonia vapour will speedily cut short an attack of bronchial spasm; and Salter reports one case where the spasm was at once nipped in the bud by cautiously inhaling the vapour of diluted ammonia. An asthmatic sea captain was free from his breath trouble when conveying a cargo of guano, a product which slowly evolves ammonia. To carbonic acid gas some degree of anti-spasmodic power has been attributed; for it has been stated that the reason why an asthmatic, when black in the face, and apparently at the very verge of asphyxia, suddenly begins to mend, is that the carbonic acid in the blood acts as an anti-spasmodic and sedative to the nerves of the bronchial muscle, and so relaxes the spasm—a theoretical notion which as yet does not seem to me convincingly demonstrated.

That the nitre paper fume is an anti-spasmodic I judge from the very speedy way in which it eases sudden seizures of breath difficulty. A man whom I saw a few days ago with extensive heart disease and dropsy, but now no bronchial spasm, had his symptoms commence with sudden asthmatical seizures, the spasm coming on in such force that he had to leap out of bed in fear of suffocation. Burning nitre paper gave relief speedily; but he was glad to give up his practice of now and then smoking his pipe, for tobacco brought on faintness and great depression. Among Salter's tabulated cases I observe how frequently those who were relieved by the nitre paper, found good also from the use of a pill containing half-a-grain of extract of stramonium.

Stramonium we know to be an anti-spasmodic medicine, and Dr. C. J. B. Williams proved that it had, in common with belladonna, a power of diminishing the contractile excitability of the bronchial muscle.

Nitrate of potash forms, I expect, the basis of the numerous list of proprietary papers sold for the relief of asthmatic persons. Some patients fancy one kind of paper, some another, and very many think nothing can surpass their own home-made nitre paper. I have made and tried papers containing iodide of potassium, as well as nitrate of potash and chlorate of potash, but do not find them to be in any way superior to the nitre paper. Nitrate of ammonia added to the nitrate of potash appears to have no

(a) Delivered before the Medical Society of London. Erasmus Wilson, F.R.S., President, in the Chair.

further effect than to diminish the activity of the combustion, while chlorate of potash increases it.

The use of such antispasmodic inhalations as tobacco smoke and the smoke of burning stramonium, tatula and belladonna, in the form of powder, cigarette, or pipeful, is so familiar to such an assembly as the present that I need not dwell on the subject.

Dr. Robert Bree tried the stramonium smoke in eighty-two asthmatic cases: in fifty-eight it had no permanent effect, and in the remaining twenty-four it acted injuriously. General Gent, who first introduced this practice of smoking stramonium for the cure of asthma, himself died from the over-use of his specific. The Datura Tatula seems a safer and better herb for smoking than the datura stramonium, and in asthma complicated with slight bronchitis I have known the datura tatula smoke prove very soothing. In common with many of my friends, I have had my attention drawn to a variety of powders which, when ignited, burn and give off an antispasmodic smoke, and it is right to say that the powders of which I have had experience, known as Senier's, Himrod's, Clery's, are really valuable remedial agents. A patient of mine at Victoria Park Hospital carries some of Senier's green powder in a tin box, and, if taken in the street suddenly with spasm in her breathing, retires to a corner, puts some powder on the lid of the box, and lights it with a match; in a minute or two her breathing is relieved. Another hospital patient carries always some nitre paper of his own make, and uses it in a similar way, and with an equally satisfactory result. I have myself soaked nitre paper in tinctures of stramonium and verbascum, having seen the verbascum thapsus recommended in the treatment of asthma, but the objection I find to the use of papers thus medicated is that their fume, when burning, while it relieves the asthmatic breathing, is apt often to produce an unpleasant headache afterwards. I prefer to let the patient try simple nitre paper first, and if that fails he may sprinkle on it some of one of the powders just named, or dry powder of stramonium leaves and seeds, or of dry belladonna leaves, and see if such addition proves of service to him.

Speaking of antispasmodic inhalations, I should like to say a word or two on the use of arsenious acid. That the vapour of arsenious acid has a special action on the respiratory organs seems a well established fact; and I am informed, on good authority, that men who work in the Cornish arsenic works are seldom affected with phthisis. Indeed, in one instance brought to my knowledge, all the symptoms of phthisis seemed to be removed by exposure to the vapour of the arsenic subliming flues. Whether this happy result was due to the antiseptic action of arsenic vapour, or to some special action of the same on the nerves of nutrition I cannot undertake to say. The fact reminds us that the smoking of arsenical cigarettes has been highly commended by good authority in the treatment of chronic phthisis.

There are various formulæ given for preparing the arsenical cigarettes, known as cigarettes of Dioscorides, of Boudin, and of Le Vasseur. Trousseau recommended that each cigarette should contain one grain of arsenite of potash—rather too strong a dose, I think, for a few full inhalations of a cigarette containing half, or less than half this amount of arsenite will usually answer the desired purpose well.

It is well known how, in Styria, the peasants eat small quantities of white arsenic to improve the breathing powers, and with the British public the use of arsenical inhalation to relieve asthma is not unknown. Dr. Wilks told me of a former out-patient of his at Guy's Hospital who, in his occupation as a stuffer of birds and animals, used much white arsenic. This man was a smoker, and very liable to asthma, and he said he always found a ready cure for his breath spasm by adding a little arsenic to the contents of his tobacco pipe.

Of the inhalation of nitrite of amyl in asthma I have not much to say. I have used it, and prefer to employ chloroform, as being more certain, more agreeable, and perhaps more safe. The nitrite varies much in strength, and acts with corresponding uncertainty on the patient. The best way to use it is in the hermetically sealed capsules. So far as my present experience of iodic ether or iodide of ethyl goes, it is encouraging, and as this is a new remedy I will give what report I can of its effects. Pure iodide of ethyl $(C_2H_5)_2I$ is prepared by mixing amorphous phosphorus with absolute alcohol and then adding iodine. After a few hours the process is complete, and the iodide of ethyl can be separated by distillation; alcohol and iodide of phosphorus, producing iodide of ethyl, phosphoric acid and water. The iodide so prepared should be almost colourless, and should be kept in a dark place or it will become decomposed and of a brown colour from the separation of free iodine. My late chemical assistant at Victoria Park Hospital, Mr. Macdonald, has been good enough to provide me with the notes of three cases, under Dr. Andrew and myself, in which the iodide of ethyl was tried. I will read a summary of these notes.

Case I.—C. D., æt. 42, admitted November 19th, 1878, asthmatical five years, has an attack every morning at five A.M., which lasts for about three hours, then passes off, and leaves him free from dyspnœa till the following morning.

Nov. 23.—Ordered to inhale 10 drops of iodide of ethyl four times in the day. The effect was diminished expectoration, and what is coughed up is white, having formerly been of a greenish hue. He said on December 12th that his attacks were neither so severe nor so frequent as they had been before he used the iodide. The urine and sputa when tested gave decided evidence of iodine.

Case II.—Elizabeth S., æt. 17, had been under my observation at intervals for two years, and has suffered severely with attacks of spasmodic asthma and frequent cough and expectoration. Twelve months ago she improved greatly, and gained weight under the use of small doses of arsenical solution.

December 10th, 1878.—Has come from Lincolnshire into Victoria Park Hospital, and every morning till December 14th she had at five A.M. a bad attack of spasmodic asthma, with tightness and wheezing of the chest. Strong coffee relieves her, and during the day she is to all appearance perfectly well,

Dec. 14th.—Began to use 10 drops of iodide of ethyl four times a day. She used it thus for one week, and then left it off, having had no asthma; and when she quitted the hospital she had been three weeks without needing the iodide; she had not a trace of dyspnœa, even after meals, no cough, and no expectoration.

In the third case, that of a man with bronchitic asthma of seventeen years' standing, the iodide, deeply inhaled, caused a temporary sensation of vertigo and dizziness; the breath, however, was relieved, and expectoration promoted.

A patient, who for 20 years had suffered much from asthma and bronchitis, told me he attributed a great improvement in his case to the use of iodide of ethyl for three weeks. "I think (writes he) it tended to discuss or lessen the swollen condition of the bronchial tubes; my doctor wishes me to continue it, but being a new remedy I am rather afraid, though it gives me more permanent relief than anything else I have tried." The iodide of ethyl seems to be, an anti-spasmodic, and further, an anti-congestive remedy, allied in action to iodide of potassium, a salt which, when freely and perseveringly given, is well known to be a trustworthy remedy in congestive asthma.

In two cases recently I have observed excellent effects follow on the employment of citrate of caffeine. One patient was an eminent medical practitioner in a large town in the north. He had suffered most severely from paroxysmal asthma, and the utter failure of a list of approved inhalations and medicines (far too long to be here enumerated) was most distressing. Four grains of citrate of caffeine produced an undue degree of wakefulness, but one grain, taken regularly at bedtime, had a

most happy effect indeed. So far as we can at present judge, it appears to have been really curative of the asthma. The last report says: "*Pari passu* with the asthma my cough and expectoration have gone, and I now have next to none of either." In another case a highly informed and observant patient of Dr. Kingsford's, who had found much benefit from the inhalation of iodide of ethyl for an asthma and bronchitis of twenty years' standing, tried the citrate of caffeine in two-grain doses every afternoon for a fortnight without any marked result. One day, however, being sadly worn out by a protracted attack of bronchial spasm which had lasted for eight hours, this patient took four grains of citrate of caffeine in coffee, with the effect of obtaining immediate relief to the spasm, followed by three hours' quiet sleep in his chair. The citrate of caffeine appears to allay the abnormal excitability of the nerve centres, and then repose ensues as a natural result. I have seen similar calming effect from the use of nux vomica in bad emphysematous asthma, with failing pulmonary innervation, and this soothing and soporific action of remedies reputed, nerve-tonics and stimulants, in cases of great exhaustion of the nerve-centres is an interesting therapeutical fact, ably set forth by Dr. Milner Fothergill in his Fothergillian prize essay. The citrate of caffeine is not a new remedy. It has been employed in neuralgic headache and sickness for many years, and a friend of mine saw it given for asthma in Paris more than twenty years ago. Lately Dr. Lewis Shapter (*a*) has employed the citrate as a diuretic in cardiac dropsy. Like belladonna and atropia, caffeine appears to stimulate the respiratory and circulatory nerve-centres, and to increase the blood-pressure in the small vessels, so that it may prove an efficient diuretic. As such it may be employed in cardiac dropsy, where digitalis does not appear to agree. The citrate of caffeine, a fine specimen of which has been sent to the Society by Messrs. Corbyn, occurs in delicate silky crystals soluble in water, but best administered in a small cup of coffee. The dose may commence with one grain and extend to four or five.

Space does not allow me to dwell further on the subject of the treatment of asthma. In old-standing emphysematous asthma it is important to relieve any abdominal plethora and congestion of liver; and when this is done by means of saline aperients, Carlsbad salts, and abstinence from all forms of alcohol, then great benefit will often follow on the use of small doses of the extract and tincture of nux vomica. I have repeatedly proved the value of nux vomica and strychnia in cases of emphysematous asthma, with very prolonged expiration, and apparent tendency to paralysis of bronchial muscle. It is in cases of old emphysematous asthma that the compressed air bath is so much commended. My experience of this mode of treatment is not very great. I have known a well-arranged compressed air-bath perseveringly tried by a youthful subject of bronchial spasm, whose heart and lungs as yet manifested no sign of structural change, without any beneficial result. In the case of elderly persons with overfilled lungs, long weak expiration, and tendency to obstruction of the circulation, I certainly think the bath is worth a trial. In one case of this description a free expectoration came on under the influence of the compressed air, and in another the effect of the bath was to cause tranquil and refreshing sleep. One great effect of the compressed air-bath I consider is the production of more perfect oxygenation of the blood, hence its very marked effect in curing cases of obstinate anæmia. Coupled with this we may bear in mind the fact that the inhalation of oxygen gas has been found by Dr. Cayley and others of great service in relieving the dyspnœa of chronic emphysematous bronchitis, and also that Trousseau, in treating some very severe forms of anæmia, found no remedy so powerful as the inhalation of oxygen.

(*a*) *Practitioner*, for January.

# Original Communications.

## ON THE GENERAL PATHOLOGY OF EAR DISEASE.

By GEORGE P. FIELD,
Aural Surgeon to St. Mary's Hospital.

PATHOLOGY has certain laws to which all tissues are liable, and the structures of the ear form no exception to this rule. We may therefore say that the ear has no special pathological anatomy, or very little; the special interest that attaches to the pathological changes occurring in it, is the effect which they produce upon the organ of hearing, and the relation which the diseased part bears to the surrounding structures. I desire to point out the analogies existing between the diseases of the tissues of the ear and those occurring in similar tissues elsewhere in the body, and thus to see from the broader standpoint the general laws or first principles which should always guide our diagnosis, prognosis, and treatment.

Let us, then, briefly proceed to trace these general principles in relation to the tissues forming the external ear. Here we find skin, subcutaneous cellular tissue, fat, a small amount of muscle, and yellow elastic fibro-cartilage, with some fibrous tissue forming ligaments. These tissues we find affected exactly as in other parts; thus, take the skin, erythema, eczema, psoriasis, pemphigus, lupus, ichthyosis, and purpura may all affect the skin of the ear as they do that of other parts, and in each condition a constitutional or local cause must be looked for; we should remember that erythema is often a manifestation of rheumatism, and seek for it accordingly in the patient, or, on the other hand, that it may be of reflex production, and due to disordered stomach or uterus. Eczema may be gouty, or due to local causes: thus the position and shape of the organ will suggest intertrigo, and its proximity to the scalp the possibility of a vegetable or animal parasite. Psoriasis, again, may have one of its numerous constitutional causes, or be apparently a purely local disease; the pemphigus and lupus will probably depend upon syphilis, and the ichthyosis have a congenital origin. Remembering the isolated position of the auricle, and its exposure of a large surface for the radiation of its heat, we shall not be surprised to find it affected with gangrene, due either to impoverished blood, or enfeebled circulation and diseased vessels; thus it is common in feeble infants; after typhus or other fevers; in heart disease, or general atheromatous degeneration of the vessels; or after frost-bite. The subcutaneous cellular tissue may become inflamed, either from injury, or the poison of erysipelas.

New growths found in the auricle will owe their origin to the tissues of which it is formed, and the analogies of these tissues in similar parts of the body will suggest the nature of the tumour. Thus the subcutaneous tissue will give rise to fatty and sebaceous tumours, and that part where it is most abundant, namely, the back of the auricle and the lobule, will be the favourite sites for such new growths; fibrous thickenings, the result of the irritation of ear-rings, sometimes amounting to tumours, or even to the more dangerous keloid, also occur here; the latter is seen especially affecting the lobule in negresses.

Large nævi, like those common enough in the scalp, are occasionally found in the auricles.

Hæmatoma auris (othæmatoma) is a curious affection resulting from inflammation of the cartilages of the ear; the perichondium is raised by the effusion of the products of inflammation, and there is much swelling of an inflammatory nature, combined with effusion of blood, in the cellular tissue of the concavity of the auricle, as well as below the perichondium. The inflammation commonly subsides, and a cretaceous, or bony nodule, often results.

Passing inwards towards the external meatus, we must look for its diseases among those which effect similar parts of the body, namely, where skin is about to change to mucous membrane. Some of these are very characteristic;

we see them on the lip, about the anus, and genital orifices. The diseases to which these parts are especially liable are epithelioma and condylomata. Epithelioma of the auricle is not unfrequent, and it takes origin more commonly from the central part in the immediate neighbourhood of the meatus than at the periphery; this distinguishes it in some measure from lupus, and perhaps from rodent ulcer, which may be regarded as a special form of epithelioma, having a clinical history and appearances peculiar to itself; both of these diseases may affect the auricle, but take origin more frequently at its periphery. The malformations of these parts can scarcely be said to be the results of diseased action.

While studying the diseases of the external meatus, we shall, as usual, find a key to them in the anatomical structure of the part. It will be remembered that the outer half of the passage is formed by cartilage, the inner half by bone; the skin is thicker over the outer half, where it consists of both cuticular layer and corium, and contains hairs, follicles, and ceruminous glands, while the inner half is lined by skin, which consists only of a cuticular layer, the corium being blended with the periosteum of the bony walls of the tube. Upon this anatomical basis we may build up the pathological history of the part.

Von Tröltsch has pointed out that the common term "catarrh of the external meatus" has anatomically no justification whatever, "except, perhaps" (as Schwartze says), "in those cases in which the epidermis has been destroyed, as, for instance, in acute moist eczema." A discharge of pus from the external meatus nearly always proceeds from the middle ear, through perforation in the tympanum. The various forms of chronic suppurative inflammation of the external meatus may be grouped together under the name of *otitis externa*, but it is always desirable to seek as far as possible their ultimate cause. The skin of the meatus may be affected by erythema, eczema, herpes, pemphigus, and erysipelas. The outer half of the canal is subject to an ordinary phlegmonous inflammation of the corium and subcutaneous cellular tissue, while the inner half, if inflamed, suffers from a periostitis, for its corium forms periosteum, and it has no subcutaneous tissue; caries or necrosis may result from this, if inflammation be severe.

Furuncles are common affections in this position; they are inflammations, commencing apparently in the follicles of the ceruminous glands; they occur, therefore, in the locality where these bodies are to be found, namely, in the anterior lower wall of the meatus. These inflammatory changes often lead to stricture of the meatus, and thus call for surgical interference; things, therefore, which would be of little importance elsewhere, eczema, for instance, occurring here are frequently of the gravest moment, for chronic eczema induces hypertrophy of the corium and stenosis of the meatus (Schwartze).

Tumours, causing strictures of the canal, are not unfrequent, and take their origin from the anatomical elements. The ceruminous glands will produce, when obstructed, sebaceous tumours or cholesteatometa. The cartilage forming the wall of the meatus gives rise to enchondroma; the bone at the inner end of the canal produces exostoses of two kinds, the inflammatory and non-inflammatory. Sarcomata doubtless occasionally occur here, but little is known about them, and none have been recorded under that name. Indeed, it appears particularly noteworthy how little liable the external meatus is to malignant growths, especially when we consider the great amount of chronic irritation to which it is liable by many of its diseases—such as irritating discharges from the middle ear, chronic eczema, and the presence of inflamed ceruminous and sudoriferous glands, or of accumulations of hardened and irritating concretions of wax. Such irritations as these we have good evidence of as causes of malignant growths in other parts of the body, and I have strong suspicions that many of the so-called aural polypi which show such great proneness to recur, may, with great propriety, be ranked among the sarcomata. Among these we should probably find examples that might be classed as fibro-sarcoma, round-celled (or granulation) sarcoma, myxo-sarcoma, osteo-sarcoma, and osteo-chondromata.

The pathology of the membrana tympani appears at first sight complicated, but its anatomical structure is the key to all the changes to which it is liable. It consists of a layer of skin, chiefly composed of epithelium, with a very delicate and imperfect corium, a fibrous membrana propria, and a layer of mucous membrane. Each lamella has a pathology of its own, and every inflammation of the structure commences in only one layer, though it may eventually involve all. Thus the outer layer of skin is liable to eczema, pemphigus, and epithelial growths; it is also liable to idiopathic or traumatic inflammations, either acute or chronic, but these are rare. In acute inflammation of this layer the epithelium is raised up and subsequently destroyed by the swelling of the corium, due to exudation of leucocytes and proliferation of connective tissue cells. It is evident that such changes as these will produce permanent thickenings and opacities of the membrane. Very frequently the inflammation involves all three lamellæ, and sometimes they produce ulceration and perforation, though this is rare. The middle or fibrous layer is especially liable to calcarous deposits, chiefly urate of soda, occuring in gouty individuals; sometimes to fatty deposits, and also occasionally to increased growth of connective tissue. Other calcareous deposits, the residue of bygone inflammations, are also found in the membrane. These, however, usually include all three layers; they commence most commonly in the internal layer; sometimes they are the results of inter-lamellar abscesses. A new growth of bone has been demonstrated in the neighbourhood of these old inflammatory calcareous deposits by Politzer and Wendt. The membrana propria having a deficient supply of blood-vessels, is the least liable of the three lamellæ to inflammatory changes. On the other hand, the internal or mucous layer for the opposite reason is, like other mucous membranes, especially liable to inflammatory changes. These we shall have to allude to more particularly when speaking of the mucous membrane lining the tympanum. The inflammation may be catarrhal, or of a more severe character, often producing perforation of the membrane. Minute tubercles occur in this membrane, in the submucous tissue, and are occasionally seen in acute tuberculosis; they may thus lend an important aid to the diagnosis of an obscure medical case, just as we find in similar cases tubercles in the choroid, which will often clear up otherwise obscure symptoms. At present, observations of this nature have been so rarely made, that it is impossible to say with what degree of frequency they will be found, or whether they are more particularly associated with tubercular meningitis than the tubercle elsewhere; the examination of the membrane is manifestly less painful to patients with meningitis than that of the retina; while in many cases severe photophobia exists and entirely precludes all possibility of observations on the latter; examination of the membrane for tubercle appears to me well worthy the attention of physicians. Inflammations of the internal layer often produce enormous thickenings of it, sometimes so much as to increase by five times its normal thickness.

*(To be continued.)*

## BLOOD-LETTING.

By Z. JOHNSON, A.M. T.C.D., F.R.C.S., L.R.C.P.,
Surgeon to the Kilkenny County Infirmary.

THE important question of "blood-letting" having been lately brought under notice in the *Lancet* by Prof. Wharton Jones, and still more recently by the very judicious leader in the *Medical Press and Circular* (Nov. 20), the record of some cases bearing very forcibly on the subject, and occurring at various periods during a practice of considerable duration, may not be out of place just now.

It is not meant by any means to advocate the indiscriminate use of blood-letting, and it seems scarcely necessary to premise that it is a measure which requires the greatest caution, and which ought to be approached only with the most deliberate circumspection and anxious care. But the cases about to be recorded have impressed the writer with the belief (some of them long since) that the outcry against blood-letting has been too indiscriminate, and that a powerful and very valuable adjuvant to the remedial means at our command has been too much discarded, and many cases in which it would have done good service, lost, or retarded in their convalescence, by its omission and neglect.

The first case which led the writer to suspect that the outcry against blood-letting needed qualification came under his notice some thirty years ago. It was that of an old clergyman who consulted him for a troublesome bronchitis, resulting from a recent cold. For many weeks the resources of the Pharmacopæia, aided by various forms of counter-irritation, were exhausted in vain; but as the patient was considerably over 60 years of age, and his medical attendant imbued with the prejudices then rife against venesection, such a measure was not so much as thought of. He was lost sight of for a short time, and when next seen was completely freed from the complaint which had at first proved so intractable and obdurate. His explanation was, that a medical man, who was on a visit in his neighbourhood, had taken blood from his arm, that he slept well the ensuing night, instead of being harrassed as usual by his cough, and that from that out the cough abated rapidly, and soon left him altogether. He added that the doctor took the blood in "a tiny little stream." This remark and the result made a deep impression on the writer's mind, and he at once "made a note on't" for future use.

It was not long after this the writer was sent for in urgent haste to see a retired army surgeon who was threatened with apoplectic seizure. He was an aged man, not far from his 70th year, who had seen foreign service. But, before the writer could arrive, he had taken his own lancet and freely opened a vein in his arm. The immediate danger appeared to have been averted. The old gentleman was in no wise the worse for the operation, and his apprehensions, whether exaggerated or not, were certainly appeased, and his mind calm and tranquil. No bad consequences ensued, and he lived for many years afterwards without appearing to suffer in any way from the self-inflicted depletion.

It was not long after this the writer was sent for, in the utmost haste, to see a farm servant who had been suddenly prostrated by a veritable fit of apoplexy. On arrival, an old man in profound coma lay on some straw in the corner of a barn. He was of spare and attenuated form. His pupils were largely dilated and wholly insensible to the impression of light; his pulse, between 20 and 40, varying and intermittent; his breathing loudly stertorous. His condition altogether was such as made it highly probable that he would not survive more than a few hours unless relieved by prompt and very decisive measures. That he was not insensible from drink was quite certain, as he had suddenly dropped, when at his work in his master's fields, far from any public house, while he did not betray the least smell of alcoholic drink, or any of the other symptoms of drunkenness.

It had happened that a short time previously a case had fallen under the writer's notice which influenced him much in his decision as to the course to be pursued on the present occasion. He had been called on to make a post-mortem examination at an inquest on the remains of a pale, exsanguineous, attenuated woman who had dropped dead very suddenly. Her appearance during life was such as would have naturally averted all suspicion of sanguineous apoplexy, and it was presumed that she had died of heart disease or the rupture of some internal aneurism or vomica; but the organs of the thorax and abdomen all proved to be free from any trace of lesion or disease, and it remained only to seek for the cause of death within the cranium To the surprise of the writer, he found a large, solid, sanguineous clot in the parietal region, evidently produced by rupture of one of the cranial sinuses and compressing one of the hemispheres of the brain. The physique and aspect of the party during life rendered such a discovery highly improbable.

With the recollection of this case deeply impressed on his mind he did not hesitate as to the course to be pursued in the present case, but at once resorted to his lancet and took blood freely from the arm of the old man, carefully watching the effect on the pulse. As soon as the indications of cardiac action showed that the limit of safety had been reached, the venous flow was arrested, and the tongue being well drawn forward, a strong purgative bolus of calomel and jalap was deposited as far back as possible on its base. The patient was now left until the following day, when considerable improvement was found to have taken place. The bowels had acted freely, the stertor had ceased, the pulse had lost its peculiar slow bounding character, and was increased in frequency, and the patient was capable of being roused and of exhibiting signs of sensibility. He could swallow and answer questions. From this out he recovered gradually, without any paralysis. Years afterwards he was to be seen at his wonted occupation of ploughman on his master's farm, apparently quite free from any vestiges of the attack, or any evil consequences from the venesection.

These three cases, occurring within a tolerably short period of each other, made a deep impression on the mind of the writer. The circumstances appeared to favour a conclusion that blood-letting ought not to be condemned absolutely, and that perhaps the prejudice against its use was too indiscriminate. In this view he was amply justified by the result of subsequent cases, a few of which shall be briefly submitted as examples.

In what is now regarded as the "heroic practice" of our professional ancestors, blood-letting was considered an important resource in the case of injuries of the head. In numerous instances the writer has found it a most useful and important auxilliary. He retains drawings of two cases of depressed fracture of the skull, which recovered, after free depletion, without trephining, and without paralysis or defect of either physical or mental powers. A still more remarkable case recovered with a piece of bone nearly the size of a sixpence, punched deeply into the brain, where it still remains, the only effect complained of by the patient being that he cannot drink whisky without suffering from his head.

Within the last year a remarkable case was under treatment in the Kilkenny County Infirmary, which further illustrates the usefulness of free blood-letting in cranial injuries. Some nine or ten fragments of bone were removed, after trephining, from the parietal region of the brain of a young man who had received a blow of a pointed stone. Some of the fragments were imbedded deeply in the brain, beneath the point of the stone, which had broken off and was impacted firmly in the skull and penetrated the substance of the brain. The patient made a slow but satisfactory recovery, and was able to prosecute his assailant at the late winter assizes. He suffers no serious defect or consequence from either the injury or the operation, save the deficiency of bone. He was bled freely and largely previous to the operation of trephining, and to this measure the fortunate result is believed by the writer to be in great measure attributable.

In some cases of puerperal convulsions blood-letting is undoubtedly useful. Here there is of course, as in every other case, necessity for discrimination. Where the patient is young, robust, and plethoric, there can scarcely be a doubt of the propriety of venesection, especially in localities and under circumstances where leeches are not procurable. In promptitude of effect, no remedy can be compared with venesection, but it must be used with great caution and circumspection.

In some obstinate skin diseases it was the practice of

the late Robert Graves to precede the usual remedies by venesection. Cases which resisted all the resources of the Pharmacopœia before the operation yielded readily after a blood-letting. Mindful of this, the expedient was lately tried on a case occurring in the Kilkenny County Infirmary. An otherwise healthy young woman, of the peasant class, was tormented for years by frequently recurrent crops of furunculi. They yielded temporarily to alteratives, antimonials, cathartics, &c., &c., but were sure to reappear after a little time again. At last a free venesection was determined on; she got immediate relief, her tormentors disappeared, and have not now, for some years, returned.

In acute pulmonary affections the efficacy of venesection in relieving embarrassed breathing and cutting short inflammatory action is unquestionable. Of course it is not meant that every case will admit of it; but where the patient is sufficiently vigorous, and the disease not of asthenic type, it may often be resorted to with decided advantage.

Two cases illustrative of this recently came under the writer's notice. One, that of a military pensioner, affected with acute pneumonia of right lung. This man had seen foreign service, and suffered from ague and liver affection in India. In January, 1878, he was seized with rigor, followed by the phenomena of pneumonia. About the third or fourth day, the symptoms not yielding to the usual remedies, he was bled to the extent of 12 ounces. The effect was immediate, his breathing was at once relieved, and respiration rapidly returned to the dull and impervious portions of the lung. He made a rapid recovery, and has since continued perfectly free from all pulmonary trouble.

The second case, which occurred in October last, was much more remarkable. The patient was of intemperate habits, a hard liver, and hard worker. The disease, double pneumonia, was, when seen, of a fortnight's duration. The respiration was extremely shallow, some 50 in the minute. The lungs were both dull on percussion, and nearly impervious to air, excepting the upper portions. The aspect was livid, showing the blood was not oxydised, and the distress was excessive. The patient could not lie down, but sat nearly erect in bed. A bleeding from the arm of some 12 ounces was followed by immediate relief. Of course, as it proceeded, the pulse was carefully watched, and was found to improve in character, until it was deemed judicious to arrest the flow. Liberal support and free stimulants were enjoined; for some days he took a half glass of whisky every two or three hours. In consequence of his former habits, it was considered necessary to keep up this free stimulation. He made a remarkably rapid recovery, and has continued wonderfully well, taking drives of 18 or 19 miles during the late inclement weather, without taking cold, and without cough or any apparent pulmonary defect.

This case is the more remarkable, in consequence of the advanced stage of the disease when the bleeding was resorted to, as well as the previous habits of the patient and the state of exhaustion consequent on the length of his illness.

The writer, when a student, was himself bled from the arm by the orders of the late Sir Henry Marsh, for an acute pulmonary inflammation. Whether it was pleuritic, pneumonic, or bronchitic, he does not know, as he was a mere tyro at the time; he only knows that he got prompt relief, made a rapid and good recovery, and still survives.

The foregoing are but a few from many cases in which blood-letting did good service, and have been selected as being typical of some of the classes of disease or injury in which it is capable, when used with due discretion, of doing good.

It may not be amiss, for the benefit of junior readers, to make a few remarks on the peculiar features of some of these cases.

That of the old clergyman, first cited, is remarkable, in the fact that his cough had merged into the chronic stage before the bleeding was resorted to, and this circumstance, coupled with his age, enhances the lesson which it teaches. It is worth noting, too, that the blood was taken in a tiny stream, so as to avoid shock or collapse; add to which the prudence of placing the patient in the recumbent position during the operation ought not to be omitted.

Of the cases of puerperal convulsions, some were plethoric, florid subjects, but some were of spare habit and irritable nervous temperament. In country practice, leeches are often an *impossibility*, and the lancet often comes to the aid of the practitioner as a valuable auxiliary, *but* must be used with extreme caution.

In injuries of the head, especially with depression of the skull, to lessen the volume of the cranial contents is a desideratum not to be overlooked. In no way can this be so effectually accomplished as by free bleeding, aided by free purgation; but of course no one would think of resorting to either during concussion or collapse, or until reaction was fully established.

The case of the spare anæmic woman is a very instructive one. Her appearance during life, as well as after death, was such as to completely avert all suspicion of a sanguineous effusion; and yet the inexorable evidence of a post-mortem exploration showed a large firm sanguineous clot compressing the left hemisphere of the brain.

The second of the two cases of pneumonia is remarkable, on account of the late period at which the bleeding was performed, the habits of the patient, and the rapidity of the recovery. The disease was of a fortnight's standing, the subject a hard liver, and the circumstances apparently almost hopeless; but desperate cases sometimes justify desperate remedies, and the truth of the adage was fully realised in this one, as the recovery surpassed all expectation, alike in expedition and completeness. But lest the record of these cases might mislead some of the junior and more "sanguine" of our body into the rash or injudicious practice of a measure fraught with danger and requiring the most astute discrimination, a few words of caution to junior practitioners may be allowable. As a rule, depletion, especially blood-letting, is borne much better by the rural population than by the inhabitants of cities. The habitual inhalation of a pure well oxydised atmosphere seems to compensate for the want of many of the requisites of life, and a badly fed and overworked peasant will bear depletion which would kill at once the dissipated citizen, or the idle slave of luxury and fashion. The cases which have been cited all occurred in provincial practice, and this must be kept strictly in view. It is not meant to advocate the same practice in all cases of the same kind. In city practice it would be often inadmissible; but it may be asked, have we not grounds for inquiry as to whether the scare about venesection has not been carried too far, and whether the prejudice which prevails on this subject ought not to be reconsidered and submitted to the test of cautious and discriminating experience?

Since penning these lines, the writer has had an opportunity of conferring with some of his brethren on the subject, and has heard of other cases where marked and decided benefit was derived from blood-letting; and he has no doubt that the experience of practical men, especially in the provinces, could supply many more. Should the few cases he has brought under view lead to any further evidence or information on this most important subject, he will not regret having trespassed so far on the pages of the *Medical Press*.

The Council of the Hospital for Women, Soho Square, ask us to announce that H.R.H. the Prince of Wales has consented to become Patron of this institution.

# Clinical Records.

## ST. PETER'S HOSPITAL.

*Stone in the Bladder—Lithotomy—Recovery.*

Under the care of Mr. TEEVAN.

THOMAS F., æt. 6, was admitted into the hospital on Dec. 9, 1878, having been put under Mr. Teevan's care by Mr. Latty, of Southminster, Essex.

*History.*—It appeared that the boy had suffered from nocturnal incontinence of urine for three years, and that one year and a half ago he began to experience much pain when he urinated. On several occasions he had hæmaturia. The boy and his parents were natives of Essex. There was no family history of stone.

*Condition on Admission.*—The child was in fair health, and there was but little mucus in his urine. He was much troubled with priapism and prolapsus ani.

*Treatment.*—On Dec. 18, at 3 p.m., the patient was put under the influence of chloroform by Mr. S. Knott. Mr. Teevan then introduced a rectangular staff, and gave it to Mr. F. Heycock to hold. He performed the ordinary lateral operation of lithotomy, and extracted a phosphatic stone weighing three drachms. There was no constitutional disturbance afterwards.

On Dec. 20th, the temperature, as taken by Mr. White, the house surgeon, was 98 deg., and the pulse 90.

On Dec. 21st, the temperature was 97·9, and pulse 100.

The patient made a rapid recovery, and after Dec. 28th passed all his urine by the penis. He left the hospital with the wound quite healed on January 11, 1879. He was quite cured of his incontinence.

Mr. Teevan remarked that he had cut twenty-one boys for stone, all of whom recovered. In each case he had performed the lateral operation, and he was so satisfied with it that he did not think he should ever try any other form of lithotomy for boys. Lithotomy was an easy or difficult operation, according as whether the finger could be introduced into the bladder or not, and as it could always be insinuated into the child's bladder the operation was, therefore, an easy one, provided only that the incisions were sufficiently free. Everything hinged upon this. If the aperture were not large enough to admit the forefinger with ease the urethra would be torn across at the membranous portion, and the bladder pushed before the operator's finger, or the latter would slip into the space between the bladder and rectum—accidents the most unfortunate which could happen to any surgeon.

*Stricture of the Urethra and Perineal Fistulæ—Internal Urethrotomy—Good Result.*

Under the care of Mr. TEEVAN.

Charles C., a lighterman, æt. 23, was admitted into the hospital on Dec. 9, 1878.

*History.*—Five years ago the patient had a clap, for which he was treated by medicines and injections. Three years ago he commenced to experience difficulty in making water. Two years and a half ago an abscess formed in the perineum, for which he went into the *Dreadnought* Hospital, where it was opened: a fistula resulted. Six months ago, another abscess appeared, for which he entered Guy's Hospital: a fistula remained after it was opened.

*State on Admission.*—The patient was in fair condition, but of scrofulous aspect; there was but little albumen in his urine. On either side of the median line of the perineum, just in front of the anus there was a fistula. There were two strictures—the first one was one and a half inches from the meatus externus, and was only about half an inch long; the second one was five inches down, and was one inch long. The largest instrument which could be introduced was No. 10 Charrière, about No. 3 English. About half the urine came by the penis, and the remainder by the fistulæ. The urethra was 6¾ inches long, and its calibre in the penile portion, 22m. The penis was 4 inches long and 4½ in circumference.

*Treatment.*—By gradual and continuous dilatation the stricture was enlarged to No. 16 Charrière—about No. 7 English, but beyond this point the dilatation could not be carried. The patient was next taught to pass a catheter, and when he had become a proficient in the practice he withdrew all his urine by the instrument. For six weeks he efficiently performed his allotted task, but without being able to close the fistulæ. Under these circumstances Mr. Teevan determined to perform internal urethrotomy.

On Feb. 12, 1879, the patient was put under the influence of ether by Mr. Knott, and Mr. Teevan divided both strictures from before backwards, with his modification of Maisonneuve's urethrotome. A No. 20 (Charrière) silver catheter was then passed and immediately withdrawn. No instrument was left in the bladder, nor was the urine drawn off. Five days after the operation the fistulæ were closed. There was no rigor. The temperature never rose above 99 deg., nor the pulse above 88. The patient left the hospital on Feb. 27 quite well and watertight.

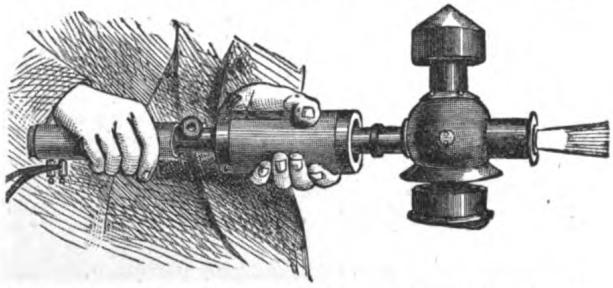
# Special.

## SURGERY UNDER THE ELECTRIC LIGHT.

A LARGE gathering of the profession assembled on the afternoon of Thursday, March 13th, in the Theatre of the Royal United Service Institution, to hear a lecture upon and to witness the trial of an experiment for facilitating surgical operations and examinations in dull weather, or after dusk, by means of the Jablochkoff electric light, by Mr. Balmanno Squire, M.B. Lond.

The lamps which the lecturer had devised, and the practical trial of which formed the subject of the demonstration, were two in number, and were respectively, a hand-lamp for use in surgical operations, such as amputations, &c., and a bracket-lamp for use in ophthalmic, aural, laryngeal, dental, endoscopic, vaginal, and rectal examinations and operations.

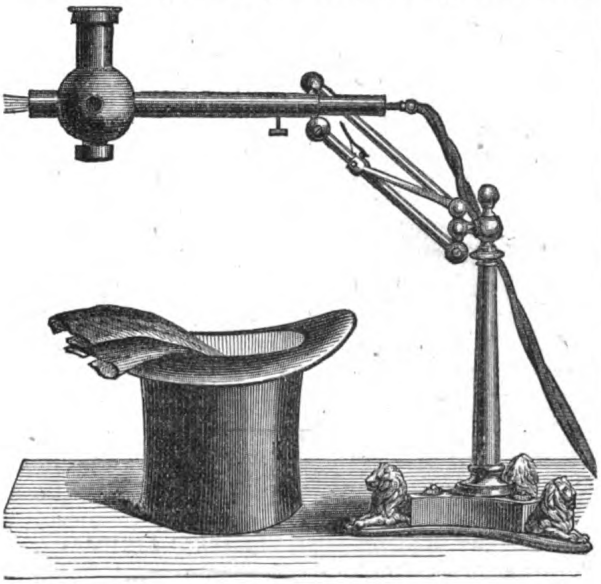
In explaining the construction of the hand lantern, of which we append an illustration, Mr. Squire showed it to be extremely portable, and being accommodated with a long



handle, the person holding it was thus enabled to keep himself out of the way of the operator, while since the dimensions of the lantern itself were remarkably small, and as there was no machinery or apparatus of any kind underneath it, it was possible to bring the light very close to the person of the subject undergoing the operation. The hand lantern exhibited was so contrived as to throw a disc of the light eighteen inches in diameter, at a distance of two feet, but by means of a short draw-tube the area of the disc could be enlarged or diminished to any required extent. The lantern would throw a disc of the full power of the electric light, or by means of caps fitted with ground glass, or with opal glass of varying thickness, the brilliancy of the light could be toned down to any gradation of softness. All of these modifications of the light were demonstrated, and the hand lantern being attached to long wires, for the purpose, it was carried about in full action amongst the audience by an assistant, in order to afford the opportunity of a close inspection of it.

The bracket lantern, figured below, differs in no respect in general appearance from the gas bracket lantern which has now for so long been in common use by aurists and laryngoscopists, excepting only that it was much smaller, and somewhat neater in shape.

The light is obtained by an ordinary Jablochkoff candle or taper, which is about nine inches long by three-eighths of an inch wide, and which passes along the centre of the narrow tubular handle, while to prevent it burning down into the



handle of the apparatus, there is a rack and pinion adjustment for pushing the candle a little, from time to time, so as to keep its illuminating extremity in the centre of the globe.

The candle itself is held in a socket which forms the front end of an inner cylinder, which latter works forward within the outer cylinder of the tubular handle, by means of the rack and pinion movement, just like the tube of a microscope. The inner cylinder contains two insular copper wires which pass back respectively from the two jaws of the small spring candle clip or socket, and are brought out into two connecting screws or clamps, which are attached to the back end of the inner cylinder at its lower side. These two clamps pierce the outer cylinder and travel forwards (as the inner cylinder is screwed onwards), through a slit or longitudinal aperture cut (for the required distance) in the lower side of the outer cylinder.

At the side of the lantern is a minute window of very dark blue glass, through which the person holding the lamp may ascertain the exact position of the burning candle-end, from time to time. This window is provided with a minute hinged metal shutter. To ascertain the position of the candle point it is not necessary that the assistant should stoop his head down to look, since by merely placing his hand opposite the window, the direction in which the dark blue ray is thrown on the hand (forwards or backwards, as the case may be), indicates with great accuracy the exact position of the candle point, and tells him whether the screw requires moving or not.

The hand lantern was constructed from Mr. Squire's designs by Mr. Fred. Weiss, jun., of the firm of Weiss and Son, of the Strand. The bracket lantern similarly was constructed by Mr. Mayer, of the firm of Mayer and Meltzer, of Great Portland Street.

The practical availability of his electric bracket lamp were demonstrated by Mr. Squire, who examined Mr. Weiss' larynx and tympanum by means of it, a ground-glass cap being used on the lantern for this experiment. Mr. Squire pointed out the advantage of such a light for ophthalmic practice, in which case an opal glass cap, of small aperture, is used, giving a small ray of mild but perfectly white light. While with the ground glass cap the lamp was admirably adapted for the use of aurists, laryngoscopists, dentists, gynæcologists, endoscopists, and those who practised in diseases of the rectum. Laryngoscopists in particular, and he believed the same remark applied to aurists, found that a London ground floor, whether at home in their consulting rooms, or at a hospital in the out-patient department, presented such rare opportunities of sufficient sunlight that they were in the habit of working entirely and invariably by gas illumination, so that many of them would probably be scarcely able to recognise the appearances that were familiar to them by the yellow illumination of gas light, if they were called upon to examine the same conditions by means of white light. This he regarded as a grave disadvantage, since, as was well known, the natural appearances, such as are presented under illumination by white light, are, when viewed by yellow (gas) light, disguised to an extent which could scarcely be conceived by any one who was not practically acquainted with the difference.

For ophthalmoscopic examinations, which are necessarily always conducted in a dark room, he conceived that a white artificial light must be a special advantage. But in all of the other examples he had instanced a strong artificial white light could not fail to be of advantage in detecting and watching those yellow deposits and discolourations, and that admixture of yellowish hues, blended with other discolourations, which were often of so much moment in studying the pathology of each of the organs he had referred to, and which alterations were often but faintly, if at all, perceptible, at least in their earlier stages, if viewed by yellow light.

There could be no doubt that a dentist attempting on a dark day to scrape out a carious cavity as perfectly as possible, but with the least possible destruction of sound tissue, would find such a light as this of very considerable assistance to him.

The problem of applying the electric light to surgical purposes was, Mr. Squire considered, a matter which admitted of easy solution, so far as the light itself was concerned, the only drawback to its immediate use being the expense and the question of the portability of the necessary electric-generating apparatus in the case of operations undertaken at the patient's residence, and equally in the case of operations performed in military field hospitals. In the case of ordinary hospital practice, and of naval practice, the question of the portability of the apparatus would not present itself; but in all cases the question of cost was a hindrance. However, in the navy the chief item of cost—namely, the motive power—was already at hand in the numerous subsidiary steam engines with which, in addition to the propelling engine, every ship of war was now provided, so that after the purchase of the electrical machine and the lantern no further expense remained beyond the electric candles, which cost only fourpence per hour; moreover, in many ships electric machines worked by steam power already existed for producing the electric light as a safeguard against torpedo attacks. In the dark cockpit of an ironclad a good artificial light is always essential, even on a bright day, and during an engagement, when every lamp on board, except those used in the cockpit is extinguished, and when powder is being handed freely about, a light which will burn in vacuo, and so can be hermetically enveloped, and thus rendered absolutely safe, must be a special desideratum. These conditions are present in the electric light only.

As to the requisite portability of the generating apparatus as part of a military train, a small one-light electric machine, associated with a one and a half-horse power steam engine, would very well travel in fixed connection with one another on the same carriage, and would together be much less cumbersome or heavy than an ordinary piece of field artillery. Fuel for a small engine and water for a small boiler are always at hand, and these, with a few Jablochkoff candles, are all that are needed.

As to the question of cost, the Jablochkoff light (which Mr. Squire had selected as the best kind of electric light for lanterns) can at present only be obtained on the condition that a four-light "Gramme" electrical machine be supplied with it; and this machine requires a steam or gas engine, of rather more than four-horse power to work it. The cost of a four-light Gramme machine is £180, and the cost of a corresponding steam engine would come to nearly £100, so that the total cost would fall not far short of £300. But for the purpose in view only one light is required, and Mr. Squire trusted that the requisite machine for one light only would soon be forthcoming. This, as he estimated, would bring the total cost down to £100, or perhaps somewhat under that. Now this as an expenditure of capital for some of our larger hospitals at least would probably not be too much for such a purpose, nor would it be so for an army corps, or for one of our larger ships of war.

For home use, say in dental practice, some of the more frequented dentists living in the same street might readily share one apparatus between them, with wires laid on to the house of each.

Suggestions had been made to Mr. Squire to employ a battery, but leaving out of consideration the very considerable

battery-power required for producing an electric light of any kind, and the infinite trouble and expense of managing a battery, there remained the consideration that no battery would produce, but that only an electro-magnetic machine could emit what was an essential for the Jablochkoff candle, and that was a rapidly alternating or "reversing" electric current. Manual power had also been suggested to him, but seven men were the estimated equivalent of one horse power, which was the minimum force required to produce one light; and the perfect steadiness of the light that was desirable was not attainable except through the steadiness of action of a steam-engine. Mr. Squire concluded his lecture amid applause. M. Berly, engineer to the Société Générale d'Electricité de Paris, was in attendance, to superintend the working of the electrical apparatus.

## HOSPITALS: THEIR USES AND ABUSES.

A PRIVATE meeting of members of Parliament, treasurers, &c., of the principal hospitals, and others, was held in London on Saturday last, at the residence of Sir T. Fowell-Buxton, "to discuss the present position of hospital and medical charities; how far they supply the wants of the population; their want of uniformity in the treatment of patients, their financial condition, and the possibility of introducing the provident system and better organisation by the aid of one central board for all the hospitals of London."

Mr. E. H. Lushington, Treasurer of Guy's Hospital, who was called to the chair, said it would be in the recollection of several gentlemen present that some years ago the treatment of patients at hospitals had attracted attention, and more especially as regarded out-patients, the system followed respecting them, and the method by which medicines were supplied. Some inquiry took place, which confirmed the idea that the funds of hospitals were not applied to the best of purposes, or with due regard to the wishes of the founders. At a meeting last year, called by Sir Sydney Waterlow, it was determined to send out a circular of inquiry, and he regretted he was not able to place before the meeting its results, which were both interesting and important. When published it would be seen, however, that about 600,000 people came annually to 13 of the best hospitals in London for medical advice and assistance, at a cost for medicine of £15,000 a year. The average attendance of these patients varied from three to seven hours before each could be attended to, and the rush was so extreme that the medical advice they received was almost perfunctory. Most of these were able to purchase medicines, and to pay for medical advice, and the system had a most debasing influence on the patients at large. It was thought that if some official and independent inquiry were instituted it might be possible to put things on a better footing throughout the metropolis, to shut the door against people able to pay unless they did pay, and to educate the poorer classes in the idea that they ought to pay for medicines which they needed for themselves. Some difficulties might arise in making so great an alteration, perhaps from the students and others interested, but all those might easily be surmounted.

Sir T. F. Buxton said the whole hospital system was in a state of disorganisation; it had no unity of purpose, and very little uniformity of practice. Every large hospital ought to be the centre of a district, and all dispensaries in that district ought to be affiliated to it. There ought to be only two sets of hospitals—pauper hospitals, and those in which payment was made; and it should be in the option of every labouring man, should he need it to choose one or the other. If that option were given, the working men of London would very soon originate for themselves provident associations, and by periodical payments secure admission to the better hospitals. He moved "That in the opinion of this meeting the present system of medical relief in London is inadequate and unsatisfactory; and that a deputation be appointed to wait on the Secretary of the Home Department and request him to advise her Majesty to appoint a Royal Commission to investigate and report on the subject."

Sir C. Treveylan, in seconding the motion, said he retained his faith in the good old English principle of voluntary charity, of which the grand medicinal institutions of London were the great achievement. Hospitals should be consultative, operative, and clinical, and all who knew what those three words implied would see that the system of medical relief had now been extended to purposes to which it had never been designed. Hospitals were intended to be courts of appeal, as it were, for cases requiring particular treatment, clinical treatment, and bedside watching, but they had in these days undertaken the medical relief of the entire population. It was a perfect scandal to talk of medical assistance in nine-tenths of these cases. What was wanted was a more intimate and family acquaintance with the persons who came for assistance. The only practical remedy seemed to be the establishment of an undergrowth of localised self-supporting medical institutions on the mutual assurance principle. This undergrowth, he was happy to say, was making satisfactory progress, and the working men, by their Hospital Saturday, which, although it had made serious mistakes, was a true representation of the working population of London, showed they were beginning to appreciate the principle of self-dependence. The statistics which had already been gathered proved that of 600 patients who resorted annually to five or six of the larger hospitals, two-thirds ought not to be patients at all—they were trumpery cases of colds, indigestion, and imaginary ailments. The principle of limitation had been already carried out at St. George's Hospital. They only took there as many cases as could be properly dealt with; they confined themselves to those which were really hospital cases, and they had three provident dispensaries working in connection with the hospital.

Ths Rev. J. T. Rowsell said it was utterly impossible for the hospitals to go on as they were, because the larger part of their support came from voluntary subscriptions, which, owing to changes of residence and the departure of the wealthier classes from the localities in which they were placed, were gradually diminishing. In fact, those located, like the London Hospital, on the east side of London, in the centre of an enormous population, were now obliged to dispose of their investments.

Mr. Stansfeld said it was not difficult to make out a *prima facie* case for inquiry, but the remedies suggested involved the very difficult problem, whether there should be an enactment to control voluntary subscribers, or a rate in aid. They could scarcely go to the Home Secretary until they had agreed what remedies they would recommend.

Mr. Coope and Sir Rutherford Alcock were in favour of a Royal Commission.

Mr. W. E. Forster suggested an amendment in the resolution, to the effect that a committee should be appointed to collect and digest information, and to prepare a statement with a view to future action.

This was seconded by Sir Rutherford Alcock, and after some discussion agreed to.

A vote of thanks to the Chairman terminated the proceedings.

# Department of Lunacy.

## LUNACY CERTIFICATES.

UNDER the existing state of our Lunacy Law a person can be confined in an asylum on two lunacy certificates, which may be signed by any two medical men who may be ignorant of the very elements of insanity. Those who sign these documents must examine the patient separately in order to elucidate the indications of the mental disorder. There is no clause relating to lunacy certificates that prevents the two medical men from consulting together either previous or subsequent to the certifying of the lunatic. We have carefully looked through the Act and cannot find any section which can be so construed. This question has, however, of late been discussed, and we take the opportunity of drawing the attention of our readers to it. There is no doubt but that the important question of confining persons in asylums should receive the careful attention of the Legislature; but it is difficult to suggest anything in lieu of the present system. Lunacy certificates must exist, but the granting of them must be differently arranged, either by some officially appointed assessors, or

by members of the profession, who must be licensed to sign certificates in the same way as some solicitors are authorised to deliver oaths in the High Court of Chancery, and this only after they have proved themselves competent to be considered as sufficiently versed in mental disorders. As long as the present system is in force so long will the practice of signing lunacy certificates be open to grave suspicion. If a certificate is not signed by a specialist, or one who has had experience in mental disorders, there is invariably some omission or mistake which, though not invalidating the document, will, nevertheless, cause much trouble to the official Board who have to peruse carefully all the certificates. At the present time the forms are too complicated, and consequently those who sign are liable to make some error, and they might with advantage be improved.

Psychological Studies at the Hospitals.—Dr. W. Allen Sturge is collecting statistics of the number of students who have attended the various psychological classes during the last five years, for publication. We understand that no students attended the classes at University College Hospital or Westminster Hospital during the last summer session.

The Temperature of the Brain in Connection with Insanity.—Margaglaino in conjunction with Sepilli (*La Salute*, No. 19, 1878) made some investigations into the temperature of the brain in 115 insane patients at the asylum of Reggio with the following conclusions :—In all cases except those of dementia and ipomania the average temperature is higher than normal. In insane as well as in sane individuals the temperature of the occipital region is higher than that of any other part of the head. The temperature of the frontal lobes is like that of the parietal lobes in ipomania agitata, dementia agitata, imbecility, and idiocy ; it is higher in mania and simple dementia, and it is lower in progressive paralysis. In all sorts of insanity the temperature of the halves of the head alike except in congenital brain lesions where the temperature of the right half of the head is higher than that of the left. These conclusions coincide with the pathological condition encountered on autopsy, inasmuch as in mania, in progressive paralysis, as well as in cerebral excitations followed by depressions, hyperæmic conditions of the brain are found, and progressive paralysis, the parietal regions are the seat of the disease. As control experiments the two Italian experiments made temperature measurements of the brain. also on twenty healthy persons and got higher figures than Broca and Grey.

The Urine of the Insane.—M. Albert Robin (*Societe de Biologie*) had occasion to examine the urine of a madman who died at the Hopital Beaujon, and communicates the very interesting result of his researches. The quantity of the urine was diminished to 300 grammes in twenty-four hours ; the specific gravity was 1030 ; the reaction acid, remaining so after exposure to the air for eight days. The amount of solids was 25 grammes in twenty-four hours, that of urea only 10·22 grammes, but uric acid, on the contrary, was present in large proportions. The chlorides were diminished, the phosphates normal ; sugar and albumen were not present. In the sediment, after evaporation, he found crystals of the hippurate of calcium, margaric acid, leucine, and an enormous quantity of uric acid. Many bacteria of a special nature were found on microscopical examination. M. Robin asks whether it might be possible to inoculate madness by means of urine?

Mrs. Dodwell's Petition to the Queen.—Mrs. Dodwell in her great distress has presented a petition to the Queen in the form of a letter which we append. It has appeared in all the daily papers. The letter is praying for the release of her husband from Broadmoor Criminal Lunatic Asylum, where he has been confined for more than a year for an offence which can be only regarded as a misdemeanour, no proof having been given that he acted from an insane impulse, or from an exaggerated sense of the ill-treatment he had received at the hands of the Brighton Guardians, his alleged delusion. If this is imaginary, then Mrs. Dodwell entertains the same morbid idea, as may be gathered from her appended letter.

"To the Queen's Most Excellent Majesty,—I have taken the great liberty of writing to your Majesty to make an appeal on behalf of my husband, the Rev. Henry John Dodwell, who is detained during your Majesty's pleasure at Broadmoor Lunatic Asylum. I humbly submit to the general opinion that he deserved some punishment for his unwise act, but after the long and happy married life we have lived, his uniform kindness to our children and myself, his calmness and perseverance for five years under the irritating difficulties experienced in endeavouring to obtain redress for the wrongs that had been done to him, is not to me consistent with his being branded as a lunatic. And as the eminent medical men who have examined him are divided in opinion, I humbly and earnestly pray that your Majesty will give him the benefit of the doubt and liberate him, so that he may return to protect our four children and release me from the helpless position I am in, and save me from my only resource, the workhouse.—I beg to remain your Majesty's most humble and obedient subject, Eliza Dodwell, wife of H. J. Dodwell, 77 Great College Street, London, N.W., 6th March, 1879. To Her Majesty, Queen Victoria, Windsor Castle."—"Home Office, Whitehall, 15th March, 1879.—Madam,—In reply to your application to her Majesty, praying the release of the Rev. Henry John Dodwell from Broadmoor Asylum, I am directed by Mr. Secretary Cross to acquaint you that the same has been laid before the Queen, who was not pleased to give any instructions thereon.—I am, madam, your obedient servant (signed), A. F. O. Liddell, Mrs. Dodwell, 77 Great College Street, N.W."

The following has been received from "Psychological Inquirer" :—

"The Watch."—It is said that this expression is often used by the insane, who have a great dread of being "watched." It would be curious if the origin of this fear could be traced. As there is frequently "reason in madness," probably a rational explanation might be found for this and other peculiarities attributed to mad people ; but from which eccentricities, so-called sane individuals are not always free.

[The insane are naturally timid and morbidly suspicious, but we have never met with patients who have laboured under the peculiarity of using this expression from the dread of being watched. Mad persons are doubtless very keen, and are always conscious of being observed, and this in some people is very marked.—Editor.]

---

The rates of mortality per 1,000 last week in the principal large towns, were—Edinburgh 19, Brighton 20, Wolverhampton 22, Bristol 23, Newcastle-upon-Tyne 23, Norwich 23, Plymouth 24, Portsmouth 25, Glasgow 25, Salford 26, Sunderland 26, Birmingham 27, Liverpool 29, London 29, Hull 29, Sheffield 29, Bradford 30, Oldham 31, Manchester 33, Leeds 34, Leicester 34, Nottingham 37, and Dublin 38.

---

The death-rate last week from the seven principal zymotic diseases averaged 3·0 per 1,000 in the large towns, and ranged from 0·2 and 0·7 in Bristol and Plymouth, to 5·6 and 5·8 in Sheffield and Leicester. The high death-rates in Sheffield and Leicester were mainly due to the fatal prevalence of whooping-cough ; this disease was also epidemic in Manchester and Leeds. The deaths from scarlet fever showed the largest excess in Oldham, Sunderland, Sheffield, and Liverpool. Small-pox caused 17 more deaths in London and its suburban districts, 18 in Dublin, but not one in any of the other large towns.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, MARCH 26, 1879.

## THE PARLIAMENTARY PROGRESS OF MEDICAL REFORM.

THE past week has been pregnant with the greatest interests of our profession, for within its six days much has been done towards the deciding of those momentous issues upon which the future of medical education and medical practice so largely depend. When we laid down our pen this time last week, the Lord Presidents' Bill was the focus of hot debate. It had made its appearance shorn of many of the qualities which had made it acceptable last year, and materially altered from the form in which it had stood when withdrawn from the consideration of the Commons at the end of last session.

Disregarding minor details, which would have been of importance if they were not overshadowed by greater issues, the Bill of 1879 was seriously faulty in two respects—firstly, that it no longer contained the assurance given by its predecessor, that the examination, curriculum, and fee, requisite for admission to the conjoint examination should be the same in every division of the kingdom; secondly, that it did contain a proviso which gave over to the Medical Council the disposal of the surplus fees (if any) which might remain, after payment of costs of examination.

It is almost supererogatory for us to point out that these two points were cardinal and vital errors in the measure, and their effect is so palpable that we can hardly conceive that the clauses which embody them had received the full attention of the Lord President before the Bill was "tabled" by him. In the absence of uniformity of examination, curriculum and fee, throughout the kingdom, it is plain that conjoint examination would effect no purpose but to intensify the diploma-competition, which the Bill was intended to terminate for, as in shopkeeping, the fewer are the competing sellers, the worse for the customer so in diploma granting, the reduction in number of the competing licensing centres would have only aggravated the evils under which the profession and the public have laboured. The omission of this uniformity is, in fact, a complete surrender of the principle, not only of this Bill, but of all measures since that of Sir James Graham; and such omission will make it altogether impossible for the Irish Conjoint Board to erect or maintain a proper educational or social standard of the profession, subjected as it will be to the competition of the Glasgow and Edinburgh schemes.

The second fault of the Bill was that it allocated, at the absolute will of the Medical Council, the surplus which might remain over after the payment of the conjoint examiners. It would seem to have been wholly forgotten that the licensing authorities which hold the examination and grant the diploma to the certified candidate, are intrinsically entitled to the appropriation of the fee paid by him; that according to the English and Irish Conjoint Schemes that surplus was rateably apportioned amongst those bodies, and that the very existence of many of those bodies, and of the libraries, museums, and lectureships maintained by them for the public use, depends altogether on this surplus, they having no means of sustenance, either by private income or State grant.

These, as we have said, were the two cardinal errors of the Bill, and upon them it was instantly decided by the Irish and English bodies to take action. Delegates were appointed by the Colleges of Physicians and Surgeons Ireland to proceed to London and represent to the Lord President the effect of these clauses.

The result of this step is at once apparent on the face of the Bill. The views of the Colleges having been laid before the Duke of Richmond, Lord Emly was entrusted with, and kindly undertook, to move amendments when the Bill was committed. These amendments were:—

(*a*) To give the making of examination rules to the General Medical Council, not to the medical authorities.
(*b*) To impose upon the Medical Council the duty of providing absolute uniformity of examination, curriculum, and fee throughout the kingdom.
(*c*) To enable the medical authorities to appropriate the surplus fees to their own public purposes, subject to the control of their charters.
(*d*) To withhold from the General Medical Council the power of delegating the making of examination schemes to a "person or persons," as was proposed by the 27th clause of the Bill.

On Thursday evening last, the Committee upon the Bill came on in the House of Lords. Upon the same morning, the corrected Bill introduced by Messrs. Mills and Childers, in behalf of the British Medical Association, had appeared, and it was found to provide for perfect uniformity; and on the same afternoon, the General Medical Council, after a lengthened debate, had accepted, with one dissentient voice, Mr. MacNamara's resolution to the same effect. Thus encouraged by the approval of the medical Parliament and the British and Irish Medical Associations, Lord Emly moved his amendments in a convincing

and lucid speech. He was supported by the Marquis of Ripon, Lord O'Hagan, and Lord Courtown, and the representations thus made were so forcible that the Lord President accepted the amendments in all points, save one, which he reserved for decision when the Bill is reported to the House.

The question thus reserved is that of uniformity of fee, and we encourage the hope that his grace will at once see that this change in his Bill follows as a natural sequence of its principle, and is absolutely essential to its success. It is clearly in the public interest—setting aside all medical considerations—that the student should not be bribed by cheapness to run from Dublin or London to Glasgow or Edinburgh. It is manifest that the money competition, engendered by want of uniformity, would overthrow the design of the Bill as certainly as the educational competition; and it is equally obvious that the very existence of the unendowed licensing bodies depend upon the payment of a uniform and adequate fee.

Therefore we venture to hope that his grace will accept Lord Emly's amendment on this point. Should he do so, the Bill will merit the warm and active support of all earnest medical reformers, and will be as perfect as all the circumstances permit.

That support will be sorely needed. The Scotch bodies have met, and will meet this or any other measure of medical reform with uncompromising hostility. Their spirit is wholly irreconcilable, and they have met the Duke of Richmond's Bill with a plain declaration that they don't want improvement, and won't consent to be improved. They do not seek concessions or amendments, and avow their intention to resist, delay, and obstruct the Bill in all and every stage until they postpone it out of existence. Already they have taken up their positions by an amendment, which was moved by the Duke of Buccleuch, to exempt Scotch universities from conjoint examination, but that proposition was at once firmly negatived by the Lord President; and in the lower House they have initiated the war by their opposition to the appointment by Government of a Select Committee upon the constitution of the General Medical Council. In the General Medical Council, again, they have tried their best to carry a resolution of delay, to refer the whole Bill to a Select Committee, but were defeated on Saturday last, upon the motion of Professor Humphry, on a division, in which the Scotch representatives to a man, and with them the Queen's University representatives, voted for delay, and the whole of the rest of the Council, with one voice, for progress.

The question is, will the Government be able to carry the Bill through the Commons in spite of this resistance? It seems to us that this question, though raised upon a piece of class legislation, involves, to some extent, the prestige of the Government. They are met by a hostile phalanx, bent on the defence of a system which Government, and the whole medical profession, declares to be nothing less than corrupt, and, in our view, a responsibility lies upon them to vindicate the principles which they have already adopted, even by a distinct outvote of the party of obstruction. If the principle of the Bill be fully carried out by the adoption of a provision for uniformity of fee, the Irish and English Licensing Bodies, and all the professional Associations will throw their whole influence into the Government scale, and, without doubt, the Bill can be passed. If, however, the support of these bodies is alienated by the sacrifice of that principle, then it seems equally certain that the measure will be obstructed by all those influences when it comes to the lower House.

## THE MEDICAL ACTS (1858) AMENDMENT BILLS, 1879.—III.

Foreign and Colonial Degrees. — Practitioners from without the kingdom have a right to be registered without examination, under secs. 7, 8, and 9, if they hold "some recognised medical diploma," and are of good character," and if they—

*a.* Are "not domiciled in the United Kingdom," or

*b.* "Have practised medicine or surgery for more than ten years *elsewhere* than in the United Kingdom;" or

*c.* In the case of persons practising in the United Kingdom at the passing of the Act, have practised for ten years *in or out* of the United Kingdom.

A "recognised medical diploma" is defined to be (sec. 9) "such diploma, &c., &c., as may be recognised . . by the General Medical Council as furnishing sufficient guarantees of the possession of the requisite knowledge and skill for the efficient practice of both medicine and surgery, including therein midwifery, and as entitling the holder thereof to practice medicine and surgery in such British possession or foreign country."

If refused registration, a foreign or colonial practitioner may appeal to the Privy Council.

These clauses are of greater importance than may appear at a glance. They admit to the Register persons who have not passed any conjoint examination, not who hold a "recognised medical diploma." The clause was introduced into the Bill as a substitute for Mr. Cowper-Temple's Bill of 1877 for the Registration of all Foreign Degrees. That Bill was drawn up in consequence of the introduction into the French Parliament, on the 29th of May, 1876, of a proposition by Dr. Roger Marvaise, that all medical practitioners, though holding a legitimate diploma from a foreign country, should be required to graduate in a French University before they were permitted to practice in France. That proposal took the form of a regular "projet de loi" on the 29th of April, 1878, and it was submitted to a select committee of the Chamber of Deputies. That Committee reported to the Chamber, on the 26th of November last, decisively and uncompromisingly approving the proposal of M. Marvaise, and recommending that English (or other foreign practitioners) should *not* be admitted to practise in France until examined and diplomate in that country.

So far, then, as the recommendation of the Select Committee of the Chamber of Deputies can go, France has definitely refused any reciprocity with Great Britain in the recognition of Foreign Degrees, and we cannot understand, therefore, why we should receive as competent practitioners persons of whose qualifications our information is altogether insufficient, and who refuse to recognise our home degrees. It is indeed obvious that the General Medical Council has, or can have, at its disposal no adequate means of forming a judgment as to

whether any particular foreign degree furnishes "sufficient guarantees for the possession of the requisite knowledge and skill for the efficient practice" of the profession. The President of the Medical Council, in a memorandum addressed to the Privy Council upon the Marvaise Bill, says, that "the Council would consider the proposal (for home registration of foreign degrees) even if it were thought requisite to send, under conditions an occasional representative to personally report on certain examinations abroad;" but it must be evident that a mission of a visitor from the Medical Council to inspect an examination in Ohio or Moscow would be utterly impossible, and, if possible, quite futile, inasmuch as such an inspection would not afford the least guarantee that the examination which was adequate at the particular occasion when it was inspected would continue to be so. Moreover, the General Medical Council having once recognised any foreign diploma, could not revoke that recognition without the approval of the Privy Council; and it would be plainly impossible for them, even if disposed to trouble themselves about the matter, to collect such evidence of the insufficiency of the examination as would justify the Privy Council in revocation of the recognition. As a matter of fact, we know that the Medical Council has recognised as sufficient the preliminary examinations held by certain antipodean bodies, of which they knew absolutely nothing except from the *ex parte* assurances of those bodies themselves; and it would be nothing less than calamitous to the profession if they acted upon the same principle in reference to medical diplomas, and admitted to practice in Great Britain a host of diploma holders from obscure American and Continental qualifying bodies.

It is true that the words of the Bill prohibit the registration of any diploma which does not "entitle the holder thereof to practice medicine and surgery in such British possession or foreign country." This proviso would be a perfectly sufficient protection for us in the case of diplomas issued (as in Germany) after a "Staats Examen," or with a Government impress, but in other places, as in America—any or every diploma entitles the holder thereof to practice, and the phrase of the Bill would, therefore, afford us no protection whatever against Canadian or American diploma-holders. The proposition contained in the Margin of the Marquis of Ripon's Bill of 1871, and adopted by the Bill of the British Medical Association of 1878, is much preferable to that contained in the Lord President's Bill. It provides (sec. 22, the Marquis of Ripon's Bill); Firstly, that the foreign medical diploma must "represent the like degree of knowledge, as tested by examination, to that which is required for obtaining a licence" in Great Britain. The Lord President, on the other hand, recognises any foreign diploma which, in the opinion of the Medical Council, "furnishes sufficient guarantees of the possession of the requisite knowledge and skill," a phrase which would enable the Medical Council to register any low-class foreign degree they pleased

Secondly—The Marquis of Ripon's Bill only gave power to the Medical Council to register a particular person holding a foreign degree upon his personal application to them. The Lord President gives them power to recognise the degree itself, and, once recognised, all holders of that degree have a right to registration without the sanction of the Medical Council, or any one else.

Thirdly—The Marquis of Ripon's Bill recognised only such foreign degrees as were granted under "the authority of the Government of a British possession or foreign country"—a very different proposition from the recognition of every diploma which confers the right to practise in its own country, which is suggested by the Lord President's Bill.

While we are quite conscious of the necessity for recognition of foreign and colonial degrees at some future period, and in some sort, we do not consider that the existing circumstances are such as to render such recognition now necessary or desirable. But, it it must be, it should not be without—1. A distinct guarantee of the country in which the diploma is granted. 2. A degree of knowledge, so far as the Medical Council can judge, equivalent to that required for the conjoint examination at home. 3. The consideration of the Medical Council of each particular application for registration.

Honorary Degrees.—"The General Medical Council shall make orders for the registration in a separate column" of such additional diplomas as have been granted . . . as testimonials of special distinction, and which appear to the Council . . . to deserve recognition as higher medical diplomas in the Medical Register. (Sec. 10, subsec. 7, line 11.)

This is a very reasonable and proper proviso, and it cannot be used for the admission to the Register of unqualified medical practitioners, because the honorary degree must be "additional" to a medical qualification previously obtained.

Dentists.—The whole of the dental clauses of the Bill of 1878 are withdrawn, as the Act of Sir John Lubbock renders them unnecessary.

Midwives.—The section (25) referring to midwives has been struck out of the Bill, the Lord President undertaking to introduce a new measure on the subject.

# Notes on Current Topics.

## The General Medical Council.

The General Medical Council is not fortunate in conducting its discussions in such a manner as to secure the respect and approbation of those who take an interest in its proceedings. It seldom meets without giving fresh provocation, even to those who were the least dissatisfied with the work it has done, and without justifying in a great measure the agitation that has been long going on in favour of its re-construction. As on many previous occasions, the Council may be justly blamed for having wasted so much of its time last Tuesday and Wednesday in discussing matters which had already received its full consideration. The present Medical Bill is substantially the same as that which was settled last year. The great point in the Bill, the clauses relating to the Conjoint Scheme, are just the same as the majority of the Council had recommended "over and over again;" and what amendments have been made in the Bill of last year might have easily been accepted without discussion, or left for consideration.

Yet neither the good judgment of Mr. Simon, nor the representations of Sir W. Gull and Sir James Paget, could prevent the Council from going over some of the old ground again. Mr. Simon moved "That the thanks of the Council be given to the Lord President for having communicated to this Council the Medical Bill before the House of Lords, and that his grace be informed that the Council having, last year, fully submitted to him their views on all questions which are involved in his grace's Bill, and still adhering to these views, do not, in the present stage of the Bill, think it requisite to submit any new observations."

The object of this motion was, as Mr. Simon said, to save unnecessary discussion, but as time and money are of no consequence to the Medical Council, and as "battledoring and shuttlecocking with regard to little amendments" is rather a pleasing pastime with this august body, Mr. Simon's motion was lost; and it was resolved "to consider the Lord President's Bill so far as it differs from the recommendations of the Council."

## The Registration of Arts' Qualifications by Doctors of Medicine.

We understand that the Earl of Courtown will, on behalf of the University of Dublin move, on the bringing up the report of the Medical Bill in the Lords, on Friday next, an amendment which will entitle the holders of University Degrees in Arts to be registered in a column of the Medical Register.

This is a proposition well worthy of consideration, and, we think, of support. Its purpose is to do tardy justice to the M.Ds. of universities which grant their doctorate only after full academic graduation. At present, especially in Ireland, as our readers know, there are two classes of doctors of medicine—those who have passed through four years of academic study and graduated in Arts, and those who have simply passed a matriculation examination, such as is required from any medical student, and put in a few months' nominal instruction in Arts. It is manifestly unjust and inexpedient that there should not exist—as there does not—any means of distinguishing these two classes of M.Ds., and the absence of such a means of differentiation has had a most injurious effect upon medical culture, because it has discouraged the taking of the higher-educated degree.

The number of those who are aggrieved by this state of things is, by no means insignificant, or unworthy of the consideration of Government.

The average annual numbers of doctorates granted within the last four years by Oxford, Cambridge, and Dublin Universities, after full arts' graduation, were respectively, 7, 15, and 46—making a total of 68 per annum. This means that little less than one-tenth of the whole number of registrées are aggrieved by the omission that Lord Courtown seeks to remedy. We certainly hope that the Lord President may see his way to give properly educated doctors in medicine the advantage derivable from their four years of academic study, and thus to stimulate medical men to undergo an education which ought to, but does not, raise them to their deserved position in public estimation.

## Dr. Wood's Motion.

Were it not that we cannot be surprised at anything that crops up with regard to the vexed question of Medical Reform, we should certainly have been astonished that a member of the Medical Council attempted at the eleventh hour to burke the Medical Acts Amendment Bill, to undo all the work of the last two or three years, and to refer the whole subject of medical reform "to a Select Committee of the House of Commons, for investigation and report, previously to further medical legislation." The grounds on which Dr. Wood made this extraordinary proposition were that the constitution of the Medical Council was about to be referred to a Select Committee, that the questions connected with medical reform were important, difficult, and had given rise to much diversity of opinion; that there was no urgent necessity for any kind of medical legislation, that the House of Commons was as yet but very imperfectly informed on the subject, and that an independent Committee would go into the whole question, examine witnesses from all quarters, and see for themselves whether and where the present system of medical examinations, &c., is found wanting. We need only remark that the specious nature of Dr. Wood's arguments was, notwithstanding his forcible and eloquent speech, quickly recognised by the majority of the Council. It was not a difficult matter to show that there was practically little or no difference of opinion with regard to the general principle of the present Government Bill and the general propriety of its several clauses; that the speedy settlement of the whole question is earnestly called for by the profession, by the majority of the Council, by both Houses of Parliament, and by the public; that the House of Commons would not, from its ignorance of medical matters, be competent to take the subject of medical legislation into its own hands; and that it would be a most foolish and undignified proceeding for the Medical Council so far to stultify itself as to cancel all its past proceedings as to medical reform, and to delegate to Parliament functions which, as Sir W. Gull very justly remarked, properly belong to the Medical Council.

Dr. Wood's motion, however, met with very little support. Dr. Humphry moved the following amendment, which was seconded by Sir W. Gull, and carried by a large majority:—"That the subjects regarding which legislation is proposed by the Lord President's Bill, now before Parliament, have been long and sufficiently discussed, and that the continued uncertainty respecting legislation upon them retards the improvement of medical education, and is detrimental to the interests of the profession and the public; and the Council trusts that the Lord President's Bill, with such alterations as have or may be suggested by the Council, will be passed during the present session of Parliament; and the Council is of opinion that the reference of the Bill to a Select Committee of the House of Commons is not necessary."

## The Plague and General Sanitation.

We are glad to see that the plague which, owing to the much abused precautions taken by the Russian Government has been stamped out of Astrachan, and is now likely to be of some service to that country by arousing local authorities to adopt some systematic method of precaution

against the spread of either this or any other infectious disease. A correspondent of the *Daily Telegraph* says that a recent visit to Moscow has convinced him that this plague scare will do the country some permanent good. "A Sanitary Commission has been appointed here, consisting almost exclusively of intelligent men of business. Each commissioner has a separate district under his charge, and a staff, consisting of a medical man and two policemen, at his orders. Under stringent regulations the work of sanitary clearing, which was urgently required, is now being briskly carried on." It is impossible to read this statement without giving due credit to so excellent an organisation. Sanitary science cannot be very backward in Russia, nor can the better class of people of that country be so ignorant of the first principles of sanitation, when we find the inhabitants of Moscow putting their shoulder to the wheel in such a thorough and systematic manner. We may ask, could our local authorities and our staff of medical officers of health, sanitary inspectors, &c., do more?

## The Cremation Society.

We cannot be surprised that so novel a method of burial as that of cremation should have attracted the notice of Parliament, or that the Cremation Society should have met with some opposition in carrying out its scheme at Woking. On Friday the Earl of Onslow called the attention of the House of Lords to the subject, and Earl Beauchamp not unreasonably remarked that this new practice should not be adopted without proper precautions being taken. Moreover, the Home Secretary, in a letter to the Society, which has been laid on the table of the House of Commons, stated that the public interest required that cremation should not be adopted until many matters of social importance have been duly considered and provided for.

Without discussing the question on which we have already expressed our opinion, we may remark that one of the great advantages of cremation, from a sanitary standpoint, would consist in the early destruction of the corpse, especially in crowded districts where the body is retained above ground in rooms actually occupied by the family to the great prejudice, not only of the relatives of the deceased, but also of the surrounding community. Against the early burial and complete destruction of the corpse it has been argued strongly and with good reason, that the ends of justice would be defeated in cases where death had been brought about by poisoning or by some forms of violence, but this matter will no doubt receive due consideration in the discussion about to take place in Parliament. We trust that Parliament will not declare cremation to be illegal as there are a large and increasing number of people amongst all classes of society in favour of this practice.

## The Medical Council and Medical Morals.

At the meeting of the Council on Friday Mr. Simon moved, "That the Council submit to the Lord President that the parts of the Bill which relate to the purpose of keeping the medical profession free from persons whose moral character would disgrace it, require, in the opinion of the Council, to be strengthened by certain additions," one of which was to the effect that the Medical Council may refuse registration to an applicant for any reason which, if he were already registered, would entitle the Council to erase his name from the Register. This proposition, however, as well as a similar one respecting the corporations, was very properly objected to by most of the members of the Council. As we remarked a short time ago, the social status and education of the rank and file of the profession are not such as will prevent any one from entering it who might be guilty of immoral or dishonourable conduct. At the same time the general character of candidates is not, we hope, so bad as to necessitate their immorality being specially provided against. There are, perhaps, certain cases in which the authorities would be warranted in preventing a person's name being put upon a Register, but for such rare and exceptional cases special legislation is quite uncalled for. Besides, such cases could always be met by the rules and conditions under which the Licensing Bodies at present grant their respective license. They all expect from the candidate a "certificate of good moral character;" and in the event of the candidate being guilty of any grossly criminal conduct on the eve of his being registered as a licensed practitioner, and enrolled in the ranks of the profession, it would be clearly within the power of the authorities to reject them, without the risk of their incurring an action for libel. It would, moreover, be difficult in an Act of Parliament to define that amount of criminality or unprofessional conduct which would justify a corporation in refusing the license or the Medical Council in refusing registration.

## Reconstruction of the Medical Council.

It is evident that the Medical Council is not much in favour of the profession having a voice in the management of its affairs. In the first place the report of its Executive Committee, respecting the nature of which, so much curiosity has been excited, turned out after all to be a very poor affair, and scarcely such a one as we might expect from a large and influential body like the Medical Council. Not only does it not represent the unanimous opinion of the council, or of a majority of the Council, but not even the unanimous opinion of the small number of members who constituted the committee. Three of the members either dissented from some of the suggestions that were made by the rest of the committee, or were of opinion that no report should have been issued until after the inquiry which the government has determined to make into the subject. The report, moreover, is of so simple and conservative a character that we cannot imagine why it was so long in making its appearance. The reporters are far from thinking that the constitution of the Council is so defective as most of us have represented. They are disposed to look upon that body as almost perfect, and in need of little or no reform. There is, moreover, every probability of the opinions of the committee being endorsed by a large majority of the Council. On Monday, Dr. Humphry moved that the Council should recommend that the principle of direct representation be not adopted, and his motion was supported by a large majority of those who

took part in the discussion on the subject, amongst whom were Sir W. Gull, Dr. Storrar, Dr. Wood, Mr. Macnamara, and others.

## Preservation of Anatomical Specimens by the Aid of Paraffine.

THE preservation of specimens is of the utmost importance. Various methods have been adopted with success, and amongst others paraffine has been recommended. In confirmation of the value of the latter agent, M. Franc, in the name of M. Fredericy, exhibited before the Biological Society, Paris, at a recent sitting, the brain and liver of a dog which had been preserved in this substance.

The two specimens were well-hardened, and had preserved their normal colour. Mr. Fredericy has made his plan known in the Bulletin of the Academy of Science, Belgium.

He begins by macerating the specimens for several days in pure alcohol, then in essence of terebenthine, then he plunged them into a heated solution of paraffine. M. Fredericy adds that it is only applicable to small specimens, human brains being too large. M. Duval, in discussing this paper, remarked that he was in the habit of using paraffine, and that previously to plunging the preparations in it, he first heated them with azotic acid and chromic acid.

THE rates of mortality in the principal foreign cities according to the most recent weekly returns were in Calcutta 37, Bombay 30, Madras 40; Paris 29; Geneva 20; Brussels 32; Amsterdam 26; Rotterdam 25; The Hague 26; Copenhagen 27; Stockholm 25; St. Petersburgh 49; Berlin 23, Hamburg 37, Dresden 30, Breslau 31, Munich 28; Vienna 32, Buda-Pesth 43; Rome 22, Turin 25, Venice 26; Alexandria 41; New York 30, Brooklyn 21, Philadelphia 20, and Baltimore 19. Of the 1,093 deaths in Paris, 40 resulted from typhold fever, 22 from diphtheria, and 18 from small-pox.

# Scotland.

(FROM OUR NORTHERN CORRESPONDENT.)

ST. ANDREWS' STUDENTS.—Eight students were on Saturday, the 15th inst., charged at the St. Andrew's Borough Court with a breach of the peace in front of Principal Shairp's house on the 14th ult. The disturbance was supposed to have taken place in connection with the "Kate Kennedy" Masquerade. Several of the professors were examined. The charge was found not proven.

GLASGOW DEATH RATE.—The mortality of Glasgow for the week ending 15th March, was at the rate of 25 per 1,000 per annum, against 21 in the preceding week, and 24, 23, and 29 in the corresponding periods of 1878, '77, and '76. The medical officer reports 20 cases of typhus fever.

FATAL ACCIDENT TO A MEDICAL MAN.—About half-past twelve o'clock on the morning of the 19th inst., Edward Macdonald, a carriage greaser, found the body of a man lying on the outside rails near the entrance to the tunnel of the Caledonia Railway, Buchanan Street, Glasgow, and, securing the assistance of a sergeant of police, had it removed to the Northern Police Office. From the clothing of the deceased, and other evidence, the body was identified as that of Dr. R. T. Thornburn, formerly residing at Harelesshohn, Dalserf, and now at Larkhall. Dr. Sloan inspected the body, and found a large deep wound on the forehead, with fracture of the skull. How the deceased met his death there is no evidence to show. The case is being investigated by the authorities.

EDINBURGH ORPHAN HOSPITAL.—Dr. Halliday Douglas was elected physician to this hospital, at a meeting recently held; Dr. Graham Brown standing second. The votes in connection with all the candidates were taken by ballot.

ODONTO-CHIRURGICAL SOCIETY OF EDINBURGH.—The annual meeting of this Society was held on the 13th inst., in the New Dental Hospital, Mr. Hepburn, L.D.S., president, in the chair. After the election of office-bearers for the ensuing year, and the reading of the secretary's and treasurer's reports, which showed an increase in the membership and funds of the society, Mr. W. H. Williamson, M.B., C.M., read a paper on "Retarded Eruption of the Teeth." In his closing address, the President took occasion to congratulate the society on the fact that it had now found a settled home in the Dental Hospital. He hoped the members would do all in their power to assist their Curator in the formation of a dental museum, which would form an instructive and valuable adjunct to the hospital. After the exhibition of various objects of interest, the meeting separated.——The annual dinner of the licentiates in dental surgery and the Odonto-Chirurgical Society took place in the evening at the Balmoral Hotel, Princes Street, Mr. W. Campbell, L.D.S., the newly-elected president, in the chair, Mr. D. Hepburn, L.D.S., acting as croupier. The following places were represented:—Glasgow, by J. R. Brownlie, L.D.S., and J. Austin Beggs; Aberdeen, by W. H. Williamson, M.B., C.M.; Dundee, by W. Campbell, L.D.S.; Stirling, by L. G. Platt; Berwick, by J. Wells, L.D.S. After the usual loyal and other toasts, the Chairman, in giving "The Dental Diploma," commented upon the fact, that the possession of that diploma, which had previously been optional on the part of those practising their art, had by the passing of the Dental Practitioners Act been made compulsory, so that all who enter their profession after August of last year must pass through the educational course it demanded. He dwelt upon the advantages which must accrue to the profession as a body, and to the public generally, by restricting the practice of their specialty to thoroughly trained and educated men. The Croupier, in proposing "The Edinburgh Dental Hospital and School," said it had given him great pleasure to see the old Dental Dispensary developed into the Edinburgh Dental Hospital. The dispensary had served its day and generation, doing good work in its time. The present institution was a natural outcome of the times, called for alike by the ever-increasing demands of the poor for the special help and relief it affords, and for the practical training of students in the specialties of that curriculum which recent legislation had rendered compulsory. He was glad to see the subject taken up so earnestly by the profession here, and by many of their brethren in the South, to whom they were greatly indebted for sympathy and help. He trusted the public would come forward, and by their liberal subscriptions express their sense of the benefits which such an institution conferred upon the suffering and the poor.

EDINBURGH BOTANICAL SOCIETY.—The fifth meeting for the present session of the Botanical Society took place on the 13th inst., in the Bible Society's Rooms, St. Andrew Square, Dr. Thomas A. Goldie Balfour, president, in the chair. A good deal of business was transacted; and several communications were made to the society.

ROYAL SOCIETY OF EDINBURGH.—A meeting of this society was held on the 17th inst., Professor Kelland in the chair. A paper was read by Sir William Thomson, on "Vortex Motion: Gravitational Oscillations in Rotating Water," in the course of which he spoke at length of the tidal phenomena of the English Channel. A contribution on the "Action of Anæsthetics on Blood-Pressure," by Dr. J. Coats, Dr. Wm. Ramsay, and Professor McKendrick, was communicated by Dr. Coats. An account was given of part of an inquiry conducted at the request of the British Medical Association, in the physiological laboratory of the University of Glasgow, on the "Action of Anæsthetics," by a committee consisting of Professor McKendrick, Dr. Wm. Ramsay, and Dr. Coats. The committee found that chloroform lowered blood-pressure to a marked extent, whereas ether scarcely affected it at all. The general result was that chloroform was by no means a safe anæsthetic. On the other hand, ether, which had been used in America instead of chloroform, whilst safer, had certain great disadvantages. The committee accordingly searched for an anæsthetic substance which should be as efficient as chloroform without its risks, and which should not have the disadvantages of ether. Such qualities they found in ethidene, a substance nearly related in chemical composition to chloroform. They found that whilst it was not entirely devoid of risk, a condition scarcely to be expected in any anæsthetic substance, it acted much less injuriously than chloroform on the heart and on the respiration. This was demonstrated by a series of curves taken by the kymograph, an instrument for registering blood-pressure. The new anæsthetic was used some years ago by a German surgeon, who spoke highly of its qualities. His observations, however, were not taken advantage of by the profession, and they were not known to the committee when they first employed ethidene. The substance had been given to about twenty persons, of all ages, during various surgical operations, often prolonged, with satisfactory results. The whole question of the physiological action of anæsthetics was being investigated by the committee, and it need scarcely be said that it was of great importance to find a substance which should be efficient, and as devoid of risk as they could expect such substances to be. Professor Rutherford spoke in high terms of the exertions and discoveries of Dr. Coats and his coadjutors. Professor McKendrick remarked that he had applied ethidene in twenty cases, and had found it most satisfactory. It certainly had many advantages over ether, and did not produce the pallor which was the usual result of other anæsthetics. The patients seemed to take it easily, although in a few cases it had occasioned sickness. Other papers were subsequently read.

DR. GAIRDNER ON "MODERN FETISH WORSHIP."—In connection with the melancholy exhibition in the new Public Halls, Glasgow, Professor Gairdner has written to the *Glasgow News* what, we fear, must be characterised as a perfectly becoming letter on his part. It is difficult to determine whether the most proper course would be to publish this letter in its entirety without comment, or to ask our readers, simply out of regard to our space, to accept the subjoined excerpts as perfectly genuine. "Now, with respect to the so-called 'disease of the faculty of wonder,' I don't wish to be bound over to any absolute theory that there is, or is not, strictly speaking, a 'faculty of wonder,' much less that it is, as the phrenological faculties were supposed to be, a simple faculty or organ in the brain. . . . . It would be perfectly just to say that I am no kind of 'ist' at all, but simply a physician, seeking for intelligible phrases to convey what is, after all, the essence of my philosophy—that the state of mind which you and *I* alike *recognise* and describe in our own way is a state, actually or proximately, of disease." Dr. Gairdner's signal failure in his search after "intelligible phrases," coupled with the recollection of his confession of defective memory not long ago at a professional meeting, and the above sentence, have, we hope, no serious import. "I think there is 'something more in it' than sheer ignorance, and that something is disease; perverted action of a faculty—call it what you please—a faculty *whose natural, normal,* and *healthy* action is to enable us to *recognise with wonder* and reverence what is *clearly above us,* and clearly beyond *the scope of our limited* faculties of *intelligent comprehension.*" In other words, a disease of a faculty, *which normally enables us to recognise with wonder and reverence that which is clearly beyond the reach and comprehension of our faculties!* "The worship and love of God, the mysterious relation between spirit and matter, almost always to be understood as within the realms of fact and law, but always and altogether out of the scope of our conceptions, and therefore essentially incomprehensible and inexpressible." Otherwise, *that which is almost always within the realms of fact and law, is always and altogether out of the scope of our conceptions, and therefore essentially incomprehensible and inexpressible.* . . "Suppose," continues Dr. Gairdner, "for the sake of *argument* (Heaven, save the mark!), that 'something,' or somebody, was said to be knocking away at all the tables in the next house, and that the something or somebody was said to be a spirit, the attitude my mind naturally takes is, Well, what then? If a spirit can't do anything more to the purpose than knock on tables, what need I to care? If the disturbance becomes serious, one can always send for a policeman" *Send for a policeman to take a spirit in custody.* Of the existence of spirits—"always and altogether out of the scope of our conceptions, and therefore essentially incomprehensible and inexpressible"—Dr. Gairdner seems to have no doubt whatever; it is of the *pastime* that he seems dubious, a point on which it suffices to say that if *disembodied* spirits are capable of such inanities as the *embodied,* nothing seems too whimsical or contemptible to meet their approbation. Have none of his numerous satellites any influence with Dr. Gairdner? The reputation of a once famous University is without doubt in jeopardy.

GLASGOW SOCIETY FOR THE PREVENTION OF CRUELTY TO ANIMALS.—This Society held their annual meeting in the Religious Institution Rooms, on the 8th inst. Sir James Watson presided. During the year the Society had to deplore the loss of Mr. John Matheson, jun., Vice-President; and during the same period 204 cases of cruelty had been investigated, and of these, 97, implicating 155 persons, were deemed fit subjects for prosecution, resulting in the conviction of 146 persons; while three cases were found not proven. The attention of the directors had been called to cruelty perpetrated on the Highland roads in connection with the summer tourist traffic, and this would be watched next summer. Irish shippers were also held in view. The magistrates, on the representation of the directors, were about to erect additional drinking troughs for horses. Professor McKendrick advocated the use of the "Bruneau Mask" in the slaughtering of animals. Professor Veitch and Mr. J. C. Burns were appointed Chairmen for the ensuing year.

REGISTRAR-GENERAL'S WEEKLY RETURN.—The death-rate in the eight principal towns of Scotland during the week ending with Saturday, the 15th March, 1879, was 23·7 per 1,000 of the estimated population. This rate is 0·4 below that of the corresponding week of 1878, and 1·7 above that

recorded for the tenth week of the present year. The death-rate from the seven most familiar zymotic diseases was 3·8 per 1,000. The only diseases in this class requiring notice were whooping-cough and diphtheria, which were rather prevalent in Glasgow, Dundee, and Greenock. There was a considerable diminution in the number of acute diseases of the chest. The mean temperature of the week was 37·2 degrees, being 5·8 degrees lower than that of the week immediately preceding, and 2·9 degrees lower than that of the eleventh week of 1878.

## THE MICROSCOPICAL JOURNAL.

THE February number of the Journal of the Royal Microscopical Society appears under new auspices, and in a somewhat altered garb. The editor, Dr. Frank Crisp, a gentleman whose name is somewhat new to journalism, shows a mastery over his work that will doubtless be highly appreciated by the Fellows of the Society. The contents of this first number for 1879, presents features of varied interest for the microscopist. It opens with a paper from Dr. Hudson, on a new species of Rotifer, a remarkably handsome one, of those interesting cave-dwellers which will long continue to be a source of wonder and delight to the possessor of a microscope. A disquisition by Dr. Royston Pigott, on the limits of microscopical vision, stands next on the list, and on this point we think with the Doctor, the limit has by no means been reached, even by the aid of the modern and much improved immersion objective. Prof. Helmholtz believes that, even with further improvements in the construction of objectives, and the assistance afforded by the immersion and reflex illuminators, no great increase in the present resolving power of the microscope will be obtained. Dr. Pigott is followed by some two or three papers of interest on Immersion Illuminators. That by Mr. John Mayall is, perhaps, the most valuable of the three. This writer sketches out the several improvements effected in illuminators since their invention by Mr. Wenham, nearly a quarter of a century ago, and then proceeds to explain very clearly their action. Professor Abbe, of Germany, and Dr. Woodward, of America, are amongst the most active and ardent workers in this direction; and it is to them we now look for further improvements in the development of the immersion system of illumination. Amongst other papers of interest, we notice that "On some recent Forms of Camera Lucida," by the editor, and a "Description of a New Camera Lucida," by Dr. Russell, of Lancaster, both useful in their way, and as offering improved mechanical aids to the less practiced draughtsman amongst microscopists. Then follows numerous valuable notes and memoranda of the microscopical investigations of biologists all over the world, and to which is added an extremely useful Bibliography. We cannot conclude our brief notice of the Journal without some reference to the excellent choice displayed by the Fellows in their new President. They certainly do themselves honour by their selection of one of the foremost microscopists of this country to fill the Presidential Chair. In Dr. Lionel Beale they have a president well skilled in the use of their favourite instrument, and an ardent promoter of microscopical science.

## "HOMŒOPATHY GONE MAD."

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—The idea struck me on reading your observations about homœopathic posology, to work out to their conclusions the centesimal dilutions of homœopathic therapeutics, and to show by the *reductio ad absurdum* reasoning, the nonsense of their posology. The following calculations are strictly accurate, at any rate they are not in excess of the truth, but quite the contrary; they may interest, amuse, and perhaps amaze some of your readers, including very likely some homœopathists.

The moderate dilution which the learned professor, Dr. Hughes himself, adopts is limited by the 30th centesimal potency, which I daresay would be considered by his American brethren a rather strong solution. The 30th centesimal dilution is expressed by 60 ciphers, that is a decillion. Now to dilute one entire grain of say aconitina, to that extent, would require a decillion grains, or, say minims, of water; 277 minims are equal to a cubic inch, and 71,000 billions to a cubic mile. A decillion minims would fill ten thousand billions of times over a hollow globe large enough to inclose the whole solar system.

What shall I say of the 200th centesimal dilution which "physicians of scientific reputation" employ, and "the evidence of the efficacy of which is undeniable?" It is expressed by 400 ciphers. Now I find that the number of minims expressed by only 80 ciphers would not leave room in the visible universe, inconceivably enlarged as it has been by the vast space-penetrating power of the great Parsonstown reflector, light requiring about thirty millions of years to reach us from its frontier, a journey of about 200 trillions of miles, which is radius; its cubic space therefore is $= \frac{4\pi \times R^3}{3} = 33 \times 10^{60}$ cubic miles, which multiplied by the number of minims in a cubic mile ($77 \times 10^{18}$) gives $234 \times 10^{77}$; or in round numbers, 2 with 79 *cyphers*, which is within the number I have already stated, would more than fill the visible universe. As to the number of units expressed by 400 ciphers, it transcends, I should say, the power of any created intelligence—human or archangelic—to conceive, and this is only the 200th centesimal dilution!

I should think the knowledge of these facts ought to cure any one outside Bedlam of his homœopathic delusions.

E. T. C.

## THE HERBALISTS AND THEIR PARLIAMENTARY APOLOGISTS.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—With some anxiety I awaited your remarks upon the above distinguished but somewhat indiscreet individuals (*i.e.*, the apologists in the House of Commons) in your last issue. And now that those remarks have appeared they err, in my opinion, in the measure of their extreme mildness.

From the Parliamentary representative of the Northumberland miners much in the way of liberality in dealing with the affairs of one of the (so-called) liberal professions need not be expected, but from a lawyer, at least, more intelligence, more knowledge of his subject, and more common sense might, not unreasonably be hoped for.

The men and women who, when the coal-mining trade was good, lived upon the "fat of the land," and dressed themselves in broadcloths, silks, furs, and sealskins—who clad their dogs in woollen coats, and ornamented them with "fancy" collars—and who, while they fed those interesting pets on legs of mutton at a shilling a pound, paid their doctors for attendance and medicine for a whole family of eight or ten the munificent sum of three-pence sterling! a week cannot have from the very nature of things, an enlarged idea of the doctor's faculty, or yet of the doctor himself. The herbalists, on the contrary, they can and do appreciate, because their fee for "consultation" and medicine is often a greater number of pounds than the threepenny wages of their doctors. As the representative, then, of the miners, and as one of themselves, Mr. Burt, M.P., knows intimately their peculiarities, and therefore the exigency of his position compels him to give a representation to views and utterance to opinions which he, as an educated and intelligent man, must know to be both illusory and unsound. To him, therefore, we may extend our pity, but the lawyer merits only our contempt and utter abomination. In venturing "to protest against the principle of protection for any profession," &c., he outtwaddled all the impudent twaddle that ever fell from lips beneath a horse-hair wig. The lawyers and the judges take every precaution that no unlicensed man among them shall trade in law for wages. Irregular he may be, and very often is, but to be unlicensed is intolerable. If that is not "protection" I wonder, in the name of Lord Beaconsfield, what the word "protection" really means. What the public, as well as the doctors, really want, however, is a due reform of

the legal profession, as without it any measure, no matter how good, of medical reform will prove to be, in the words of an eminent lawyer himself, "a mockery, a delusion, and a snare."

I am, Sir, yours respectfully,

THE AUTHOR OF
"Medical Men and Manners."

22nd March, 1879.

## DISPENSARY STATISTICS.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—I have tabulated some results of the figures given in the "General Summary of Dispensary Statistics," which are, I think, of interest. The death-rate I have taken from the Quarterly Reports of the Registration Office. It is very remarkable that Leinster, which has the highest ratio of visiting tickets to the population, has also the highest death-rate, and that, as the death-rate diminishes so do the number of visiting tickets. Can we infer from this that where there is a high death-rate there is also a large amount of severe illness? Again, why is Leinster at the top of the scale? Can it be that the enormous death-rate of Dublin, and its great and sickly pauper population, influences the death-rate and the number of visiting tickets for the whole province? Again, the question arises whether Connaught is really such a very healthy province. The dispensary districts are nearly twice as large as those in Leinster. Can it be that because of the long distances to be travelled the people do not seek medical relief, and for the same reason do not come in to register deaths when they take place?

| Province. | Percentage of tickets to whole population. | | Cost of drugs to 100 patients | Payme't for each visiting ticket. | Area of D. D.s, | Death rate. |
|---|---|---|---|---|---|---|
| | Visiting tickets. | Dispensary tickets. | | | | |
| | | | £ s. | s. | | |
| Ulster | 3 | 6 | 4 0 | 8-88 | 25,623 | 16·4 |
| Munster | 3·7 | 10 | 3 14 | 9-40 | 29,599 | 18·0 |
| Leinster | 4·5 | 11.8 | 3 5 | 8-77 | 24,024 | 21·0 |
| Connaught | 2 | 6·9 | 4 10 | 14-00 | 44,837 | 14·0 |

It appears that the cost of medicines and medical appliances was £4 10s. in Connaught, and only £3 5s. in Leinster for every 100 patients relieved. If the whole country had been as economically worked as Leinster in this respect it would have effected a saving of £3,000. I am of opinion, however, that a larger saving even than this might be effected under a different system of supplying medicines. I believe a great deal of medicine is wasted by being ordered in too large quantity, and being kept in damp dispensaries. And, further, that the medicines being often of inferior quality leads to their being thrown out as useless. I have therefore recently adopted the following plan:—I have made out a list of about twenty remedies, chiefly made up in pearl-coated pills, and these I have claimed as specialties, to be got by the contractor from Richardson and Co., of Leicester, and to be charged for at a fair price. I am only beginning the experiment now, but I fully expect that I shall thus supply my dispensary at less cost to the rates, and certainly with far less trouble and more satisfaction to myself and safety to the sick. It appears to me that if the medical officers of dispensaries could carry out any arrangement by which the ratepayers could be saved several thousands a year, we could with the more force claim a retiring allowance as a right and not a gratuity.

Another subject of interest suggested by these figures is the payment for each visiting ticket. It appears that our Connaught *confréres* are paid much better than others are, but it is very probable that any advantage they have in this respect is more than balanced by the largeness of their districts and the want of private practice. The lowest payment is 8s. 6d. for each visiting ticket, and as it probable that each ticket involves at least three visits on an average, this is little more than 2s. 6d. a visit, setting aside the attendance at the dispensary altogether. There certainly seems room for improvement here. Among the suggestions that have been recently made in reference to "abuse of medical relief," there has been one for the formation of clubs for medical relief similar to those in England. There have a number of letters recently appeared in the *British Medical Journal* on the social position of the profession in England, and on "unqualified assistants" which afford matter for much reflection. The outcome of it, to my mind is, that the club doctor is the servant of a class of men who have proved themselves in various ways to be the worst masters under the sun, because they can neither rule themselves nor their lusts. He must be at their beck, he must compound their medicines for them, and he is under the temptation to eke out his scanty pay by supplying their wives and daughters with perfumery and hair-oil. If one adds to all this what politico-religiously a club would be in Ireland—a guild would probably be its designation—one feels that the profession here had better remain as it is.

Yours, &c.,

A. W. WALLACE, M.D.

Parsonstown, March, 1879.

# Obituary.

## DR. BEEVOR, OF MANSFIELD.

THE gentleman whose death we announce was at one time physician to the Newark Hospital, where, after obtaining his M.D. degree in 1841, he first commenced practice. Three years later he took the F.R.C.P. Ed. diploma, being already a member of the London College of Surgeons. At the time of his death Dr. Beevor was suffering from angina pectoris; he had several seizures, and at last succumbed somewhat suddenly to an attack at the house of a friend at Bawtry, Yorkshire, on the 9th inst. Dr. Beevor had scarcely fallen into the "sere and yellow leaf," but he had in large measure that which should accompany old age—

"Honour, love, affection, troops of friends;"

and at Scarborough, where he lived for many years, he was widely esteemed and respected by people of all classes. His kindly, genial nature; his openheartedness; his sincerity; made him lasting friends wherever he went. Dr. Beevor had a distinguished college career, and was a sound medical practitioner; but lately he had retired from the active pursuit of his profession, and had accepted the appointment of officer of health to a large district in North Notts. He was of a good old family, but more than that, he was a gentleman at heart. Not only his family and relations, but a very large circle of friends, will mourn and long in vain "for the touch of a vanish'd hand, and the sound of a voice that is still."—J. P.

## PARLIAMENTARY WORK OF THE COMING WEEK.

WEDNESDAY, MARCH 26TH.

ADJOURNED debate on Dr. Lush's Bill, second reading; and at same stage of Messrs. Mill's and Errington's Bill. Motion by Mr. Sergeant Simon on behalf of herbalists and quacks to throw out Dr. Lush's Bill. Motions by Mr. Errington, Dr. O'Leary, and Mr. James Stewart, to refer all to a Select Committee.

THURRDAY, 27TH.

Lord George Hamilton.—To move for a Select Committee to inquire into the constitution of the General Medical Council of Education and Registration for the United Kingdom under "The Medical Act, 1858;" and to report whether any, and if so, what changes are desirable in the constitution of that body to render it more efficient for the purposes for which it was formed.

Mr. Errington.—Amendment. That the appointment of the said Committee be postponed until this House has had time to consider the measure of medical reform which the Government have announced their intention of introducing, and the scope of the reference to be made.

Dr. O'Leary.—Amendment. After "1858," to insert the words "and the conjoint scheme of examination as defined by the Medical Act (1858) Amendment Bill of the present session."

Dr. Cameron.—Amendment. To add, at the end of the question, the words "and also to consider the various Bills relating to medical reform at present before Parliament."

Dr. Lyon Playfair.—Amendment. To add, at the end of the question, the words "and to consider how far the Medical Bills now before Parliament are calculated to affect the teaching of Medicine in the Universities and other Schools of Medicine."

FRIDAY, 28TH.

Report of the Lord President's Bill as amended in House of Lords.

Probable amendment to be moved by the Earl of Courttown to enable Arts degrees to be inserted in a separate column in the Medical Register.

Probable amendment by Lord O'Hagan to provide for uniformity of fee throughout the United Kingdom.

MISCELLANEOUS MOTIONS.

THURSDAY, 27TH.

Vaccination Acts (Ireland) Amendment Bill. Second reading. Motion thereon by Mr. Hopgood (on behalf of the anti-vaccination party) to throw out the Bill.

Mr. Macartney.—To ask the Secretary to the Treasury whether a scheme has yet been drawn up for arranging a system of payment to the medical officers of prisons in Ireland, who, being at the same time surgeons of the county infirmaries, have since the handing over of the prisons to Government, been performing the duties of medical officers of such prisons without any remuneration; and if so, whether those medical officers are to receive payment for their services from the date of the transfer of the prisons from the county to the Government authorities.

## NOTICES TO CORRESPONDENTS.

INQUESTS IN GAOLS.—A correspondent says: Since the Government took up the Irish prisons two inquest have been held in the male jail to which I am surgeon. I had to attend at both and give evidence. The coroner presented at the present assizes for my fees, but the grand jury refused to pay, as they held it was my duty to attend such as surgeon to the jail without further fee than my salary. Is this the law?

We believe it is *not* the law, but we are aware that in some places in Ireland the fee for inquest evidence which had been always paid was stopped long ago, and has since never been allowed. The section of the Coroner's (Ireland) Act bearing on the subject (see "Irish Medical Directory") is as follows: "XXXII *Inquest in Hospital, &c.: no remuneration to Medical Officer.*—And be it enacted, that when any inquest shall be holden on the body of any person who has died in any public hospital or infirmary, or in any building or place belonging thereto, or used for the reception of the patients thereof, or who has died in any county or other lunatic asylum, or in any public infirmary or other public medical institution, whether the same be supported by endowments or by voluntary subscriptions, then and in such case nothing herein contained shall be construed to entitle the medical officer whose duty it may have been to attend the deceased person as a medical officer of such institution as aforesaid to the fees or remuneration herein provided." The county gaol is certainly neither a "public hospital or infirmary," nor a "county or other lunatic asylum," nor a "public medical institution," and, therefore, we believe that the medical officer is entitled to his fee. In connection with this subject, we protest against this law, even in its application to hospitals. It is the business of hospital medical officers to treat disease, not to instruct juries; and the State has no moral right whatever to expect such service for nothing. There is talk of a Bill to amend the Irish coroner's system, and, if such a measure is framed, we hope that a decisive effort may be made to repeal this very unfair proviso.—ED.

DR. SOMERS.—We should have been most happy to chronicle the fact, but it is hardly a medical appointment.

DR. B.—Most certainly.

ETIQUETTE BETWEEN MEDICAL MEN.—Referring upon a case in the Scotch law courts, the *City Press* of Saturday last makes these sensible remarks:—"It is certainly injudicious for a medical man when called in to bind up a wounded man to ask whether a brother practitioner, who had previously dressed the victim, was drunk at the time at which he was called upon to employ his professional skill. The remark having been repeated and passed round a circle of select friends, it is not perhaps surprising that the injured man should bring an action against his slanderer. To have exclaimed when called in to treat a bruised eye, 'Good gracious! who dressed it?' and to have followed this with the inquiry, 'Was he drunk?' is apparently 'evil speaking and slandering.' Twice, however, the Scotch courts have decided against the plaintiff in the action, and have refused to allow expenses to either party, although, as an afterthought, their lordships of the Court of Session characterised the remarks of the defendant as 'incautious and injudicious.'"

MR. WILLIAMSON.—Gant's "Surgery," or Erichsen's, will answer every requirement; you will find special subjects more fully treated in the former, and as you require something short and reliable in "Dental Surgery," the chapter by Mr. Tomes in Gant will probably suffice.

DR. B. W. RICHARDSON, F.R.S., President of the Medical Defence Association, will deliver an address on "Medical Defence," at the rooms of the Medical Society of London to-day (Wednesday) at 4½ p.m. After the address the members of the Association and their friends will dine at the Grosvenor Restaurant, Old Bond Street. Members of the profession who are not members of the Association will be admitted to the President's address on presenting their cards.

A GENERAL PRACTITIONER.—The answer given in our last to your inquiry (as to which were the best books for your purpose) was, by the printer's blunder, made to appear very absurd. It should have read thus:—Bucknill and Tuke's "Manual of Psychological Medicine" and Winslow's "Manual of Lunacy."

ROYAL COLLEGE OF PHYSICIANS OF LONDON.—This day (Wednesday), at 5 p.m., Croonian Lectures: Dr. W. H. Stone, "On some Applications of Physics to Medicine."

HUNTERIAN SOCIETY.—To-day (Wednesday), at 8 p.m., Mr. Reilly will exhibit a Patient suffering from Chronic Œdema of one Leg.—Mr. Jacobson, "On a Case of Acute Intestinal Obstruction, ending fatally ten days after Operation, with Remarks on Treatment."

CLINICAL SOCIETY OF LONDON.—On Friday, March 28, at 8½ p.m., Mr. Heath, "Foreign Body (end of a Silver Catheter) in the Bladder; Median Lithotomy: Recovery."—Mr. Keetley, "A Case of Severe Traumatic Meningitis treated in the stage of Coma by Cold Douche for 2½ hours; Recovery."—Mr. Teevan, "A Case of Cystotomy" (living specimen).—Mr. MacCormac, "A Case of Unreduced, old-standing Thyroid Dislocation of the Femur, in which Excision was successfully performed with the object of obtaining a useful Limb."

## VACANCIES.

Coleraine Union, Articlave Dispensary.—Medical Officer. Salary, £90, with fees, and £22 as Sanitary Officer. Election, April 3.

Coombe Lying-in Hospital, Dublin.—Apothecary and Registrar. Election, March 27.

Olgar Union, Essex.—Medical Officer for No. 1 District. Salary, £105, with the usual extra fees. Applications to the Clerk before April 1.

Queen's University.—Examiner in Medicine. Salary, £100. Election, April 18. (See Advt.)

Royal Westminster Ophthalmic Hospital.—House Surgeon. Personal applications to the Secretary, between 1 and 4 o'clock.

St. Georges in the East, London.—Assistant Medical Officer. Salary, £120, with board. Applications to the Clerk, Charles Street, E., by March 27.

Sunderland Infirmary.—House Surgeon. Salary commencing at £80, with board. Applications to the Chairman of the Medical Board before April 23.

Wrexham Infirmary.—House Surgeon. Salary, £100. Applications to the Secretary, Temple Row, Wrexham, before April 3.

## APPOINTMENTS.

BATTERSBY, H. J., M.B., C.M., Medical Officer, Medical Officer of Health, &c., for the Hacketstown and Coolkenno Dispensary District of the Shillelagh Union, co. Wicklow.

CLOWES, J. S., M.R.C.S.E., Medical Officer of Health for the Smallburgh Rural Sanitary District, Norfolk.

GOLLAND, A., M.R.C.S.E., House Surgeon to the Bolton Infirmary and Dispensary.

GWYNNE, C. N., M.B., C.M., a Medical Officer to the Sheffield Free Hospital for Sick Children.

HALL, J. C., M.B., B.Ch. Univ. Dub., Medical Officer to the Scotstown Dispensary, Monaghan Union.

HEARN, R. T., M.B. Univ. Dub., L.R.C.S.I., Medical Officer to the Rathmines Dispensary, South Dublin Union.

JEWELL, C. C., M.R.C.S.E., House Surgeon to the Scarborough Dispensary and Accident Hospital.

JOSEPH, G. W., L.K.Q.C.P.I. & L.M., M.R.C.S.E., Medical Officer for No. 1 District of the Warrington Union.

KELLY, J. D., L.R.C.S.I., L.R.C.P.Ed., Medical Officer to the Mullingar Union Workhouse.

MCENIRY, D., L.R.C.P.Ed., L.R.C.S.Ed., Medical Officer, Medical Officer of Health, &c., for the Ballymacarbry Dispensary District of the Clonmel Union.

MURPHY, E., L.K.Q.C.P.I. & L.M., L.R.C.S.I., Medical Officer, Medical Officer of Health, &c., for the Dunfanaghy Dispensary District of the Dunfanaghy Union, co. Donegal.

NUNDY, E., L.R.C.S.Ed., Resident House Surgeon to the Beckett Hospital and Dispensary, Barnsley.

O'KELLY, T. E., L.R.C.P.Ed. & L.M., L.R.C.S.I., Medical Officer, Medical Officer of Health, &c., for the Maynooth Dispensary District of the Celbridge Union, co. Kildare.

PALMER, F. W., L.R.C.P.Ed., Medical Officer to the No. 4 District of the Devizes Union.

SELLS, C. J., L.R.C.P.L., M.R.C.S.E., a Medical Officer to the Royal Surrey County Hospital, Guildford.

## Deaths.

BUCKLEY.—On the 12th inst., at York Place, Harrogate, William H. G. Buckley, M.R.C.S.E., aged 62.

BUSH.—On the 7th inst., at Frome, Edwin Bush, M.R.C.S.E., aged 71.

DUCKWORTH.—On the 6th inst., at Addingham, Yorkshire, Walter Duckworth, Surgeon, aged 67.

EDMONSTON.—On the 7th inst., at Halligarth, Unst, Shetland, Laurence Edmonston, M.D., aged 84.

FLETCHER.—On the 7th inst., at Brook Road, Stoke Newington, George F. Fletcher, M.R.C.S.E., aged 56.

JAMES.—On the 14th inst. (suddenly, in a railway train), Thos. James, M.R.C.S., of Louth.

MARTIN.—On the 16th inst., at 36 St. Peter's Square, Hammersmith, W., W. Martin, F.R.C.S., late Bengal Medical Service, aged 65.

OLLARD.—On the 8th inst., at York Row, Wisbech St. Peter, William Ollard, M.R.C.S.E., aged 79.

O'REILLY.—At Adelaide, South Australia, Charles O'Reilly, M.D., L.K.Q.C.P.I., formerly of Dublin, aged 80.

ROSE.—On the 6th inst., at Hermon Hill, Wanstead, Charles Rose, L.R.C.P.Ed., aged 71.

# IRISH POOR-LAW INTELLIGENCE.

## VACCINATION ACTS (IRELAND) AMENDMENT.

A BILL TO AMEND THE ACTS RELATING TO VACCINATION IN IRELAND.

1. *Short Title.*—This Act may be cited as the Vaccination Amendment (Ireland) Act, 1879.

2. *Extent of Act.*—This Act shall apply to Ireland only.

3. *Parents and Guardians of Children to have such Children Vaccinated within three months after birth.*—The father or mother of every child born in Ireland *after the passing of this Act* shall, within *three months* after the birth of such child, or in the event of the death, illness, absence, or inability of the father and mother, then the person who shall have the care, nurture, or custody of the said child, shall within *three months* after receiving the care, nurture, or custody of such child, take or cause to be taken the said child to the medical officer of the dispensary district in which the said child is resident for the purpose of being vaccinated, unless he shall have been previously vaccinated by some duly qualified medical practitioner, and the vaccination duly certified; and the said medical officer shall and he is hereby required thereupon, or as soon after as it may conveniently and properly be done, to vaccinate the said child; provided that in the vaccination of children who are inmates of the workhouse or other public or charitable institution, the master, matron, or chief officer of the workhouse or other such institution shall take the steps required to be taken under the provisions of this Act by the father or mother of the child, or other person having the care, nurture, or custody thereof.

4. *Provision for Inspection of Vaccination.*—Upon the same day of the week following the day on which any child has been vaccinated as aforesaid, the father or mother, or other person having the care, nurture, or custody of the said child, shall again take or cause to be taken the said child to the medical officer by whom the operation was performed, in order that such medical officer may ascertain by inspection the result of such operation, and, if he see fit, take from such child lymph for the performance of other vaccinations; and in the event of the vaccination being unsuccessful, such parent or other person shall, if the medical officer so direct, cause the child to be forthwith again vaccinated and inspected as on the previous occasion.

5. *Certificate of successful Vaccination to be transmitted to the Registrar, and duplicate given to the Parent.*—Upon and immediately after the successful vaccination of any child the medical officer or practitioner who shall have performed the peration shall deliver to the father or mother of the said child, or to the person who shall have the care, nurture, or custody of the said child, a certificate under his hand, according to the form in the first schedule to this Act marked (A), that the said child has been successfully vaccinated, and shall also transmit a duplicate of the said certificate to the registrar of births and deaths of the district within which the birth was registered; but if such district is not known to the medical officer or practitioner, or if the birth of the child has not been registered, to the registrar within whose district the operation has been performed; and such certificate shall, without further proof, be admissible as evidence of the successful vaccination of such child in any information or complain which shall be brought against the father or mother of the said child, or against the person who shall have had the care, nurture, or custody of such child as aforesaid, for non-compliance with the provisions of this Act; provided that if the medical officer of any dispensary district is also the registrar of that district, it shall be sufficient for him to sign one certificate, to be delivered to the father or mother or other person as aforesaid, and to register the fact of such vaccination in the manner provided by the Vaccination (Ireland) Acts.

6. *Rate of Payment for successful cases of Vaccination.*—And whereas by the fifth section of the Act of the twenty-sixth and twenty-seventh years of the reign of Her present Majesty, chapter fifty-two, it is provided that the Board of Guardians shall pay to the medical officer of each dispensary district, in addition to any salary or allowance payable to him, the sum of one shilling for every person successfully vaccinated by him: Be it enacted, that the said section shall be and is hereby repealed; and the Board of Guardians shall pay to every such medical officer for every person successfully vaccinated by him within his dispensary district, after the passing of this Act, the sum of *one shilling and sixpence*, provided that the said medical officer shall have made the report to the committee of management, regarding the persons so successfully vaccinated, which is required by the Act of the session of Parliament held in the twenty-first and twenty-second years of the reign of Her present Majesty, chapter sixty-four.

7. *Payment of fee by re-vaccinated person where not Inspected.*—Where the operation of re-vaccinating any person is performed on the application of such person by the medical officer of the dispensary district without charge to such person, the medical officer shall deliver to such person a notice requiring him to attend at the same place on the same day in the following week, in order that he may be inspected, and the result of the operation ascertained, and stating that in default he will be liable as in this section mentioned; and the medical officer, if required, shall deliver to the person re-vaccinated a certificate of the result of the operation of re-vaccination; and if such person fails to comply with such notice, or to permit the medical officer to ascertain the result of the operation, he shall pay for such re-vaccination the sum of *two shillings and sixpence*, which fee shall be a debt due from him to the guardians of the union in which such medical officer acts, and all such fees shall be paid to, and all expenses of the guardians incurred under this section shall be paid out of the fund out of which the expenses of the guardians under the Vaccination (Ireland) Acts are paid.

8. *Legal Proceedings.*—Every person who prevents any dispensary medical officer from taking from any child lymph, as provided by section two of this Act, shall be liable on summary conviction, to pay a penalty not exceeding *twenty shillings*.

The defendant in any proceedings under the Vaccination (Ireland) Acts may appear by any member of his family, or any other person authorised by him in this behalf.

Where any parent or other person having the custody of a child fails to produce such child when required so to do by any summons under the said Acts, such parent or other person

shall be liable, on summary conviction, to a penalty not exceeding *twenty shillings*.

Every parent or person having the custody of a child who neglects to take such child or to cause it to be taken to be vaccinated, or after vaccination to be inspected, according to the provisions of the Vaccination (Ireland) Acts, and does not render a reasonable excuse for his neglect, shall be guilty of an offence, and be liable to be proceeded against in a summary manner, and upon conviction shall be liable to a penalty not exceeding *twenty shillings*.

9. *Penalty on Vaccinator and Parent neglecting to transmit Certificate, and Persons signing false Certificates.*—Every medical officer, parent, or person, as the case shall require, who shall neglect to transmit any certificate required of him by the provisions of the Vaccination (Ireland) Acts, completely filled up and legibly written, to the registrar within the time specified by the said Acts, and every medical officer who shall refuse to deliver the duplicate to the parent or other person, on request, or who shall refuse to fill up and sign the certificate of successful vaccination, shall be liable to pay upon a summary conviction a penalty not exceeding *twenty shillings*; and every person who shall wilfully sign a false certificate or duplicate under this Act shall be guilty of a misdemeanour, and punishable accordingly.

10. *Notice not to be proved by prosecutors. Certificates to be Defence.*—In any prosecution for neglect to procure the vaccination of a child it shall not be necessary in support thereof to prove that the defendant had received notice from the registrar or any other officer of the requirements of the law in this respect; but if the defendant produce any such certificate as herein-before described, or the register of vaccinations kept by the registrar, in which the certificate of successful vaccination of such child shall be duly entered, the same shall be a sufficient defence for him, except in regard to the certificate marked B in the first schedule to this Act, when the time specified therein for the postponement of the vaccination shall have expired before the time when the information shall have been laid.

11. *Power to Guardians of Poor to direct proceedings, and Remuneration of Medical Officers of Dispensary Districts.*—The guardians of any union in Ireland may direct proceedings to be instituted for the purpose of enforcing obedience to the provisions of the Vaccination (Ireland) Acts. The medical officer of any dispensary district who may be required by the guardians of the union to attend and who shall attend at any such proceedings shall, in addition to his actual expenses, be entitled to receive for his remuneration for such attendance such sum not exceeding *one guinea* for each day upon which his attendance shall have been required and given, as the court before whom the proceedings are had shall certify; and as to such remuneration and expenses, and all other expenses incurred in the prosecution, if the court is of opinion that they should be allowed, the justice or one of the justices shall ascertain and certify the amount thereof to the guardians of the said union, as set forth in Form C in the first schedule of this Act, and such amount shall be payable out of the poor rates of the union in which the neglect or default shall have arisen; and such proceedings on account of neglect to have a child vaccinated may be taken at any time during the continuance of the neglect.

12. *Transmission to the Medical Officer of List of Births and Deaths.*—Every registrar of births and deaths for any place, not being the dispensary medical officer of the district, shall, once at least in every month, transmit, by post or otherwise, to each dispensary medical officer whose district is wholly or partly comprised in such place, a return, certified under the hand of the registrar to be a true return, of all births and of all deaths of infants under twelve months of age, which have, since the date of the last return (or in the case of the first return, since the passing of this Act), been registered by such registrar as having occurred in the district of the dispensary medical officer to whom the return is sent.

The registrar shall be entitled to a fee of *twopence* for every birth or death entered in such return; and such fee shall be paid to him out of the same funds, and by the same persons, and in the like manner, as the fees for carrying out the provisions of the Registration of Births and Deaths (Ireland) Act.

The returns under this section shall be made in such form and contain such particulars as may be from time to time prescribed by the Registrar-General of Births and Deaths in Ireland, with the approval of the Local Government Board for Ireland; and forms necessary for such purpose shall be supplied by the said Registrar-General to every registrar of births and deaths.

13. *Interpretation.*—The term "the Vaccination (Ireland) Acts" shall mean the Act passed in the session of Parliament held in the twenty-first and twenty-second years of the reign of Her present Majesty, chapter sixty-four, and the Act passed in the session of Parliament held in the twenty-sixth and twenty-seventh years of the reign of Her present Majesty, chapter fifty-two, and the Act passed in the session of Parliament held in the thirty-first and thirty-second years of the reign of Her present Majesty, chapter eighty-seven, and this Act.

14. *Repeal.*—The Acts specified in the second schedule to this Act are hereby repealed, to the extent specified in the third column of that schedule: Provided that this repeal shall not affect the past operation of any enactment hereby repealed, nor anything done or suffered under any enactment hereby repealed; nor any right, interest, obligation, or liability accrued or incurred under any enactment hereby repealed; nor any penalty, forfeiture, or punishment incurred in respect of any offence committed against any enactment hereby repealed; nor any investigation, legal proceeding, or remedy in respect of any such right, interest, obligation, or liability as aforesaid.

SCHEDULES REFERRED TO BY THIS ACT.

*First Schedule.*

FORM (A).

I, the undersigned, hereby certify that the child of of aged in the county of has been successfully vaccinated by me.

Dated this day of 18

(Signed) A.B.,
Medical officer of the dispensary district (or other medical practitioner, as the case may be).

FORM (B).

I, the undersigned, hereby certify that I am of opinion that the child of of in the county of aged is not now in a fit and proper state to be successfully vaccinated, and I do hereby postpone the vaccination until the day of

(Signed) A.B.,
Medical officer of the dispensary district (or other medical practitioner. as the case may be).

FORM (C).

To the guardians of the Union.

I one of the justices of the peace presiding at petty sessions at , hereby certify, under the provisions of the Vaccination (Ireland) Acts, that the expenses herein set forth have been this day incurred at the prosecution of certain persons for an offence against said Acts.

Fee to dispensary medical officer for attending as a witness, £; expenses of medical officer, £; other expenses, £.

(Signed) Justice of the peace.

## IRISH CORONERS AND MEDICAL EVIDENCE.

"I ATTENDED at an inquest held in my district on a child, æt. 2¼ years, who fell 4½ feet into a ditch containing 1 foot of water. At the *dictation* of the coroner, and without any examination being made of the body of the child, a verdict was given that the child had been accidentally drowned. The foreman of the jury and one of the jury asked for me to be examined, but their application was completely ignored, as was also my presence. Would you oblige me by letting me know if it is legal for an inquest to be held without the evidence of a doctor, particularly when that evidence has been asked for by members of the jury? I may state that the coroner in this case has not the excuse that he himself is a doctor; although holding a dispensary and being a medical attendant to the police, he is neither qualified as a physician or surgeon."

The sections of the Coroners (Ireland) Act referring to this matter (see the "Irish Medical Directory") are as follows:—

"XXXIII. In all cases where any Coroner shall hold an inquest on any dead body, and shall deem the attendance of some medical witness to be necessary at such inquest, he shall summon as such witness any legally qualified medical practitioner, being at the time in actual practice at or near the place where such death happened; and it shall be lawful for the Coroner, at any time between the issuing of such summons and the termination of such inquest, to direct the performance of a post-mortem examination by such medical witness.

"XXXIV. And be it enacted, that whenever it shall appear to the majority of the jurors upon any inquest that the cause of death has not been satisfactorily explained by the evidence of such medical practitioner, or of the witness or witnesses who shall have been examined at such inquest, it shall be lawful for the said jurors, by a requisition in writing, to call upon the Coroner to issue his summons for the attendance of some other legally qualified medical practitioner or practitioners; and if the Coroner, on the receipt of such requition, shall refuse or neglect to issue his summons as aforesaid, he shall be deemed guilty of a misdemeanour."

Thus, the discretion is completely with the coroner, unless the jury issue "a requisition in writing." In suspicious cases it is, in our opinion, highly reprehensible to take a verdict without proper evidence, but it is frequently done, for the law makes the coroner responsible for the fee, and, in case of there be any doubt of his being eventually recouped, he will do without evidence sooner than run the risk.—Ed. M. P. & C.

## MEDICAL CERTIFICATES IN LUNACY.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—The Act about Lunatics says, "Any two justices . . . shall call to their assistance the medical officer of the dispensary district in which they shall be at the time, to assist them in determining whether or not the alleged lunatic may be a fit subject for an asylum." Now it happens that in certain districts in this (and other) unions the above provision throws this duty or privilege—as the case may be—on the medical officer of the district in which the resident or other magistrate resides, no matter in what district the case may have transpired. This gentleman can know but little about the case, and consequently can give but little information about it in the query sheet; whereas the medical officer of the district in which the case occurred, and who generally has attended it previously, and therefore could give information as to its origin, &c., is left out, and the case is "sent off," accompanied by such crude and meagre "observations" as the other doctor is able to append to it after one visit, in which, perhaps, he has scarcely even seen the patient. I know of one case in which the lunatic shut the house door against the doctor, who only gathered the materials for his certificate out of a conversation held through the door.

Pray, Sir, say, do you not think there exists a very grave and damaging defect in this Act for the Commitment of Dangerous Lunatics, viz., 30 and 31 Vic., cap. 118, sec. 10, or is it as perfect as many other Acts of Parliament?

Please also to say what remedy is there when a magistrate or magistrates, either through ignorance or some other motive, call to their assistance a doctor who neither has attended the case, nor resides in the same district with themselves, nor in that of the patient, and when there is one in the same district who has previously attended the case and knows all about it?

Your Obedient Servant,
A M. O. of Donegal Union.

[It would be undoubtedly better if the certificate of lunacy could be given by the practitioner who knew the case, but to do so is not always practicable, as the lunatic could not be kept waiting for the time necessary to fetch his own local doctor; the magistrate, in the terms of sec. 10 must call the Dispensary Medical Officer of his own district, and only when he cannot be had, can he employ another doctor. If he does so under any other circumstances, the doctor called in will not be paid, but there is no remedy available to the medical man who ought to have been sent for.—Ed. M. P. & C.]

## LIMERICK DISPENSARY AND ITS DRUGS.

The Secretary read the following letter:—

"Local Government Board,
"Dublin, 8th February, '79.

Sir,—The Local Government Board for Ireland desire to inform the Committee of Management of the Limerick Dispensary District that they have received a report from their Inspector, Mr. Bourke, relative to the statements which were made at a Committee of Management, on the 4th inst., by Drs. O'Connor and Holmes, respecting the conduct of Mr. Lee, the apothecary.

"It appears that the medical officers reported that their prescriptions were on various occasions improperly or imperfectly made up by Mr. Lee; that in some cases the ingredients ordered were not used; and that other lesser quantities of medicine were dispensed than the prescriptions specified.

"They added that they had remonstrated with the apothecary on a former occasion for such conduct and for a time had no cause to complain, but the same improper cause was soon after renewed.

"It further appears that Mr. Lee, the apothecary, when called before the Committee and questioned, admitted to a certain degree the justice of the complaints, attributing his irregularity in the compounding of the medicines to hurry and stress of work, and this reduction of the quantities ordered to his desire to husband his resources.

"The Board understand that Mr. Lee was reprimanded by the Chairman of the Committee on this occasion for the great impropriety of his proceedings, but such serious consequences might possibly grow out of such neglect as that alleged that the Local Government Board are of opinion that Mr. Lee should not be continued in office, and they have to request the Committee of Management to take the question into consideration.—By order of the Board. "B. Banks, Sec."

Dr. O'Connor, Dr. Holmes, and Dr. T. Gelston were requested to attend, and in reply to several questions they stated that Mr. Lee was very attentive to his duties, and most satisfactory in the performance of them since the last meeting, and a resolution was unanimously adopted, requesting the Local Government Board to withdraw their letter, as Mr. Lee was giving the fullest satisfaction, and as he possessed the confidence of the medical officers of the dispensary district.

## AMENDMENT OF THE REGISTRATION OF BIRTHS AND DEATHS (IRELAND) ACT.

The following letter has been addressed by order of the Council of the Irish Medical Association to the Chief Secretary for Ireland on this subject, and it is hoped that the Bill proposed by the Council may be introduced at once, and become law this Session, as the preliminary formalities have been got over.

Irish Medical Association,
Royal Coll. Surg. in Ireland,
Dublin, 7th day of March, 1879.

Sir,—With reference to the subject of my letter of the 27th November 1878—the receipt of which was acknow-

ledged by letter "No. 21,546," dated 11th December, 1878—I am directed by the Council of the Irish Medical Association to request that you will have the goodness to inform them whether the Government contemplate the introduction of, in the present session of Parliament, any measure to amend "The Registration of Births and Deaths (Ireland) Act, 1863;" and, if so, whether the Bill drawn up by the Council with that object in view, and presented in the House of Lords, during the session 1875-76, by the Right Hon. the Earl of Donoughmore, viz.: Bill No. 208, ordered to be printed 8th August, 1876, is the measure to be brought forward?

The Council of the Irish Medical Association believe that that Bill was at the time favourably reported upon by the several departments, and ever since only awaited a favourable opportunity for reintroduction, which doubtless, but for the absence of the Earl of Donoughmore, would ere this have been afforded.

In the event of it not being the intention of the Government to introduce any such measure this session, the Council would endeavour to have the Bill above referred to introduced into Parliament as soon as possible as a private measure, in the hope that, as no objection has been made to it, it may receive the support of the Government.

The Council trust that, as the law regulating the registration of births and deaths in Ireland is admittedly very unsatisfactory and imperfect, the original Act of 1863 (now over fifteen years in operation), never having been amended, and as a Bill which has been officially approved is now before Parliament, the Government will facilitate the earliest possible consideration in Parliament of this much needed reform.

I have the honour to be, Sir,
Your obedient servant,
JOHN WILLIAM MOORE, M.D.,
Hon. Secretary to the Council.

To the Right Hon. James Lowther, M.P.,
Chief Secretary for Ireland.

## KERRY ASSIZES.

CORONERS' FEES.—His Lordship, addressing the grand jury, said before he could discharge them there were one or two matters about which he wished to speak to them. Counsel mentioned to him in the morning that instructions had been given to make application to the court relative to the fact of the grand jury having refused to pass presentments for coroners' and doctors' fees for attending on inquests. He (his lordship) wished to know whether the grand jury refused to sanction the presentment?

Foreman—We did, my lord. We appointed a committee to inquire into the matter, and after a minute investigation they came to the decision that the coroner acted unfairly in holding certain inquests.

Mr. C. J. Murphy, solicitor, said he had instructed counsel to argue before his lordship that the coroner did what was absolutely necessary, and the crooner was prepared to swear that on oath. If that were so, counsel would submit to his lordship that the grand jury could not refuse to pass the presentment.

Foreman—We only followed Mr. Justice Keogh's decision.

His lordship—I see. Then I need not interfere, gentlemen (laughter). However, we shall hear what counsel has to say on the subject.

Mr. Rearden said he appeared on behalf of Coroner Spring, who had presented to the grand jury for the expenses of inquests he had held. When the coroner made an affidavit that he believed the inquest was necessary, the grand jury had no power but to grant his fees.

His lordship—That is the law. Mr. Foreman, when you heard evidence on this claim, did you hear the coroner and examine him?

Foreman—We called him, but he was not present.

His lordship—And you hadn't the benefit of his presence? Then I won't interfere with your decision.

Mr. Rearden—I would ask the grand jury to hear the coroner now.

His lordship—Will you re-open the case Mr. Herbert?

Foreman—We won't do that, my lord.

His lordship—No. They are inexorable (laughter).

Mr. Bourke said he appeared on behalf of half-a-dozen doctors of Kerry, who had been duly summoned to coroner's inquests, where they had given evidence. They applied before the grand jury, and they were of opinion that they had no power to grant the money.

His lordship—They cannot grant it, but they can present for it.

Mr. Bourke said the doctors were summoned by the coroner, and they accordingly attended at the inquest. In consequence they became entitled to the fees in the precise form they had been in the habit of presenting to the Board of Superintendence. The Board was abolished by the new Prisons' Act, and the grand jury had now the power to pay them.

The Foreman said the application was rejected at the last assizes by the Finance Committee of the grand jury, and they had not presented for the amount since.

In reply to his lordship, Mr. Fitzgerald, secretary to the grand jury, said the applications had been lodged with him, but he returned them, as the grand jury had not power to grant the amount.

His lordship.—Of course these grants ought to be paid some way.

Mr. Bourke.—We presented them on Monday last, my lord.

His lordship suggested to the grand jury that the better way would be for them to fill in a blank presentment and send it down to the Clerk of the Crown. He would not fiat it unless he was justified in doing so in point of law.

The grand jury then withdrew.

## QUEENS' COUNTY ASSIZES.

THE PRISONS' ACT.—With regard to a presentment for £20 which it was proposed should be made to the County Treasurer for expenses incurred by the coroner for medical witnesses, the secretary said he did not think there was any Act of Parliament that would sanction the presentment and he was ordered to put the Act of Parliament before every presentment.

Mr. Owen said the Committee of Public Accounts felt justified in recommending the presentment should be passed, because they had before them the fact that the coroner had himself to pay the medical witnesses.

Mr. Smyth said it was a great hardship, and there should be an Act of Parliament to remedy it.

Mr. Franks.—Could we not make an order for the Treasurer to pay the fees on the coroner's certificates.

Mr. Kemmis.—This is a matter overlooked by the Prisons' Act. There is now no one to pay the medical witnesses who give evidence at an inquest.

Mr. Franks.—If there is an inquest a doctor may say he won't go to it.

Colonel Carden.—We cannot do anything without an Act of Parliament.

Mr. Young.—If any hardship should arise it will show the necessity for some new Act of Parliament.

## TO READERS.

THE Editor will feel especially obliged by receiving copies of newspapers which contain any Poor-law or other intelligence of medical interest, in order that he may, if fit, republish it for the benefit of the readers of the *Medical Press*. Although twenty-one of the leading Irish newspapers are received at the Irish office, many things may escape notice which are deserving of attention.

### ON THE GENERAL PATHOLOGY OF EAR DISEASE.

By GEORGE P. FIELD,
Aural Surgeon to St. Mary's Hospital.

(*Continued from page 422.*)

HÆMORRHAGES not unfrequently occur in the membrane, as they do in other parts; these may take place in either the skin or mucous membrane, sometimes into both. They may be traumatic, or due to certain blood or vascular conditions, such as purpura in any of its forms, hæmorrhages from increased venous pressure, as in heart disease, bronchitis, or obstruction to the superior vena cava, innominate, or internal jugular veins. On the other hand, it may arise from increased arterial pressure, like the hæmorrhage in the retina or brain of Bright's disease. The hæmorrhage may be scanty or severe; it has sometimes a peculiar tendency to wander over the surface of the membrane; this characteristic locomotion has been described by Von Tröltsch. Otologists describe, in addition to these changes, certain abnormal appearances of the membrana tympani, which Schwartze, in his excellent handbook of the "Pathological Anatomy of the Ear," (*a*) classes under the following headings:—1. Anomalies of colour and transparency, thickening, opacity, and calcification. 2. Anomalies of curvature. 3. Perforation and cicatricial formations. 4. Detachment of the membrane. 5. Abscess. 6. Ulceration. 7. Anomalies of the membrana flaccida shrapneli. The etiology of most of these changes is sufficiently evident from the foregoing general observations on the pathology of the membrane. Some of its appearances depend, however, on the condition of surrounding parts, more especially of the tympanum. The *colour* of the membrane varies considerably with the age of the patient; "the infantile drum-membrane on account of the greater thickness of its cutis and mucous layers, always appears of a thicker whitish grey than does the membrane of adults." In old age a yellowish or milky opacity is usually due, according to Gruber, to a fatty degeneration of the membrana propria. The pearl-grey colour of health may become deep grey, whitish grey, yellow, or yellowish red. The yellow and red colours being often due to the contents of the tympanum, yellow meaning pus, and red hyperæmia. The causes of opacity I have already indicated; they are usually due to inflammatory changes, and may consist of new growths of connective tissue in either lamella, of deposits of fat, lime salts, or of affections of the epithelium of either side; the production of calcareous and ossific deposits has also been alluded to. Flattening or increased convexity or concavity of the membrane is generally due to contraction or paralysis of the muscles acting on the drum, or to various conditions of the tympanum. Atrophy of the membrane may take place; it is usually divided into partial and total atrophy. The former is due to chronic inflammatory changes, the latter to tension from within, due to closure of Eustachian tube, or pressure from without, due to wax or tumours. Hernia of the membrane is described, produced by bulging of the mucous layer through a weakened and incomplete fibrous layer. Emphysema of the membrane is also occasionally produced by a collection of air beneath its cutis due to destruction of its mucous and fibrous layers.

Passing next to the tympanum itself, we may as usual reckon up its diseases in a similar manner, namely, by its anatomical structures. Chief amongst these is the mucous membrane, which lines it, next the bony walls, and lastly, the small bones and muscles which it contains. The mucous membrane is liable to inflammations usually of a catarrhal kind, which are analogous with the changes seen in other mucous membranes. The most severe forms are those which are extensions of the inflammations occurring in the mucous membrane of the fauces and

(*a*) Recently translated by Orne Green.

pharynx in diphtheria and scarlet fever; these pass along the Eustachian tube, and affecting the tympanum with the same severity that they do the throat, often work terrible havoc there; for not only will they fill it with pus and produce perforation, by inflammation and over-distension of the drum-membrane, but frequently the deeper structures are also involved, so that the periosteum becomes injured and caries or necrosis of the bony walls ensue, producing in many cases an utter destruction of the organ, if not of the individual. I have already pointed out (*a*) the extreme dangers which arise from inflammation of the tympanum on account of its immediate surroundings. These perils of meningitis, phlebitis, abscess of the brain, paralysis or pyæmia, and the like, are all threatening when this most severe form of disease in the tympanum occurs. We may consider it fortunate sometimes when the cavity becomes blocked with a mass of cheesy material, which may become quiescent, though unfortunately remaining as a hidden danger, which at any time may develop into an active centre of infection, and cause a general tuberculosis. This form of disease is most frequently seen in young children, and it often affects both ears at once; when this happens they generally grow up as deaf mutes. I have published one case in which this happened, and which resulted in the manner just described.

In the ordinary and less severe forms of catarrhal inflammation the mucous membrane of the tympanum resembles all other mucous membranes. The cause may be constitutional or local. Gout and Bright's disease are both alike known to produce mucous catarrh; no part escapes from them. Gouty bronchitis or gastro-intestinal catarrh are well known to every practitioner, so also are gouty conjunctivitis (though sclerotitis is more common), urethritis, and vaginitis; the same is true of Bright's disease, and both conditions affect the tympanum as they do other mucous membranes. Tubercle is another constitutional disease which affects mucous surfaces, and it appears probable that this one suffers like the rest. Tubercles have not been found after death and identified as such in man, but Schütz has found them in the pig, and Schwartze believes that he has seen them on the drum-membrane during life. Syphilis, as far as we know, does not attack mucous surfaces, nor is it often found in the ear, except when it commences in the auricle and travels inwards along the external meatus, or in the Eustachian tube, and travels outwards to the middle ear.

In early life most tympanic catarrhs are strumous, if we exclude those following fevers, and being strumous take their origin I believe in tubercle, which I cannot but think must be regarded as the primary cause of all strumous inflammations; while I regard tubercle, however, as commonly a local and frequently non-infectious disease, although having a constitutional origin, yet I cannot but think that in some cases it does become infective and spreads rapidly, by means of the lymphatics, from one centre, first to the neighbouring parts, and subsequently perhaps throughout the body. It is I believe because of this tuberculous or strumous nature of the disease that the results produced by it in children and young adults are so severe. Many of those cases, commonly classed as "purulent catarrh," are I believe of this character, and little but general constitutional treatment will effectually relieve such cases, although local treatment is of course also most necessary to guard against the special local dangers, such as blocking up the Eustachian tube, over-distension of the cavity, adhesions of the drum membrane to the walls, ankylosis of the ossicles, formation of polypi, and extensive caries or necrosis of the walls.

Other cases of a less severe nature in young people and most cases in adults, including those due to gout and Bright's disease, resemble the ordinary catarrhs of the Schneiderian membrane or of the bronchi, but are more chronic. When they are acute and severe they produce in their first stage a considerable swelling of the mucous membrane with arrest of secretion; subsequently secretion becomes profuse and often muco-purulent; as in other parts the mucus may contain more or less pus, according to the severity of the affection and the duration of the disease. If this condition persists for a long period, as it is very apt to do, serious consequences to the organ ensue. The cavity it must be remembered is a small one; a little swelling brings parts into contact, and synechiæ or adhesions result. Little strings or bands of organised lymph are seen very frequently stretching across the cavity. The swelling of the sub-epithelial connective tissue may be very severe, and being produced in large measure by exudation cells or proliferated connective tissue corpuscles, very considerable thickening may result from it. As the membrane surrounds the ossicles the delicate little structures may have their movement very greatly embarrassed. The labyrinthine fenestræ may be partially or completely closed by the swelling; if the catarrh be very severe, resulting in a highly purulent discharge, the drum-membrane may be softened and perforated, though these perforations, if resulting from simple catarrh, usually heal rapidly. Most modern writers, including Schwartze, divide the catarrhal inflammations of the tympani mucous membrane into—1. Serous catarrh. 2. Mucous catarrh. 3. Purulent catarrh. I cannot, however, agree with these divisions. The term "serous" catarrh is confessedly employed to denote an inflammation akin to that occurring in a serous membrane, and therefore conveys a false idea of its pathology; while the "purulent" catarrh is made to include two distinct diseases, one of them in no sense catarrh. A catarrhal inflammation essentially consists of one not producing destruction of tissue, or at least of no tissue below the epithelial layer; and to this I would limit it, except for some few slightly deeper, but still superficial erosions of the surface and destruction of mucous membrane; but when more severe than this the changes belong to another type, and, as I believe, are generally tubercular, it is therefore eminently necessary to distinguish between them and simple catarrhs.

Now a catarrhal inflammation of the mucous membrane in any part may result in the exudation of clear serous fluid, of mucus, muco-pus, or pus, together often with a little blood, and occasionally when exceptionally severe, with some highly corpuscular lymph. Now all these products are found in the tympanum when affected with catarrh; and although it may be desirable to indicate by the name the nature of the fluid effused, nevertheless it is necessary to remember that they are only slight modications of the same disease, although they may require somewhat different treatment. In some cases the effusion from the tubular and racemose glands of the mucous membrane is a weeping of a clear serous fluid containing but little mucin. The catarrh is chiefly glandular, and produces but little thickening of the membrane; in others the glands secrete a viscid, thick, tenacious mucus, which adheres firmly to the walls of the cavity and causes great inconvenience; at other times it is chiefly pus, mingled more or less with mucus. It is accompanied, as I have said, with much swelling of the walls; the whole membrane is involved, and the results are often severe and sometimes permanent. The changes thus produced are those described by all the leading authors on the ear, including Morgagni, Von Tröltsch, Toynbee, Politzer, Grüber, Wendt, and more recently by Schwartze, as "adhesive inflammation" and "sclerosis," and a parallel is drawn between the tympanic mucous membrane and *serous* membranes in this tendency to *adhesive inflammation*. But surely the pathology of the adhesions formed in the tympanum and those in serous membranes is altogether different. As I have remarked, adhesions and bands are common in the tympanum, but they result, I believe, in many cases from the tubercular or strumous form of inflammation, in others from the swelling which takes place producing contact between the opposite sides, sometimes perhaps from organised blood-clots. I cannot believe that fibrinous lymph is *commonly* effused from a mucous sur-

(*a*) *Medical Press and Circular*, May, 1877.

face. It must be remembered in judging of the results of catarrhal inflammation in the tympanum, that stagnation of fluids and contiguity of walls render its circumstances peculiar and probably its results eccentric.

Another source of difficulty in dealing with the pathology of the tympanum is that the lowest layer of the mucous membrane becomes also the periosteum of the bone; hence it follows that a severe catarrh may penetrate sufficiently deeply to produce an inflammation of bone. This may be either an acute periostitis, leading to necrosis, or it may produce a chronic periostitis, inducing hypertrophy and irregularity of the bone, which may either be general throughout the whole tympanum, or localised to a part; sometimes only the ossicles are thus affected, indeed they more frequently suffer in this manner than any other part, for the mucous membrane covering them is thinner than elsewhere, and a less severe inflammation is required to produce irritation and proliferation of the osteoblastic layer: in this way the ossicles readily become ankylosed to one another, or to the part to which they are attached; the stapes is thus frequently fixed to the foramen ovale of the vestibule. This condition when general is called bony sclerosis (Von Tröltsch) of the tympanum; sometimes it is called hyperostosis. If the primary catarrh be less severe, only the sub-epithelial layer becomes affected; this becomes greatly thickened and fibrillated; it presents a stiff and leathery appearance, described by Toynbee; occasionally the deep periosteal layer is similarly affected by *connective-tissue sclerosis.*

In old persons, especially those suffering from osteo-arthritis, a similar change in the ossicles and their articulations to that seen in other joints, has been described. Their cartilages have been eroded, and the articulating surfaces thickened and ankylosed.

Polypi frequently occur in the middle ear, and are, perhaps, invariably the results of inflammation. Their structure and history vary with the severity of the inflammation and the parts from which they spring. The most common is the ordinary *mucous* polypus of a similar nature to those seen in the nose and uterus. These spring from the mucous surface, are formed of soft cellular tissue; they contain induplications of the epithelial surface, forming gland-like tubes or sacs. The surface of the growth is covered with ciliated cylinder epithelium, which changes sometimes at its extremity to a mixed or pavement epithelium. More rare are the fibromata developed from the periosteal layer. "Their structure consists of a firm connective tissue, with numerous spindle or star-shaped connective tissue corpuscles, the processes of which anastomose with each other" (Schwartze). Myxomata are considered by the author just quoted extremely rare; with this my own experience does not quite agree. Certainly a far more common form of polypus is the exostosis, which from its nature, origin, and shape may fairly be classed among these growths: these always result from inflammation of the periosteum and bone, and are generally pedunculated. On the distinction between these structures and the ivory-like tissue of the hyperostosis I have already insisted. (*a*)

In addition to the polypi of the tympanum other new growths occasionally exist, such as cholesteatoma, retention, sebaceous and dermoid cysts, osteo-sarcoma, and epithelial cancer.

The mastoid cells are closely allied to the tympanic cavity in their diseases, but they are more liable to caries of their bony walls. The reason for this is sufficiently evident when we consider that they are lined with extensions of the mucous membrane of the tympanum, but this mucous membrane is not ciliated; a catarrh of the tympanum always extends into these cells, but there is deficient outlet for the effused inflammatory products, which are no longer wafted onwards by the ciliary currents; it is like lobular pneumonia occurring in a lung; the cellular material once effused or proliferated is got rid of with great difficulty; it tends to caseate and often to produce caries of the surrounding or intercellular bony walls. If the inflammation is more severe, or of a *croupous* nature, it may produce rapid necrosis of the bone. Primary inflammation of the mastoid cells is rare; on the other hand, primary inflammation of the external periosteum is not uncommon; these frequently lead to subcutaneous abscesses beneath the periosteum, which I have already described; the early treatment of this condition is most important and necessary for the safety of the patient. This periostitis on the external surface of the mastoid is frequently secondary to primary disease of the middle ear; sometimes, however, no reason can be assigned for its occurrence. In all cases of disease about the mastoid it is well to remember its close proximity to the lateral sinus; plugging of this vessel from phlebitis and death may result from extension of the inflammation from the bone to it.

The Eustachian tube forms a connecting link, both anatomically and pathologically, between the throat and the tympanum. Its diseases are chiefly limited to its mucous membrane, which may suffer from acute or chronic catarrh, the result of which may be an exudation of glairy, inspissated, or purulent mucus. It may undergo thickenings or contractions throughout its whole length, or at various parts. The causes of its most intense inflammation are certain fevers, namely, scarlatina, variola, and diphtheria; less severe acute or subacute inflammations result from catarrh, arising from cold, gouty catarrh, catarrh from irritation of the alimentary canal, or from local hyperæmia, the results of smoking, and perhaps of alcoholic excess. The ulcerations of the Eustachian tube are interesting; they are chiefly such as affect the throat; namely, syphilitic, tubercular, follicular, diphtheritic, and variolous; these are nearly all confined to the region of its mouth in the pharynx; nearer the tympanum ulcerations are chiefly secondary to caries of the temporal bone or epithelial cancer. Polypi have sometimes been met with in the tube.

The diseases of the labyrinth are more commonly functional than structural. They depend in great measure, as I have already indicated (*a*) on vascular conditions, such as anæmia, hyperæmia, high or low arterial pressure, and sometimes hæmorrhages; the causation and effects of these have been previously dwelt upon. Occasionally inflammation extends into it from the tympanum; the result may be a serous or purulent exudation, or sometimes a sclerosis. Suppurative inflammation may result in a blocking of the labyrinth with caseous material, or a caries, or sometimes necrosis. Chronic and less severe inflammatory changes may affect the soft structures, and produce thickening, atrophy, or fatty degeneration of the membranous labyrinth, of the organ of Corti, or of the ultimate nerve endings. It is doubtful whether the variations in size of the otoliths and lime crystals are pathological or not.

The auditory nerve itself is especially liable to diseases; caries of the petrous bone, or meningitis, produce occasionally neuritis. Atrophy is described as the result of many brain lesions; from locomotor ataxy; tumours of brain, meninges, or petrous bone; hæmorrhage or periostitis in its bony canal; and also, according to some observers, from long-continued arrest of function. Numerous new growths have been found involving the sheath of this nerve, including fibromata, neuromata, sarcomata, and gummata. Many other minor conditions of the labyrinth and of the auditory nerve have been described, and many remain to be discovered, but I have not tried to give an account of the special pathology of the ear, but I have rather endeavoured to indicate the application of the general laws of pathology to the diseases of this organ, for I feel assured that such considerations will prove our safest guides to correct diagnosis and to successful treatment.

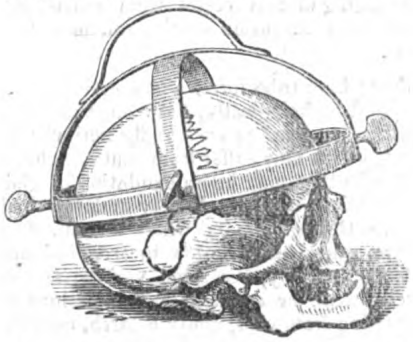
## NEW FORM OF CRANIUM HOLDER.

By LAMBERT H. ORMSBY, F.R.C.S.,
Surgeon to Meath Hospital and co. Dublin Infirmary; Senior Demonstrator in the School of Surgery, Carmichael College of Medicine and Surgery, Dublin.

HAVING very frequently experienced great difficulty in holding and commanding the skull during the operation of sawing through the calvarium when removing the brain in the dissecting room and other places, it occurred to me that the skull might easily be commanded by a strong wire or iron frame. Having made numerous experiments in the dissecting room with various appliances, I became satisfied with the form of instrument which the accompanying wood-cut gives a very good representation of.



I feel sure there are few persons who have removed the brains from many subjects have not at one time or other felt the difficulty and inconvenience of holding the skull steady during division of the calvarium, the possibility when using a saw of injuring and scraping the hand or fingers being always a matter of danger. Also they must have found the difficulty of making an even horizontal section of the skull, besides the time lost in completing such a section. The present form of appliance I am anxious to introduce into the various medical schools and hospitals in this city, as well as to the notice of the Poor-law medical officers and infirmary surgeons in the country, as such gentlemen are frequently called on at coroner's inquests and other places to perform post-mortem examinations, and with the aid of such an appliance I venture to hope the calvarium will be removed with ease and remarkable rapidity.

As will be seen in the wood-cut, the "Cranium Holder" consists of a light polished steel framework of the size and shape of an average cranium. It embraces and ts the vertex of the skull evenly above the ear, supra-orbital ridge, on frontal and occipital protuberance behind. It is furnished with a convenient handle for the hand of the operator. It is also provided with four thumb-screws placed opposite each other, the frontal and occipital screws being screwed home at the same time; the two lateral screws are then tightened in the same manner, and it will be found that the appliance grasps the head in the firmest possible manner, and the calvarium can then be sawn evenly through with the greatest rapidity.

The advantages of such an appliance must be apparent, and since I have introduced it in the medical school I am attached to it has given the greatest satisfaction. I subjoin a letter I have just received from Surgeon-Major Boileau, of Netley, regarding its merits:—

"Royal Victoria Hospital, Netley,
"March 10th, 1879.

"MY DEAR SIR,—We have found the instrument you sent for trial in our mortuary to be one of great practical utility; in fact, we have found it so very convenient that we now look on it as indispensable. The anterior and posterior screws were too short; longer ones have been substituted, and the instrument now fulfils all its requirements. "Yours faithfully,

"J. P. H. BOILEAU, M.D.,
"Assistant Professor of Pathology,
"Army Medical School, Netley."

I may mention that the cranium holder was made after my direction by Messrs. McAdams and Corcoran, 22 Bachelors' Walk, Dublin. The cost of it is from 15s. to 17s. 6d., and the above firm will be glad to supply any institution with the appliance.

## PUERPERAL FEVER AND PUERPERAL SCARLATINA.

By DR. G. DE GORREQUER GRIFFITH,
Senior Physician to the Hospital for Women and Children; Consulting Physician-Accoucheur to St. Saviour's Maternity.

WHEN I had written the paper on the above subject, published in your journal of January 29, 1879, I sent it to Dr. John Harley, knowing how much interest he has taken, and continues to take, in this matter, and from him I received the following letter, which, with his permission, I send you:—"I think your difficulty arises from a too exclusive view of the origin of scarlatina—'a fever contracted by one person from another affected with it, or from something belonging to the infected, and become tainted with the virus, and capable thereby of propagating it'! I have been taught by experience to regard scarlatina as more usually produced autogenetically—a development of the poison *de novo* in the bodies of one or more simultaneously, or nearly so, rather than in the mode you state in your paper. I believe that putrid matter in the uterus, or the introduction of septic poison by a puncture, will produce scarlatina in perfection. I endorse most heartily your advocacy of keeping the parturient uterus clean. This is the one means in our power to prevent toxæmia in the patient.

"From your standpoint your paper is a very good argument, and you will leave to others the onus of proving an agreement, or distinction, between 'bastard scarlatina' and the 'true scarlatina.' I had rather you had argued the other way, which implies the frequent origin of scarlatina poison *de novo*.

"Very truly yours,
"JOHN HARLEY."

I would add, that some time ago I published in the *British Medical Journal* a letter in which I upheld the view that scarlatina and typhoid may arise from the same poison, and from it originate *de novo* in the one group of individuals, the juvenile members being affected with what we have come to be in the habit of calling scarlet fever, the senior with what we term typhoid. In this particular instance to which I refer there were scarlatina among the little ones, and typhoid among the elder members of the same household; indeed, even the family considered the two affections to have been contracted in the same way, viz., from inhaling the foulness of putrescent matter.

We know how, as in this household, the younger and elder members of other families are seized in the same way, viz., the former with scarlatina, the latter with typhoid, both being affected at the same time; and we know that in the cycle of age, as influencing the development of disease, scarlet fever symptoms show themselves in child-life most frequently, typhoid usually in more advanced periods. Moreover, we know, also, that milk or cream, polluted with certain germs, will in some induce scarlet, in others typhoid.

I was mooting this subject in a private circle of medical men, when one gentleman said: "Curiously enough, I know two cases in point which bear you out. A patient with scarlatina and another with typhoid died; the intestines were given to an eminent pathologist, who pronounced from his post-mortem examination that one had died from one fever, and another from the other, *exactly reversing the cases;* that is, the patient who, during life, had shown the scarlatina symptoms was pronounced to have died from typhoid, while the typhoid was stated to have succumbed to scarlet fever,"

This very emphatically endorses the views of Dr. John Harley, and very materially corroborates the opinions I have advanced in my paper, as well as on a former occasion before the Obstetrical Society during its great debate on puerperal fever.

In a subsequent paper I hope to adduce facts which prove—or go far to do so—the unity of the poison of scarlet fever, typhoid, puerperal, and erysipelas—a *unity* of the poison, differentiation of symptoms, or phenomena resulting from the action of the poison.

## ADENOID TUMOURS OF THE NASO-PHARYNX; THEIR INFLUENCE ON RESPIRATION AND PHONATION; THEIR TREATMENT.

By Dr. B. LÖWENBERG, Paris.
Translated from the French by H. Macnaughton Jones, M.D., F.R.C.S.I. & Ed., Professor in the Queen's University, Ireland, &c.

The pathology of the nose, the naso-pharynx (*a*) and the Eustachian tubes, has lately been elucidated since the rhinoscope has exposed these parts, formerly concealed from view. Hand in hand with this rapid progress, important results have been obtained, in the treatment of these regions, so essential to respiration, phonation, and hearing.

One of the first results, which this (rhinoscopic) method has yielded in the hands of its discoverer, the eminent physiologist, Czermack, was the recognition of a particular group of tumours, situated in the naso-pharynx, and interfering, in the most serious fashion, with the functions of this region, and also those of the middle ear and nasal fossa.

Many authors, following in the footsteps of Czermack, have made a series of observations on the subject, of which we now treat.

Thanks to rhinoscopic examination, which we have for some time applied in the study of the pharyngeal complications of certain aural affections, we, amongst other foremost workers, have been able to add some facts to those already ascertained, not alone with reference to the method of examination itself, and its unquestionable usefulness, but also to a more intimate knowledge of the affection which we are now discussing.

Our first observations have furnished the material for a treatise published in 1865, in the second number of the eleventh volume of the *Archives d'Otologie*, bearing the following title: "Sur l'utilisation de la Rhinoscopie et d'une nouvelle douche naso-pharyngienne, pour le diagnosti cet le traitement des affections de l'oreille et de la cavité pharyngo-nasale." See the *résumé* in various journals—the *Union Médicale* and the *Bulletin Général de Thérapeutique*.

Adenoid tumours of the naso-pharynx are peculiar to childhood and youth; having attained a certain degree of development they give the patient a characteristic look, a type of countenance, familiar to every one, the etiology of which is generally misunderstood, as we shall explain further on. By their size, obstructing the naso-pharynx, these tumours render respiration by the nose impossible, obliging the patient to keep the mouth open day and night, and thus giving to the face an expression of characteristic stupidity. In many cases the pronunciation is imperfect from the same cause. Usually the ear is also affected, and the hearing diminished, often to an extreme degree. Besides that, in many cases, the general health is finally implicated, unless we interfere sufficiently early to arrest the cause of the mischief, and prevent its disastrous results.

While considering on the one hand the serious consequences of this affection, and, on the other, the complete success with which we can combat it, we believe it to be our duty to call general attention to it, the more so, that it is frequently met with, and that, notwithstanding the striking group of symptoms caused by the presence of pharyngeal adenoid tumours, the real sources of the mischief are generally sought elsewhere, to the great detriment of the patient, as we have frequently found.

We will commence our description, with an historical sketch, of our experience on this subject.

### History.

Adenoid tumours of the naso-pharynx were recognised by Czermack, during his first trials of rhinoscopy, in a case described in pages 41 and following, of his book. (*a*)

The case which he records may be thus epitomised:—In performing catheterisation of the Eustachian tube for a case of bilateral otorrhœa, Czermack experienced great difficulty, each time he attempted to insufflate air into the cavity of the left side, though he succeeded easily on the right.

He found with the rhinoscopic mirror that the sound passed well into the entrance to the right tube, but he could not follow it to the corresponding position on the left side. "There were here," he said, "two pathological swellings of mucous membrane, growing in front of and above the pharyngo-palatine arch, which extended close to the opening of the right Eustachian tube.

"These tumours, of which one portion took the form of a cockscomb, while the base was formed by the lateral wall of the pharynx, were enclosed between its posterior wall and the soft palate, which compressed them superiorly and a little to the right."

Since Czermack, Türck and M. Semeleder have observed tumours of various forms, equally having their seat in the naso-pharynx.

Our treatise already mentioned, published in 1865, contains a portion of the results of our researches. Amongst others there are five cases recorded, which we treated in Paris between 1863 and 1865. As the title of the memoir implies, we then noticed these tumours more particularly with reference to their action on the ear, and evidences of our desire to regard them thus may be continually found throughout our remarks. The chapter on "The results of chronic pharyngitis" contains these five cases.

Here is one which will serve as a typical example:—

Case I.—M. L. B., æt. 5 (in 1864), very lymphatic, and a large child for her age, has been affected for some time with chronic catarrhal inflammation of the nose, naso-pharynx, and middle ear, and there is on both sides considerable deafness, with very troublesome tinnitus. Nasal respiration is impeded, the mouth is constantly open, salivation is abundant, pronunciation defective, particularly for the consonants *m* and *n*, which the patient replaces by *b* and *d*. There is frequent and prolonged neuralgia of the head.

Besides the characteristic symptoms, of catarrh of the nasal fossa, and tympanic cavities, the most striking facts are brought to light, by the otoscopic and pharyngoscopic examination of the patient; both membrana tympani are extremely thin, and very concave. On both sides the handle of the malleus can be seen, and from the transparency of the membrane, the inferior process of the incus; while their inferior extremities appear to be confounded with a large yellowish mass with diffused edges.

The watch is heard on the right at 2 centimetres, on the left at 2½ centimetres (a normal ear hears it 60 centimetres). The ticking is heard better on contact with the bones of the skull.

The posterior wall of the pharynx is covered with granulations. The rhinoscopic examination immediately discloses the existence of a very singular tumour, of a pale rose colour, with a circumference of 25 millimetres, and 12 millimetres long. Its inferior extremity is lobed and shaped like a cockscomb. It is inserted above the

(*a*) We shall apply the term naso-pharynx to that portion of this organ, which is above the soft palate, assuming that it is raised horizontally; the buccal pharynx commences according to us beneath this septum and extends below to the laryngeal pharynx.

(*a*) "Du Laryngoscope," &c.

posterior openings of the nasal fossa, of which it conceals the superior portion, but, in reality, there is no relation between it and these two cavities. These, in so far as they are visible to the rhinoscopic mirror, are seen to be entirely filled by large sized horny growths, and covered with extremely hard masses of secretion.

It is impossible to recognise the faucial end of the right Eustachian tube, or its opening; we were obliged to repeat the examination, so difficult was it to explore this region, in consequence of the elevations and depressions alternating with each other. However, catheterisation and the method of Politzer succeeded perfectly, although with difficulty; therefore the channel exists, and is permeable. The sound is passed without difficulty on the left side, with the aid of the rhinoscope, the beak of the sound can be seen to enter the orifice, though not on the right.

The preceding description is borrowed chiefly from our treatise—it contains also some details which we have noticed since its publication; we shall now complete the case, briefly relating its termination, and showing the method we adopted, to obtain the complete cure of the troubles caused by the affection, whether at the seat of the disease or in the approximate organs.

Some time after the publication of this paper, while we were examining the inferior portion of the buccal pharynx, the patient raised the soft palate in an unusual manner and we saw a very resisting mass, of the size of a franc piece, projecting to the middle of the posterior wall of the naso-buccal pharynx. There was no trace of inflammation. The sudden appearance of this tumour rather disconcerted us, and we considered it necessary to confirm our diagnosis, and therefore submitted the case for the opinion of our regretted master and friend, Adolphe Richard, who pronounced favourably on the case.

The patient was treated with gargles and naso-pharyngeal injections containing alum. Besides that, we used the catheter, with injections of astringent solutions into the Eustachian tubes and tympanic cavities; a tonic *régime*, sea baths, sulphurous waters, &c. This treatment continued for some time to keep the general health and hearing in a comparatively satisfactory condition; but we could not obtain a complete cure. More energetic treatment then became necessary, this appeared the more requisite as a most serious train of accidents ensued; there was first acute otitis media of the left side, resulting in perforation of the membrana tympani and a purulent discharge. The usual treatment soon led to cicatrisation of the perforation, and cessation of the discharge. Subsequently, during a prolonged cessation of all treatment, an abscess in the interior of the left mastoid process supervened, with its truly alarming train of symptoms; it became necessary to perforate the bone to give exit to a quantity of extremely fœtid pus, &c. After the cure of this incidental affection, the urgent necessity of attacking the root of the mischief became evident. With the aid of a forceps we proceeded to remove the cockscomb tumour, and we succeeded in dispersing the excrescences of the pharynx, the projecting mass, and the other throat granulations, by repeated cauterisations. Since then, not alone has the hearing been perfect, but, as it appears to us from comparative trials, frequently repeated, surpasses even average acuteness. Further, the impediment to nasal respiration being finally removed, all the secondary troubles caused by the suppression of this physiological act have slowly, but completely, disappeared. It required, however, assiduous attention to conquer the tendency to keep the mouth permanently open, and a course of real phonetic gymnastics, to obviate the objectionable pronunciation of the patient.

The consideration of this history proves, that the train of symptoms, that we have briefly related, represents a typical case of adenoid growth in the naso-pharynx, and their consequences, with this restriction, that the otitis media caused by these tumours only occasionally implicates the mastoid process in such cases.

The other notices of cases of adenoid tumours contained in our treatise of 1865 will be, in part, duly noticed in this work; they have been recorded with a special view to their importance in relation to the middle ear.

Those which only have reference to the interference of these tumours with special operative manipulations, especially catheterisation of the Eustachian tubes, will be omitted for the sake of brevity.

The large number of cases which we have been enabled to observe since then, will be utilised for the description of the affection, for its diagnosis, and the method of treatment. We are also indebted to an excellent work by Dr. Meyer, of Copenhagen (see his treatise in the *Archives d'Otologie*, from 1873 to 1874). (*a*)

Our Danish colleague has observed 175 cases of these vegetations situate in the naso-pharynx, of which 130 were complicated with aural affections.

## Anatomy.

*Histology.*—M. His describes "adenoid" and M. Kölliker "cytogene" as a tissue resembling that of the lymphatic ganglions; it is a reticulum of fine and transparent fibrils, which form a network filled with very numerous lymphatic cellules (the same collection of elements which constitute mucous follicles). The growths we are describing are equally composed of this tissue, and contain an enormous quantity of blood-vessels. The roof of the pharynx and the contiguous portion of the posterior wall, are the favourite seat of these hyperplastic productions. Here they attain their greatest degree of development. The lateral walls of the naso-pharynx are less frequently subject to this affection, and when they are situated here, the growths are generally flatter and less exuberant than in the neighbourhood of the roof of the pharynx.

The tumours which we have extirpated have been submitted to a careful microscopical examination; we made fine sections according to the method we employed in our researches on the cochlea (see *Gazette Hebdomadaire*, 1864, pp. 694, 697; *Journal de l'Anatomie et de la Physiologie*, 1866, pp. 605, 651, and 1868, pp. 626, 657; and our Inaugural Thesis, Paris, 1866). All these tumours are found covered with a layer of epithelium, of which the superficial cellules are cylindrical and generally vibratile. The substance of the tumours is composed of adenoid tissue, of which the trabecules only become visible after we have removed with the forceps the numerous lymphatic cellules which fill the network. The drawing in the excellent work of MM. Cornill and Ranvier (*b*) gives an idea of the structure of these tumours.

Adenoid tissue, rich in follicles, is found abundantly distributed, in the normal condition, in the mucous membrane of the naso-pharynx, particularly the portion bordering on the entrance to the Eustachian tubes, and in the fossa of Rosenmüller, still more abundantly at the roof of the pharynx and the contiguous portion of the posterior wall; it forms here, from the entrance of one Eustachian tube to that of the other, a bed of variable depth and consistency (to as much as 8 millimetres in thickness) which may be regarded as a special organ, and has been called the "*pharyngeal tonsil.*" (*c*)

The first mention of this organ is made by Lacauchie. (*d*)

"The glands of the pharynx," he said, "form, at the superior portion of this organ, a kind of secreting sponge, &c."

As the latest researches have proved, this mass adheres intimately to the fibro-cartilage which attaches the pharynx to the base of the cranium, it is blended on the opposite side insensibly into the pharyngeal mucous membrane.

# Clinical Records.

## THE UNION INFIRMARY, TOXTETH PARK, LIVERPOOL.

1. *Retro-Uterine Hæmatocele.* 2. *Endocervicitis and Amenorrhœa.* 3. *Stricture treated by Maissonneuve's Operation.*

Under the Care of Dr. LYSTER.

Reported by Mr CHARLES WOODS, Resident Medical Officer.

1. E. M., æt. 26, charwoman, admitted into hospital May 9, 1878, suffering from melæna, great pain in the left inguinal region, and presenting the general symptoms of collapse.

*History*—In March, about three days before she expected her next menstrual period, she strained herself, felt very faint, and suffered great pain in her abdomen. A few days afterwards, bleeding commenced from the bowel during defæcation, and continued until her admission. She had sought medical advice outside, but was treated without examination for bleeding piles. On examination per rectum, a large, firm, globular tumour was felt filling the posterior cul-de-sac. The same tumour was felt per vaginam. When the uterine sound was passed, and the uterus straightened, which proved to be slightly retroflected, the tumour was still felt. The cervix uteri, which was swollen, red, and elongated, was punctured, and relieved of a couple of ounces of blood. Astringents were administered, large linseed poultice applied externally, and perfect rest enforced. The hæmorrhage ceased, and the tumour disappeared gradually. The interior of the uterus, which was in an unhealthy state, was exposed and cauterised with nitric acid. The patient experienced much relief, and was discharged well July 30.

2. C. Q., æt. 22, came under notice suffering from great pain over the left eye and temple, loss of appetite and debility.

*History.*—The catamenia commenced at the age of 13, and were regular till twelve months ago, when they ceased. Every kind of medical treatment was tried without avail, whilst the patient was suffering great pain, and becoming thin and anæmic.

On examination per vaginam, the cervix uteri was found thickened, elongated, and very tender to the touch, and from the os uteri was hanging a thick, gelatinous secretion. As a primary measure the cervix was punctured and relieved of a few ounces of blood, and a glycerine pad placed against the os uteri. Relief was obtained, but the pain and discomfort returning, it was thought advisable to dilate the cervix with sea-tangle, and cauterise the interior of the uterus with carbolic acid. Glycerine pads were applied to the uterus till the sloughs separated. The pains ceased, the appetite returned, and the patient was discharged from the hospital; but the catamenia not returning, the patient again applied for admission. A galvanic pessary was introduced which brought on the catamenia in a week: menstruation was again deficient, but the introduction of the galvanic pessary was again sufficient to produce them, and since then the patient has been in good health, and menstruates freely.

3. D. W., æt. 55, labourer, was admitted into the Toxteth Park Workhouse Hospital, Dec. 16, 1878, suffering from constant desire to pass water, shooting pains in the perineum, and great uneasiness in the loins. He had been suffering from symptoms for six years, but neglecting them, he at last found himself unable to pass the slightest quantity of urine. He was ordered a warm bath, and a hypodermic injection of morphia. This gave relief, and the patient passed some urine. Examining the urethra with a No. 1 catheter, a tight stricture near the orifice was passed, but the instrument failed to pass a stricture a little further down the urethra. As the patient was suffering from phymosis, which interfered with the necessary manipulations, he was circumcised.

On Dec. 31, the finest filiform bougie, attached to a Maissonneuve's instrument, was passed through into the bladder and screwed on to the steel director, and the operation performed in the usual manner. The patient felt a general relief such as he had never experienced for the last six years, and declared himself free from all irritability of bladder.

Since the operation, there has not been the slightest sign of urethral fever, nor did any bad symptom occur. He now passes a full-sized bougie daily, and there does not appear to be any tendency on the part of the stricture to recontract.

# Transactions of Societies.

## CLINICAL SOCIETY OF LONDON.

FRIDAY, MARCH 28TH.

Dr. GREENHOW, President, in the Chair.

Mr. BARKER exhibited

A PATIENT SUFFERING FROM ICHTHYOSIS OF THE TONGUE.

Mr. CHRISTOPHER HEATH

ON A CASE OF A SILVER CATHETER BROKEN INTO THE BLADDER.

The patient, æt. 71, with an enlarged prostate, who had been in the habit of using a catheter, on August 2nd employed an old silver one, which had been broken, and roughly soldered, and in withdrawing it, left the end behind. He at once came to the hospital, and Mr. Heath saw him soon after; and with a lithotrite, caught and brought away the extreme end of the catheter, including the eye. The following day, Mr. Coxeter, the instrument maker, being clear that there was still a missing piece, Mr. Heath again introduced the lithotrite, and grasped the fragment, but was unable to withdraw it. On a subsequent occasion, Mr. Heath tried to break up the fragment with a more powerful lithotrite; but failing in this, on August 7th performed median lithotomy, and removed the fragment, which measured 1⅜ inches, and weighed 25 grs. The patient made a slow recovery, the enlarged prostate giving a good deal of trouble, and was discharged September 27th, well.

Mr. TEEVAN observed that he had himself performed a similar operation, and called it median lithotomy, as Mr. Heath had done. Inasmuch, however, as in the operation for removal of a broken catheter, the neck of the bladder was neither cut nor torn, it would be much better if surgeons were to call it external urethrotomy, which it really was, and not median lithotomy. The operation was usually a most successful one, simply because it was *extra-pelvic*, and hence attended with little risk. Lithotomy, on the other hand, was an *intra-pelvic* operation, and consequently more dangerous.

Mr. BRYANT remarked on the interest of Mr. Heath's case, and the fact that the different lines of treatment that may be followed are not sufficiently clearly recognised. No doubt the lithotrite was the best instrument to begin with; and on failure of this means, external urethrotomy should be performed. In his own practice, a small gutta-percha catheter had once broken in the urethra. Here there was no alternative, and he therefore proceeded to perform external urethrotomy, and to remove the fragment. He was not aware of the record of any case similar to Mr. Heath's, where a silver catheter had broken in this way.

Mr. KEETLEY

ON A CASE OF SEVERE TRAUMATIC MENINGITIS TREATED IN THE STAGE OF COMA BY COLD DOUCHE FOR TWO HOURS AND A HALF.

The patient was a groom, æt. 30, who was thrown from his horse into a ditch, alighting on his head. There had been a short period of insensibility, but on admission to the hospital he was conscious and irritable. The accident had happened at 5 p.m., and at 6 the next day, having passed a quiet night, he was seized with a convulsive attack, confined to the left side. During the day he had several similar seizures, in which his eyes were strongly turned to the left; in the inter-

vals he vomited occasionally. On the third day he remained in much the same condition; but on the fourth, the right side was affected; and after the attack this side was found to be paralysed. Towards evening he improved considerably; and on the following day it was noted that his face was heavy, his pupils contracted, and he resembled a patient suffering from opium poisoning; the temperature was 100 deg. On the sixth day the coma was increased; temp. 100 deg., pulse 120; the cold douche was applied to the head for two hours and a half; the temp. was 99 deg., pulse 70; his face rather blue; he could answer questions, but had a fatuous expression, and his answers were often childish. After this time he steadily improved, and ultimately recovered. A fracture of the posterior fossa was diagnosed, extending to the base of the skull; the severity of the injury, and the severity of the meningitis, appearing to point to such a condition. The epileptic seizures at first appeared to point to an injury of the dura mater, over the seat of violence; and the later attacks on the opposite side, to an extension of the inflammation to the meninges of the other hemisphere. There was no difficulty in regulating the time during which the application of the douche was beneficial. The blueness of the lips was only noticed after more than two hours of this course of treatment. It should be added that he had previously been treated by an ice-bag to the head, and the administration of aperients.

Dr. STURGES had lately seen a case which presented many features of resemblance to Mr. Keetley's. An elderly woman had fallen on her head down a flight of stairs. On admission she could hardly be called semi-comatose. In two or three days she had convulsions of the left side, with a rapid rise of temperature to 106 deg., followed by an equally rapid fall. Afterwards the convulsions passed over to the right side. Eventually, after fifty or sixty fits, the patient began to recover, and gradually got well. A fracture of the base was diagnosed, and a meningitis, affecting first one side and then the opposite.

Mr. GODLEE asked why an ice-bag had not been used, instead of the cold douche. He had seen a somewhat similar case, where, after using the ice-bag for two days, the fits subsided. In another, where the convulsion had passed from one side over to the other, arachnoid hæmorrhage had been present, but no meningitis.

MR. TEEVAN

ON A CASE OF CYSTOTOMY.

The patient, who was exhibited, was a wine cooper, æt. 43, who came under his care in July, 1875, having a stone in the bladder two inches by one and three-quarters. The urine was a mass of muco-pus streaked with blood; no renal elements could be found. He suffered much pain, and could not work. Mr. Teevan determined to crush the stone, because he had, by lithotrity, completely cured a similar case, where the stone was only one-quarter of an inch smaller, and he wanted to find out the extreme limit to which the operation could be advantageously pushed. Accordingly, in twenty-six sittings, of about one minute each, he completely removed all the stone. The patient was, however, not cured, but only relieved. The pain he suffered incapacitated him from work, and the urine contained much muco-pus. For many months various medicines and injections were tried, without success. Under these circumstances he determined to perform cystotomy. The bladder was carefully examined by many surgeon, but not a particle of stone could be discovered. On Sept. 17, 1876, Mr. Teevan opened the bladder by a median incision from the perinæum, incising the neck vertically with a probe-pointed knife to the depth of about half-an-inch. The immediate effect of the operation was that the patient was relieved of his pain, and his urine began to clear about ten days afterwards. Three weeks after the operation the patient was apparently cured of his cystitis. The wound, which had been kept well open, was then allowed to close, and three weeks later the patient was perfectly well and water-tight. He remained perfectly well, and continued uninterruptedly at work ever since. Cystotomy was rarely performed in England, and was only mentioned in a few surgical works of modern date. In America, however, it had been established as a set operation since 1850, when Willard Parker, of New York, introduced it. The propositions he would lay down were—1. That cystotomy was indicated in those cases of obstinate cystitis, which resisted ordinary treatment. 2. That renal disease was no bar to the operation. 3. That the general conditions of the patient rather than the results of an examination of the urine, ought to determine whether, in a given case, an operation were justifiable or not.

Mr. MARSH asked if this case could not have been better treated by lithotomy from the first.

Mr. BRYANT quite agreed as to the advisability of cystotomy for chronic cystitis. He had done five or six cases, of which three recovered; the others eventually died of the disease which led to the cystitis; but he differed from Mr. Teevan in being disinclined to touch cases where there was evidence of renal disease, and mentioned a case of stricture which had lately been under his care, where he refused to do perineal section in consequence of the presence of nephritis, and where shortly after considerable relief had been obtained by catheterism. The patient died uræmic.

Mr. HEATH inquired whether the whole prostate had been divided along the floor. Surely such a treatment must interfere with the ejaculatory ducts. He was also desirous to hear the experience of Mr. Teevan and Mr. Bryant with regard to the amount of hæmorrhage met with in these elderly men with enlarged prostates where a free incision was made.

Mr. TEEVAN replied that if he had the time over again he would not have done lithotrity pure and simple in this case, but having performed a perfect lithotrity at one sitting, would have immediately done external urethrotomy, so as to have got rid of all the fragments at once. He did not, however, think the combination suitable for very large calculi, but for those only which were just outside the pale of lithotrity. In answer to Mr. Bryant he said that he thought it better to operate in cases where there was renal disease, and so afford patients a chance of recovery rather than leave them to die a miserable death. He had known cases in which there was renal disease do well after operation, and the experience of Mastin on diabetic patients was most encouraging to the surgeon. In reply to Mr. Heath he stated that he thought a medio-lateral operation would be preferable in old men, although he thought median lithotomy unjustifiable in boys on account of the risk of emasculating them. He considered the objection sank into insignificance in the case of middle-aged adults.

Mr. BARKER

ON A CASE OF EXCISION OF THE TONGUE IN WHICH A PRELIMINARY TRACHEOTOMY HAD BEEN PERFORMED.

After giving a short history of the treatment of such cases by an immediate tracheotomy to avoid the risk of the passage of blood down the trachea, he alluded to two cases in which, to his own knowledge, this source of danger had proved fatal; but he added that in the case brought forward that night the tracheal wound had been purposely kept open in order to avoid, as far as possible, the risk of the inhalation of septic matters into the lung during the earlier part of the after-treatment. This was a real danger, for he had seen such operations followed by death, the result of septic pneumonia, or even gangrene of the lung. The patient was a man, æt. 49, who was admitted to University College Hospital in April, 1877, suffering from an epithelioma of one side of the tongue, and some glandular enlargement below the jaw. Tracheotomy was performed with unusual ease, a small circle of the trachea excised, and Trendelenburg's tampon tube introduced and inflated. Considerable dyspnœa resulted at first, which however soon passed off. Syme's operation for the removal of the tongue was then performed, the jaw and lip divided in the middle line, and first one half of the tongue cut through, and the vessels secured, and then the other. On the next day the tracheal tube was removed, the nostrils stopped with wool, a tube introduced into the mouth, and connected by an elastic pipe with a reservoir under the bed, while the mouth was otherwise closed by a pad. The patient was allowed to breathe through the tracheal wound. In five days the plugs were removed from the nostrils, and in a few days more the mouth was freed from the tube. The after history presented few unusual features. There was on two occasions some oozing, requiring the application of perchloride of iron; and there was once a rise of temperature to 103°. This, and probably the oozing, depended on an alveolar abscess, which was relieved by the extraction of some loose teeth. The convalescence was rendered rather tedious by the exfoliation of two pieces of bone from the cut surfaces of the jaw, but the patient is alive, and in fairly good health at the present time.

Mr. MARSH thought the subject one of great importance. He had lately removed one-third of the tongue in a case of epithelioma, and the gentleman died in a few days of septic

pneumonia, and to obviate this danger Mr. Barker's suggestion was valuable. For the better management of hæmorrhage he did not think it would be generally necessary to open the trachea. He had seen many such operations, but in none had the hæmorrhage been alarming. The method of cutting one half of the tongue, and then the other, did not appear to him as good a practice as to split the tongue longitudinally, and to remove each half with a whip-cord écraseur. He believed that when the jaw was divided in the middle line it seldom united well, and necrosis of small portions was common.

Mr. BRYANT said no doubt the subject was an interesting one, but after a considerable experience in excision of the tongue, he was not prepared to adopt Mr. Barker's method of operating. Serious hæmorrhage after use of the écraseur was rare, and generally the fault of the surgeon. He was also inclined to doubt the reality of the evil effects following the inhalation of air which had passed over the sloughs in the mouth; and they could be greatly obviated by keeping the mouth clean. He also wished to learn whether the opening in the neck was large enough for the whole of the inspired air. In conclusion, he was still of opinion that the ordinary method of treatment was sufficient. Generally it would be better to operate below the jaw rather than to divide it.

Mr. BARKER replied that he had carefully tested the sufficiency of the hole in the trachea; that his cases of abscess of the lung had been very striking, and to his mind, conclusive; and that he knew of two cases at least which had ended fatally by the passage of blood into the trachea.

The meeting then adjourned.

## THE COUNTY INFIRMARIES OF IRELAND.

As it is expected that legislation in some form, probably connected with the proposed Grand Jury Bill, may affect the interests of the County Infirmaries and their officers, Dr. Brunker, the Honorary Secretary of the Association of Infirmary and Gaol Surgeons, has called the attention of Members of Parliament to the subject by the following statement:—

These Infirmaries have been in existence since 1765 under several Acts of Parliament—5 and 6 Geo. III., ch. 20—7 and 8 Geo. III.—54 Geo. III., ch. 62—58 Geo. III., ch. 47—3 and 4 Wm. IV., ch. 92—6 and 7 Wm. IV.. ch. 116—the Grand Jury Act—and do now, and have ever since their first institution, continued to enjoy the confidence of the sick and wounded poor, their governors and the public, and have *uninterruptedly* received support from county grants (in some counties to the full amount authorised by Act of Parliament, namely, £1,400 a year), and have been largely endowed by the donations of the resident land proprietors, &c. (from which latter funds the present buildings have been erected), the county grants being exclusively expended in the support of the patients and maintena ce of the buildings, &c.

Very few of the original buildings are now in existence: most of them have been replaced by others of superior description as to size and internal arrangements, the actual cost of which cannot now in all cases be ascertained, but at least £90,000 have been expended on these buildings.

In some counties the lands on which the buildings have been erected were granted *for ever* by the proprietors for that purpose; and in some cases a clause was inserted in the leases, providing that, should the buildings at any time *cease* to be used as *County Infirmaries*, they should at once revert to the landlords, and thus cannot be made available for any other purpose by the public.

The Carlow, Down, Louth, Queen's County, and Kildare Infirmaries are instances of this provision.

These hospitals have been willingly had recourse to by a class of persons, when labouring under severe illness or accidents, who are above the rank of the mere pauper, viz., artizans, small farmers, shop-keepers, domestic servants, and even decayed gentlemen, who, it is believed, could never be induced to enter a poor-house hospital, and who could not be satisfactorily treated in their own houses; and it is considered that a wise legislature should encourage this spirit of independence, and not deprive them of a system of hospital relief appreciated for generations.

Pay patients are frequently admitted.

These hospitals have been schools for the preliminary education of young men, are recognised as such by the Royal College of Surgeons in Ireland, and afford abundant opportunity of acquiring a sound practical knowledge of their profession; and very many men now holding important appointments in the public service and in private practice commenced their education therein. In this respect the general public has derived much benefit. In them all the most serious surgical operations have been from time to time, and are still, constantly performed.

It has been ascertained that the cost of their maintenance does not exceed ¼d. per acre each.

During many years, unmistakeable expressions of opinion as to the value of these institutions and undesirableness of even endangering their existence, have proceeded from several grand juries, governors, guardians of the poor, and the public, and numerous petitions have been presented to Parliament in their favour.

The choice of places in which the infirmaries were directed to be established by 7 and 8 Geo. III., was derived from the fact, "that they would be convenient to the *best inhabited* parts of the country."

The repeated rumours of threatened abolition or change have had the effect of deterring benevolent persons from bestowing donations, or subscribing.

The Poor-law Commissioners themselves, in their Second Report, 1854, page 7, say: "These instituutions have been generally well conducted in a professional point of view, and have afforded within the circles over which their utility effectively extends, the greatest and most unquestionable benefits to the sick poor; at the same time, by the influence they have exercised, in maintaining the high standard of medical and surgical skill, for which many of the physicians and surgeons of the provincial hospitals of Ireland have long been distinguished, they have indirectly conferred corresponding benefits upon every class of the community." And yet, in the same Report, page 14, they avow their intention that all support from county cess should cease.

It is believed that the removal of such a stimulus to exertion, as the possession of the appointment of surgeons to a County Infirmary has hitherto been, cannot fail to result in an inferior class of young men entering the profession.

The extension of the dispensary system throughout Ireland has served only to weed a small percentage of chronic cases from the wards of the infirmaries.

It would be impossible to carry out any change for the non-destitute buildings without considerable outlay for the necessary buildings. Union amalgamation was under deliberation. If adopted, the result will place the remaining unions in a very similar position, as regards distance and inconvenience to the sick poor, as might be represented against the infirmaries.

It is therefore suggested that all desired advantages might be attained by permitting the infirmaries to continue as county institutions, supported, as heretofore, for the reception of the acute and serious cases of their districts, modified as may be deemed necessary and prudent. It is also suggested that a subscription of one guinea annually might be legalised, as is the case in the County of Dublin, Cashel, and Queen's County.

The area affording relief is not confined to the county, as

has been stated. Many serious cases requiring immediate attention are from time to time admitted from adjoining counties.

In any future legislation affecting the infirmaries, it would be but just that retiring allowance should be granted to all their officers, as in the case of those connected with the gaols, poor houses, dispensaries, and other branches of the public service. In the case of the Mallow Infirmary, which was closed on the removal of the County Infirmary to Cork, by the 24 and 25 of Victoria, ch. 29, clause 3, the salary of the surgeon of the former was continued to him for life.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, APRIL 2, 1879.

## HOSPITAL REFORM.

RECENTLY a private meeting of Members of Parliament, treasurers, &c., of the principal London Hospitals was held at the residence of Sir. T. Fowell Buxton, "to discuss the present position of hospital and medical charities," and other questions, to which we referred in our last issue. Judging from the speeches of some of the gentlemen present the chief grounds of complaint against the present system appeared to be the old out-patient grievance, the abuse of hospitals by persons who could well afford to pay for medical advice, and the number of patients who applied for relief in comparison with the little time and attention that could be given to them. So far, the profession will not regard these statements as unfounded, but when it is suggested that there should be one central board for all the hospitals in London, or that they should be placed under some form of Government control, we doubt whether Sir T. F. Buxton and his friends will find much support from any party interested in maintaining our great medical charities. It was moved by this gentleman that the present system of medical relief in London is inadequate and unsatisfactory, and that Government be requested to appoint a Royal Commission to investigate and report on the subject. Mr. Stansfeld, however, said they could scarcely go to the Home Secretary until they had agreed on what remedies they would recommend; and Mr. W. E. Foster very wisely suggested an amendment to the effect that a committee be appointed to collect and digest information, and to prepare a statement with a view to future action. This amendment was agreed to, and there for the present the matter rests.

There is no class of people who will be more ready to court inquiry into the subject than the medical profession, for they are quite sensible of, and have often themselves reason to regret, the grievances and abuses complained of. The medical and surgical staffs attached to our hospitals, the great body of general practitioners, medical students, and the public at large, all suffer in some way or other from the manner in which hospitals are abused. First and foremost is the great question of hospital accommodation, and the mischief arising from the number of special hospitals that have within the last few years sprung up in various parts of the metropolis. It is a remarkable fact that nearly all the hospitals in London gravitate towards the West End of the metropolis, while in the densely populated districts of the East End there is only one large general hospital. So that while, with regard to the western half of London, hospitals do supply the wants of this population, and in excess, in the East End there is decidedly a dearth of these institutions. What is the reason of this? Simply because the great majority of the hospitals established in the West End consist of special hospitals, founded not so much for the benefit of the public as for the aggrandisement of those who have established them. Nothing in fact can better show the *arrière pensée* of the founders of special hospitals than the fact that these hospitals are nearly all to be found in that part of London where its wealthy or well-to-do inhabitants chiefly reside. No doubt in the thickly populated districts comprised in the eastern half of the metropolis there is a large scope for the study of special disease; but as the relief of the poor, or the advancement of medical science is not so much the aim of the founders of these institutions, as the desire to establish among the wealthy classes a lucrative practice, and a reputation for superior knowledge in the treatment of special diseases, we must not be surprised if, to use a vulgar expression, our specialists "fight shy" of such districts as those of Bermondsey or Bethnal Green. The disadvantages arising from the presence of so many special hospitals have been so frequently pointed out by us and our contemporaries that we shall not now again refer to them. We may, however, mention one fact that appeared to have escaped the observation of the several speakers at Sir T. F. Buxton's meeting, namely, that the application for medical relief by people who can well afford to pay receive much more encouragement at these special hospitals than is the case at our general hospitals. The cause of this is obvious from what we have just said on the subject. Perhaps in many cases the medical officers of special institutions have good reason for giving this encouragement. They profit generally by the introductions thereby afforded to

the more wealthy members of the community, but at the same time they, in a great measure, prevent both the medical student and the general practitioner having so many opportunities, as they otherwise would have, of studying several diseases which they are not only sure to meet with in general practice, but also under circumstances in which a consultation with a specialist is difficult or impossible.

With regard to the over-crowded state of the out-patient department, no doubt there is plenty of room for improvement. There must always be, for purposes of medical education, a department of this kind, and a place, moreover, where comparatively, or apparently, slight cases can be attended to as well as those that are more serious; for not only do cases often turn out much worse than they at first appeared to be, but the student must have the opportunity of studying all kinds of diseases, whether severe or not. At the same time we admit that too many persons resort to the out-patient rooms of our general hospitals for "trumpery cases of cold, indigestion, and imaginary ailments," to whom a dispensary or the open surgery of a general practitioner would be better adapted. If, therefore, the authorities at our large general hospitals could find some effectual means of checking this evil, a great point would be gained. The principle of limitation, said Sir C. Trevelyan, has been carried out at St. George's Hospital. They only took there as many cases as could be properly dealt with, and they had three provident dispensaries working in connection with the hospital. No doubt St. George's Hospital is fortunately situated for a trial of this plan, but perhaps it would be as well if some such scheme, especially this system of auxiliary dispensaries, could be likewise carried out at all the other hospitals.

The most objectionable and impracticable suggestion, however, made at this meeting was that of having one central board for all the hospitals of London. Such a plan would do away with the responsibility and liberty of action which should attach to the governors of each hospital, and which impose upon them certain duties that would be very perfunctorily performed if they were all under the control of a central board. Still more open to criticism is the idea of placing hospitals under the control of the State, for if Government took up the matter hospitals would be no longer a charity. The State could only deal with funds already in hand; subscribers would fall off, and these institutions would no longer be maintained by those voluntary contributions and philanthropic principles that have hitherto formed so distinguishing a feature of all Christian communities.

## HEALTH OF THE NAVY.

In a Blue-book of over 500 pages we have a statistical Report of the Health of the Navy for the year 1877. During this period, observes the Inspector-General, the sanitary state of the navy was very satisfactory, and the ratios of cases of disease and injury, of invaliding and of mortality, show a considerable reduction when compared with those of the previous year. The total force in the service afloat in the year 1877 was 44,940, and the total number of cases of disease and injury entered on the sick-list was 50,583, which is in the ratio of 1,128·56 per 1,000 being a decrease compared with the preceding year equal to 72·12 per 1,000. The death-rate for the year from all causes was 7·05 per 1,000, and from disease alone, 4·92 per 1,000, and it is worthy of note that these rates are the lowest that have ever been recorded in the Annual Reports. The lowest sick rate was on the South-east Coast of America Station, and the highest on the China Station. The ratios per 1,000 of men sick daily on these stations were respectively 32·55 and 68·77, as compared with 37·06 on the Home Station. The only stations on which there was a higher death-rate were, the Mediteranean, East Indies, and the China Stations. On the first of these the increase is small and is almost entirely due to a larger number of casualties. The increase on the China Station was due to an exceptional number of cases of deaths from drowning; and on the East India Station to the prevalence of fevers. Cholera appeared in a vessel lying at Bombay, where at the time the disease was epidemic, but it ceased on the ship being moved to another anchorage and the adoption of the usual sanitary measures. There was also a slight outbreak of small-pox in two vessels lying at Sydney. The interest attached to this outbreak is such that we shall again return to the subject. The table given in the report for 1876, showing the extent to which the "Contagious Diseases" prevailed in Her Majesty's ships at five protected ports, and in five unprotected ports, has been brought down to the year 1877, and gives further proof of the benefits resulting from preventive legislation.

With these prefatory facts respecting the general health of the navy we shall now direct our attention to a few diseases to the prevalence of which in this service a peculiar interest is attached. One of these is *enteric fever*, regarding the occurrence and etiology of which in the navy some curiosity may be naturally excited. It appears that only two stations, the South-east Coast of America and the West Coast of Africa, were free from this disease. It is found in the returns of the squadrons on all the other stations, and the total number of cases reported during the year was 54, of which 12 proved fatal. The Home and the Mediterranean Stations show the largest number of cases, as well as the greatest mortality from this form of fever. In many instances its origin could not be exactly determined, but the fact of nearly all the cases occurring while the ships were in port makes it probable that most of the cases were contracted on shore. Indeed, in several instances this was proved to have been the fact. A case on board the *Revenge* was contracted at Queenstown, where, owing to the insanitary condition of the place, there were many sources of infection. Several cases originated at Southsea. Of those occurring on the Mediterranean Station, some were traced to Malta, while one was contracted at Burgas, "where the boat had frequently to wait at the landing-place, and where the smell from the refuse of a slaughter-house close by, and from decaying vegetable matter, was sometimes sickening and overpowering." On the East India Station a case originated in the patient drinking, while on shore, some water which had a very fetid taste. On another occasion, also, the disease was attributed to drinking impure water obtained at Malta. This water, says the medical officer, "was no doubt polluted, as indicated by its unpleasant taste and odour, being amber-coloured and aerated, and when subjected to chemical analysis organic

matter was detected." Again, we read of "a man who contracted the disease on shore at Simon's Bay, where he slept at some ill-drained, badly-ventilated, and foul smelling place, and fell ill a few days after he returned on board." On the other hand, there were some cases which originated on board ship. In a case which occurred on board the *Rapid*, the medical officer was "inclined to attribute" the origin of the illness to the man sleeping under the forecastle exposed to the emanations from the latrines and urinals. In another case, which could not have been contracted on shore, suspicion was thrown on the good sanitary condition of the ships; a careful inquiry was instituted, "and, owing to the construction of the ship's 'heads' or latrines, it was found that a sewer smell was almost constant under the top-gallant forecastle, and this existed notwithstanding the free use of carbolic acid."

Only 17 cases of *small-pox* occurred during the year; but there is an interesting account of the origin and suppression of an outbreak on the Australian Station, which shows that the Australian Colonies narrowly escaped what might have turned out a fearful epidemic of the disease. Two cases occurred on board the *Wolverene* at Sydney. One of these was communicated by a washerwoman who had visited the ship from a place on shore where there was a young woman suffering from malignant small-pox, which in its turn was traced to the steamer *Brisbane*, arrived from China, and on board of which there were several cases of the disease. The existence of small-pox in this steamer was not known to the authorities until the day following her arrival in port, and numbers of people (among whom was the young woman just mentioned) had visited her before she was removed. Previous to this, says Staff-Surgeon W. Reid, no epidemic of small-pox had ever occurred in the Australian colonies. Every exertion was, therefore, made to stamp out the disease, and to avert the calamity of a small-pox epidemic in the Australian colonies. It was feared that should the disease once gain a fair footing it would rage extensively and with great severity, as the people were unprotected by previous epidemics, and it was known that a large proportion of them were not vaccinated. The preventive measures adopted by our naval authorities were as thorough as they were successful. The locality in which the young woman resided was carefully searched, but no other cases were found. The house in which she resided was surrounded by a cordon of police; when the case proved fatal the building and its contents were burnt to the ground; and the other members of the family were placed in quarantine on board a hulk in an unfrequented part of the harbour. We need scarcely say that the usual precautions were taken with regard to the cases which occurred on board the *Wolverene* and *Sappho*.

It is impossible to look over the tables or the pages of this voluminous Report without noticing the great prevalence of *rheumatism* in her Majesty's navy. The total number of cases of this disease was 2,528, giving a ratio of 56·25 per 1,000. The average duration of each case was about fifteen days, and 106 men were on the average daily rendered ineffective by it. This was, of course, to be expected from the wet, cold, and inclemency of the weather to which a sailor's life is necessarily exposed. For the same reason some difference in the relative prevalence of the disease is found at the different stations. Thus, at the Home Station the ratio for 1,000 men was only 46·04; at the Mediterranean Station, 60·41; at the North American and West Indian Station, 71·15, exposure to a moist atmosphere and inclement weather at Bermuda, off Newfoundland, at St. John's, &c., being particularly favourable to attacks of this disease; at the East India Station, 52·50; at the Australian station 59·3 per 1,000, the great and sudden changes of temperature at this station predisposing to the complaint; and of the Irregular Force 62·72, owing to the "exposure to constant change of climate of a large majority of those employed in this force." In speaking of the disease as it prevailed on the Mediterranean Station, the medical officer says that "the ironclads do not compare unfavourably with the wooden ships as respects the prevalence of rheumatism." Among the former the highest ratio was in the *Alexandra*, where it amounted to 98·11 per 1,000, and the lowest in the *Triumph*, where it was only 8· per 1,000. In the wooden ships the highest ratio was 138·46; while from the gun-vessel *Flamingo*, which was for six months on the Mediterranean Station, no case of rheumatism was returned.

*(To be continued.)*

# Notes on Current Topics.

## Dr. Richardson on Modern Quackery.

THE subject of modern quackery, to which we have on several occasions given our attention, was admirably dealt with by Dr. Richardson in his recent address before the Medical Defence Association. He justly observed that the different classes of irregular practitioners must be dealt with in different ways, and that the terrorists, the nostrum-mongers, and the pretenders to special and baseless systems of cure would be best met by a clause in the new Medical Act, which would not only prevent them from assuming false and misleading titles, but also from assuming false medical practice. To two suggestions, however, which he made, some objections may not unreasonably be raised. We quite agree with him that for protection against the "protected" quacks and homicides, the best course was to watch more carefully the proceedings of the coroner's courts, and to provide for a more efficient mode of registration of deaths. But we doubt whether it would be practicable to adopt Mr. Chadwick's recommendations, and make every medical officer of health institute a personal inquiry into every death, and to endorse the certificate of death that is ordinarily given previous to burial. Such a practice would be quite unnecessary in that large number of cases in which the certificate has been signed by a well-known, duly-qualified, and respectable practitioner; it would be throwing a good deal of additional work upon the hands of the medical officer of health; and it would, as a contemporary has remarked, be virtually creating two coroners' courts for every one now existing. It is not so necessary to endorse the certificate of duly-qualified practitioners as to see that no one is buried without a certificate of death, or unless the certificate has been signed by a medical man who is well known to the registrar of deaths, and who is duly qualified to give one.

Still more open to objections was Dr. Richardson's suggestion that "counter-practice" should be legalised by instituting an examination conjointly by the Apothecaries' Company and the Pharmaceutical Society which should qualify the chemist for counter practice as distinct from that of attending to patients at their own houses. This is, indeed, one of the most revolutionary ideas we have heard of for a long time, and we can fancy with what a storm of indignation it would be received by the profession were it seriously intended to carry out such a suggestion. It needs very little reflection to see that such a plan would be neither more nor less than converting half the chemists in the kingdom into general medical practitioners of an inferior grade. Both the profession and patients would be losers by such an arrangement. The profession, generally, would be lowered in the estimation of the public. Every medical man would lose half his patients, who would be flocking to the chemists' shop to get advice and medicine at the rate of 1s. 6d. per bottle; while the patients themselves would suffer by being tempted by the license held by the chemist to put themselves into the hands of a class of practitioners who, whatever might be their other qualifications, would not be competent to undertake the difficult task of diagnosing and treating the insidious approaches of incipient disease. To a certain class of people the well lit-up shop and coloured show-bottles of a chemist have as much attraction as our gin-palaces have for the habitual toper, and although we would not for a moment insinuate that the comparison might go any further, we must say that if to the attractive appearance of a chemist shop was added that of the imposing licence of the Apothecaries' Company, we might expect the greater number of general practitioners to look upon their occupation as having "gone," or to emigrate to some other country where the chemist would not be entrusted with the responsible task of attending to the health of the public.

## The Disqualification of Voters Bill.

We referred, as may be recollected, to Mr. Rathbone's Bill upon this subject at the time that it was introduced, as involving a great hardship upon Poor-law medical officers, inasmuch as it removed one of the discouragements which prevented well-to-do people using pauper medical relief. We suggested that the advice of the Irish Medical Association should be adopted, and that a patient entering a workhouse hospital should be relieved of his disqualification as a voter only upon payment of all his fees and cost of his maintenance. Mr. Rathbone did not accept this suggestion, but went a certain distance with us by restricting the operation of his Bill to in-patients. The Bill having passed the Commons the week before last, came to the Lords for its second reading, which was moved by Lord Aberdare. The Duke of Richmond said that the Bill, though only consisting of one clause of ten lines, was full of anomalies and mistakes. He doubted if this measure would have passed the House of Commons if the President of the Local Government Board had not been seriously indisposed at the time. He could not agree to any infringement of the law which disqualified from voting after receipt [of poor-law relief, whether medical or otherwise. In Ireland a measure passed in 1862 provided that persons admitted to the fever hospital or infirmary of the workhouse may, on repayment of the cost of maintenance, be free from any disability by reason of having received relief from the Crown rates. Such a measure he could agree to, but the Bill now under discussion, if passed, would override this. Moreover, no provision was made in the Bill for the maintenance of persons during their residence in the pauper asylum. They might receive medical relief without disqualification, but other relief paid out of the rates would disqualify them. He did not object to the principle of the Bill, but would ask leave to introduce amendments in committee, so that it might include the cost of maintenance, and thus follow the lines of the Irish Bill. The Bill was read a second time.

In pursuance of this promise, the Lord President has tabled the following amendment :—

Clause 1, page 1, line 9, after "(family)" leave out to the end of the clause and insert "(has before or after the passing of this Act received relief and medical treatment as an in-patient of any hospital or infirmary maintained under the laws for the relief of the poor in consequence of such patient suffering from any dangerous infectious disease, provided such person shall have repaid or tendered to the authority of such hospital or infirmary the cost of the in-maintenance therein of himself and any member of his family as aforesaid, such cost to be determined according to the average of the cost of in-maintenance in such hospital or infirmary during the half-year preceding the admission of the patient."

"The expression 'cost of maintenance' in this section shall be deemed to include the expense in and about the maintenance, treatment, and relief of the in-patients of the hospital or infirmary, exclusive of the repairs and furniture thereof and the salaries, remuneration, and rations of the officers and servants, but inclusive of the necessary expenses incurred in the warming, cleaning and lighting of the building, and otherwise keeping it fit for use)."

After clause 1, insert the following clause :—

This Act shall not extend to Scotland or to Ireland.

## A Reward for Gallantry.

We were pleased to notice in last Friday's Official *Gazette*, that Surgeon J. H. Reynolds, M.B. Dub., who was present at the battle of Rorke's Drift, had been promoted to "Surgeon-Major in recognition of his gallant services in the defence of Rorke's Drift." In our issue of March 19th, we gave space to the letter of a correspondent drawing attention to the heroism displayed by this gallant officer, which was graphically described in a letter from a wounded soldier, thus :—"After the negroes surrounded us we fought like tigers. I saw Dr. Reynolds (A.M.D.) blazing away at them, cheering those who were hit, running to the fellows, dressing their wounds, and then fighting away like a hero. He and the Hospital Corps men defended the Hospital to the last moment." When the first list of honours appeared, the name of Surgeon Reynolds was conspicuous by its absence, whether intentionally or from oversight we knew not, but we expressed a hope that such conduct should not go unrecognised. It affords us, therefore, great pleasure to

announce his promotion, and with it to convey to Surgeon-Major Reynolds the thanks of the profession, of which he is so honoured a member, for adding yet another to the long list of medical heroes, who have never been known to shrink from danger when duty or humanity bade.

## Appointments in the Irish Schools of Medicine.

On Saturday, March 15th, at a meeting of the Board of the Ledwich School of Medicine, Dublin, for the purpose of electing lecturers to the vacant chairs of Materia Medica and of Botany, Dr. Richard D. Purefoy, a graduate in medicine and surgery of the University of Dublin, and Obstetric Surgeon to the Adelaide Hospital, was appointed to the chair of Materia Medica; Dr. Charles Robinson, a Fellow of the Royal College of Surgeons, Ireland, was appointed to that of Botany. Dr. William Ramsay McNab, Professor of Botany in the Royal College of Science in Ireland, has been appointed to the chair of Botany in the Carmichael College of Medicine and Surgery, vacant through the resignation of Dr. Edmund B. Blakely. Mr. Biggs, Assistant Curator at Cambridge, has been appointed to the Professorship of Zoology and Comparative Anatomy at the Royal College of Science in Ireland, vice Dr. Leith Adams, who has accepted a chair in the Queen's College, Cork. Dr. J. Magee Finney, Physician to the City of Dublin Hospital and Registrar of the College of Physicians of Ireland, has resigned his office of Demonstrator in the School of Physic, in Ireland, and his connection with the private teaching of that school, both of which he has been associated with since the year 1864. Dr. Finney received the marked thanks of the Board of Trinity College on his retirement.

## Relation of Ozone to Health and Disease.

In his address at the Sanitary Congress, which has already appeared in our columns, Dr. Henry Day, of Stafford, remarked that when a warm-blooded animal is subjected to a stream of ozonised air, symptoms of great bronchial irritation are produced, succeeded by great rapidity of respiration and violent action of the heart. If the effect of the ozone be kept up, a form of congestive bronchitis is manifested, and finally there is lividity of the skin, coldness of the surface, gasping respiration, jactitation, and death. Hence it has been surmised whether the superabundant presence of ozone in the atmosphere may not be connected with many diseases affecting the human family, especially epidemics of catarrh, influenza, bronchitis, and the like. The question, however, arises whether there is ever such an excess of ozone in the air as would be likely to create such a result? This is very doubtful, for in the laboratory, and during experiments, no disagreeable effects are produced, either on man or animals, unless the ozone be in sufficient quantity to be appreciable to the senses. Then, again, Dr. Moffatt, who has for several years made many careful observations on the subject, believes that there is some connection between the ozoniferous condition of the atmosphere and the prevalence of other diseases than those just mentioned. He first of all ascertained that the atmospheric conditions during which phosphorescence takes place, are identically the same as those of ozone periods, whilst periods of non-phosphorescence and no ozone also occur under similar atmospheric states. The former occur with low atmospheric pressure, high temperature, and a south-east wind; whilst the latter, or non-ozonic and non-phosphorescent conditions, obtain, under a high atmospheric pressure, low temperature and a north-east wind. Dr. Moffatt further noticed that cases of apoplexy, epilepsy, sudden death, epistaxis, neuralgia, and diarrhœa were prevalent either immediately before or during ozonic periods, and at the approach of gales and storms, and the issuing of Admiral Fitzroy's cautionary telegrams. He also suggests that, as ozone is formed by the catalytic action of phosphorus on moist air, and as brain and other tissues of the body contain phosphorus, the oxidation of phosphorus in the system might be modified by atmospheric changes, which would probably be evidenced by the varying quantities of phosphoric acid excreted by the kidneys. With the view of determining this point, he tested the urine of a healthy man daily for twelve months, with the result of showing that the quantity of phosphorus oxidised in the air and in our systems depends upon similar atmospheric conditions, the maximum with the ozonic and phosphorescent periods, and the minimum with the non-ozonic and non-phosphorescent periods. We may, however, here observe that Dr. Moffatt does not clearly show that the above diseases are more prevalent in one period than in another, and the reader will notice that they are all diseases which are constantly prevalent amongst us at all times, in all seasons, and which do not appear to be subject to any atmospheric or meteorological conditions whatever. While, however, the connection between a superabundance of ozone in the air and the prevalence of certain diseases is exceedingly problematical, there is one disease which may with much reason be believed to be connected with an absence of ozone, and that is—cholera. From a report of the ozone registrations that were kept at fifteen cholera stations, it appears that cholera was in its greatest ascendancy when ozone was either absent from the air, or at its minimum. These observations have been corroborated by a series of experiments that were instituted in 1854 during the epidemic at Strasbourg, and more recently by some experiments which Mr. Glashier made on the subject. As Dr. Day remarks, it is sometimes very difficult to distinguish between a "coincidence" and a "consequence.' We are inclined to believe that the co-existence of certain phenomena above-mentioned should be regarded as a coincidence, and not in the aspect of cause and effect; but we will admit that the subject is sufficiently important and obscure to claim for it further consideration.

## Vidal on Eczema Marginatum of Hebra.

In many cases, M. Vidal said, the eczema marginatum, of Hebra, was only one of the forms of pityriasis versicolor. The malady is produced by the *microsporon furfur*. In some cases the *tricophyton* of herpes circinata, causes the eruption. But there are some forms more embarrassing. A vesicular eruption shows itself on the arm-pits, thighs, trunk, extending with rapidity. There is less redness than

in herpes circinata. Under the microscope is found the parasite of pityriasis rosea of M. Bazin. In the course of the year 1878, he had two patients on whom an eruption appeared, which disseminated rapidly, and tended to become general. Some sulphur baths produced an easy and rapid cure.

On microscopical examination of the epidermic *dèbris* Vidal found that the parasite had its seat in the middle layer of the epidermis. It was composed of very small spores united in round groups. In the diseased epidermic cells, were very fine sporullary tubes. The spores were smaller, and less refractive than the spores of *tricophyton*.

In the ensuing discussion, M. Hillairet observed that, he shared the opinion of M. Vidal on the subject of the confusion which Hebra introduced into dermatology, by giving the name of eczema marginatum to a parasitic affection produced by a tricophyte. M. Cornil declared that the parasites described by Vidal were frequently met with in the epithelial cells without alteration of the epidermis, and without any trace of a skin eruption. M. Malassely had observed an interesting case, analogous to one of those by M. Vidal. The parasites were more numerous at the periphery than in the centre. A cure was obtained by sublimate lotion.

## Blood-letting.

We had great pleasure in publishing in our last issue Dr. R. Johnson's experience of a plan of treatment which there is much reason to believe has fallen into unmerited neglect. Dr. Johnson, however, is in error in supposing that we have only recently taken up the subject, inasmuch as more than twelve months before Professor Wharton Jones's communication in the *Lancet* we devoted more than one leading article to the "revival of blood-letting." Dr. Johnson adds fresh testimony to what has already lately been adduced in favour of the moderate and discriminate use of this therapeutic agent. His remarks, moreover, are the more valuable, because he is not biassed by theory and preconceived opinion, but by the result of his own practice, and because he has no wish to "mislead the sense of our juniors and more sanguine of our body into the rash or injudicious practice of a measure fraught with danger and requiring the most astute discrimination." As he truly says, the constitution of the patient, his habit of body, his age, mode of life, the nature of the disease, and many other circumstances have to be taken into consideration before any blood is abstracted, and no one would now think of advocating the same practice in all cases of the same kind. If, indeed, we carefully reflect on the cases which Dr. Johnson, Professor Wharton Jones, and others have lately published, we shall be certainly justified in asking "whether the scare about venesection has not been carried too far, and whether the prejudice which prevails on the subject ought not to be reconsidered and submitted to the test of cautious and discriminating experience." What we want, however, are more facts and careful observation, with all the assistance that the thermometer and the sphygmograph can now give us in forming a judgment with regard to the utility of bloodletting in the treatment of disease. We are firmly convinced that in many cases, especially in young, plethoric individuals, the patient's recovery is retarded, or the parts affected more damaged than they ought to be by the inert, temporising, and expectant plan of treatment too generally pursued now-a-days. We trust, therefore, that we shall be favoured with further contributions towards the elucidation of this important subject, care being taken to accurately report the condition of the patient before and after the abstraction of blood, and to note not only the favourable results, but also the apparent failures of this method of treatment.

## The Herbalists.

With regard to the herbalists and their parliamentary apologists, we had no intention last week of taking up the subject seriously, or our remarks would certainly not "erred in the measure of their extreme mildness." We quite agree with our correspondent, the author of "Medical Men and Manners," in regarding the opinions, which the apologists of the quacks in the House of Commons recently expressed, as either pitiable or contemptible; and it is also highly, probably, that many practitioners among a certain class of the community, especially those who belong to clubs and provident societies, are, on account of the small fees they charge, less respected and less appreciated than the low ignorant herbalist, who, knowing that there is a great tendency on the part of the public to take a man at his own valuation, makes it a principle to charge as much for his "consultation" and medicine as would suffice to pay the fee of a consultant physician. Cheap advice, like cheap articles, is seldom thought much of; and when quacks put, as they generally do, a high price upon their advice and medicines, it is not only because of their extortionate principles, but also because their knowledge of human nature tells them that the credulity and confidence of their victims will be, in proportion, to the audacity of their professions and the exorbitancy of their charges. If regular medical practitioners make themselves so cheap, they must not be surprised if their services are valued accordingly, and if the prescribing chemist or the herbalist meets with as much confidence and respect as if he were a well-educated and duly qualified doctor.

## Treatment of Post-Partum Hæmorrhage.

If ever a more positive and exact system of therapeutics is introduced into the province of obstetric medicine, post-partum hæmorrhage is just one of those accidents in which the adoption of such a system should be most practicable. The causes of post-partum hæmorrhage are few, simple, and well understood, and in an accident of so common occurrence it is surprising that obstetricians have not by this time come to some decision with respect to the best and most positive method of arresting it. Amongst the plans of treatment most recently recommended is that by compressing the abdominal aorta. This plan, which is however by no means new, is strongly advocated by Dr. G. de Gorrequer Griffith in the February number of the *Obstetrical Journal*. When the vessel cannot be compressed externally in the ordinary way, he grasps the uterus, and by means of it compresses the artery against the back, or he compresses the artery by introducing his hand either into the cavity of the uterus or into the rectum. We quite believe with him that we do not

utilise the cavity of the rectum so frequently as we might, either for purposes of diagnosis or treatment; but it has been recently shown that the introduction of the hand into the rectum is not only a difficult operation, but one that is attended with some danger. Besides, the safe introduction of the whole hand into the rectum should be effected in a gradual manner, and while the patient is under the influence of chloroform, whereas its introduction for the purpose of compressing the aorta in cases of post-partum hæmorrhage would have to be immediate, and without the assistance of anæsthetics.

## Rabies Treated and Cured by Oxygen.

We learn from the *Gazette des Hôpitaux* that two Russian physicians, Schmidt and Lebedew, have lately cured (?) by the above means, a young girl, æt. 12, who had been bitten on the hand by a mad dog. The wound had engaged the skin and subcutaneous cellular tissue, and had been immediately cauterised by nitrate of silver; and at the end of eight days cicatrisation was complete.

Seventeen days after the bite the first symptoms of hydrophobia developed. The physicians prescribed the inhalation of oxygen, with the result of producing a complete state of calm. On the next day fresh symptoms came on—dysphagia, dyspnœa, tonic convulsions, spasm of the respiratory muscles, and complete absence of sensibility. A fresh inhalation of oxygen, for forty-five minutes, relieved all the symptoms, with the exception of a slight degree of dyspnœa, which was overcome by the use of the mono-bromide of camphor. The patient ultimately recovered.

In reference to the use of oxygen, we may call to mind our "Reports on Rabies," where it was mentioned that Drs. Constantin Paul and Josias employed it on a very characteristic case in 1875, but the patient died, though the asphyxia was relieved.

## The "Midnight Oil."

It seems like going back to the days of Alfred the Great, when we read in *La Nature* of a simple and convenient night lamp, indicating the hour by the extent of combustion of the oil. From the oil reservoir rise two vertical glass tubes; one contains oil and is graduated for the hours, the other contains the wick saturated with oil and giving the light. The construction is such that one hour is required to consume the quantity of oil between two graduations of the first-mentioned tube. A reflector placed under the flame at the side throws a luminous beam across the graduated tube. During the night one can thus see at what height the oil stands in the tube and read the corresponding hour.

## A New Dental Hospital for Dublin.

We understand that the house in York Street, Dublin, recently occupied by the late Dr. B. F. McDowel, has been taken on lease by a number of dental surgeons, who have joined together for the purpose of founding a dental hospital and school in order to supply to students the instruction necessary for the dental license of the Irish College of Surgeons. We believe that Mr. Stack, Dr. Baker, and Mr. Moore are associated with the movement.

In the principal foreign cities the rates of mortality according to the most recent weekly returns were in Calcutta 32, Bombay 28, Madras 32; Paris 29; Geneva 23; Brussels 31; Amsterdam 28; Rotterdam 34; The Hague 29; Copenhagen 25; Stockholm 20; St. Petersburgh 44; Berlin 26, Hamburg 24, Dresden 24, Breslau 34, Munich 32; Vienna 33, Buda-Pesth 37; Rome 22, Turin 27, Venice 24; Alexandria 41; New York 30, Brooklyn 20, Philadelphia 18, and Baltimore 21 per 1,000 of the population. Small-pox caused 58 deaths in St. Petersburgh.

The annual death-rate last week from the seven principal zymotic diseases in the large towns, ranged from 0·0 in Portsmouth to 6·7 in Newcastle-upon-Tyne. Whooping-cough showed excessive fatality in Manchester and Sheffield; and measles in Newcastle-upon-Tyne, Norwich, and Wolverhampton. The deaths from scarlet fever were proportionally most numerous in Sunderland, Oldham, Sheffield, and Bradford. Small-pox caused 16 more deaths in London and its suburban districts, 14 in Dublin, but not one in any of the other large towns.

The rates of mortality per 1,000 last week in the principal large cities and towns in the United Kingdom were —Edinburgh 16, Portsmouth 19, Sunderland 19, Leeds 22, Bristol 22, Brighton 23, Oldham 24, Norwich 24, Birmingham 25, Glasgow 25, Salford 26, Plymouth 26, Bradford 27, Nottingham 27, Liverpool 28, Newcastle upon-Tyne 29, Wolverhampton 29, Leicester 29, London 30, Manchester 31, Hull 31, Sheffield 32, and the highest rate Dublin 34.

Information has been received at the Admiralty that no fresh cases of small-pox have occurred on board her Majesty's ships *Boadicea* and *Flora* since the 14th February. This ship has been placed under quarantine for the last six weeks in consequence of several severe cases on board. She is now declared free.

Dr. Kiemann, the Austrian medical delegate, telegraphs to his government from Wetlianka, that the last case, a little girl, æt. 10, who was attacked by the plague, has already left her bed, and that no fresh cases of sickness have occurred. The demolition and burning of the infected houses continue.

The annual Festival Ball in aid of the French Hospital in London, was given at the Freemason's Hall, on Thursday evening last, and was well attended. The majority of the guests were in fancy costumes, and some used masks. The charity will probably receive a large accession to its funds.

Dr. Murchison was, on Friday last, gazetted to the honour of Physician-in-Ordinary to their Royal Highnesses the Duke and Duchess of Connaught.

On Friday last in the House of Lords, the report of Amendments on the Medical Acts Amendment Bill was brought up and agreed to.

A WOMAN, an in-patient in St. John's Hospital for Diseases of the Skin, London, suffering from leprosy in its most horrible form, died in the hospital on Saturday last.

# Scotland.

(FROM OUR NORTHERN CORRESPONDENT.)

HEALTH OF EDINBURGH.—The mortality still keeps low. Last week, ending 22nd March, there were 64 deaths, which gives a death-rate of 15 per 1,000. No deaths from scarlatina or measles were recorded, and the zymotic mortality was otherwise very moderate. Of the 151 births, 11 were illegitimate.

A STUDENT'S FUNERAL.—The remains of Mr. John Melville, medical student, who succumbed to an attack of fever, were interred in Edinburgh, on Saturday, the 22nd ult. About 100 medical students attended the interment in Echo Bank Cemetery, and of the teachers of the deceased, Professors Maclagan, Sanders, Simpson, G. Stewart, Fraser, Drs. Wylie, Littlejohn, M. Brown, and Affleck. The funeral attracted much attention as it passed along the streets. At the grave a short service was conducted by Mr. MacMillan, pastor of the Reformed Dutch Church in the Orange Free State, who spoke of the genial character of the deceased, and of his diligence as a student, both in Aberdeen and Edinburgh. The cosmopolitan character of the Edinburgh school was evinced by the presence of forty students from Cape Colony, who are at present there pursuing their medical studies.

MORE "YOUNG GENTLEMEN" IN TROUBLE. — At the Edinburgh Police Court on Saturday, the 22nd ult., two medical students, named Thomas Clark and George Rothwell, were charged with creating a disturbance on South Bridge Street, on the previous Thursday night, Clark being further charged with assaulting Constable Alexander Sutherland while executing his duty. Sheriff Hallard, who presided, said it was desirable that students should present an example of gentlemanly behaviour, and this element being lamentably wanting in this case, a fine of £2 was imposed in each case, or ten days' imprisonment.

MEDICAL EDUCATION OF WOMEN.—A bursary of £30, tenable for three years, is to be offered by the National Association for Promoting the Medical Education of Women, in Edinburgh.

PAISLEY INFIRMARY.—The annual meeting of this charity was held on the 27th ult., in the Museum Hall, Paisley; Mr. Stewart Clark occupied the chair. The annual report, which was adopted, showed that during the year 932 patients had been admitted, of whom 799 were cured or dismissed, 66 died, and there were remaining in the house 67. Of the 66 deaths, 8 were within twenty-four hours after admission. Nearly a fourth of the 932 cases were fever ones. The number of patients prescribed for at the Dispensary had been 3,376, an increase of 642 over last year. The treasurer's statement showed that there had been a deficiency of £61 15s. 9d. for the year, but this had been met off last year's balance, and a sum of £93 19s. 11d. carried forward. The total expenditure was £2,464 17s. 3½d., or about £8 more than last year, notwithstanding the great increase of patients in the house and of those treated at the Dispensary. The sum expended on wines and spirits was £89 4s. 6d. as against an average for the last ten years of £150. Bailie Clark, Messrs. James Arthur, Thomas Coats, William Hodge, J. S. Kerr, William Morrison, Provost Murray, and Bailie McGown, were elected directors for the ensuing year. Bailie McGown intimated the receipt that night of a donation of £33 6s. 8d. from Mr. Riddell, of Blackhall—this was part of £100 paid to Mr. Riddell by a person whom he sued for damages.

CLOSING OF THE SCOTCH MEDICAL SCHOOLS.—The Glasgow medical schools closed last week; and the Edinburgh University Medical School was closed on the 27th ult., with an address by Professor Annandale. Before distributing the prizes and honour certificates to the successful students of the past session, the Professor, while congratulating the members of his class on the evidence of successful study they had given in the course of the session, said that at the same time he could not but feel that one little weakness in the teaching of clinical surgery, as at present conducted in this school, lay in the instruction in the wards at the bedside. Mere attendance twice a week at the clinical lectures in the theatre was not enough, and he attached great importance to instruction given at the bedside, where the treatment and course of the injuries and diseases spoken of in the lecture-room could be followed and observed. The limited space at their disposal in the present infirmary building had made it difficult to do all that was desirable in that way. But in the next winter session the clinical course would be open in the New Infirmary buildings, in which he and his colleague of the extramural school would have a wing to themselves, and every facility for carrying out instruction in the wards as well as in the theatre. The clinical professor would have a theatre to himself, which would accommodate at least 300 students, and which could be used every day, if necessary, for the purposes of the class; while there would be other rooms set apart for the class, such as in the present buildings were not available. The visits to the wards which, in the past session, he had made on Saturdays with the senior students, had been attended with mutual advantage to both the students and himself.

PROFESSOR BALFOUR'S RETIREMENT.—An order of her Majesty in Council, dated 22nd March, 1879, has been received by the Senatus of the University of Edinburgh, containing her Majesty's approval of a Report by the University Court of the University of Edinburgh, recommending that Dr. John Hatton Balfour should be permitted to retire from the Professorship of Botany and Medicine in the University on the retiring allowance, as provided by the Universities (Scotland) Act, 1858.

THE FINANCIAL DIFFICULTY OF THE GLASGOW WESTERN INFIRMARY.—A public meeting was held in the Religious Institution Rooms last week to consider the financial difficulties into which the Western Infirmary had fallen, owing to a deficiency in subscriptions. Mr. Thomas Watson, Chairman of the managers, submitted a statement of income, 1st Nov. to the 22nd March, which showed that the subscriptions and donations amounted to £4,649 2s. 6d., a decrease of £1,854 17s. 7d. compared with the same period in 1877-8; students' fees, £764 18s. 6d., decrease, £214 16s. 6d.; and interest and sundries, £345, increase, £92 2s. 11d. There was at the same time an increase of £30 14s. 1d. in the cost of maintenance (64 additional patients having been treated), and the nett deficiency of £2,008, compared with the same date last year. In 1877-78, the sum of £1,412 was received from the Committee of the calico ball. The balance at the credit of the supplementary fund is £1,181 15s. 5d. The stock account shows a balance of £12,559 0s. 7d., as compared with £12,425 0s. 7d. at 31st October, 1878. There is a balance of £4,428 14s. 3d., which the managers have resolved to pay off as soon as they have funds available. Mr. Thomas Watson said there was a balance of £1,181 remaining

at the credit of the reserved account, raised in 1875 for the purpose of making up deficiences that might occur from time to time in the income. Considering that they were at present upwards of £2,000 behind, and, further, that the numbers of patients applying for admission to the Infirmary was daily on the increase, this reserve balance is quite inadequate to meet the case; and the managers felt it their duty to make their position known to the public. Resolutions were adopted, with a view to urging the claims of the Institution on the public. However much the directors, and the clergymen of fashionable and rich congregations, may deplore these, their financial, difficulties, it will not be in the slightest degree a matter of regret to the medical practitioners of Anderston and Partick, that a gratuitous institution, *open to all comers*, without distinction, should find itself thus circumstanced. The fallacy that the more patients it treats, the more money should the public give, is too palpably absurd to be dwelt upon.

Glasgow Medico-Chirurgical Society.—At a meeting of this Society, held on the 21st ult., Dr. Hugh Thomson read an interesting paper, "On Vaccino-Syphilis; or, the Accidental Transmission of Syphilis by means of Vaccine Lymph." We purpose publishing this paper in full in an early number.

Vivisection.—The Scottish Society for the Total Suppression of Vivisection held a meeting in Edinburgh on the 27th ult., when addresses were delivered by a number of gentlemen interested in the movement, including Professor Hodgson, and Dr. Walls, of London, who was prevented by the medical students on a former occasion from expressing his views to an Edinburgh audience. A petition to both Houses of Parliament, for the suppression of the system, was resolved upon.

# Correspondence.

## THE INDIAN MEDICAL SERVICE.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—As an examination for admission to the Indian Medical Service will shortly take place, I trust you will afford me an opportunity, through the medium of your paper, of laying before your readers my experience of that service, acquired during a period of more than eight years' residence in India. At all the examinations a great number of the candidates are Irishmen; therefore the following remarks may be of interest to some of the intending competitors, and for that purpose I will "a round unvarnished tale unfold."

The Regulations as to pay and pension issued by the India Office are very alluring at the first glance—286 rupees per month on arrival in India, and 450 rupess when qualified in the native language. Do not let any candidate be deluded by this glittering bait. In my case I passed the lower standard examination in Hindustani within three months of my arrival in the country, and although, among the first on the list passing out of Netley, the higher rate of pay was not granted to me until I had been one year in India, and then for six months only, or during the time I was temporarily in medical charge of a regiment. My next appointment was an officiating one—that is to say, the permanent incumbent was on furlough—and my pay was 286 rupees, plus 100 officiating allowance. This continued for three months. My next appointment was an officiating one also, and the pay 386 rupees, which continued for nine months. For six months afterwards my monthly stipend was the lower rate of 286 rupees, and this, too, in a country where one's monthly expenses, even with the strictest economy, are never less than 250 rupees. In fact, Sir, it would be occupying too much of your valuable space were I to recount the very many changes to which I was subjected during the first four years of my service, and that, too, at an inferior rate of pay, not to speak of repeated attacks of severe jungle fever, from being obliged to perform long and tedious journeys at unseasonable times of the year. Until a young medical officer gets permanently appointed to a regiment—and this does not generally happen for the first four years of his service, he is liable to be knocked about all over the country, and at the shortest notice. In my case I have been several times ordered away by telegram, and have been obliged to dispose of my property at a great loss. On more occasions than one I have been obliged to traverse distances of more than 800 miles. Were all the Regulations of the Indian Medical Service fully and honestly explained, and not made delusive, as they appear on paper, candidates would weigh gravely the advantages (?) of entering a service in a sickly country, where the prime of a man's years must be spent, and where life is so uncertain.

Then take into consideration the Furlough Rules of '68, in which furlough pay at the rate of 2s. per rupee is promised; but men must now be content with 1s. 9d., the Government rate, and when any complaint is made no notice is taken, nor is any redress to be expected.

In India it is useless to grumble before those sitting in high places. They have good pay and comfortable appointments; consequently they fail to see why their junior brethren should be dissatisfied. But some of your readers may say—"Then why not give up the Service at first?" To that I would answer—*Necessitas non habet legem.* The cost of outfit and other circumstances are to be considered.

Assuring you that not one of the above statements is exaggerated,

I am, yours faithfully,

Dissappointed.

March, 1879.

## THE IRISH VACCINATION AMENDMENT BILL.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—I read with very great interest in your last issue a notice having reference to the proposed Irish Vaccination Amendment Bill, and it occurred to me that while dealing with this subject one or two salient points seem to have escaped your attention. Let me remind you that medical men in Ireland only receive tenpence for each successful vaccination; the remaining two-pence they may fairly consider themselves entitled to for the proper registration of same, a similar sum being allowed to non-medical registrars for the performance of this duty. Furthermore, the Government do not seem to take into account that additional labour has been thrown upon the medical officer some years since by the establishment of rural vaccination depots, at two of which, as a rule, he is obliged to attend weekly for one month in each half-year, making in all sixteen journeys, the distance seldom being less than four or five miles from his residence, and for this extra duty no additional remuneration whatever is allowed, although under other circumstances for similar labour he might justly claim a sum of sixteen guineas, which, in many instances (as in my case) would be a sum far in excess of his entire vaccination fees. In England, where I practised for some time, an additional fee was invariably allowed when the operation was performed at a distance from the doctor's residence. I would say, in common justice a similar claim might reasonably be made by medical men on this side of the channel.

Yours faithfully,

P. J. Bodkin, Medical Officer.
Glenamaddy Workhouse and Dispensary,
co. Galway.

**St. John Ambulance Association.**—At a meeting of the medical committee of the St. John Ambulance Association, held on Friday, at St. John's Gate, Clerkenwell, Dr. Sieveking, Physician to the Queen, in the chair, supported by a considerable sprinkling of the medical profession, the following resolution was unanimously adopted:—"That this meeting recognises with satisfaction that the central committee spare no exertions to limit the instructions given to the ambulance classes to matter which enables the pupils to render first aid to injured persons, and does not interfere with the province of the medical profession; and further considers the instruction to have been of eminent advantage to the public at large."

**The Harvey Memorial Fund.**—A meeting of the sub-committee of this fund was held on Monday last, at the London College of Physicians, Sir George Burrows, Bart., M.B., in the chair, at which it was decided that the commission for the the statue of Harvey, to be erected at Folkestone, should be entrusted to Mr. A. Bruce Joy, the designer of the model marked B now being exhibited at the South Kensington Museum.

**Medical Acts Amendment Bill.**—This Bill was read a third time and passed in the House of Lords on Monday night.

**The Medical Staff in Zululand.**—In reply to a question in the House of Lords on Monday as to the efficiency of the Army Medical Department at the Cape, Lord Bury stated that there were two surgeons of the department, two naval surgeons, and three civil surgeons with Colonel Pearson's force at Ekowe. There were also three army and three navy surgeons on their way to the Cape; ample provision was also made in other ways for medical care.

# Obituary.

## DR. JAMES McBAIN, OF EDINBURGH.

THIS esteemed and well-known medical man died at his residence, Logie Villa, Trinity, Edinburgh, on the 24th ult. Dr. McBain was born at Logie, in the parish of Kirriemiur, Forfarshire, on the 11th of November, 1807. Having served as an apprentice with Dr. Stewart, surgeon, in his native place, he, in 1823, went to Edinburgh to commence his curriculum of study in medicine, and in March 1826, passed his examination at Surgeons' Hall, and received his diploma when only a few months over nineteen. In the same year he graduated in medicine at the University of St. Andrews. During his course of study, as was the practice at that time, he made a voyage in a whaling ship to the Arctic regions, which he often referred to as having afforded him an opportunity of making many interesting observations. In August, 1827, Dr. McBain passed his examination for Assistant Surgeon in the Royal Navy, and shortly after was appointed assistant surgeon to H. M. S. *Undaunted*, which took out Lord William Bentinck as Governor-General of India. Dr. McBain served for several years in this ship, visiting various foreign places of interest, and adding much to his store of scientific observation and profitable experience as a naturalist. In 1832 he was appointed assistant surgeon to H. M. S. *Investigator*, surveying vessel, commanded by Captain George Thomas, who was then employed in the survey of the Shetland Islands. The survey was completed in 1834, and in the autumn of that year the survey of the Orkney Islands was proceeded with. While occupied in this work, Dr. McBain, along with Lieutenant Thomas, carried on a system of dredging round the shores of the Orkneys, and in deep water between Orkney and Shetland, and had the satisfaction of supplying large collections of the marine invertebrata to Messrs. Forbes and Hanley, then employed on their great work on the British Mollusca. Many new and rare specimens were the result of these dredgings. Fine collections of marine algæ were also made, which were sent to Dr. Harvey for his great work on the "Phycologia Brittannica." In 1848 the survey ship was paid off, and since then Dr. McBain had not served afloat. In 1849 he took up his residence in Elie, in Fife, and four years afterwards removed to Perniefield, Leith, and became the intimate friend and companion of the late Professor John Fleming, who then resided at Seagrove, in the neighbourhood. They enjoyed many natural history excursions together, often accompanied by their highly valued friend and fellow-student in science, the late Mr. Alexander Bryson. Dr. McBain has for many years resided at Trinity, where he became the centre of a large circle of scientific friends, many of whom looked up to him as their mentor. Dr. McBain was an accomplished botanist as well as geologist, and in all that appertained to these branches of knowledge he took the deepest interest. He delighted particularly to assist young men, and imbue them with a taste for natural history pursuits; and many can trace their success to the encouragement and help received from him while attending the University.

Dr. McBain was a Fellow of the Royal Society of Edinburgh, and of the Royal Physical Society, of which he was twice President, and of the Botanical Society of Edinburgh, in the proceedings of which he took an active part. Although to some of his friends he might appear rather reserved, by his intimates he was greatly beloved for his genial and affectionate disposition, and all who were accustomed to associate with him will feel that, considering at once his virtues and accomplishments, his place in their circle will not readily be refilled.

# NOTICES TO CORRESPONDENTS.

READING CASES.—Cloth board cases, gilt-lettered, containing 26 strings for holding each volume of the MEDICAL PRESS AND CIRCULAR, can now be had at either office of this Journal, price 2s. 6d. The postal regulations not allowing the Journal to be stitched. these cases will be found very useful to keep each weekly number intact, clean, and flat after it has passed through the post.

NOTICE TO SUBSCRIBERS.—Subscribers who have not already paid their subscriptions—£1 2s. 6d.—for last year, are reminded that they are now due, and should be sent to the publishers, who will be happy to acknowledge their receipt.

DR. PATTERSON CASSELLS, Glasgow, is thanked for the second par of his translation of Delstanche's "Contribution to the Study of Osseous Tumours." These papers will appear as soon as Dr. McNaughton Jones's translations of Löwenberg's "Adenoid Tumours" are completed.

DR. EVELYN LITTLE.—The proceedings of the Surgical Society are being held over for your paper, which we shall be glad to receive at once.

DR. MUTER announces in our advertising columns a course of Physical Lectures to Students commencing April 22nd at the South London School of Chemistry and Pharmacy.

ROYAL COLLEGE OF PHYSICIANS OF LONDON.—On Wednesday and Friday, at 5 p.m., Lumleian Lectures: Dr. Bristowe, "On the Pathological Relations of the Voice and Speech."

OBSTETRICAL SOCIETY OF LONDON.—This (Wednesday) evening, at 8 o'clock, Specimens by Dr. Godson.—Dr. Routh, "On a Case of Extra-uterine Pregnancy."

EPIDEMIOLOGICAL SOCIETY.—This evening, at 8½ o'clock, Mr. George Turner, Medical Officer of Health to Portsmouth, "On Summer Diarrhœa."

HARVEIAN SOCIETY.—On Thursday, at 8½ p.m., Dr. G. C. P. Murray, "Cases of Uterine Disease."—Dr. Stewart, "On Simulated Scarlet Fever."—Dr. J. W. Langmore, "On Contracted Kidney in young subjects."

ROYAL INSTITUTION.—On Friday, at 9 p.m., Mr. Wm. Crookes, "On Molecular Physics in High Vacua."

### EPITAPH ON A PLEASANT FELLOW WHO DIED OF ATROPHY OF THE LIVER.

HE passed away from life,
And resigned his eau-de-vie,
Missed sadly by his wife,
Ah! miss him, so do we.
He disarranged his stomach,
He disarranged his chyle,
And very soon did flummock
His receptacle for bile.
Each day its size diminished,
It was beautifully less,
He felt 'twould soon be finished,
So he took a B. and S.
'Twill, I hope, a les Son Be,
He did'nt love his liver,
Tho' a *liver good* loved he;
Yet over Charon's river
He took of it *A trophy.*
How could he be a liver long
When he was of a liver short?

C. O'C. REDMOND, Cappoquin.

THE Annua lDinner in aid of the funds of University College Hospital will be held at Willis's Rooms on Tuesday, May 6th.

THE Senate of the Queen's University in Ireland announce that on Friday, the 18th April next, they will proceed to elect an Examiner in Medicine, in the room of Dr. Charlton Bastian, at a salary of £100.

ODONTOLOGICAL SOCIETY OF LONDON.—On Monday, April 7th, 8 p.m., Ordinary Meeting.—Paper by G. W. Field, D.D.S., "On Gold Filling."—Casual communications from Dr. Walker, "Abnormal Dentition;" W. C. Ranger, "Mechanical Restoration of contour of Nose and Hard Palate;" Oakley Coles, "On Sarcoma from Periosteum of Lower Molar Root;" Robert Waller, per A. Coleman, "Mechanical Treatment of Gun-shot Wound of Mouth;" Dr. Morrison, "On Fang Filling with Gold."

THE next Evening Meeting of the Pharmaceutical Society of Great Britain will be held on this (Wednesday) evening, when the following papers will be read:—"Action of Iodine on Rhubarb," by Mr. H. G. Greenish; "Note on Plasma," by Mr. W. Wilmott; "Note on Shea Butter," by Mr. E. M. Holmes; "On Mongumo Bark," by Professor Dragendorff.

THE Medical Society of the King and Queen's College of Physicians will meet on Wednesday next, at 8 o'clock, in the College Hall, when the following communications are set down for reading: Dr. Nixon to exhibit the Heart of a Person who suffered from Cyanosis.—Dr Grimshaw, "On Thoracic Aneurism simulating Mediastinal Cancer

—Dr. MacSwiney, to communicate "The Personal Report of a Case of Nervous Shock."

## VACANCIES.

Ashton-under-Lyne.—House Surgeon for the District Infirmary. Salary, £'0, with board. Applications to the President by May 1.
Castlebar Union, Castlebar Dispensary.—Medical Officer. Salary, £110, with fees, and £15 as Sanitary Officer. Election, April 19.
Naas Union, Clane and Timahoe Dispensary.—Medical Officer. Salary, £125, with fees, and £15 as Sanitary Officer. Election, April 7.
Queen's University.—Examiner in Medicine. Salary, £100. Election, April 18. (See Advt.)
Royal Free Hospital, London.—Physician for Diseases of Women, and an Ophthalmic Surgeon. Both Honorary. Testimonials, &c., to the Secretary before April 30. (See Advt.)
St. George the Martyr, Southwark.—Medical Officer of Health. Salary, £150. Applications to the Vestry Clerk, on or before April 8.
Sunderland Infirmary.—House Surgeon. Salary commencing at £80, with board. Applications to the Chairman of the Medical Board before April 23.

## APPOINTMENTS.

Buckly, D. F., L.R.C.P.Edin., L.K.Q.C.P.I., Medical Officer to the Kilmeaden Dispensary, Waterford Union.
Caithness, J., M.D., C.M., Public Vaccinator for the Llanrhaidr District of the Ruthin Union.
Christie, W. J., M.B., L.R.C.S.E., House Surgeon to Leith Hospital.
Davidson, A., M.B., M.R.C.S.E., Assistant House Surgeon to Leith Hospital.
Douglas, A. H., M.D., F.R.C.P.Ed., Medical Officer to the Orphan's Hospital, Dean, Edinburgh.
Hall, J. C., M.B., Medical Officer, &c., for the Scotstown Dispensary District of the Monaghan Union.
Jones, W. D., L.R.C.P.Ed., M.R.C.S.E., Medical Officer for the Ruthin District of the Ruthin Union.
Lyden, M. J., M.D., M.Ch., Medical Officer to the Abbey Dispensary, Tuam Union.
Mason, H. H., M.R.C.S.E., Medical Officer of Health for the East Ham Urban Sanitary District.
O'Neil, H., M.D., an Assistant Surgeon to the Extern Department of the Belfast Royal Hospital.
Stoker, W., F.R.C.S.I., L.K.Q.C.P.I., & L.M., a Surgeon to the Jervis Street Hospital, Dublin.
Tattersall, W. J., L.R.C.P.L., M.R.C.S., Medical Officer for the Hale and Woolton Districts of the Prescot Union.
Walker, T. H., L.R.C.P.Ed., Public Analyst for the City of Carlisle.
Williams, Mr. R., Surgeon to the Liverpool Eye and Ear Infirmary.
Workman, C., M.D., an Assistant Surgeon to the Extern Department of the Belfast Royal Hospital.

## PUBLIC HEALTH (IRELAND) ACT, 1878.

(*Continued.*)

97. (*Verb*). *Offences by Keepers of Houses.*—Any keeper of a common lodging-house who—

(1) Receives any l dger in such house without the same being registered under this Act ; or,

(2) Fails to make a report, after he has been furnished by the sanitary authority with schedules for the purpose in pursuance of this Act, of the persons resorting to such house ; or,

(3) Fails to give the notices required by this Act where any person has been confined to his bed in such house by fever or other infectious disease

shall be liable to a penalty not exceeding five pounds, and in the case of a continuing offence to a further penalty not exceeding forty shillings for every day during which the offence continues.

98. *Evidence as to Family in Proceedings.*

99. (*Verb.*) *Conviction for Third Offence to Disqualify Persons from keeping Common Lodging-Houses.*—Where the keeper of a common lodging-house is convicted of a third offence against any of the provisions of this Act relating to common lodging-houses, the Court before whom the conviction for such third offence takes place may, if it thinks fit, adjudge that he shall not at any time within five years after the conviction, or within such shorter period after the conviction as the court thinks fit, keep a common lodging-house without the previous license in writing of the sanitary authority, which license the sanitary authority may withhold or grant on such terms and conditions as they think fit.

### Byelaws as to Houses let in Lodgings.

100. (*Abs.*) *L. G. B. may empower Sanitary Authority to make Byelaws as to Lodging-Houses.*—The L. G. B. may declare the following enactments to be in force within the district, and such authority shall be empowered to make byelaws for the following matters ; that is to say,

(1) For fixing and from time to time varying the number of persons who may occupy a house or part of a house which is let in lodgings or occupied by members of more than one family, and for the separation of the sexes in a house so let or occupied :

(2) For the registration of houses so let or occupied.

(3) For the inspection of such houses.

(4) For enforcing drainage and the provision of privy accommodation for such houses, and for promoting cleanliness and ventilation in such houses.

(5) For the cleansing and lime-washing at stated times of the premises, and for the paving of the courts and courtyards thereof.

(6) For the giving of notices and the taking of precautions in case of any infectious disease

101. (*Verb.*) *Saving for Common Lodging-Houses.*—The provisions of the last preceding section shall not apply to common lodging-houses.

### Clocks.

102. *Urban Authority may Provide Public Clocks.*

103. *Urban Authority may provide Markets.*

104. *Power for Sale of undertaking of Market Company to Urban Authority.*

105. (*Verb.*) *Power to provide Slaughter-houses.*—Any urban authority may, if they think fit, provide slaughter-houses, and they shall make byelaws with respect to the management and charges for the use of any slaughter-houses so provided.

For the purpose of enabling any urban authority to regulate slaughter-houses within their district the provisions of the Towns Improvement Clauses Act, 1847, with respect to slaughter-houses shall be incorporated with this Act.

Any urban authority may make byelaws for the decent and seemly conveyance of meat through the public thoroughfares.

106. *Notice to be Affixed on Slaughter-Houses.*

### Nuisances.

107. (*Verb.*) *Definition of Nuisances.*—For the purposes of this Act—

1. Any premises in such a state as to be a nuisance or injurious to health.
2. Any pool, ditch, gutter, watercourse, privy, urinal, cesspool, drain, or ashpit so foul or in such a state to be a nuisance or injurious to health.
3. Any animal so kept as to be a nuisance.
4. Any accumulation or deposit which is a nuisance or injurious to health.
5. Any house or part of a house so overcrowded as to be dangerous or injurious to the health of the inmates, whether or not members of the same family.
6. Any factory, workshop, or workplace not kept in a cleanly state, or not ventilated in such a manner as to render harmless as far as practicable any gases, vapours, dust, or other impurities generated in the course of the work carried on therein that are a nuisance or injurious to health, or so overcrowded while work is carried on as to be dangerous or injurious to the health of those employed therein.
7. Any fireplace or furnace which does not as far as practicable consume the smoke arising from the combustible used therein, and which is used for working engines by steam, or in any mill, factory, dyehouse, brewery, bakehouse, or gaswork, or in any manufacturing or trade process whatever ; and

Any chimney (not being the chimney of a private dwelling-house) sending forth black smoke in such quantity as to be a nuisance,

shall be deemed to be nuisances liable to be dealt with summarily in manner provided by this Act : Provided—

First, that a penalty shall not be imposed on any person in respect of any accumulation or deposit necessary for the effectual carrying on any business or manufacture if it be proved to the satisfaction of the Court that the accumulation or deposit has not been kept longer than is necessary for the purposes of the business or manufacture, and that the best available means have been taken for preventing injury thereby to the public health.

Secondly, that where a person is summoned before any Court in respect of a nuisance arising from a fireplace or furnace which does not consume the smoke arising from the combustible used in such fireplace or furnace, the Court shall hold that no nuisance is created within the meaning of this Act, and dismiss the complaint, if it

is satisfied that such fireplace or furnace is constructed in such manner as to consume as far as practicable, having regard to the nature of the manufacture or trade, all smoke arising therefrom, and that such fireplace or furnace has been carefully attended to by the person having the charge thereof.

108. (*Verb.*) *Duty of Sanitary Authority to Inspect District for Detection of Nuisances.*—It shall be the duty of every sanitary authority to cause to bemade from time to time inspection of their district, with a view to ascertain what nuisances exist calling for abatement under the powers of this Act, and to enforce the provisions of this Act in order to abate the same; also to enforce the provisions of any Act in force within their district requiring fireplaces and furnaces to consume their own smoke.

109. (*Verb.*) *Information of Nuisances to Sanitary Authority.*—Information of any nuisance under this Act in the district of any sanitary authority may be given to such sanitary authority by any person aggrieved thereby, or by any two inhabitant householders of such district, or by any officer of such authority, or by the relieving officer, or by any constable or officer of the police force of such district.

110. (*Verb.*) *Sanitary Authority to serve Notice requiring Abatement of Nuisance.*—On the receipt of any information respecting the existence of a nuisance the sanitary authority shall, if satisfied of the existence of a nuisance, serve a notice on the person by whose act, default, or sufferance the nuisance arises or continues, or, if such person cannot be found, on the owner or occupier of the premises on which the nuisance arises, requiring him to abate the same within a time to be specified in the notice, and to execute such works and do such things as may be necessary for that purpose: Provided—

First. That where the nuisance arises from the want or defective construction of any structural convenience, or where there is no occupier of the premises, notice under this section shall be served on the owner:

Secondly. That where the person causing the nuisance cannot be found andit is clear that the nuisance does not arise or continue by the act, default, or sufferance of the owner or occupier of the premises, the sanitary authority may themselves abate the same without further order.

111. (*Verb.*) *On Non-compliance with Notice, Complaint to be made to Justice.*—If the person on whom a notice to abate a nuisance has been served makes default in complying with any of the requisitions thereof within the time specified, or if the nuisance, although abated since the service of the notice, is, in the opinion of the sanitary authority, likely to recur on the same premises, the sanitary authority shall cause a complaint relating to such nuisance to be made before a justice, and such justice shall thereupon issue a summons requiring the person on whom the notice was served to appear before a court of summary jurisdiction.

112. (*Verb.*) *Power of Court of Summary Jurisdiction to make Order dealing with Nuisance.*—If the court is satisfied that the alleged nuisance exists, or that although abated it is likely to recur on the same premises, the court shall make an order on such person requiring him to comply with all or any of the requisitions of the notice, or otherwise to abate the nuisance within a time specified in the order, and to do any works necessary for that purpose; or an order prohibiting the recurrence of the nuisance and directing the execution of any works necessary to prevent the recurrence; or an order both requiring abatement and prohibiting the recurrence of the nuisance.

The court may by their order impose a penalty not exceeding five pounds on the person on whom the order is made, shall and also give directions as to the payment of all costs incurred up to the time of the hearing or making the order for abatement or prohibition of the nuisance.

113. (*Verb.*) *Order of Prohibition in case of House unfit for Human Habitation.*—Where the nuisance proved to exist is such as to render a house or building, in the judgment of the court, unfit for human habitation, the court may prohibit the using thereof for that purpose until, in its judgment, the house or building is rendered fit for that purpose; and on the court being satisfied that it has been rendered fit for that purpose the court may determine its previous order by another, declaring the house or building habitable, and from the date thereof such house or building may be let or inhabited.

114. (*Verb.*) *Penalty for Contravention of Order of Court.*—Any person not obeying an order to comply with the requisitions of the sanitary authority or otherwise to abate the nuisance, shall, if he fails to satisfy the court that he has used all due diligence to carry out such order, be liable to a penalty not exceeding ten shillings per day during his default; and any person knowingly and wilfully acting contrary to an order of prohibition shall be liable to a penalty not exceeding twenty shillings per day during such contrary action; moreover, the sanitary authority may enter the premises to which any order relates, and abate the nuisance, and do whatever may be necessary in execution of such order, and recover in a summary manner the expenses incurred by them from the person on whom the order is made.

115. (*Verb.*) *Appeal against Order.*—Where any person appeals against an order to the court of quarter sessions in manner provided by this Act, no liability to penalty shall arise, nor shall any proceedings be taken or work be done under such order, until after the detrmination of such appeal, unless such appeal ceases to be prosecuted.

116. (*Verb.*) *Order may be addressed to Sanitary Authority.*—Whenever it appears to the satisfaction of the court of summary jurisdiction that the person by whose act or default the nuisance arises, or the owner or occupier of the premises is not known or cannot be found, then the order of the court may be addressed to and executed by the sanitary authority.

117. *Power to Sell Manure, &c.*

118. (*Verb.*) *Power of Entry of Sanitary Authority.*—The sanitary authority, or any of their officers, shall be admitted into any premises for the purpose of examining as to the existence of any nuisance thereon, or of enforcing the provisions of any Act in force within the district requiring fireplaces and furnaces to consume their own smoke, at any time between the hours of nine in the forenoon and six in the afternoon, or in the case of a nuisance arising in respect of any business, then at any hour when such business is in progress or is usually crrried on.

Where under this Act a nuisance has been ascertained to exist, or an order of abatement or prohibition has been made, the sanitary authority, or any of their officers, shall be admitted from time to time into the premises between the hours aforesaid, until the nuisance is abated, or the works ordered to be done are completed, as the case may be.

Where an order of abatement or prohibition has not been complied with, or has been infringed, the sanitary authority, or any of their officers, shall be admitted from time to time at all reasonable hours, or at all hours during which business is in progress or is usually carried on, into the premises where the nuisance exists, in order to abate the same.

If admission to premises for any of the purposes of this section is refused, any justice, on complaint thereof on oath by any officer of the sanitary authority (made after reasonable notice in writing of the intention to make the same has been given to the person having custody of the premises), may, by order under his hand, require the person having custody of the premises to admit the sanitary authority, or their officer, into the premises during the hours aforesaid, and if no person having custody of the premises can be found, the justice shall, on oath made before him of that act, by order under his hand, authorise the sanitary authority, or any of their officers, to enter such premises during the hours aforesaid.

Any order made by a justice for admission of the sanitary authority, or any of their officers, on premises shall continue in force until the nuisance has been abated, or the work for which the entry was necessary has been done.

119. (*Verb.*) *Penalty for Disobedience of Order.*—Any person who refuses to obey an order of a justice for admission of the sanitary authority, or any of their officers, on any premises shall be liable to a penalty not exceeding five pounds.

120 (*Abs.*) *Costs and Expenses of Execution of Provisions relating to Nuisances.*—All reasonable costs and expenses incurred in making a complaint, or giving notice, or in obtaining any order of the court or any justice in relation to a nuisance under this Act, or in carrying the same into effect, shall be deemed to be money paid for the use and at the request of the person on whom the order is made; or if the order is made on the sanitary authority, or if no order is made, but the nuisance is proved to have existed when the complaint was made or the notice given, then of the person by whose act or default the nuisance was caused; and in case of nuisances

caused by the act or default of the owner of premises, such costs and expenses may be recovered from any person who is for the time being owner of such premises: Provided that such costs and expenses shall not exceed in the whole one year's rackrent of the premises.

Any costs and expenses recoverable under this section by a sanitary authority from an owner of premises may be recovered from the occupier for the time being of such premises; and the owner shall allow such occupier to deduct any moneys which he pays under this enactment out of the rent from time to time becoming due in respect of the said premises, as if the same had been actually paid to such owner as part of such rent.

121. (*Abs.*) *Power of Individual to Complain to Justice of Nuisance.*—Complaint may be made to a justice of the existence of a nuisance under this Act on any premises within the district of any sanitary authority by any person aggrieved thereby, or by any inhabitant of such district, or by any owner of premises within such district, and thereupon the like proceedings shall be had with the like incidents and consequences as to making of orders, penalties for disobedience of orders, appeal, and otherwise, as in the case of a complaint relating to a nuisance made to a justice by the sanitary authority.

221. (*Abst.*) *Power of Officer of Police to proceed in certain cases against Nuisances.*—Where it is proved to the satisfaction of the L.G.B. that a sanitary authority have made default in doing their duty in relation to nuisances under this Act, the L.G.B. may authorise any officer of police or constabulary acting within the district of the defaulting authority to institute any proceeding which the defaulting authority might institute with respect to such nuisances, and such officer may recover in a summary manner, or in the civil bill or any superior court, any expenses incurred by him, and not paid by the person proceeded against, from the defaulting authority.

123. *Sanitary Authority may take Proceedings in Superior Court for Abatement of Nuisances.*

124. (*Verb.*) *Power to Proceed where Cause of Nuisance arises without District.*—Where a nuisance under this Act within the district of a sanitary authority appears to be wholly or partially caused by some act or default committed or taking place without their district, the sanitary authority may take or cause to be taken against any person in respect of such act or default any proceedings in relation to nuisances by this Act authorised, with the same incidents and consequences, as if such act or default were committed or took place wholly within their district.

125. (*Verb.*) *Provisions in case of Two Convictions for Overcrowding.*—Where two convictions against the provisions of any Act relating to the overcrowding of a house have taken place in respect of the same house within a period of three months (whether the persons convicted were or were not the same) a court of summary jurisdiction may, on the application of the sanitary authority of the district in which the house is situated, direct the closing of the house for such period as the court may deem necessary.

126. *Provision as to Ships.*

127. *Provisions of Act relating to Nuisances not to affect other Remedies.*

(*To be continued.*)

## Duties and Remuneration of Medical Officers of Health in Ireland.

THE following letter has been addressed by the Council of the Irish Medical Association to the Local Government Board.

Irish Medical Association,
Royal College of Surgeons, Ireland,
Dublin, 7th day of March, 1879.

SIR,—With reference to the subject of my letter of the 2nd October, 1878—the receipt of which was acknowledged by letter "No. 20,335—1878—Miscellaneous," dated 3rd October, 1878—I am directed by the Council of the Irish Medical Association to request that you will have the goodness to inform them whether the duties of the "Medical Officers of Health," under the 11th section of the "Public Health (Ireland) Act, 1878," have as yet been assigned to them, and also whether the Local Government Board has taken any step with a view to ensure the award of equitable remuneration by the sanitary authorities to those officers for their services?

I am, Sir, your obedient servant,
JOHN WILLIAM MOORE, M.D.,
Hon. Secretary to the Council.

To B. Banks, Esq.,
Secretary, Local Government Board.

Upon a satisfactory arrangement of the two points referred to in this letter, depends in a great measure the success of the operation of the new Act, and although complete success cannot possibly be attained in the absence of independent supervision, comparative success may follow the proper assignment of duties, and equitable remuneration to the "medical officers of health;" while, on the other hand, if those officers be not fairly remunerated for legitimate services, the result must be a failure—inadequate pay means, as little work done as possible—"medical officers of health" cannot afford, and should not be expected, to be mere philanthropists.

## THE POOR LAW SYSTEM OF IRELAND.

AT the meeting of the Belfast Guardians last week, the following motion was agreed to:—"That a petition from this board be presented to Parliament praying for a commission into the poor-law system in Ireland—first, to ascertain how far the object of the laws relative to the relief of the poor in Ireland has been attained; and second, if the benefits resulting from the poor-law system have been commensurate with the burden imposed upon the ratepayers." It was also agreed that a copy of this resolution should be sent to other unions in Ireland.

## A CONVALESCENT HOME FOR DUBLIN.

WE have already spoken in approving terms of the movement to provide Dublin with a suitable convalescent home for the reception of cases discharged from hospital and liable to carry their diseases into their own homes. An urgent appeal for funds has just been issued by the committee.

The establishment of a Convalescent Home for the reception of patients suffering from infectious diseases is a movement of the utmost public importance, and concerns all classes of the community. A large amount of disease is spread by persons in a convalescent, but still infective, state. For their accommodation the proposed home would adequately provide.

The purchase of suitable premises, and the first outlay will involve an expense of not less than £4,000.

The Institution cannot be permanently maintained without an annual subscription from the public amounting to £2,000.

The committee are anxious to open the Home without loss of time, but cannot do so without the necessary funds.

## THE RETIREMENT OF DR. BROWNE.

AT the late Galway Assizes, the Grand Jury, in fixing the retiring allowance of Dr. Browne, who recently resigned the medical officership of the county prison, unanimously adopted the following resolution:—

"That the Grand Jury cannot see their connection with Dr. Browne severed without expressing their sense of the value of the services which he has rendered this county in his late capacity as medical officer to the prison, and their regret that they cannot grant him a higher retiring allowance than they have done."

## VACCINO-SYPHILIS; OR, THE ACCIDENTAL TRANSMISSION OF SYPHILIS BY VACCINE-LYMPH. (*a*)

By HUGH THOMSON, M.D.,

Fellow of the Faculty of Physicians and Surgeons of Glasgow; formerly Surgeon to the Greenock Infirmary, &c.

OPINION having within the last few years undergone some considerable modification regarding the communicability of syphilis in the performance of vaccination, I have thought it might profitably form the subject of a paper to the Medico-Chirurgical Society. One of the few drawbacks connected with the great boon of vaccination to our race is the possibility of conveying along with the vaccine-lymph the elements of other morbid poisons, and thus giving rise to accidents more or less serious; and it hence becomes a question of the utmost importance to ascertain how such contingencies are to be avoided.

For a long time it was generally supposed that the contents of the vaccine vesicle were incapable of communicating anything but vaccinia. As a proof, it was customary to point to such cases as concurrent vaccinia and variola, where the matter taken from the vaccine vesicle produced vaccinia and vaccinia only, and that taken from the variolous pustule produced variola and variola only. Here is the case of two unquestionably constitutional diseases, the *materies morbi* of which appeared not to trench upon the domain of one another. It was reasonable to conclude that the same would hold true as regards other constitutional diseases, and, *à fortiori*, other merely local affections.

Then, as regards syphilis, it was generally believed, since the time of Hunter, that after passing into what is called the secondary stage it ceased to be contagious, that is to say, inoculable. Hunter held that if secondary syphilis were contagious, every scratch in a syphilitic subject would become a chancre, and as nothing of the kind takes place, therefore, constitutional syphilis is not contagious. Inoculations with the products of secondary symptoms were often made upon subjects already syphilitic, and as no results followed, it was concluded that this was owing to the innocuous character of these products. No wonder then that many, even of our highest authorities, asserted that the communication of syphilis by vaccine-lymph was an impossibility.

These experiments, however, were always made upon subjects already syphilised, the insusceptibility thence arising not having been recognised, whilst experimenters were restrained by a wholesome fear from operating upon the non-syphilised.

Wallace, in 1835, showed the fallacy of these conclusions by inoculating a healthy individual with the secretion from a syphilitic condyloma, the result being syphilitic tubercle in twenty-eight days, succeeded by secondary symptoms in seventy-five days—an experiment which has been often repeated since with like results.

Again, in 1850, Waller, of Prague, successfully inoculated syphilis with the blood of a syphilitic. These evidences of the contagiousness of constitutional syphilis must have done much to stagger the faith of those who thought it impossible to transmit syphilis in the performance of vaccination.

In 1856, Mr. Simon, the Medical Officer of the Privy Council, in order to elicit the opinions of the profession on various points connected with vaccination, addressed a series of questions to a great number of its most distinguished members both in this country and on the Continent. Question 3rd was as follows:—

"Have you any reason to believe, or suspect, that lymph from a true Jennerian vesicle has ever been a vehicule of syphilitic, scrofulous, or other constitutional infection to the vaccinated person? (*b*) or that unintentional inoculation with some other disease, instead of

(*a*) Read before the Glasgow Medico-Chirurgical Society, March 21st, 1879.

the proposed vaccination, has occurred in the hands of a duly educated medical practitioner?"

The answers to this question showed great diversity of opinion. They might be classified into such as were more or less strongly negative; such as were more or less stronger affirmative; such as only stated a probability that another disease might be transmitted along with the vaccine; and such as expressed no opinion on the points included in the question. By far the largest proportion, both as regards numbers and weight, were against the transmission of any other disease; nevertheless, a very respectable minority replied in the affirmative, among whom we find the names of Alison, Edinburgh; Alquié, Montpellier; Bamberger, Wartzburg; J. R. Bennet, London; I. G. Fleming, Glasgow; R. Guersant, Paris; J. Hutchinson, London; Frosch, Wittingau; Hammernick, Prague; Lever, London; and Startin, London.

It is impossible, however, to rise from a perusal of these answers without a feeling that if the transmission of syphilis in the performance of vaccination does occasionally happen, it must be, in the hands of a competent vaccinator and with due care, an exceedingly rare occurrence, as many of the gentlemen of the most extensive experience in vaccination, in syphilitic, and general disease, confessed to never having once seen such a case.

It would far exceed the time which could be given to a paper such as this, to attempt even a summary of the cases of alleged transmission of syphilis in vaccination. Any one who is interested in the subject will find an excellent review of them in Ballard "On Vaccination," or Seaton's "Handbook of Vaccination." An account of them will also be found in Bouchut's "Maladies des Nouveau-nés," and Lancereaux, "Traité de la Syphilis." A great many of these cases are, from want of sufficient details, not very reliable.

A recent addition has been made to them by Mr. J. Hutchinson, who was requested to report upon some cases of the kind by the Medical Officers of the Privy Council. The able report which he made was published in the "Transactions of the Royal Medical and Chirurgical Society," and re-published in his beautiful work entitled, "Illustrations of Clinical Surgery" in a more extended form. As conveying an accurate idea of vaccino-syphilis, I cannot do better than give a summary of that report, especially as I have no experience personally of it, never having witnessed a case:

The first series consisted of twelve re-vaccinations of persons varying from 14 to 45 years of age. Of the twelve, two youths, aged respectively 14 and 16—the first and second of the series—had normal vesicles, and escaped all untoward consequences. Of the remaining ten, nine were successful vaccinations, which passed through the usual course of vaccinia, and one failed. In all, except two of these ten cases, when first seen by Mr. Hutchinson two months after the vaccination was done, on the site of one or more of the punctures or cicatrices left by the vaccine disease, there were found ulcers of rounded form, varying in size from that of a fourpenny-piece to a florin, with hardened bases, in some cases open, and in others covered with a thin crust. In one, "three glossy buttons of induration formed, but never passed into the stage of ulceration."

Some were secreting healthy pus, but most of them were deficient as regards secretion. The glands in the axilla on the affected side were, for the most part, enlarged, but not painful. As the patients were not under medical observation previous to being seen by Mr. Hutchinson, we have no definite information as to when the syphilitic disease first manifested itself. According to the statements of the patients, hardening at the site of cicatrices was first observed about the sixth week, and was attended in about the half of the cases by febrile disturbance.

Papular eruptions on the skin and ulcers of the throat were common. In all, except one, mercury was administered, and with the most beneficial effect.

Vaccinifer, when vaccinated, was a remarkably well-grown and healthy-looking infant, and the vaccination passed through all its stages normally. Four months thereafter there was observed a slight peculiarity in tint of skin, a nasal twang on crying, firm small condylomata close to anus, said to have been present only a week. After two weeks the condylomata were in the same condition, and symptoms of hydrocephalus with marasmus manifested themselves. The mother was cachectic, and the father was not seen but suspected. Of the four vaccine vesicles used, some, if not all, bled somewhat.

In the second series were twenty-four vaccinated from one vaccinifer. Of these, eleven were primary, six were re-vaccinations, and seven were not found. In the seventeen who were seen, the vaccination failed in one, was normal in nine, and in seven the vaccination was long of healing. At the date of Mr. Hutchinson's visit, that is the thirteenth and fourteenth week, all the chancres were healed, except in one case, eleven had decided symptoms of constitutional syphilis, such as indolent engorgement of the lymphatic glands, various forms of syphilitic eruptions on the skin, symmetrical ulcers on the tonsils, and condylomata. Six appeared to have escaped syphilitic infection. The vaccinifer in this series was a stout well-grown infant, æt. 4 months at the date of vaccination, which was in every respect normal. At seven months his head was large, and fontanelles widely open; he snuffled much; and there was a condylomatous patch at anus, which, however, soon healed. Blood was probably not transferred in this case. Parents appeared healthy.

In the third series twelve children were vaccinated from the same vaccinifer, in one only of whom, according to the statement of the vaccinator, did anything untoward result. He was a respectable married man, æt. 46, and had no trace of a primary sore on the genitals. On the site of the vaccination were large inflamed phagedænic ulcers, the size of a shilling, on hardened dusky bases, when first seen by Mr. Hutchinson about ten weeks after vaccination. At the same time there were present double iritis, syphilitic lepra and roseola, enlarged glands in the axilla, and symmetrical ulcers in throat. The patient stated that just as the vaccination sores were about healed, during the fourth week, they again inflamed and became ulcerated. Under mercury both his iritis and rash disappeared. The vaccinifer was a large and very fat baby, æt. 8 months, and had been vaccinated three months previously. The bridge of the nose was broad and sunken. He was the third child, and the first two had died in infancy. The mother appeared healthy.

The fourth, fifth, and sixth series presented no features differing notably from the foregoing, so that I need not detain you with a particular account of them.

How is vaccino-syphilis to be recognised? What are the diagnostic marks? The description just given gives a fair idea of them. We are not to imagine every troublesome sore which follows vaccination is syphilitic. It would lead us too far away from our present subject to describe the various causes and characters of post-vaccinal affections, many of which are not due to the lymph used in vaccinating, but to the previous health of the individual vaccinated. The vaccination has only played the part of a common excitant in developing the phenomena in question.

The features presented by so-called vaccino-syphilis do not differ materially from those of syphilis inoculated in other manner from the products of secondary symptoms. There is the same lengthened incubation ere the initial symptoms appear, the same variableness in the character of these, and followed, after a time, by the same secondary or constitutional symptoms, as they are called. Where it has been accurately observed, the period of incubation is found to be from three to four weeks, exactly the same as occurred in experiments performed with the view of testing the inoculability of the products of secondary symptoms on healthy subjects. About the time that the crusts of vaccinia fall, that is, at the end of the third

week, the cicatrix becomes irritable, slightly inflamed, and hardened. In most cases it becomes ulcerated, whilst in others it remains in the dry state, covered by a thin crust or scab, its size ranging from that of a pin to that of a shilling, upon a hardened base of variable extent, and of dusky hue. In some cases the vaccination sores appear to open afresh, or they have not quite healed and remain in that condition for several weeks. They have even been known to become phagedænic—much, no doubt, depending on the previous health, as is also observed when syphilis occurs under other conditions.

The glands of the axilla usually at the same period become engorged and slightly painful, with little or no tendency to suppurate. After a few weeks more, the glands in other localities, especially about the occiput and groins, swell, and are accompanied by other indications of derangement of the general health—slight fever, syphilitic roseola, symmetrical ulcers in the throat, mucous patches and condylomata in the mouth and near the anus, syphilitic lepra, iritis, and all the various forms of secondary symptoms.

The treatment, with which I need not detain you, belongs to that of syphilis in general.

An important consideration is by what means are such painful consequences in the performance of vaccination to be avoided. It has been recommended that we should not take lymph from a child whose parents we are unacquainted with, and until these parents have given proof of being untainted by having produced a healthy child. A very good rule in private practice, but one not very workable in the conducting of public vaccinations. It often happens, too, that parents contract the disease after a child has been born to them. The production of a healthy child previously is not therefore an absolute guarantee of the soundness of those which come after. It is well to be familiar with the appearance of syphilis in the infant, that we may detect its presence by inspection. But, again, these sometimes do not manifest themselves until after vaccination, or they may have disappeared for a time under treatment.

It may have been noted that in most of the cases which I have brought before you the vaccinifer is described as a remarkably stout and healthy-looking infant at the period of its vaccination. As this is by no means a rare occurrence, we must not therefore presume it is healthy merely because it is big and fat. It is necessary to look carefully at the mouth and nostrils, the anus and sexual organs, also the general surface of the body so far as practicable. Snuffles is one of the most persistent symptoms of infantile syphilis. Mr. Hutchinson lays considerable stress upon a sunken condition of the bridge of the nose, a large head with the fontanelles widely open showing a tendency to hydrocephalus. A prominent condition of the veins of the scalp is also a frequent symptom, but one which is by no means peculiar to syphilis, being generally present in marasmus from whatever cause. But no one is likely to vaccinate a child in such condition, far less choose it as a vaccinifer.

Being satisfied by this inspection of the absence of any suspicious appearance (and a mere suspicion should be sufficient to cause the rejection of anyone as a vaccinifer), the next precaution is to avoid all contamination of the lymph with blood.

The experiments of Waller, of Prague, in 1850; of Gibert; of the anonymous of the Palatinat in 1856, and of Pellizzari in 1862, have abundantly demonstrated the possibility of inoculating syphilis by means of the blood of one labouring under secondary or constitutional syphilis. It is true, many experiments of a similar kind have yielded negative results, but a single positive, where all care has been taken to avoid error, as was done by Pellizzari, is sufficient to outweigh a hundred negatives, and establish the fact.

As early as 1823, the opinion was mooted by Hannibal Amodei, an Italian physician, that where syphilis was inoculated in vaccination, the blood was the infecting agent. In 1860, Rollet, a surgeon of Antiquaille, revived the idea of Hannibal Amodei, and in the same year, M. Viennois advocated similar views, and supported them by an elaborate review of all the well-authenticated facts relating to the subject published up to that time. These opinions do not appear to have been founded on carefully performed experiments; indeed, I am not aware that any experiment with the blood, of an infant labouring under hereditary syphilis has been made. Their conclusions were chiefly formed from the fact that in many of the recorded cases, blood certainly mixed with the lymph; and likewise from the circumstance that many of those vaccinated from syphilitic vaccinifers, where no blood was observed, escaped contamination. In some of the cases reported on by Mr. Hutchinson, it is positively stated that several of the vesicles which yielded the lymph had bled.

But is it necessary that there should be visible blood globules mixed with the lymph? Keber, of Dantzig, has shown "that even clear vaccine lymph contains pus and blood corpuscles" when examined under the microscope. It is probable, also, that too serous a lymph, such, for example, as runs down the arm of the child, would contain any morbid elements, which might be present in the blood. M. Depaul is of this opinion, and says in support of his views, that it is generally the last vaccinated who are attacked, whilst those done first, escape. I do not think there is sufficient evidence on the point, but I notice that in Mr. Hutchinson's first series, the two vaccinated first, escaped infection. In this connection it is worthy of note, the very large number of vaccinations performed from a single vaccinifer, in many of the recorded cases of vaccino-syphilis:—in one case 24, in another, 30, 40, 46, 63, culminating in 64!

It is a notable fact that almost all these cases of vaccino-syphilis, amounting in several instances to a sort of epidemic, occurred in Italy, where vaccination appears to have been conducted in a manner altogether unknown in this country. Seaton remarks in regard to them: "It is a common thing to read of the same child being used two or three days running for yielding lymph, and of fifty, sixty, or a hundred children being vaccinated off it. In one case, 104 children were vaccinated from the same child on three different days."

However, as there can be no doubt that the first drawn lymph is unquestionably the purest, as shown by its superior activity, it is advisable not to vaccinate too many from a single vaccinifer; about a dozen is, in my opinion, as many as should be attempted even from well-developed vesicles. (The vesicles resulting from six insertions on one arm.)

Finally, unless when we are otherwise certain that no syphilitic taint exists, it is not safe to take a vaccinifer who is under four months old. Of 158 cases of congenital syphilis collected by Diday, in 86, symptoms appeared before the completion of the first month; in 45 more, before the end of the second month; in other 15, during the third month; and in 7 during the fourth month; leaving only 5, in which 1 manifested symptoms of the disease for the first time in the fifth month, 1 in the sixth month, 1 in the eighth month, 1 at 1 year, and 1 at 2 years of age. I think, therefore, we may conclude that by taking care that the vaccine-lymph is free of blood, that it is not serous, and taken from a vaccinifer, whom, if we are not certain from our knowledge of the parents to be untainted, we know to be over four months old, and has not manifested symptoms of the disease, the risk of transmitting syphilis by means of vaccine lymph becomes practically null.

I have said nothing of another method of avoiding syphilitic infection in vaccination, one which may be said to afford an absolute security against it; viz., *animal vaccination*, or the employment of the calf or heifer only as vaccinifers. The reason is, that the drawbacks connected with such a mode of vaccinating are so great, though of a different sort, as so far to outweigh the small, it may be said infinitesimal, advantage it may have in respect to syphilis, that it is never likely to be adopted on a large scale in this country.

## CARIES OF OS CALCIS AND ASTRAGALUS—RARIFYING CARIES OF TIBIA — CARIES NECROTICA OF FEMUR.—AMPUTATION AT THE HIP (a).

By B. WILLS RICHARDSON, F.R.C.S.I.

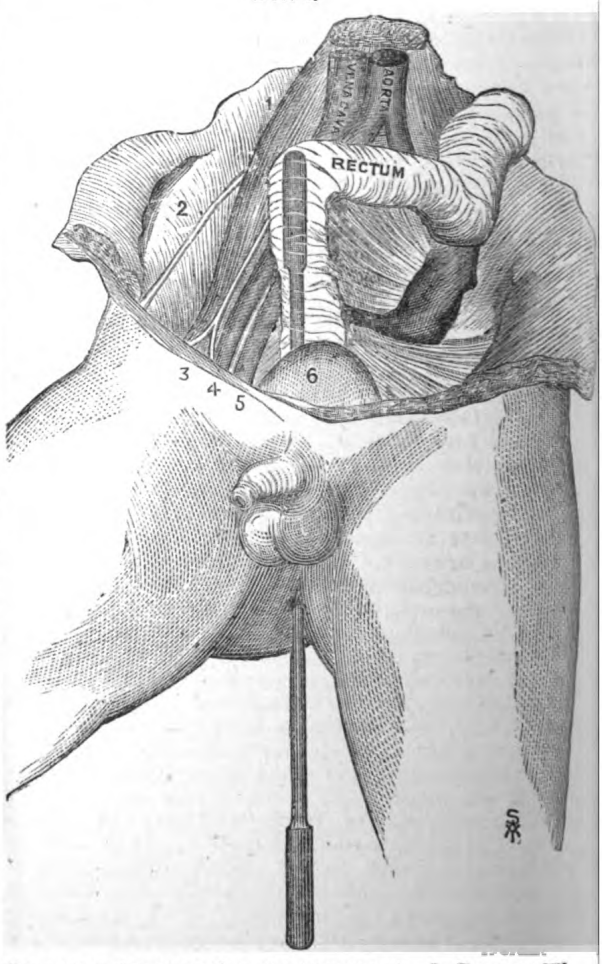
THE specimens I have the honour to exhibit formed part of a lower extremity I removed by amputation at the hip in a child, 8 years of age, on Saturday the 1st inst. The following condensed account of the case was made for me by our resident surgical pupil, Mr. Richard Sawyer.

Dora Strong, æt. 8, was admitted to the Adelaide Hospital under Mr. Richardson's care on the 26th December, 1878. We were told that she had been apparently a healthy child previous to July, 1876, but that in this month she fell and bruised her right forearm and left leg, considerable tumefaction resulting therefrom. At the expiration of three weeks the leg suppurated, and was opened below the knee by Dr. Mahony, and later on at the instep. The suppuration appeared to have been caused by diseased bone, a few small exfoliations having come away, which not long after were followed by what was evidently a considerable portion of the shaft of the tibia, and the leg became quite flexible at its upper part. The forearm next suppurated, and a few fragments of dead bone escaped through sinuses, which eventually closed. A little afterwards a sore formed over the right clavicle, and another on the left loin, both of which healed in a few weeks. As time wore on the left hip became diseased, and there were decided signs of extensive implication of the thigh-bone. At last she became so helpless, and her condition so harassing she was brought to hospital on the day stated. Her symptoms were then as follow :—The left lower limb was shortened one and a-half inches, the left leg being slightly œdematous, and marked here and there with depressed brownish cicatrices, the largest and best marked corresponding to the middle third of the front of leg; the latter was flexible, the centre of motion being at its upper third. The upper two-thirds of the thigh were much enlarged, and very convex forwards and outwards. Three sinuses discharged at the outside and at the front of the hip very fœtid pus. At the bottom of each sinus bared bone could be easily detected, and a little fulness or thickening was felt in the iliac fossa just above Poupart's ligament. At the lower and outer part of the thigh just above the knee there were two depressed cicatrices. Every attempt was made with the view of improving her general health, but it soon became too evident that her only chance of life was amputation, and that it could scarcely be performed too soon.

At my request Dr. James Little made a very careful examination of the child, and not finding any evidence of medical disease, I suggested amputation at the hip to her father, frankly laying its risks before him. He at once consented, and I performed the operation on the 1st inst. The bones of the removed extremity now exhibited, show the following alterations :—The os calcis and astragalus are much softened and hollowed by caries, these bones being mere shells. The foot, it should be observed, cannot be flexed to a right angle with the leg. The tibia is very much altered by caries, which implicates the shaft as well as the extremities of this bone. In the shaft it seems to be a good specimen of rarifying caries, the shaft having been previously rarified by the inflammatory process to allow of the development of the carious action. There seem to have been some feeble attempts at the deposition of new bone corresponding to the fibula. I imagine, but of this I am very doubtful, that the tibia was obliquely fractured from above and without, near the junction of the epiphysis with the shaft downwards and inwards to near the middle of the bone. The upper fragment of this supposed fracture is enlarged from expansion of its tissue, and is almost a mere shell of bone, if it deserves the name of such. The connection between the epiphysis and shaft is loosened, and was the seat of the abnormal motion observed on admission of the patient to hospital.

Of the fibula the head and external malleolus are softened, the remainder of the bone being tolerably sound. The patella also is softened. It is evident that the greater portion of the femur must have necrosed, and, to my surprise, at the time of the operation there were no traces of either the head, neck, or trochanters of this bone. All had disappeared, if we except two sequestra which protruded from a new bone case, and passed for a little distance through an opening into the pelvis in the site of the acetabulum. These had to be removed before I could divide a firm fibro-cartilaginous band that joined the posterior portion of the new case to the pelvis. Obviously the acetabulum had been completely destroyed by caries, as I could pass my finger into the pelvis. With the exception of the sequestra to which I have alluded, no others were to be detected, and as the new bone-case which has replaced the shaft of the original femur almost reaches to the femoral condyles, more than two-thirds of the femur must have been completely destroyed. The new case terminates abruptly above in a nearly circular thin serrated margin in the situation of the top of the middle third. This new case is softened in spots, and consequently not healthy. Between its lower end and the condyles there are posteriorly several openings leading to carious bone.

FIG. 1.



The rectum is supposed to be transparent. 1. Psoas magnus muscle; 2. Iliacus muscle and external cutaneous nerve; 3. Genito-crural nerve; 4. External iliac artery; 5. External iliac vein; 6. Bladder.

Being against rule to give the particulars of operations in recent specimen exhibitions I must crave your permission, Mr. Vice-President, to allow me to deviate from our custom

(a) Read before the Surgical Society of Ireland.

on the present occasion, and to allude to one matter only, it being not altogether devoid of novelty, and cannot fail to be of great interest to those gentlemen present who might at any moment be called upon to amputate at the hip. The full particulars of the case I purpose publishing at some future period, but this is well worthy of immediate corroborative mention. I refer, Sir, to a method for controlling the vessels in amputation at the hip, which is thoroughly effective and easy of application, the compression of soft structures being reduced to a minimum.

In the *British Medical Journal* for the 18th of May, 1878, Mr. Richard Davy, of the Westminster Hospital, London, described a wooden lever for compressing the common iliac artery in amputation at the hip (fig. 1). It appeared to me so simple and applicable that I resolved to use it in preference to the abdominal compressor attributed to Mr. Lister, and can now confidently recommend it as an instrument capable of rendering amputation at the hip one of the most bloodless capital operations in surgery, with a minimum amount of risk to the abdominal or pelvic contents. The lever (exhibits it) is turned out of a piece of box-wood, its length being about 22½ inches. Both ends enlarge, each enlargement being 3½ inches long, the diameter of each being 1 inch. They are oval at the free end, and at the other diminish in calibre, and become continuous with the shaft, which has a uniform diameter of ¾ of an inch.

I here take the opportunity of saying a few words in grateful acknowledgment of the efficacious manner in which the lever was handled in this case by Mr. William Thomson, for my colleague, Dr. Barton, who was at the time recovering from lumbago, and unable for the stooping posture essential for its proper working.

The rectum being empty, two ounces of linseed oil were thrown into it. One end of the lever having been oiled also, Mr. Thomson carefully, with a rotatory motion, passed it through the anus, and up the rectum, until it was felt above the brim of the true pelvis by pressing the abdominal wall. An Esmarch's bandage, which had been previously applied to the whole limb and around the pelvis, to save for the child as much as possible of the blood that had circulated in the limb, was removed. Mr. Thomson, at the commencement of its unrolling, brought forward the protruding end of the lever, making a fulcrum of the perineum, thereby throwing the other end backward and compressing the common iliac artery in the groove between the bodies of the lumbar vertebræ and the psoas magnus muscle. Pulsation at once ceased in the femoral artery, and the operation was then commenced and soon completed. So effectual was the control of the iliac artery, that at the very utmost not more than two ounces of blood were los. Indeed, it is probable, that when the operation was finished, the child, thanks to the elastic bandage also, had more blood than she possessed before it. It is a source of great satisfaction to me to be able to report that, with the exception of some vomiting the day after the operation, seemingly caused by absorption of carbolic acid; the urine being then dark olive-brown, nearly black, from the presence of thed rug (exhibits specimen) she has not had a symptom to excite alarm for her safety. The urine was tested by our assistant physician, Dr. Walter Smith, who reported to me that although free from blood and albumen, there was no doubt of the presence of carbolic acid. Those who believe in the deleterious influence of bacteria on the system after operations, might argue with much plausibility that the circulation for a few hours of carbolic acid in the blood may have had some influence in leading to her present favourable condition.

I should observe that the lever used was the smaller (in diameters) of the two exhibited; the other, the one described above, being a little too large for the child. It was turned for me by Mr. Prescott, of South King Street, Dublin, and has not warped which the larger has done.

Before I sit down, I had better state that Mr. Davy mentions in a letter I received from him, dated the 20th of February, that he was using the lever in compressing the common iliac artery for the cure of an external iliac aneurism.

## ON THE THERAPEUTIC EFFECT OF THE INHALATION OF THE FUMES OF BURNING NITRE PAPER, IN ASTHMA.

By DENIS CROFTON, B.A.

THE beneficial effects arising to the patient in a fit of asthma from inhaling the fumes of a bibulous paper steeped in a strong solution of nitre, then dried, and afterwards set fire to, and the smoke inhaled, have long been known. The fact has been recognised by the most able writers on asthma, as Salter, Trousseau, and Watson, but no explanation has been offered of the *modus operandi*. Our effort here shall be in some degree to do this, or, at least, to make a tentative effort in that direction. *In limine*, it may be stated that by "asthma" we mean nervous spasmodic asthma, uncomplicated, or but little complicated, with other affections. It is not dyspnœa proceeding from the condition of the heart, from dropsy, severe bronchitis, emphysema from a wounded lung, &c., although in ordinary parlance all such forms of difficulty of breathing are frequently clubbed together under the general name of "asthma."

Let us first find out the nature of our remedy; then the diseased condition; and, lastly, the method of relief.

In the first instance, we may reckon the very slight quantities of carbonic acid, carbonic oxide, and watery vapour generated from the burning of the paper as quite inconsiderable, and not to be taken into account. Next, the violet colour of the flame (which may be seen more clearly when a portion of the paper is burnt at a gas jet) shows that the potash of the nitre undergoes dissociation; but the potassium oxidises again, as the solid residual product is a fused mass, shown, by its sluggish combustion if ignited, to consist evidently of a mixture of potassic carbonate and nitre. And now the nitric acid remains to be dealt with. No acrid gases arise from the burning. We may therefore eliminate nitric oxide and nitrous acid, and fairly assume that the nitric acid passes into nitrous oxide and oxygen. So far for the nature of the remedy.

Let us now investigate the diseased condition, which is a matter of difficulty, and must be approached with becoming diffidence. It is impossible to vivisect an asthmatic patient during a fit and observe the morbid processes. Nor can the stethoscope alone do all we want. But analogy may do something. What is cognisable? We find an obviously nervous disorder violently assailing and contracting the dorsal and thoracic muscles, and it has been shown by Moleschott and others, that the more minute bronchial tubes contain around them, muscular rings, which there is fair reason to suppose may also be brought under the influence of spasm, and contract so as to impede the influx of air to the air-cells and mucous membrane, and thereby prevent normal oxidation of the blood.

Having so far cleared the way, it will be well to examine the method, or presumed method, of relief. This we believe to be due to two factors—first the effect of the liberated nitrous oxide upon the nervous system, having its secondary effect upon the muscular one, and so relaxing the spasm which contracts the bronchial rings, thereby opening them, and allowing inspiration and expiration to go on freely. Next to this comes the benefit derivable from the oxygen also liberated, which can now, through the enlarged diameters of the tubes, be freely inspired to aerate the blood, and afterwards freely expired as carbonic acid and watery vapour.

If our hypothesis be correct, it would appear that nitrous oxide alone (or properly diluted) would produce the beneficial effect, although more slowly, by doing for atmo-

spheric air what it does when liberated from the burning paper for its associated oxygen, and that oxygen alone (or properly diluted) without nitrous oxide, could not be expected to confer the same benefit, as the tubes might remain contracted, and so offer an impediment to expiration of the generated carbonic acid.

In illustration of these two positions, we have heard a remarkable instance. A young geologist of our acquaintance, happening in India to live in the house with an old gentleman who was asthmatic—upon the latter being seized with an attack at night, made a bagful of nitrous oxide, which he caused the patient to inhale, and which brought immediate relief. Subsequently, on another attack occurring, he gave him oxygen, but with little or no benefit.

In what we have said about nitrous oxide, we have spoken of it in its topical, or presumed topical effects. Its constitutional action should also be taken into account. This is known to be great, from the symptoms which it produces when inhaled by healthy persons, in whom it often brings on the effects of laughing, pugnacity, &c.

Some further experiments are desirable in this matter. Could they be made upon a patient whose asthma was uncomplicated, or nearly so, they would be of the greater value. First, it would be well to try the inhalation of a mixture of nitrous oxide with only atmospheric air. Secondly, a mixture of oxygen with only atmospheric air; and if this latter were found beneficial, which may be doubtful, a useful burning paper might be made by substituting chlorate of potash for the nitrate. This we have once known used; but as the patient was not suffering from a fit of asthma at the time, no conclusion can be drawn.

We have thus tried roughly to investigate an interesting subject, and trust that others who handle it afterwards may be able to throw more light upon the question, and so confer a benefit upon humanity.

# Clinical Records.

## GUY'S HOSPITAL.

*A Case of Hysteria with Vomiting.*

Under the Care of Dr. GOODHART.

(Reported by Mr. A. PHILLIPS HILLS.)

E. S., æt. 12, was admitted under Dr. Goodhart on March 18th, 1879.

*Family History.*—Father alive and healthy. Mother suffers from jaundice and varicose veins. Has two brothers and one sister, with whom patient had whooping-cough and measles.

*History of Patient.*—Since measles, has been rather deaf. Not been subject to cough. Well till Feb., 1878 (with the exception of above complaints).

*History of Present Attack.*—On Feb., 1878, had a fright, and soon afterwards became sick after taking food; this gradually becoming more frequent. Four months ago hysterical fits came on, occurring about once a fortnight; getting gradually more frequent, and for last three weeks have occurred nightly.

*Condition on Admission.*– Quiet expression of face; skin hot and dry; hair light brown, rather thin, has come out much during last twelve months; teeth very irregular (canines ? syphilitic). Appetite bad; considerable thirst; always vomits immediately after taking food, apparently all that was taken, with sour mucus. Bowels irregular. very much wasted, except face, which is pretty plump. Has not walked for three months; says she cannot stand on her legs. Respiratory and circulatory organs normal; Urine, sp. gr. 1,044—no albumen, sugar, or blood; small in quantity; on standing, a quantity of lithates come down, equal to about 25 per cent. of bulk of urine. Ordered by house physician,

℞. Aqua camphoræ, ℥ss., t. d. s.

Diet, milk, beef-tea. To remain in bed.

March 19th.—Had a slight crying fit last evening; complains of headache.

20th.—Complained that lying in bed made her headache, and asked the sister to let her get up in a wheel-chair. The sister knowing the case to be one of hysteria, said she could not allow her to get up unless she could walk. Soon afterwards patient said she thought she could walk a little if a trial were allowed, so to test her before Dr. Goodhart went round, she was allowed to get up, and walked about ten yards leaning on a nurse's arm, and then back to her bed alone. In the afternoon, Dr. Goodhart came round, and said a great deal could be done in hysteria by means of rewards and punishments, so told her walking was bad for sickness, but as soon as that stopped she might get up a little, and ordered emplastrum lyttæ, 2 × 2 in., pro applic. ad. epigastrium.

℞ Ferri sulph. gr. j.;
Aqua camph. ℥j., t. d. s.

Milk 1 pint, with ice.

21st.—Patient has not been sick since seeing Dr. Goodhart.

22nd.—Wants to get up.

23rd.—No more sickness. Got up yesterday afternoon, and walked about ward.

25th.—Up daily; no sickness; to have fish diet.

29th.—No vomiting; appears well, but thin from want of nourishment. Had meat for dinner to-day without any evil consequences.

April 2nd.—Left the hospital this afternoon; eats, drinks, and sleeps well; no vomiting; walks well; no appearance of any illness.

# Transactions of Societies.

## BIOLOGICAL SOCIETY OF PARIS.

AT the February meeting of this Society, M. PAUL BERT communicated an interesting note

ON ANÆSTHESIA BY THE PROTOXIDE OF AZOTE.

The Author in introducing the subject remarked, that his method of applying the protoxide of azote to human beings was put in practice on a young woman, æt. 20; the operation consisting of tearing out the nail, with extirpation of the matrix, a very short operation, but at the same time, extremely painful.

At 11 o'clock, continued the author, we entered the great bell *à compression* of the splendid ærotherapeutic establishment in the Rue Male-sherbes, under the direction of Dr. Daupley—the party consisting of the patient, Dr. Leon Labbé, who was about to operate, M. Preterre, whose experience is very great in the employment of protoxide of azote, MM. Reynard, Laffont, Blanchard, and self. At 11.10 pressure was increased by 17 cent., without any of us feeling any change, with the exception of some buzzing in the ears and a feeling of tension of the membrana tympana, easily corrected by a movement of deglutition. M. Preterre applied to the nose and mouth of the patient the mouth-piece which he daily uses, and which communicated with a large bag filled with a mixture of

| | |
|---|---|
| Azo | 85 |
| O | 15 |

After some seconds of hesitation, the patient began to respire deeply, insensibility and muscular resolution came on almost suddenly, in a quarter of a minute, more or less. M. Labbé then performed the operation with his well-known skill, and without any sign of pain or of reflex movement being shown by the patient. The eye was closed, but insensible, the pupil a little contracted. About the fourth minute, as M. Labbé was dressing the wound, some contraction of the hand and feet occurred. The operation was terminated, and the mouth-piece was taken away. It was then fifteen minutes past eleven, The contractions immediately ceased, the patient

remained insensible for about half a minute, and then said, "It makes me feel ill," and had a short crisis of tears. In less than a minute afterwards she sat up, and declared she did not feel anything with the exception of a slight headache; there was no *malaise*.

As regards appearance, nothing could be more different than this easy and calm awakening, from that following anæsthetic poisoning by the carburets and chloro-carburets of hydrogen. During all the phase of insensibility the pulse remained calm and the skin retained its rosy tint. The total pressure was equal to 75 c. + 17 c. = 92 c.; the tension of the protoxide of azote may be expressed by the formula—

$$85 + \frac{92}{76} = 104$$

that is to say, it was a little higher than that of the protoxide absolutety pure, respired under normal pressure.

The tension of the oxygen was $15 + \frac{92}{76} = 18{\cdot}4$, that is to say, a little lower than that of air (30·9). The difference is too slight to induce any trouble; it is as if one were transported to Chamounix (barometric pressure, 67 c.).

It is then proved by experience on man, as we have so often seen it on a dog, that with a mixture which, at ordinary pressure, will not produce any anæsthetic phenomena, we may by compression (1) obtain complete insensibility; (2) maintain it for a long time without any fear of asphyxia.

The protoxide of azote is now introduced into surgery, with its four principal advantages upon which I have insisted:—

1. No discomfort in application.
2. Dosage easy.
3. Perfect innocuity.
4. Immediate return to sensibility.

# Department of Lunacy.

## THE CARE OF THE INSANE.

THERE are very few subjects which have at various periods of our history occupied the attention of mankind more than the care and treatment of the insane. Parliamentary committees and meetings have frequently been held to inquire into the working of the lunacy laws.

Under the feudal system in England, when lands were held under military tenure, lunatics were placed under the immediate protection of the Crown. During the year 1272, in the reign of Edward I., a statute was passed giving the property of those insane *a nativate* to the Sovereign. In the following reign an Act *de prærogativa regis* was made by which the King became the possessor of the property of all natural fools during their life-time, restoring it to the lawful heirs at the death of the lunatic. In 1547 we read of the foundation of Bethlehem—the first hospital for the insane in England—and in 1644, during the reign of Charles I., it was proposed to enlarge it, but this could not be done, in consequence of its being in a confined situation; but in 1675 it was removed to Moorfields, the building beiug erected at a cost of upwards of £17,000, and the design taken from the Tuileries, at Paris. The first clause referring to the legal care of lunatics is a section in the Vagrant Act, by which two justices of the peace were authorised to issue a warrant for the arrest of any lunatic, who was to be locked up in a secure place, or if it was found necessary, chained and confined in his own parish. The first Committee of the House of Commons was appointed in the year 1763, who examined many witnesses and the following resolution was passed—"That it is the opinion of this Committee that the present state of madhouses requires the interposition of the Legislature." A discussion arose in consequence of this resolution, but nothing was done for ten years after the Committee had sat, when Mr. Townshend introduced his Lunacy Bill, the first that was framed by Government relating to this important subject. In 1814 the attention of Parliament was again directed by Mr. Rose to the question of the supposed incarceration of sane persons in asylums. This Bill, though passing the Commons was thrown out by the House of Lords, and led to the appointment of another Parliamentary Committee, who, though appointed in 1814, did not examine the witnesses until the subsequent year. The Report framed by this Committee was laid by Mr. Rose before the House. Nothing resulted, and another one sat during the session of 1816, who decided that the immediate interference of the Legislature was required to reform and organise our lunacy laws. Many legislative measures were from time to time introduced, but they were all rejected by the House of Commons, and it was not until the year 1828 that any new lunacy law was made. This was introduced by Mr. Gordon, and seconded by Lord Ashley (now Lord Shaftesbury), the Chairman of the Board of Commissioners. In 1833 an amended Act was passed, and in 1845 Lord Shaftesbury introduced our present Act, 8 and 9 Vic., c. 100, which was slightly amended in 1853 and 1862. Attempts have frequently been made since then to bring about additional legislative enactments in our Lunacy Law. Questions of a very erratic character have been asked in the House by some of its members, in consequence of some sensational case which has occurred; and, lastly, a Committee was again appointed last year who examined witnesses, and, after a lengthened deliberation, issued a report which, up to the present moment, has led to no reform in lunacy matters; but we are anxiously awaiting the Lunacy Bill of Mr. Dillwyn, about which he gave notice last week, and to which we shall again allude.

---

WE wish to draw the attention of our readers to the *Journal of Psychological Medicine* which has just appeared. It contains a number of articles to which we shall refer *in extenso* on a future occasion. One on "Mad Poets," and one by Mr. Paget, magistrate, on "Constance Kent and the Road Murder," are well worthy perusal as the subjects are discussed fully. The present number is replete with interesting matter, and it is deserving of the support of those interested in the treatment and care of the insane.

# Special.

## LICENSING OF FOREIGN MEDICAL MEN IN FRANCE.

SUMMARY Report furnished by M. Frébault, Deputy, in the name of the Fifth Initiative Parliamentary Committee charged with the Examination of M. Roger-Marvaise's Bill for the Licensing of Foreign Medical Men in France.

Gentlemen,—During the Session of April 29th, 1878, a Bill for Licensing Foreign Medical Men to practise in France was presented at the office of the Chamber of Deputies by M. Roger-Marvaise. This Bill is simply the reproduction of one already presented by him during the Session of March 29th, 1876. The Chamber, on this occasion, not only voted that the Bill should be considered, but had also appointed a committee to do so, when a dissolution put an end to all further proceedings.

Article 4 of the Law of the 19th Ventôse, year XI. of the

Republic (10th March, 1803), which applies to this matter, is thus worded :—

"It shall be in the power of the Government, if it consider it suitable to do so, to grant to foreign physicians or surgeons, graduates of a foreign University, license to practise medicine and surgery within the territory of the Republic."

In a remarkably clear exposition of his views, M. Roger-Marvaise particularly insists on the following points :—

That the tests imposed, by the Law of the 19th Ventôse, year XI. of the Republic, on Frenchmen desirous of practising medicine in their native land, are instituted in the interests of society for the protection of the persons and the health of the citizens of the Republic.

That Article 4, introduced for the purpose of strengthening the Royal perogative, is contrary to the spirit of this law.

That, as a matter of fact, since it has been in action, it has ever been a source of abuse, and has been strongly condemned, under all circumstances, by the most distinguished representatives of the French medical body.

For these reasons he proposes that the Chamber should adopt in its place the following resolutions :—

Article 1.—Article 4 of the Law of 19th Ventôse, year XI., relating to the practice of medicine, is altered as follows :—

Foreign physicians and surgeons, graduates of a foreign University, may obtain a dispensation of the academic course, from the Minister of Public Instruction, on notice having been given by the Faculty of Medicine that they have passed before it, the so-called authorised examinations.

They cannot obtain a license to practise medicine and surgery, within the territory of the Republic, without having passed two examinations ; one theoretical, the other practical, of which the forms and matter shall be prescribed by a regulation of the Public Administration.

Any foreign physician or surgeon who shall have passed these two examinations, will receive the title of authorised physician or surgeon.

Article 2.—No person practising medicine shall take the title of Doctor, if this title has not been conferred on him by a French Faculty. Any unauthorised person assuming the title of Doctor shall be liable to a fine of from 50 frs. to 1,000 frs., and to an imprisonment of from six days to six months.

Article 463 of the penal code is applicable. The Bill of our honourable colleague appears to the Committee to unite all the conditions which should recommend it to the serious consideration of the Chamber. As has been remarked by its author, the examinations imposed on young men intending to devote themselves to the practice of medicine, are tests instituted in the interests of society, for the security of the persons and health of the citizens of the Republic. They are guarantees of society against ignorance and charlatanism, and are essential to one of the most honourable professions, for the preservation of that dignity which should ever surround it.

Article 4, therefore, is contrary to the spirit of this law, giving, as it does to the Government the power of granting to foreign physicians, who do not present sufficient guarantees of their efficiency, those prerogatives enjoyed by physicians, members of our Faculties.

In several European countries, in order to preserve the public health against the too great indulgence of University examination boards, independent of the Government, the law attaches no professional rights to the title of "Doctor," and the right of practising medicine is granted to those only who have obtained a title distinct from that of "Doctor" from a Government examination board, acting in the name of the Government.

Throughout the whole extent of the German empire, in Holland, and in German Switzerland, the title of "Doctor" confers no professional rights. It has, therefore, appeared to the committee to be but just that such guarantees as are imposed on them in their own countries should be exacted from all foreign physicians desirous of practising in France ; but what should be the extent of these guarantees ?

Should we consider as absolutely null all titles previously acquired by them, and require from them not only those tests imposed on all students when beginning their studies, but also certificates of their academic course? This would be excessive, and the first article of M. Roger-Marvaise's Bill appears to provide for all interests concerned in a most satisfactory manner. Before advising its adoption, however, the committee have considered it necessary to examine the question of reciprocity in a special manner.

In imposing certain tests on foreign medical men desirous of practising in France, do we not affect unfavourably the interests of our fellow countrymen who are desirous of practising in foreign countries? This question is fully answered in M. Spuller's Report, in which we read :—

"The committee having applied to the Minister of Foreign Affairs for information, a precise and detailed account of the state of the law in relation to the practice of medicine in the countries in which they resided was by him immediately demanded from our foreign agents. All these accounts have been forwarded to the committee. From the study of the documents furnished by the Minister we have arrived at the conclusion that our honourable colleague's propositions tend to place France, as regards the subject to which our attention is now given, on the same footing as the greater number of the other Continental nations."

It is noteworthy that nearly everywhere it is not academic certificates which are required from foreign medical men desirous of practising, but proof of having passed several probationary examinations before national faculties or special examination boards appointed by law. We have among our colleagues in the Chamber of Deputies men who, in order to practise during a time of exile, have been obliged to pass these examinations, even in the frontier countries, in places but a short distance beyond the limits of our territory. In fact, with the exception of the United States of America, in which professions are free, the Spanish Republics of South America, and three or four Swiss cantons, though academic certificates are dispensed with, yet all foreigners are required to pass an examination before obtaining a licence for the practice of medicine and surgery. It is M. Roger-Marvaise's Bill, therefore, which virtually establishes reciprocity in this matter.

The first article of our honourable colleague's Bill is, then, completely justified, as the title of "Doctor," which is so highly appreciated when conferred by a French faculty, does not enable any of our countrymen who are desirous of practising in a foreign country, to dispense with the probationary examinations.

The second article appears to the committee to be of equal importance. The title of "Doctor" denotes that its holder has obtained, after long and laborious study, the public confidence ; it is essential, therefore, that it should be borne by those only who are worthy of it.

On examining the Medical Directory we find the names of a considerable number of doctors who have obtained their degrees from the Faculties of Jena, Giessen, Louvain, and elsewhere, and who are far from being in a position to furnish the scientific guarantees required by our legislation. Further, as has also been remarked by our honourable colleague, a considerable number of sanitary officers go to foreign countries, and, having there acquired, often by unjustifiable means, the title of "Doctor," which they were unable to obtain in France, take this title, omitting all mention of the Faculty by which it has been conferred.

This is a fraud which the law cannot tolerate without serious injury to the reputation of the French medical body. For these reasons the Fifth Initiative Parliamentary Committee proposes that the Chamber of Deputies shall take into consideration M. Roger-Marvaise's Bill on the Licensing of Foreign Medical Men in France.

---

THE notorious plaster of Paris flour adulteration case terminated on Saturday with a verdict for the defendants, the jury holding the opinion that the original exporters were the guilty parties, no proof being adduced to show that the recipients were cognisant of the fraud.

---

A TELEGRAM from Egypt, dated Friday, states that Mr. Baird, who was sent to Upper Egypt to take measures for relieving the starving population, has sent in a report to the Government, in which he fully confirms the appalling extent of the famine, and proves by statistics that 10,000 persons have died from starvation alone in Ghirgeh, Kena, and Esna.

## THE LAST SITTINGS OF THE MEDICAL COUNCIL.

As we have already mentioned, Sir J. Paget and one or two other members were of opinion that no report respecting the reconstruction of the Medical Council should have been issued, considering that it was the intention of the Government to appoint a Select Committee to inquire into the matter. Sir James Paget thought that this vexed question should have been left entirely to that committee, before whom any member of the Council could have stated his own views. It is to be regretted that this good advice was not taken, for although we would not go so far as to say with some that the character and result of the recent discussion of the Council respecting its own reconstruction was such as to forfeit the good opinion of the profession, we must confess that very little can be said in favour of that discussion. Indeed, one or two of its own members appear to have entertained a similar opinion. Dr. Pitman expressed his "disappointment at the small amount of work that has been done by the Council during its present sitting;" and although it does not follow that a reconstruction of the Council would have saved it from so humiliating a reflection, such a confession coming from one of its own members, coupled with the almost enforced and adverse criticism of the press, are not calculated to allay the outside agitation on the subject. Sir James Paget said he did not regret that the discussion had taken place, because it had given all members an opportunity of stating their views. Considering, however, the great expense that is involved in the sittings of the Council, as well as the valuable time of most of its members, something more may be reasonably expected from that body than a long, desultory, and barren discussion on a subject which is of so much importance that the Government thinks it worth while to appoint a Select Committee to inquire into the matter.

Moreover, the general tenour of the debate was in more than one respect very unsatisfactory. Not only was the general opinion of the Council exactly the reverse of that which it had formerly expressed on the subject, but it repudiated its own past views of the subject in such a cavalier fashion as could not fail to be offensive to the rank and file of the profession. There is nothing so very unreasonable in the agitation in behalf of a more direct and very partial representation of the profession, as to call for the strong remarks, or to warrant the selfish views that were made or expressed by some of the members of the Council. "Fanatics and wire-pullers" were scarcely the terms in which a member of the Medical Council should speak of those who merely ask that a very small portion —only three or four members—of that body should be chosen from among the great class of general practitioners. It was, moreover, natural that there should be some difference of opinion as to the best way of effecting the proposed reconstruction, but it was scarcely to be expected that the Council would reverse its former decision on the subject, and resolve that after all there was no necessity of making any change. An impartial consideration of both sides of the question forces us to declare that the grounds on which the agitation in favour of direct representation are based, are more substantial and more logical than any of the arguments which the Council adduced on the other side. As a matter of principle it will be generally conceded that the parties to be represented in the Council are the Government, the corporations, the profession, and the public. But in fact, while the Government, and through it the public, are represented by the Crown members, and the corporations by all the other members of the Conncil, the great body of the general practitioners, for whose education and in whose interests the Council was chiefly established, are precluded from having directly any voice in the management of its affairs. It is no use saying that the profession is sufficiently well represented by those who represent the universities and the different examining bodies, inasmuch as the interests of the corporations are not only not identical with those of the profession, but may be in many respects directly opposed to them.

It is needless, however, to pursue the matter further, as the question is so soon to receive the consideration of a Government Committee. We may, however, express our hope that the passing of the Lord President's Bill will not be jeopardised by the obstacle which the agitation in favour of direct representation has thrown in the way. The very decided opposition of the Council to the proposed reform shows that we have been all along right in recommending that the new Medical Bill as now amended should be passed with as little delay as possible, so that when this great instalment of medical reform has been secured, we may all be in a position to deal more effectually with the question of direct representation.

## HEALTH OF THE NAVY.—II.

PASSING on now to the prevalence of *syphilis* in the navy, we find that of the primary form, 1,692 cases were under treatment, and of the secondary 631. Compared with the previous year, there was an increase of primary syphilis to the extent of 3·6 per 1,000, as well as a slight increase in the secondary form. With regard to the Home Station, there was an increase equal to 4·16 per 1,000 when compared with the ratio in the previous year, but this increase was owing to a larger number of cases being entered in the three depôts for seamen, than in the previous year. In one of these depôts (*Duke of Wellington*) 81 cases were recorded, of which as many as 39 were contracted out of the district (Portsmouth). Moreover, at Sheerness Barracks, the primary disease chiefly occurred in men who had contracted it, before joining the barracks, in unprotected districts. "The number contracted in Sheerness itself has been but small, thus proving the efficacy of the Acts. The largest percentage of cases occurred on the coast-guard ship, at Hull, an unprotected port. In the vessels composing the Channel Squadron, there was an increase both in the number and virulence of the primary disease, chiefly attributable to the squadron having been at anchor at Portland (an unprotected port) for some time. In the *Black Prince* many cases were contracted at Portland, Weymouth, or Dorchester, and these were extremely virulent. "I cannot," says the medical officer, Fleet Surgeon Keenan, "too strongly endorse the desirability that those places should have the benefits of the Contagious Diseases Acts extended to them, more especially as Portland has lately become a rendezvous for the Channel Squadron." The medical officer of the *Thunderer*, in commenting upon the large number of cases entered on the sick list of that ship, expresses the same opinion. As a striking instance of the benefit to be derived from preventive treatment, we find, in referring to the North American and West Indian Station, that the medical officer of the *Bellerophon* calls attention to the entire immunity from syphilis after the crew had been on leave in Quebec and St. John's, Newfoundland, and that he attributes it to the care taken by the public women, who have established among themselves a system of voluntary attendance at a medical office, and are admitted into the general hospitals at these ports. With regard to this station, great complaints are made of the lax manner in which the Contagious Diseases Acts are enforced at Barbadoes, where the disease was so prevalent and of so virulent a type as to call for a special investigation. Coming to the African Stations, we remark that one medical officer strongly recommends the introduction of these Acts at the principal ports of the Cape Colony, where venereal disease rides rampant, there being no kind of supervision whatever; while another complains of their inefficient administration at St. Helena, "as every ship on the African Station suffers severely from venereal disease amongst the men after a visit to this otherwise healthy place." Primary syphilis was very prevalent at Bombay and at Sydney, Australia. At the former place, the Contagious Diseases Acts have not been enforced on account of the expense; while at Sydney, the increase of the disease was attributed to infected prostitutes flocking from the neighbouring colony of Queensland, which is protected, to Sydney, which is not protected, and where they can ply their calling without any hindrance. But of all places the China Station is the one where the ravages of syphilis are most to be dreaded. The ratio for the primary disease was as high as 69·01 per 1,000. No disease on this station causes so much loss of service as primary syphilis; and 58 men were daily ineffective from this disease. Most of the cases of the primary disease were contracted at Hong Kong, while the rest, which were of a formidable character, were contracted at the various Japanese ports. We may, however, remark that the Contagious Diseases Acts are so well carried out at Hong Kong, that syphilis of a bad form may almost be said to be eradicated from that town. But the Acts only affect prostitutes who are resorted to by Europeans. There is a class of women not under any medical supervision, and it is amongst them that Europeans contract the disease. In consulting the tables to which we referred at the beginning of this article, it will be observed that while, in the years 1871—77, the ratio of primary and secondary syphilis was, in *ports under the Acts*, only 40·32 per 1,000 of Force, it was in ports *not under the Acts*, as high as 90·10. On the other hand, the tables show an "apparent" increase of gonorrhœa at the protected ports, as compared with the number recorded at the unprotected ports. This is said to be only apparent, because "previous to the time of the passing of the Contagious Diseases Acts it was not the practice of the navy to place slight cases of gonorrhœa on the sick list, and thus the majority of cases was not recorded." This explanation, however, is not very satisfactory, for on referring to the tables for 1871—77, years in which the Acts have been in full force, and in which we may presume that all cases of gonorrhœa were registered, we still find an increase in the ratio of this disease in the protected ports over those contracted at unprotected ports, for while the ratio for those years was 61·71 in the ports under the Acts, it was only 50· in the ports not under the Acts. This is at least a remarkable statement, the accuracy of which should be further investigated. It is not sufficient to say in a note, that "the apparent increase of gonorrhœa which has taken place at all the stations, whether under the Acts or not under the Acts, is probably due to this cause, and not to any real increase of disease." We may be sure that the opponents of these Acts will take some notice of this attempt to explain away a statistical statement which, as far as gonorrhœa is concerned, does not bear out the alleged protection afforded by them. Nor must we expect that the protection afforded by the Contagious Diseases Acts will ever be as great in respect of gonorrhœa as they undoubtedly are in respect of syphilis, inasmuch as the former disease is not always so easily detected in the female as the latter, and consequently is not, from a preventive point of view, so much under the control of the authorities who are charged with the carrying out of the Acts.

---

THE solicitor for Perryman, who was last week sentenced to death for the Kentish Town murder, has appealed to the Secretary of State for a reconsideration of the case, on the ground that three medical men were not called who were prepared to prove that the deceased had, to all professional appearance, died by suicide, and not murder.

# Notes on Current Topics.

## Are We Right or Left-Handed?

Dr. Crichton Browne, Lord Chancellor's Visitor in Lunacy, has issued a number of questions in the hope of solving the above problem. He has also lectured on the subject. We have heard of the coming man, who shall be ambi-dextrous, but, judging from Dr. Browne's lecture, the advent of this creature seems far distant, and the men and women of the future will have to content themselves with the general method in use of using the right hand—a method not imposed by custom, education, or tradition but as the result of a special organisation, depending on a motor centre, which leads to, if not impels, the use of the right hand.

This we gather to be the result of the condensed and necessarily mutilated accounts we have read of Dr. Browne's lecture. The subject selected for inquiry well illustrates the all-searching tendency of the age we live in. There is nothing too minute, in connection with man or his movements, to escape the attention of the scientist. A common place movement, like the use of either hand, to an ordinary mind would not seem a subject capable of being invested either with a scientific aspect, or even of being made popular or attractive. Moreover, it required a more than ordinary degree of what we might call self-reliance to issue such a number of questions as those framed by Dr. Crichton Browne, and to coolly ask us to expose our little weaknesses as regards our petty habits—about winking, walking, running, kicking, toying with our hands, &c., for on such seemingly trifling and unimportant data Dr. Browne is endeavouring to rear a superstructure, philosophically considered and argumentatively worked out, which will destroy the dream of ambi-dextrous advocates. Long-eared men—and we are afraid there are a large number in the world—might feel insulted at being asked such a pointed and personal question as—"Can you move your external ears separately; and, if so, which of the two do you move more freely?" Some men might have a delicacy in stating that they are possessed of this supposed asinine accomplishment.

Seriously, we trust that Dr. Browne will receive a sufficient number of replies to assist him in his investigations. We feel certain that he will extract all the wheat from the chaff (and we have no doubt there will be plenty of chaff), and present us with the result of his researches in a style worthy of his antecedent literary productions, which are well known to all, whether interested in psychological medicine or not, and which have deservedly gained for him a high rank as a *litterateur*.

## A New Saline Purgative.

M. Rabuteau announced some experiments he had made relative to the physiological action of the sulphomethyla e or methysulphate of sodium. It is a colourless salt crystallising with difficulty, without any disagreeable taste. M. Rabuteau first injected in the veins of a dog a solution of ten grammes in twenty-five grammes of water, without producing any diarrhœic phenomena. Later he administered to a patient in the Hôtel Dieu a dose of fifteen grammes in two glasses of water—the woman had abundant stools.

## Cremation.

It is to be regretted that one of the leading daily journals, though apparently writing impartially upon the subject of cremation, yet is unmistakably employing its influence to direct the feeling of the public altogether against cremation, and therefore to affect the decision in the House when the subject comes before them for consideration. Notwithstanding that the number of the people in favour of cremation is rapidly increasing, it is evident that the vast majority are from an imperfectly comprehended religious sentiment strongly disposed against this method of disposal of the dead, and would not fail to exert their influence to prohibit it, disregarding the matter as a question of science and the sanitary advantages which would accrue if cremation were introduced on a large scale, and unfairly disregarding the opposing sentiment of those who, dreading the burial of the body, are relieved from mental annoyance by the knowledge that they can exchange the grave for the crematorium.

We have already entered upon the arguments in favour of, and against, cremation, but there are one or two points recently referred to by the journals which cannot be allowed to rest undisputed. It must not be argued that because the individuals who at the present time desire this rapid and complete form of dissolution of the body after death are but few in number, therefore, the public gain will be too inconsiderable to warrant any reconsideration of the laws which are affected by it. It is impossible to say what views will be taken by the people in general when cremation has received the sanction of the Legislature, and just in proportion as the burial of the dead diminishes, so, logically, must follow the diminution of the evil consequences upon the living now brought about by the burial of the dead. It is a known fact that churchyards and cemeteries have been recently closed, and that vast numbers of useful wells in the neighbourhoods have been condemned in consequence of the evils ensuing; further it is no argument to say that in future our graveyards are to be removed far away from our populous districts, for no greater centre of attraction exists than a new necropolis. Stone-masons and labourers congregate, shops are opened the choice spots around are selected as the sites of mansions because of the travelling conveniences which the necropolitan necessities have developed, and thus originate vast towns in the immediate proximity of the dead.

Perhaps the strongest reason that can be put forward in favour of burial and against cremation is, that exhumed bodies have been brought up in judgment against their murderers. But the records of generations must be searched to find such cases, in number more than can be counted upon the fingers, and the danger of foul play undetected is far over-balanced by the danger of a living entombment undetected such as there is too much reason to believe has occurred in epidemics.

The increased opportunity for foul play when the body is to be cremated is slight, yet it exists; and it is for Parliament to consider how it may be averted—a matter of no difficulty. It is, however, to be remembered that Parliament is not called upon to make cremation compulsory upon the people, but only to permit it on the part of the few who, for their own particular

reasons, have a strong desire that with life their body also should cease to exist. A majority have no right to coerce a minority, provided the actions of the latter concern themselves only; and if any person should choose, during life, to determine that his or her body should be disposed of by cremation, it would be a retrogressive act on the part of the Legislature to prohibit it.

## Vaccination Certificates.

We informed our readers some weeks since that the Irish College of Surgeons had decided to require a certificate of instruction in vaccination from all candidates for its licence after August next. The Council of the College has finally adopted the regulations on this subject, which are as follows:—

Any public vaccinator, holding office under the Local Government Board for Ireland, may be recognised by the Council as entitled to grant the certificate recognised for the letters testimonial of the College, if he shall produce such evidence as shall satisfy the Council:—

*a.* That the number of vaccinations performed by him at his dispensary are sufficient for the instruction of students.

*b.* That he has made special arrangements for the instruction of students upon at least two days in each week during the period covered by the certificate.

The instruction shall include—

1. The performance of the operation of vaccination.
2. The conditions of the patient which contra-indicate vaccination.
3. The characteristic appearances of the true vaccine disease at the different stages of its course, and the deviations therefrom, which are compatible with its protective influence.
4. The taking of lymph, and the method of preserving it in tubes or on points, and of recognising impurities.

The candidate shall be liable to be examined upon these subjects at his final examination.

The certificate required from candidates shall be in the following form:—

*I certify that Mr.*
*has diligently attended upon the instruction given by me during months ending the day of* 187 *, and that he has been duly instructed by me in the performance of the operation of vaccination, and in the allied subjects, as required by the regulations of the College.*

(*Signed*)
Public Vaccinator,
Vaccine Institution or
Dispensary.

Dated this day of 187 .

Public vaccinators shall return to the Registrar of the College, at the commencement of the period of instruction, the names and addresses of all students who shall be entered by them for instruction; and no certificate shall be received unless it shall be dated at least one month subsequently to such return. The Council may revoke their recognition of the certificates issued by any public vaccinator if it shall appear to them, from examination of the students instructed, or for any other reason, that the instruction is insufficient.

It will be observed that all public vaccinators are eligible to become recognised instructors in vaccination, but they must apply for special recognition—make special arrangements for *bonâ fide* instruction—return the names of their pupils before the period commences. If gross ignorance be displayed by such pupils on examination the ecognition may be revoked.

## Professional Confidences.

In a recent lecture delivered by Dr. Kinkead, Professor of Forensic Medicine in the Galway College, he said:—

A question often arises: Is a medical man justified in refusing to answer a question on the ground that by so doing he would violate professional confidence? The law allows us no such privilege, which it extends to the Church and the Bar; and yet, gentlemen, to us, in the exercise of our profession, are confided secrets no less momentous than the confidence of a client in his counsel, involving frequently the honour of families, the life-long happiness of individuals—no less sacred than the confession of the penitent to his clergyman. These secrets the law tells us we are bound, under penalty of contempt, to divulge in open court. Such a law, in my opinion, is more honoured in the breach than in the observance. I trust that if it ever falls to your lot to decide whether you will obey or not, that you will elect to keep sacred the confidence of your patient, and undergo whatever penalty may attach to your silence, rather than betray the trust which, perchance in a moment of pain or weakness, in a hope of relief from suffering, and in firm belief in your faithfulness and honour, was committed to your keeping.

We entirely concur with Dr. Kinkead's feeling, and we believe that the good sense of our judges will protect medical men in their refusal to divulge the professional confidences of their patients. It is time that the position of medical men in this matter should be distinctly understood, for it is, but a few weeks since, that a Poor-law inspector in Ireland assumed the right to compel a medical man to testify to a conversation which had no reference to his official duties, and, in the end, succeeded in frightening the doctor into a full confession of all details.

## Longevity of Quakers.

It appears from the annual list of the members of the Society of Friends, that the number of deaths among that body during the past year, in Great Britain and Ireland, was 281. There are about 17,000 members; the mortality is consequently much below that of the population generally, and shows the longevity which prevails among the members of the Society. The infant mortality was very small, only 15 deaths of children under one year; between 1 and 5 years, 18 occurred; between 5 and 20 years, 11; between 20 and 30 years, 19; from 30 to 40 years, 15; and 11 only between 40 and 50 years. Above 50 years old the numbers rise, the deaths in the first decade being 24; between 60 and 70, 46; while from 70 to 80 (the most fatal period) the deaths were 65. Above 80 and below 90 the number was 53—a very high rate out of a total of 281; while from 90 to 100 there were 5 deaths. Of the total 281, 147 were males and 134 females.

## The Netley School.

The thirty-eighth session of the Army Medical School was opened on Tuesday, the 1st inst., when the introductory address was delivered by Professor F. de Chaumont, M.D., who welcomed the new candidates for the Indian and Naval Medical Services, and expressed regret that the Army was still unrepresented, a state of things which, it was hoped, would not occur again. The present session is attended by fourteen candidates for the Naval Service, besides two officers of the Indian Service, one surgeon-major and one surgeon.

## M. Renan's Address at the French Academy.

M. RENAN'S brilliant reception at the French Academy was signalised by a remarkably eloquent and eulogistic description of the life and labours of Claude Bernard. "Claude Bernard," said M. Renan, "was the greatest physiologist of our age. He spent his life in an obscure laboratory at the College de France, and there, in the midst of the most repulsive spectacles, inhaling the atmosphere of death, with his hands steeped in blood, he discovered the most hidden secrets of life; and the truths that proceeded out of this sad retreat dazzled all who knew how to see them. A writer he certainly was, and an excellent writer, for he never gave the matter a thought. He possessed the first quality of a writer, which is complete unconsciousness of the process. His style is his very thought, and as that thought is always lofty and powerful, his style also is elevated, solid, and strong." We were particularly struck with this last observation, for we have always considered that as medical and other scientific writers have chiefly to state in plain and simple language the results of their experience, observation, or reflection, they would naturally fall into a plain, perspicuous, and unaffected style of writing. It may, however, be doubted whether the nature of the subjects which scientists have to deal with is such as to enable them to write in an attractive manner, as there is so little scope for the point, epigram, illustration, graphic description, and other graces of style that characterise popular or eminent writers.

But the most original and thoughtful part of M. Renan's address was a few sentences, each of which might be made the text of a brilliant discourse. Alluding to the religious and other prejudices with which scientists have to contend, he said: "What do misconceptions signify in the eyes of eternal truth? *The purest worship of the Deity sometimes hides itself behind apparent negation; the most perfect idealist is he who considers that he owes it to a certain frankness to call himself a materialist. How many saints are concealed beneath the cloak of irreligion?* How many among those who deny immortality would deserve a startling disclosure? Reason triumphs over truth, and to work for reason is to work for eternity." These are certainly grand thoughts, the full meaning, the truth, and the purity of which, it will not be in the power of every one to understand. We have not space now to dwell upon the many points of interest in this eloquent address of the author of the "Life of Jesus;" but we hope that its publication will soon give us the opportunity of perusing it in the language in which it was delivered.

## Mr. Millerchip and the Poor-law Medical Officers' Association.

AT a meeting of the Council of this Association on April 1st, a resolution was passed, strongly disapproving of the very unjust and rigorous manner in which this surgeon has been treated by the authorities:—

"The Council are desirous in the first instance of pointing out that although it is in evidence that some fourteen applications for Mr. Millerchip's attendance were made at his house, it did not appear that Mr. Millerchip ever had more than one intimation that his services were required; although the father of the child was out of work, he never applied personally to Mr. Millerchip—only children were sent. If the father had called upon Mr. Millerchip he would have at once ascertained that at that time he (Mr. Millerchip) was suffering from perineal abscess, and his legally appointed deputy, Dr. Brown, of Coventry, was not only in attendance upon him, but was also visiting his other patients. Mr. Millerchip was not only suffering from this disease, but, according to affidavits of Drs. Brown, Plowman, and Mr. Reed, also from epilepsy of some years' standing, and it is shown that his memory was seriously affected thereby. And this Council begs to express their regret that the Home Secretary should have delayed so long his decision in this case. This Council wish also to signify their sense of the injustice done to the prisoner by the partial character of the charge made to the grand jury, and by the summing-up of the Lord Chief Justice Coleridge. They also feel that, even if nothing had been put forward in extenuation, the sentence would, even then, have been unnecessarily severe and unjust."

We willingly and unreservedly endorse the opinion thus expressed, and trust that the profession generally will do something to mark their sympathy with Mr. Millerchip, and the indignation they must feel at a member of the medical profession being, under the circumstances above mentioned, so unjustly and severely punished.

## The Revival of Bloodletting.

M. CHAUFFARD (*La Presse Medicale Belge*) thinks that phlebotomy is at the present day often neglected in cases where it might be found very useful. He lately had under his care in the hospital a young man, twenty years of age, robust, moderately stout, and rather plethoric, who, after enjoying good health, had a severe attack of hæmoptysis. By occupation he was a stone cutter, and doubtless the attack had been excited by the irritation caused by inhalation of the dust. The symptoms having lasted for three days without any signs of improvement he entered the hospital. After examining the lungs, and finding them free from any serious disease, M. Chauffard prescribed bloodletting to the extent of 500 grammes. The result was very remarkable, for the hæmoptysis, which had continued up to the time of the operation, ceased immediately afterward. His appetite and strength soon returned, and the blood so quickly recouped itself that no trace was left of the double loss it had undergone. It may be observed that the above is the inverse of what takes place in those cases in which a suppressed normal hæmorrhage gives rise to one that is vicarious of it. It is not, however, merely the accidental attack of hæmorrhage that may be arrested in this manner, for it should be borne in mind that the hæmorrhagic molimen to which, by habit, an organ has been subjected may be a source of danger. For instance, one of the most useful applications of bloodletting is the prevention of those catamenial congestions which persist after impregnation, and which lead to the separation of the ovum. Prof. Hardy, of Paris, has come out decidedly in favour of venesection in apoplexy, renouncing the doctrines of Trousseau, which have so long held sway. He prefers to bleed at the first sign of the return of consciousness.

## The Alkaline Waters of Vals.

M. CLERMONT, of Lyons, who has carefully studied these waters, says (*La France Médicale*) that they are very beneficial in biliary derangements, and that they stimulate

digestion, secretion, and the nervous system. The spring, *Précieuse*, from the bicarbonate of magnesia which it contains, possesses gentle laxative properties. Another character of this spring is the intimate mixture of its several ingredients. It contains carbonic acid to the extent of two grammes to the litre, and yet the solution of this gas is so complete that it is not seen to be attached to the sides of the glass. The bicarbonate of soda, of which there is 5-8 gms. per litre, does not impart to the water a disagreeable taste, and patients who have been drinking the waters of Vichy are astonished at the contrast, as regards taste, between the strong alkaline waters of that spring with the equally strong alkaline waters of Vals. The carbonic acid of these waters evidently plays a modifying *rôle*, and accounts for their agreeable taste. These waters are particularly serviceable in the treatment of biliary calculi. "I have," says M. Chabannes, "known at Vals people who, having never suffered from nephritic or hepatic colic, but from gastro-hepatic derangement of uncertain origin, have been attacked during 'the cure' with pains in the right side, in a very short time after which calculi were passed per anum."

## Nerve Stretching in Anæsthetic Leprosy.

Surgeon Laurie, M.D., Resident Surgeon of the Medical College Hospital of Calcutta, states in the India *Medical Gazette* that owing to the difficulty in following up cases in dispensary practice, he has not been able to report upon one complete case of local anæsthesia treated by nerve stretching. One such case has, however, now occurred to him, and the result is satisfactory. A European female consulted him on March 22nd, having suffered for four months from pain and tingling in the hand and forearm, gradual loss of sensation in the ulnar area of the hand, and a peculiar weakness and stiffness in the fingers. The ulnar nerve was much thickened; the ulnar area of the hand was of a dull red, with complete anæsthesia all over this discoloured patch; and the hand had a wasted appearance, due to atrophy of the muscles supplied by the ulnar. The nerve was stretched the same day under chloroform, and in a few days considerable improvement took place. When the patient was seen six months afterwards, no trace of disease existed in any part of the hand, forearm, or arm, the woman having been quite well from the time the wound had healed.

## Corns and their Treatment.

M. Guibout (*L'Année Médicale*) says that corns consist of an induration and hypertrophy of the epidermis which grows downwards, taking the form of a nail, with the point directed against the deeper parts. The portion of skin adjacent to the induration, becomes inflamed and altered; its papillæ disappear, and at last it becomes a true matrix, producing from below new layers of hard epidermis as the upper ones are removed. His treatment is to soften the corn by applying to it for one night an ointment consisting of equal parts of turpentine and acetate of copper, mixed with white resin and yellow wax. The corn is then to be excised with scissors, care being taken to go deep enough to remove its summit. After excision, the matrix should be cauterised with sulphuric acid, to prevent the corn being reproduced.

## The Eighth Congress of the German Surgical Society.

It is announced that the above Congress will meet at Berlin on April 16. The sittings will take place on April 16, in the hall of the University, from 12.30 to 4 p.m., and on April 17, 18, and 19, from 2 to 4 p.m. Demonstrations of patients and preparations will be held from 10 a.m. to 1 p.m. in the University Clinic and at the Charité Hospital. Objects for exhibition will be received at No. 7 Ziegelstrasse, Berlin, N., and the address of the office of the Society is "Berlin, N.W., 3 Roonstrasse." The President for the coming meeting is Professor Von Langenbeck.

## The Abortive Treatment of Bubo.

The following plan is that adopted by the French surgeon, Malplaquet:—

The cuticle over the swelling having been removed by blistering fluid, to the extent of a shilling piece, a scrap of lint steeped in a saturated solution of perchloride of mercury was applied to the raw surface, with a linseed poultice over all, and left for about twenty-four hours. When again seen, a greyish eschar was found to have formed, and we had occasion to notice that the firmer was this eschar the more certain and speedy was the good result. After two or three days' poulticing, a clean, shallow, granulating depression only remained for treatment, and readily healed by simple means, the swelling itself having meanwhile quite disappeared.

## Minims and Grains—Poisoning by Atropine.

The Leeds coroner lately held an inquest upon the dispenser at the Leeds Dispensary. The deceased was suffering from acute consumption, and it was stated that at most he could not have lived more than two or three weeks. At a consultation between his medical adviser and Dr. Clifford Allbutt, the former prescribed a solution of atropine, one minim to the half-ounce. The prescription was taken to the dispensary, where, unfortunately, one minim was read as one grain, and a dose of this strength was administered to the deceased, who died some hours afterwards. The jury returned a verdict of died from misadventure.

## The Mortality in Dublin.

It is worth recording that last year (1878) there were 1,369 burials in Mountjerome, the Protestant Cemetery of Dublin. For the first three months of 1878 there were 380 burials, and for the first three months of this year (1879) there have been 474 burials, nearly 100 more than in the corresponding period of last year. These returns, it should be recollected, have special reference to the deaths of the upper classes within the Dublin district.

## "Castor-Oil" Pills.

Bell and Son, of Liverpool, the manufacturers of the pills in respect of which a store manager was recently fined under the Food and Drugs Act, have abandoned their appeal against the conviction. It will be remembered that a box of pills, purporting to be "compound castor-oil pills," was purchased and sent for analysis to the county analyst, who certified that the pills "contained no castor oil."

## Stammering.

Dr. J. Schrank, of Munich, alleges stammering (*Medical Reporter*) to be the result of disease of the cortical portion of the brain. It is brought about through mental influences. Speaking requires a succession of acts of volition; but with the stammerer the behests of the will are hindered by anxiety or doubt as to his powers of execution of the words to be uttered. Undue attention is thus thrown upon the special acts of pronuciation. The stammerer is therefore one placed under the influence of dominant ideas, having especial reference to his capacity for articulation. He thus belongs to the same class as those suffering from agoraphobia or ataxia muscularis.

Dr. Schrank rejects Kussmaul's view, that stammering is owing to a born weakness of the apparatus by which syllables are co-ordinated. If this were so, stammering ought also to occur in reading and singing, which is not always the case.

The author would seek for an anatomical basis of stammering in the parts around the island of Reil, where the so-called motor speech centres have been located. Stammering appears to be hereditary. Colambat found it to be inherited in two-fifths, and Coën in one fifth of his cases.

Dr. Schrank gives an instance where stammering ran through four generations, originating from the mother's side. In those cases where there was no direct inheritance of the disorder, other diseases of the nervous system, such as epilepsy, hysteria, or chorea, were frequently found. The author sees a confirmation of his theory in the treatment which has been found most efficacious in removing stammering. This consists in different devices and exercises to increase the strength of the will, and to diminish anxiety in speaking. Electricity has not been found of any efficacy in the treatment of stammering.

Very great success is reported as attending the treatment of stuttering by purely physiological training, according to the system of M. Chervin, of Paris. Three types of stuttering are distinguished. First, that occurring during the inspiration; second, stuttering expiration; third, stuttering during both these periods and between breaths. The first involves various respiratory exercises, and the pupil is first taught to make long, full inspiration, and follow it by regular, forcible expiration. Then the respiratory movements are made with various rhythms until they become full, regular, and easy, instead of being jerky, laboured, and fatiguing. In the second stage of treatment, exercises with vowel sounds are substituted for the previous mute breathings, giving to each vowel the various modifications of tone, pitch, duration, &c., heard in conversation. The third stage comprises exercises on consonants alone, and in combination with vowels; at first slowly, then rapidly, varying the duration and pitch of each syllable, and passing from words of one syllable to those of two and more syllables. Prepared by these exercises, the pupil learns to articulate slowly and methodically short sentences, then longer periods and paragraphs, separating sentences, and always beginning with a deep inspiration. Twenty days of this treatment usually suffice for a perfect cure.

## Alleged Neglect.

We are sorry to see that there has been another charge of neglect against a Poor-law medical officer. Last Thursday an inquest was held at Woolwich on the body of Geo. Scarr, aged 75, of 12 Trinity Street, Woolwich, who died on Sunday week under circumstances which excited a considerable degree of public interest. The deceased was employed by Mr. S. C. Harrington, who instructed Mr. Peake to watch the case on behalf of the widow, who stated that the deceased had been ill for three months. She got an order from Mr. Padgham, relieving officer, for Dr. Fegan to attend him. The doctor attended next day, and sent some medicine. Dr. Raitt, partner to Dr. Fegan, called next. His daughter directed his attention to deceased's toe; but he did not look at it. On the second time of Dr. Raitt calling, he looked at the toe and said it was a mortified chilblain. Dr. Raitt sent some oil and lotion, which was duly applied. Dr. Raitt next called in nine days, and told her to persevere in the treatment. It got worse, and she sent several times for Dr. Raitt, but he did not come. The inflammation went up the leg, and Dr. Raitt at last cut off the toe. Dr. Raitt called on Sunday, when deceased was insensible. The doctor said the leg was mortifying, and that he could not live many hours.

We abstain from making any comments while the case is *sub judice*, but it shows that Poor-law medical officers cannot be too careful to avoid that unenviable publicity and prejudice which a charge of this kind, even if unjust, is sure to bring upon them. There is no class of people so exacting and particular with regard to medical attendance as the poor, and none more sensible of any attention or kindness that is paid to them.

---

The Council of the Royal College of Surgeons in Ireland has given notice that on the 5th day of June next it will proceed to elect a Curator of the Museum, in the room of the late Dr. John Barker, at a salary of £250 a year. Candidates will be required to lodge at the College, on or before the 31st of May next, preparations in human and comparative anatomy made by themselves, as prescribed in the regulations. The curator need not necessarily be a medical man, but he must not be a teacher in any medical school, nor directly or indirectly interested in any museum other than that of the College.

---

The death-rate from the seven principal zymotic diseases averaged 2·9 per 1,000 in the large towns last week, ranged from 0·4 and 0·5 in Portsmouth and Brighton, to 5·0 and 6·4 in Sunderland and Newcastle-upon-Tyne. Whooping-cough showed the greatest fatality in Sheffield, Newcastle-upon-Tyne, and Manchester; scarlet fever in Sunderland, Oldham, and Nottingham; and measles in Newcastle-upon-Tyne. The deaths from enteric fever were proportionately most numerous in Bristol and Nottingham. Small-pox caused 9 more deaths in London, 17 in Dublin, but not one in any of the other large towns.

---

In the principal foreign cities the rates of mortality, according to the most recent weekly returns were in Calcutta 34, Bombay 30, Madras 35; Paris 31; Geneva 35;

Brussels 39 ; Amsterdam 29 ; Rotterdam 28 ; The Hague 21 ; Copenhagen 22; Stockholm 19 ; Christiana 24 ; St. Petersburgh 48 ; Berlin 26, Hamburg 27, Dresden 27, Breslau 31, Munich 39 ; Vienna 36, Buda-Pesth 45 ; Rome 28, Naples 39, Turin 30 ; Alexandria 45 ; New York 29, Brooklyn 19, Philadelphia 18, and Baltimore 20 per 1,000 of the populations. Fevers caused 45, and small-pox 49 deaths in St. Petersburgh.

We regret to learn of the death of the United States Surgeon-General, Dr. John M. Woodworth, of the Marine Hospital Service, which took place at Washington on March 14th. Dr. Woodworth's valuable work in promoting sanitation ; his researches into the etiology of yellow fever, &c., have made his name respected throughout English speaking countries ; and it is probable that his premature death, at forty-one years of age, was induced by overwork and anxiety.

The rates of mortality per 1,000 last week in the principal cities and large towns, were as follow :—Edinburgh, 18 ; Brighton, 18 ; Bristol, 23 ; Portsmouth, 23 ; Bradford, 23 ; Norwich, 24 ; Leeds, 25 ; Salford, 25 ; Glasgow, 25 ; Liverpool, 26 ; Leicester, 26 ; Birmingham, 26 ; Plymouth, 27 ; Sheffield, 29 ; Nottingham, 29 ; Hull, 29 ; Manchester, 30 ; London, 30 ; Oldham, 30 ; Newcastle, 31 ; Wolverhampton, 31 ; Sunderland, 31 ; and Dublin 33.

The question of infected milk is attracting much attention at this moment, both at homeand on the continent. It is sought to discover whether or no the milk of cows that have become consumptive by being kept pent up in large cities, is capable of communicating that fearful disease to young children. Our contemporary, the *Analyst*, has devoted several articles to the subject.

# Scotland.

(FROM OUR NORTHERN CORRESPONDENT.)

Mortality of Glasgow.—During the week ending the 29th ult., the deaths in Glasgow were at the rate of 25 per 1,000 per annum, against the same figure in the preceding week, and 28, 31, and 29 in the corresponding periods of 1878, '77, '76.

Health of Glasgow.—Dr. Russell reported that during the fortnight ending 22nd of March, there were 568 deaths registered, compared with 554 in the preceding fortnight. The number of deaths of persons under one year was 111 in place of 101, and persons aged 60 years and upwards 80 in place of 88, as compared with the preceding fortnight. The deaths from pulmonary diseases were 225 in place of 223. The deaths from fever were 11 in place of 4, viz., 9 from enteric fever, and 2 from typhus. The number of deaths from infectious diseases of children was 55 in place of 45, viz., 39 from whooping-cough, 10 from scarlet fever, and 6 from measles. Whooping-cough is always most fatal in the months of March and April. The number of cases of fever registered was 42 in place of 41, viz., 33 of enteric fever, 8 of typhus, and 1 undefined. In addition to these cases of fever, 92 cases of measles, 59 of whooping-cough, 38 of scarlet fever, and 19 of diphtheria were the occasion of sanitary supervision.

Edinburgh Royal Maternity Hospital.—The medical board of this hospital have appointed E. F. Scougal, M.A., L.R.C.S.E. and L.M., and G. T. Atkinson, M.B. and C.M., to be house-surgeons for the quarter beginning on May 1. Dr. Angus McDonald will be succeeded by Dr. Kieller at the end of the quarter.

Edinburgh University—Election of a Professor of Botany.—The Curators of the Edinburgh University met on the 1st April to appoint a professor of botany in room of Professor Balfour, resigned. All the Curators, with the exception of Lord Rutherford Clark, who voted by letter, were present. It is understood that, owing to the high qualifications of the several candidates the Curators had a considerable difficulty in making their selection. Dr. Dickson, of the University of Glasgow, was the successful candidate. This gentleman graduated in medicine at the University of Edinburgh in 1860 ; in the same year he obtained a gold medal from the Medical Faculty for a thesis on a botanical subject. He was for some time President of the Royal Medical Society of Edinburgh, and shortly after his graduation he abandoned the practice of the medical profession and devoted himself to botanical research. During the summer of 1862 he conducted the class of botany in the University of Aberdeen in room of Professor Dickie, who was then in ill-health. In 1866 he was appointed to the Chair of botany in the University of Dublin, and held the office for two years. In the second of these years he also held the appointment of Professor of Botany in the Royal College of Science for Ireland, and in the course of his stay in Dublin he received from the Senate of the University the honorary M.D. degree. In 1868 Dr. Dickson was appointed to the Glasgow Chair of Botany, having held the office till now. Since 1858 Dr. Dickson has been a frequent contributor to scientific societies and journals on his own subject.

University of Edinburgh—Scholarship.—The senior Mackenzie bursary has been awarded to Benjamin Wainwright, and the junior Mackenzie bursary to D'Arcy Wentworth Thompson, being the students who displayed the greatest industry and skill in practical anatomy work during the winter session in the senior and junior classes respectively.

Dr. Andrew Wood.—The Senatus Academicus among other honorary degrees conferred the degree of LL.D. on Dr. Andrew Wood, F.R.C.S., F.R.S. Edin., the learned representative of the Edinburgh College of Surgeons on the General Medical Council.

Knowledge in High Places.—At a meeting of the Medical Council held last week Dr. Rolleston remarked that "he had listened with great delight to Dr. Scott Orr's vindication of his own country. He said that Scotland had laid the world under great obligations, because she had held aloft the torch of knowledge and science at a time when the English were using the lamp only for coal mines." The illuminating influence of "the torch" can be pleasantly illustrated by the subjoined prescription of a *Scotch University Professor*, viz.:—

℞ Saponis mollis, uncias 2.
Sp. rect., unci*um*.
Sp. rosmarini, *drachmum*. Solve.

The "signatur" is in English, and is correctly spelt. Again:

℞ Ung. rumicis *c* sulph., unci*um*.

This is no slip of the pen, as the prescription is printed by means of a type-writer. A few days ago we saw a certificate about to be submitted to the sheriff in which a graduate of the University of Glasgow said of a patient supposed to be insane that he "jesticulates" in a particular manner. Such as this is not at all uncommon, as 75 per cent. of medical practitioners in Scotland have been tradesman, drapers, or drapers' clerks

and have received consequently no preliminary education befitting them for a *learned* profession. No wonder all sensible medical men fervently hope success to the Medical Reform Bill of the Government.

# Correspondence.

## "AN APOTHECABY GUESSED TO HAVE BEEN POISONED."

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

DEAR SIR,—I have read your remarks relative to the proceedings at the inquest held at Limerick on the body of the late Mr. John Joseph Furlong, apothecary, &c.—a very fair criticism, indeed, on proceedings which you justly stigmatised as "an utter farce." Putting aside my slight acquaintance with the deceased, and regarding him only as a member of our profession, it is repugnant to feel that he has been branded as a suicide (through "unsound mind") by a coroner's verdict, from the mere fact that a medical man found after death "glistening eyes, dilated pupils, placid (flaccid ?) muscles, and a maculated side," and that a two-ounce phial was found, the contents of which were mere merely guessed at.

If on such grounds verdicts in all similar cases were arrived at, I believe that many deaths would be recorded as suicidal which ought to be recorded as natural. I have the greater reason for arriving at this belief from the result of an inquest case which came, not many months ago, under my own immediate notice, the details of which I will briefly give, with your permission.

A photographer in this town was found dead in his bed, under suspicious circumstances, pointing to suicidal poisoning. He had been for many months ailing, and, though not thereby entirely incapacitated, he could not follow his occupation with his usual energy. This, with domestic troubles and pecuniary embarrassments, brought on a low state of despondency. He was highly sensitive, given to night thinking, and suffered much from want of sleep. One day he confessed that he felt such depression of spirits he was afraid of himself, and feared lest he would be driven to commit suicide. Four or five days before his death he told me he had taken the night before *half-an-ounce of tincture of opium*, with the legitimate object of procuring sleep. I was literally stunned. He was not an opium eater, as far as I could discover, and was quite ignorant of the dose. On questioning him, and pointing out the great danger incurred in having taken this enormous dose, he said he was not aware of that, but felt so "tortured for want of sleep" that he took it, and that "really it had but very little effect after all." There could be no mistake about the quantity taken, for he accurately described it, and, in fact, after his death a two-ounce phial was found by me amongst his chemicals in his sleeping room with laudanum in it, evidently of an inferior kind. The bottle was full, minus half-an-ounce exactly. Not including other poisons, he had within reach in his bed-room (where for convenience he stored his chemicals) as much cyanide of potassium alone as would poison every human being in this large town. Taking into account his physical condition, his embarrassed circumstances, his discontented state, his sleepless nights, and great despondency, more than once expressed, also his dread of being driven to do himself harm, and the fact that he had abundance of cyanide of potassium and other poisons in his very bed-room, what more reasonable conclusion could one arrive at than that he had poisoned himself. In these circumstantial links every fact pointed strongly to that conclusion, and there was scarcely a shadow of doubt that the result of post mortem examination would fully verify that belief. Our worthy coroner (James J. Shee, Esq., J.P.) rightly directed a post-mortem examination, which I accordingly made, in conjunction with my respected friend, Dr. Scully, of this town. We discovered evidence of fatty change in the heart structure, and had that organ, together with the stomach, duodenum, and contents, carefully sealed up, and forwarded, by order of the coroner, to Dr. Cameron for analysis and microscopical inspection, having firstly stated as our opinion at the inquest that it was possible that death was caused by failure of the heart's action owing to the degenerative change. The result was, *not a trace of poison of any kind was detected* by Dr. Cameron, who reported the heart structure to have undergone interstitial fatty change, and a verdict of death from this natural cause was accordingl given.

Such an example would clearly show the necessity for post-mortem examination in cases of suspected poisoning, as the only means for arriving at the true cause of death. In the case of Mr. Furlong, there having been made no such examination of organs which might have shown disease sufficient to produce natural death, no particular examination of the stomach and its contents, no analysis of the contents of the two-ounce phial, it is a shame that so great a stigma should be cast on his memory ; and I am surprised that any medical man under the circumstances should, without protest, have silently agreed to the non-performance of a post-mortem examination. The coroner's verdict may be forced upon us, but I, for one, mentally acquit Mr. Furlong of the act imputed to his memory, in the absence of better proof to the contrary.

Dear Sir, very truly yours,

CHARLES W. MACCARTHY,
L.K.Q.C.P.I., L.R.C.S.I., &c.

Jervis Place, Clonmel, March 21st, 1879.

## A DISPENSARY DOCTOR'S WILL.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—I have recently drawn up the will of an aged dispensary doctor. Amongst the provisions are the following :—"1st. There is to be no wake whatever. My brothers and sisters, with their children, are to be the only persons admitted while my body is laid out. No clergyman is to be invited to my funeral ; as they do not attend the burial of the poor, they shall not attend mine. No crape, gloves, cypruses, hat-bands, or such emblems of mourning, to be made use of at my funeral. The cost of my coffin shall not exceed one pound. The money thus saved, amounting to over £60, shall be distributed among the poor of the village of ———, where I have lived for the last thirty-three years." What will surprise some of your readers is that the testator has, up to the present, lived, and, I believe, still continues to be, a strict Roman Catholic.

A SOLICITOR.

19th March, 1879.

## TREATMENT OF POST-PARTUM HÆMORRHAGE.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

DEAR SIR,—Under the above heading reference is made in the 2nd of April No. of the *Medical Press and Circular* to my paper recently published in the *Obstetrical Journal*, and these words of the kindly reviewer occur—"But it has been recently shown that introduction of the hand into the rectum is not only a difficult operation, but one that is attended with some danger. Besides, the safe introduction of the whole hand into the rectum should be effected in a gradual manner, and while the patient is under chloroform ; whereas, its introduction for the purpose of compressing the aorta in cases of post-partum hæmorrhage would have to be immediate, and without the assistance of anæsthetics."

It is quite true that the introduction of the hand into the rectum *is* a difficult operation, and attended with some danger if the operator have a large hand, and be rough and hurried in his manipulations, thrusting and forcing the hand into the bowel, or attempting to do so, instead of gently, and with boring motion, working in the fingers folded together cone-shaped and well larded, and then the hand narrowed as much as the operator can. If there were malignant disease of the bowel, or organic stricture, then, indeed, if the operation were attempted, it would be difficult and most dangerous. But in such instances no man should be rash enough to attempt such a proceeding, and would, of course, by digital examination, first ascertain the state of the bowel. I can understand that in some cases, other than childbed, it would be especially "difficult" if called upon to perform it without being able to have had the bowels cleared out, though such must be extremely rare, and "dangerous" to some, because of pain and shock if anæsthetics could not be administered. But in the post-partum patients, to whom I refer, it is not so difficult, because the bowels have been unloaded during the parturient efforts ; their muscular coats are relaxed, as well as the sphincters, owing to the post-partum loss and hæmorrhage,

which call for such interference ; and the necessity for reducing anæsthesia obviated because of the unconscious or semi-unconscious state of those patients in whom the operation is needed. The introduction of the hand, will, indeed, ofttimes be a judicious stimulus towards rousing the sinking energies.

It must be borne in mind that it is a last resort, and it will prove a very effectual one, I have no doubt ; that the patient is *in extremis*, and that there is only the choice between her dying of hæmorrhage and the performing of this operation, which the reviewer speaks of as "difficult, and one attended with some danger." The difficulties, I hold, are, in a great measure, removed by the carefulness and skill of the operator (provided he has not an unduly large hand) ; the danger also is reduced to a minimum, for the same reason, as well as because of the prostrate and flethel or lethargic state of the patient. Moreover, I greatly question whether, in such a post-partum condition, there is more danger (or even as much) in introducing the hand into the rectum than into the vagina and uterus ; and whether there is more risk in this procedure than in injecting iron into the womb—flabby, relaxed, and unable, through general and local debility, to respond to even such stimulation, and when the hand within its cavity has failed to excite to natural contractile efforts. By tourniqueting the aorta in the manners I have named we have time to have stimulants given our patient by mouth and nose ; we are enabled to have the womb also compressed by the hands of an assistant ; to permit it to rest ; to allow clotting of the blood in the open uterine vessels, the rush of blood being stopped, or very greatly eased, by the compressing, while, at the same time, we throw back upon the vital organs the blood, diminished in quantity, and keep up their supply, thus sustaining them, and preventing the stoppage of their functions and the cessation of life.

Yours truly,

G. de Gorrequer Griffith.

9 Lupus Street, Belgravia.

# Medico-Parliamentary.

## HOUSE OF COMMONS.—Thursday, March 27th.

### THE CORONERS' BILL.

The Select Committee appointed to consider the provisions of this Bill resumed their inquiry this morning, Sir Matthew Ridley presiding. A preliminary meeting was held some time ago, when the chairman was selected, and a course of proceeding was decided upon after some discussion amongst the members, who are, besides the chairman : Mr. Ashley, the Attorney-General for Ireland, Lord E. Fitzmaurice, Mr. Goldney, Sir Julian Goldsmid, Mr. Mitchell Henry, Mr. Herschell, Lord F. Hervey, Mr. Hicks, Mr. Law, Sir T. Lawrence, Sir P. O'Brien, Mr. Pell, the Solicitor-General, Mr. Benjamin Williams, and Mr. Yorke. No evidence was taken to-day, and the public were not admitted to the room.

## Tuesday, April 1st.

### RELIEF OF INSANE POOR BILL.

Mr. Rodwell, in moving the second reading of this Bill, observed that the demands for the accommodation of lunatics had been becoming more and more burdensome to the local taxation of the country. There were only six counties in England which were not under peremptory orders to provide increased accommodation for pauper lunatics. The Lunacy Commissioners were bound to treat any one whose mind was affected in any way—all harmless, crazy, fatuous, imbecile, and incurable persons—as unatics ; and the consequence was that their lunatic asylums were crowded with patients who did not require the complete and costly system of attendance which was provided in these establishments. The persons who were chronic and harmless imbeciles might be maintained at a much smaller cost, and the object of his Bill was to enable a board constituted for the purpose to take from the lunatic asylums those patients and put them into infirmaries. He believed that in this way they would lessen the burden of local rates caused by the expense of lunatics, and they would separate the curable from the incurable lunatics. It was well known that the crowding of lunatic asylums with incurable patients retarded the recovery of those whose cure might otherwise be rapid. The Bill provided that the governing authority should consist of the visiting justices and of the chairman of the board of guardians in the county. In regard to the question of management and control, he would remove this class of paupers out of the hands of the Lunacy Commissioners and transf er the supervision to the Local Government Board.

Mr. Salt said that the Bill was one of very great importance, and he should be very happy to consent to its second reading.

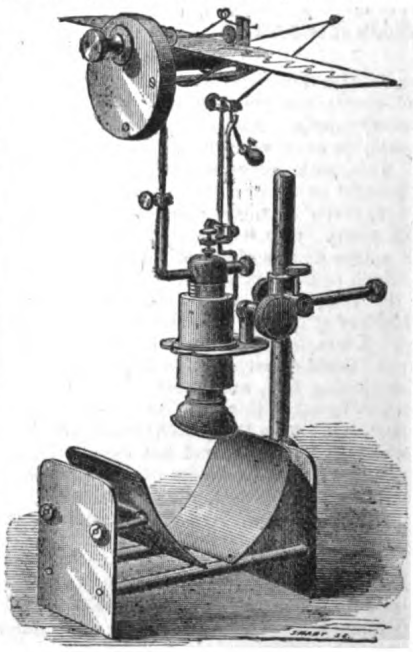
Dr. Cameron said the Bill dealt with a most important subject ; but he feared it would not be found economical in the working.

The Bill was then read a second time, and ordered to be referred to a Select Committee.

# Novelties.

## IMPROVED SPHYGMOGRAPH.

The diagram represents a sphygmograph recently invented by Dr. Pond. The pulse movement is taken by the working of a delicate spring with levers attached, so that the tracing paper or mica lies horizontally. The instrument can be fixed to an arm rest, as in the diagram, to prevent movement of the limb, but as a matter of fact the application is so simple, and so easily accomplished, that the operator requires only to rest the wrist of the patient in the palm of his left hand whilst with his right he places the spring of the instrument upon the pulse. The small supports give it a fragile appearance, but as no real force is sustained by them, the instrument is rendered light and elegant, and at the same time it cannot easily get out of working order.



It has been said the vibrations of the needle would give false impressions to the pulse tracing, but experience shows that such is not the case, and that the pulse tracing is, on the contrary, clearer than that by any other sphygmograph.

## LIQ. SANTAL FLAVA C BUCHU ET CUBEBA

Is an elegant preparation, readily miscible with water. It is a combination of drugs the effect of which is well known in the treatment of urethral discharges and catarrh of the bladder. It may be considered a very useful medicine, for it is more effective than preparations of copaiba, and has none of the disadvantages of that drug. Messrs. Hewlett and Sons, manufacturing chemists of Cree Church Lane, London, are the introducers of this preparation.

## THE MEDICAL BILL.

THE Duke of Richmond's Bill has passed the House of Lords, and, in its transit, has been amended, so as to make it a very excellent measure, but for the absence from it of provisions for the reconstruction of the General Medical Council, which provisions we hope to see inserted in it with the approval of Government when the Bill is in the Commons. Saving this omission, we can express a hearty approval of the measure, and an earnest desire to see it passed. It provides for conjoint examination in a form which affords every promise of efficiency and practicability, and without unduly interfering with licensing bodies—it leaves the ladies without any grievance upon which they can expect sympathy. It disposes of the money question in an equitable way, and, it manages the admission of foreign and colonial graduates, so as to leave that very questionable move as little open to abuse as it can be hoped to be.

Above all, it puts the principle of perfect uniformity of education, examination, and fees throughout the Kingdom, upon a firm basis, and leaves no loophole for the continuance of that diploma-selling competition which has been at once the disgrace and the misfortune of the profession.

Having been thus perfected, the Bill can go no further for the present. The question of reconstitution of the Medical Council stops the way, and, very reasonably, claims adjustment before the measure can be proceeded with. The Government has recognised the propriety of that claim—has promised to stay proceedings until that subject has been discussed, and wishes to entrust the matter to a Select Committee.

But at this position the obstructionists of medical reform have entrenched themselves, and will resist the appointment of such a committee. The Scotch licensing bodies, whose continued prosperity depends on their still being permitted to undersell England and Ireland in the education, the examination, and the money payment requisite for their diplomas, have been consistently and continuously hostile to this Bill, or any Bill which provides for uniformity of standard. They do not ask for amendments or concessions, nor do they make any counter-proposals for improving the existing system. They simply express their complete contentedness with the present system, and their determination not to be reformed if they can help it, and they mean to defend their right and title to sell diplomas to anyone they please, and at any price—educational or monetary—they please.

They, therefore, have proposed to remit to a Select Committee not only the question of reconstruction of the General Medical Council, but the whole question of medico-educational reform, and all the matters included in that very comprehensive subject. The purpose of this proposal is manifest—it is not even attempted to be concealed. The Scotch representatives know that a discussion as to the re-constitution of the General Medical Council might readily be arrived at in a few weeks, but that no conclusion as to the general question could be reached within the present session, and they think it most probable that the present Parliament will have expired before legislation could be effected next year, and that the Government would probably have its hands full after the election of a new House of Commons, and would be unwilling to re-open the subject then. Thus the Scotch licensing bodies hope, by resisting the appointment of a Select Committee on the General Medical Council, to tide over the present danger, and postpone indefinitely the day of reckoning with them which the profession has been looking forward to.

In this plan of obstruction the canny Scots have shown their characteristic astuteness and wisdom, for they have made it appear that they are clamorous for inquiry, when, in reality, no one fears inquiry so much as they do. They cry out for a Select Committee because they know that the Government will not grant it, but if they thought that there was the least chance of such a calamity to their cause as a full investigation of their system, they would throw every difficulty in the way of such a proposition.

Such being the present condition and prospects of the Medical Bill, the profession at large and the English and Irish licensing bodies are brought face to face with the difficulty which must be overcome some time or other if we are ever to have an improvement in medical status. If not now, certainly at some future time, the Scotch bodies must be coerced. Ten years hence they will be less ready to submit to reform than they are now, and ten years hence medical reformers may not have at their back the potent aid of a strong Government. We, therefore, most earnestly urge all those who are interested in raising our profession from the discredited position which the Scotch licensing bodies and the Queen's University have been instrumental in placing it, to put out their whole strength in support of the Government Bill, and the proposal to submit nothing but the constitution of the Medical Council to a Select Committee.

Adopting this policy there is a reasonable hope that a fair measure of medical reform may become law this session. Adopting any other course, the hope of a change for the better is indefinitely distant. We cannot afford to wait another ten years until public indignation becomes strong enough to deal peremptorily with those who traffic in the abuses of medical education, and a golden opportunity now offers to bring to a crisis the state of affairs which has been borne so long and with so much fretting. We earnestly counsel the medical reform committees of the various medical associations of England and Ireland to put forth their energies for the purpose of forcing the progress of the Bill before it is too late. The Government have shown so earnest a desire to do what is right in the matter that we feel convinced that they will not shrink from the necessity of out-voting the Scotch representatives if they are well supported by English and Irish members, and we trust that—in view of the very critical circumstances of this well-meant effort at medical reform—the profession will exercise the whole of its influence to provide for the Government that support.

---

**The Birmingham Queen's Hospital.**—At the annual meeting of the Governors of this Hospital last week, the report stated that the total expenditure for the past year was £7,703 5s., being nearly £700 less than in the previous year, although some of the retrenchments had been in operation during only part of the year, and the bank charges had increased from £239 in 1877 to £399 in 1878. The efficiency of the hospital had, however, not been diminished. As regarded income, the subscriptions had increased from £2,839 4s. 2d. in 1877 to £2,876 8s. 9d. in 1878, notwith-

standing the severe depression of trade, from which a contrary result might naturally have been expected. Legacies and donations had fallen off to the serious extent of £1,454. Hospital Saturday produced £636; and Hospital Sunday, after payment of all expenses, £6,075 17s. 3d., which was not only the largest amount received by the hospital from this source, but the largest since the collections were organised. We commend the retrenchment scheme of the Queen's Hospital to the attention of the authorities of some of the Metropolitan Institutions, where there is full scope for its exercise.

**Vaccination Acts (Ireland) Amendment Bill.**—On Monday last, in the House of Commons, Mr. Gibson moved the second reading of this Bill. Mr. Hopwood moved, as an amendment, that the Bill be read a second time upon that day six months. The hon. member denounced as intolerably cruel a law which compelled a man, by a repetition of convictions, to do that which he honestly believed to be dangerous to the health of his child. This view had been supported by evidence given before the Select Committee on the subject, and there was grave reasons to doubt the efficacy of the system of vaccination. There was no guarantee that vaccination would prevent small-pox, and it might import into the system of a child the most loathsome disease. He asked the Government to introduce a provision into the Bill to the effect that no person should be prosecuted more than twice for refusing to vaccinate his child. Mr. Meldon said that all the efforts of the Anti-Vaccination League had failed to stir up any feeling in Ireland against the practice of vaccination. One of the great objects of the Bill was to secure that vaccination was successfully performed. After a few remarks from Mr. M. Henry and Major Nolan, the amendment was not pressed, and the Bill was read a second time.

## NOTICES TO CORRESPONDENTS.

HARVEIAN SOCIETY OF LONDON.—The Harveian Lectures will be delivered by Mr. Edmund Owen, F.R.C.S., "On Certain Practical Points in connection with the Surgery of Childhood."

EMPROSTHOTONOS.—Your queries shall be answered in our next.

Is it according to a man's valuation that members of dispensary committees are to judge of his right to obtain dispensary relief, and, if so, what is the standard that prevents him being entitled to it? [We are astonished to observe that our correspondent—though himself a dispensary medical officer—is perfectly ignorant of the law under which he acts. Any one, and every one, is entitled to medical relief if the granter pleases to call him a "poor" person. If the question arises as to the cancelling of the ticket, the committee judges as to the fitness of the person for medical relief, not upon any standard of valuation, but upon all the circumstances.—ED. M. P. & C.]

DR. C. DRYSDALE'S paper, "On Urethritis," will be inserted in due course.

THE ACTON PRIZE.—The Royal Institution of Great Britain announce that the next Actonian Prize will be awarded in the year 1879 to an Essay, the subject being "The Structure and Functions of the Retina in all Classes of Animals, viewed in relation with the Theory of Evolution." The Prize is One Hundred Guineas, and will be awarded or withheld as the managers in their judgment shall think proper. Further particulars are given in our advertising columns.

A. B.—The "registered dentist" who is, it would seem, entitled to call himself dental surgeon, is, in many instances, a druggist's shopboy. This accounts for the *Chemist and Druggist's* assertion of his claims to the title of surgeon. Without doubt he can call himself dental surgeon if he pleases.

DR. J. G. WILSON, writing to the *Glasgow Medical Journal*, asks, "Do bank-notes ever convey infection?" We should say certainly. The desire for possession is decidedly infectious.

BETHESDA (AMERICA) MINERAL WATERS.—A correspondent asks, Will any of your numerous readers kindly inform me through your columns if they have any experience of the efficacy of the Natural Mineral Waters of *Bethesda*, of Wancesha, Wisconsin, U.S. America, in urinary diseases? I am aware they are shipped by the barrel to this country, but had to confess ignorance to a patient were they considered of much value or largely used.

[*** We have no personal knowledge of these waters. Our correspondent will find a full description of the waters of America in the medical directory for that country published in London.—ED.]

COMMUNICATIONS, Enclosures, &c., have been received from—Dr. Wise, Norwood. Dr. Peirson, Scarborough. Dr. Ewing Whittle, Liverpool. Dr. Chitwood, Connersville, America. Dr. Kennedy, Dublin. Mr. B. ### VACANCIES.

Ashton-under-Lyne.—House Surgeon for the District Infirmary. Salary, £50, with board. Applications to the President by May 1.

Castlebar Union, No. 1 Dispensary District.—Medical Officer. Salary, £110, with fees, and £15 as Sanitary Officer. Election, April 19.

Castlebar Union, No. 2 Dispensary District.—Medical Officer. Salary, £110, with fees, and a salary as Sanitary Officer. Election, Apr. 19.

Lisnarkea Union, Derrylin Dispensary.—Medical Officer. Salary, £100, with fees, and £15 as Sanitary Officer. Election, Apr. 11

Liverpool Northern Hospital.—Assistant House Surgeon. Salary, £70, with board, &c. Applications to the Chairman by April 19.

Nottingham Dispensary.—Assistant Resident Surgeon. Salary, £100 per annum. Applications to the Committee by May 1.

Royal College of Surgeons, Ireland.—Curator of the Museum. Salary, £250 per annum. Applications to be lodged before May 30. (See Advt.)

Royal Free Hospital, London.—Physician for Diseases of Women, and an Ophthalmic Surgeon. Both Honorary. Testimonials, &c., to the Secretary before April 30. (See Advt.)

St. Patrick's Hospital for Insane, Dublin.—Master. Salary, £200, with allowances. (See Advt.)

Sunderland Infirmary.—House Surgeon. Salary commencing at £80, with board. Applications to the Chairman of the Medical Board before April 23.

### APPOINTMENTS.

ATKINSON, Dr. W. T., Medical Officer, Medical Officer of Health, &c., for the Killashee Dispensary District of the Longford Union.

BROUGHTON, H. T., M.R.C.S.E., a Medical Officer to the Dewsbury and District General Infirmary.

CRIPPS, E. C., L.R.C.P.L., M.R.C.S.E., Assistant Medical Officer to the Central London Sick Asylum District Asylum, Highgate.

CUMMING, J., M.D., Physician to the Royal Edinburgh Hospital for Sick Children.

CUNYNGHAME, R. J. B., M.D., an Extra Physician to the Royal Edinburgh Hospital for Sick Children.

DALE, H. R., L.R.C.P.Ed.. M.R.C.S.E., Medical Officer for the Sunderland District of the Sunderland Union.

DANIEL, J., M.R.C.S.E, L.K.Q.C.P.I. & L.M., Medical Officer for the Burton District of the Kendal Union.

## Births.

BARK.—On March 31, at 87 Aston Road, Birmingham, the wife of Ernest Bark, L.R.C.P., of a son.

BORTHISTLE.—On March 28, at Clonevan, co. Wexford, the wife of H. Borthistle, L.R.C.S.I., of a daughter.

KNIGHT.—On March 28, at 56 Synge Street, Dublin, the wife of Charles F. Knight, M.D., of a son.

O'GRADY.—On March 25, at 105 Stephen's Green South, Dublin, the wife of E. Stamer O'Grady, M.B., of a son.

SANDERSON.—On April 1, at Drymen, N.B., the wife of Charles Sanderson, L.R.C.P.Edin., of a daughter.

## Deaths.

BOLTON.—On March 24, at Kustendjie, Roumania, Geraldine, wife of A. I. Bolton, A.B., M.B., F.R.C.S.I., daughter of the late T. Orpen, M.D., of Queenstown.

COMYN.—On March 30, at Roxborough, Limerick, S. E. Comyn, M.D., aged 61.

DAVEY.—On March 27, at Folkestone, Surgeon-Major William Davey, Bombay Service, aged 58.

DEMAIN.—On March 26, at Sheffield, Joseph Demain, M.R.C.S.I., aged 37.

GARLAND.—On March 29, at Cambridge, Thomas H. Garland, L.R.C.P., L.R.C.S., formerly of Hokitika, New Zealand, aged 35.

JACKSON.—On March 28, at Dunoon, Duncan Jackson, L.F.P.S.G., aged 83.

KNOTT.—On March 26, at Lakeview, Dundrum, co. Dublin, Mary Elizabeth, wife of John F. Knott, L.R.C.S.I., aged 28.

MUTCH.—On March 23, at Orton, Westmoreland, Wm. Mutch, L.R.C.P., aged 43.

RAY.—On March 26, at Cambridge Street, Hyde Park, Edward Bunley Ray, M.R.C.S.E., of Milton, near Sittingbourne, aged 50.

SELLS.—On March 31, at Guildford, T. J. Sells, M.R.C.S., J.P., late of Kingston, Jamaica.

SMYTHE.—On April 3, at 82 Amiens Street, Dublin, Ralph Smythe, M.R.C.S.Eng.

WARD.—On March 25, at Hyde Gardens, Eastbourne, Thomas Ogier Ward, M.D., aged 75.

WOODHOUSE.—On March 29, at Reading, Richard T. Woodhouse, M.D., aged 78, for nearly 40 years Physician to the Royal Berks Hospital.

WOODHOUSE.—On March 23, at Westport, co. Mayo, Frances Woodhouse, M.R.C.S.Eng.

WORSLEY-BENISON.—On April 2, at Gordon Villa, Grange Road, Canterbury, Millie, wife of H. W. S. Worsley-Benison, aged 30.

YEATES.—On March 30, at Balderstone, Lancs., W. M. Yeates, M.R.C.S., aged 35.

## DUTIES AND REMUNERATION OF MEDICAL OFFICERS OF HEALTH.

THE following letters have passed between the Irish Medical Association and the Local Government Board since those already published in former issues of this journal; we shall refrain from making any remarks upon the subject until the correspondence has terminated.

No. 5086—1879, Miscellaneous.

Local Government Board, Dublin,
March 13th, 1879.

SIR,—The Local Government Board for Ireland acknowledge the receipt of your letter of the 7th inst., in which, referring to your letter of the 2nd October last, you inquire whether the duties of "the medical officers of health," under the 11th section of the Public Health (Ireland) Act, 1878, have as yet been assigned to them, and also whether the Board has taken any step with a view to ensure the award of equitable remuneration by the sanitary authorities to those officers.

In regard to the remuneration of the sanitary officers, the Board have to state that they addressed the Lords Commissioners of the Treasury shortly after the deputation of the Irish Medical Association had waited on the late Chief Secretary, Sir Michael Hicks-Beach, in the month of May, 1877, and communicated the views of the Association as to the proposed increase in the maximum of remuneration awarded to the sanitary officers, submitting at the same time that the maximum scale of additional salaries to dispensary medical officers might properly be increased from one-fourth of their existing salaries to one-third of such salaries, and the Board received a reply that my Lords were not prepared under present circumstances to assent to that proposal.

With respect to your inquiry whether the duties of the medical officers of health, under the 11th section of the Public Health Act, 1878, have as yet been assigned to them, the Local Government Board have to state that the Sanitary Order of the 9th September, 1874, is still in force, and the section of the Public Health Act, 1878, to which you refer, does not appear to make any further regulations of the Local Government Board necessary.

By order of the Board,
B. BANKS, Secretary.

To John Wm. Moore, Esq., M.D.

Irish Medical Association, Dublin,
March 26, 1879.

*To the Secretary of the Local Government Board for Ireland.*

SIR,—I am directed by the Council of the Irish Medical Association to acknowledge the receipt of your letter, "No. 5086—1879, Miscellaneous," bearing date the 13th inst., which the Council have had under consideration; and in reply thereto, I am instructed to direct the attention of the Local Government Board to the fact that the scale to be approved by the Commissioners of Her Majesty's Treasury which was to regulate the amount of salaries to be paid to the medical sanitary officers under the 10th section of "The Public Health (Ireland) Act, 1874," has been omitted from "The Public Health (Ireland) Act, 1878;" and further, that the omission of that scale was one of the latest concessions made by the Government in deference to the remonstrances of the Irish Medical Association.

Whilst the Council are pleased to learn that the Local Government Board communicated to the Commissioners of the Treasury the views of this Association with regard to remuneration of the medical sanitary officers, and at the same time proposed an increase of their salaries, the Council must dissent from the statement in your letter to the effect that *they* (the Council) proposed an increase in the maximum of remuneration. On this point the Council have ever felt that it was unjust and inadvisable that any maximal scale whatever should be fixed. The Council strenuously opposed such a course, as they have always considered that each case should be decided on its merits. It appears from your letter that the representations of the Local Government Board to the Commissioners of the Treasury regarding this matter were made shortly after the 17th May, 1877 (the date of the reception in London by Sir Michael Hicks-Beach of the deputation from this Association), and previous to the passing of "The Public Health (Ireland) Act, 1878." However, any action taken or intended to be taken by the Commissioners of the Treasury before the 8th August, 1878, relative to fixing a maximal scale of remuneration for the "medical officers of health" became null and void since that date, as "The Public Health (Ireland) Act, 1874" was repealed *in extenso* upon the passing of "The Public Health (Ireland) Act, 1878," on the 8th August, 1878.

The Council most strongly object to the proposal of the Local Government Board which suggested that one-third of the salary of a dispensary medical officer might be considered proper remuneration for his services as "medical officer of health;" to any such officer who discharges fully all the onerous duties imposed upon him under "The Public Health (Ireland) Act, 1878," such rate of remuneration would be utterly inadequate.

The Council cannot think that any orders relating to the duties or remuneration of the "medical officers of health" which were made under an Act of Parliament since repealed *in extenso*, are legal and binding under the provisions of "The Public Health (Ireland) Act, 1878;" whether the Council are correct or otherwise in holding such opinion, they are aware that the "medical officers of health" appear generally, if not unanimously, to take a similar view of the matter, and accordingly have been expecting and awaiting a new definition of their duties, as well as much more liberal remuneration for their services than that hitherto given.

The 11th section of "The Public Health (Ireland) Act, 1878," provides (in the future, not the past, tense) that the Local Government Board "*shall* assign to the 'medical officers of health,'" &c., their duties, which the Council conceive means that not only shall the duties of those officers be assigned to them subsequently to the date of the passing of the Act, but also that the duties of those officers shall be specifically defined separately from those of the other sanitary officers, so as not to be mixed up with them, as they were in the Sanitary Order of the 9th October, 1874. It was with this view that the Council, in a former communication bearing date 2nd October, 1878, suggested that the duties of the "medical officers of health" should be confined to those which properly come within the province of a medical practitioner to perform, and that they should be relieved from the performance of unnecessary duties relating to the inspection of nuisances, the removal of which, upon notice served by the sanitary sub-officer (now designated by the new Act as "Inspector of Nuisances"), was not contested.

The Council trust that the Local Government Board will re-consider the matter, and assign to the "medical officers of health" their professional duties under the new Public Health Act in accordance with the suggestions expressed in my former letter, and also take steps to ensure that those officers shall be equitably remunerated for their services.

The Council are moved to make this request as much in the interest of the public as in that of the "medical officers of health," feeling confident that unless those officers be fairly remunerated for their services the valuable provisions of the new Public Health Act will remain, to a very great extent, inoperative. They would all the more deplore such a state of things at the present time when the sanitary condition of Ireland is proved to be sadly defective, and the cause of spread of disease and loss of many valuable lives annually; which would doubtless be obviated by due effect being given to the means provided by the Legislature.

I am, Sir, your obedient servant,
JOHN WILLIAM MOORE
Hon. Secretary to the Council.

## ABBEY DISPENSARY.

At a meeting of the Committee of the Abbey Dispensary, held on the 24th ult., for the purpose of electing a medical officer for the district—the Local Government Board having refused to sanction the previous election of Dr. Lambert owing to some irregularities in the formation of the committee—Dr. Lyden, Medical Officer of the Castlebar Dispensary, was elected by a majority of two. The election caused great local interest. Major Nolan, M.P., came over for a second time from London, and Mr. R. W. Waithman, J.P., who was so ill, was allowed to record his vote without leaving his carriage, both voting for Dr. Lyden.

## REPORT OF HEALTH OF DUBLIN AND SUBURBS FOR WEEK ENDING MARCH 29, 1879.

| | | | |
|---|---|---|---|
| Total registered deaths in Dublin and suburbs* | | ... | 197 |
| Ten years average of same week ... | ... | ... | 199 |
| Decrease of mortality below average ... | ... | ... | 2 |

| „ „ Edinburgh ... | | 17·9 | „ |

* District extends over 10,050 acres, and contains 314,666 persons.

† This district includes City of Dublin and Incurable Hospitals.

Zymotic diseases caused 43 deaths, being 2 more than the number in the preceding week. and 7 over the average for the thirteenth week of the last ten years. They include 17 from small-pox, 9 from scarlatina, 7 from fever (3 typhus, 3 typhoid, and 1 simple continued fever), 2 each from diphtheria and whooping-cough, &c.

The deaths from small-pox are 3 over the number registered in the preceding week. Twenty-three new cases of the disease were admitted into the Dublin hospitals during the week, being 7 less than in the week ended 22nd inst. There has been a slight increase in cases of measles, scarlatina, and typhus fever under treatment in the principal Dublin hospitals.

Diseases of the respiratory organs caused 49 deaths, being 2 over the average for the corresponding week of the ten years 1869-78. They comprise 26 from bronchitis, 8 from pneumonia, 1 from asthma, and 4 from lung disease unspecified.

## PUBLIC HEALTH (IRELAND) ACT, 1878.

*(Continued.)*

### Offensive Trades.

128. (*Verb.*) *Restriction on Establishment of Offensive Trade in Urban District.*—Any person who, after the passing of this Act, establishes within the district of an urban authority without their consent in writing, any offensive trade; that is to say, the trade of blood boiler, or bone boiler, or fellmonger, or soap boiler, or tallow melter, or tripe boiler, or gut manufacturer, or any other noxious or offensive trade, business, or manufacture, shall be liable to a penalty not exceeding fifty pounds in respect of the establishment thereof, and any person carrying on a business so established shall be liable to a penalty not exceeding forty shillings for every day on which the offence is continued, whether there has or has not been any conviction in respect of the establishment thereof.

129. (*Abs*). *Byelaws as to Offensive Trades in Urban District.*—Every urban authority shall from time to time, with the sanction of the L.G.B., make bye-laws with respect to any offensive trades established.

130. (*Verb.*) *Duty of Urban Authority to complain to Justice of Nuisance arising from Offensive Trade.*—Where any candle-house, melting-house, melting-place, or soap-house, or any slaughter-house, or any building or place for boiling offal or blood, or for boiling, burning, or crushing bones, or any manufactory, building, or place used for any trade, business, process, or manufacture causing effluvia, is certified to any urban authority by their medical officer of health, or by any two legally qualified medical practitioners, or by any ten inhabitants of the district of such urban authority, to be a nuisance or injurious to the health of any of the inhabitants of the district, such urban authority shall direct complaint to be made before a justice, who may summon the person by or on whose behalf the trade so complained of is carried on to appear before a court of summary jurisdiction.

The court shall inquire into the complaint, and if it appears to the court that the business carried on by the person complained of is a nuisance, or causes any effluvia which is a nuisance or injurious to the health of any of the inhabitants of the district, and unless it be shown that such person has used the best practicable means for abating such nuisance, or preventing or counteracting such effluvia, the person so offending (being the owner or occupier of the premises, or being a foreman or other person employed by such owner or occupier) shall be liable to a penalty not exceeding five pounds nor less than forty shillings, and on a second and any subsequent conviction to a penalty double the amount of the penalty imposed for the last preceding conviction, but the highest amount of such penalty shall not in any case exceed the sum of two hundred pounds.

131. (*Verb.*) *Power to proceed where Nuisance arises from Offensive Trade carried on without District.*—Where any house, building, manufactory, or place which is certified in pursuance of the last preceding section to be a nuisance or injurious to the health of any of the inhabitants of the district of an urban authority is situated without such district, such urban authority may take or cause to be taken any proceedings by that section authorised in respect of the matters alleged in the certificate, with the same incidents and consequences, as if the house, building, manufactory, or place were situated within such district; so, however, that summary proceeding shall not in any case be had otherwise than before a court having jurisdiction in the district where the house, building, manufactory, or place is situated.

### Unsound Meat, etc.

132. (*Verb.*) *Power of Medical Officer of Health to inspect Meat, &c.*—Any sanitary officer of the sanitary authority may at all reasonable times inspect and examine any animal, carcase, meat, poultry, game, flesh, fish, fruit, vegetables, corn, bread, flour, milk, or butter exposed or being conveyed for sale, or deposited in any place for the purpose of sale, or of preparation for sale, and intended for the food of man, the proof that the same was not exposed or being conveyed, or deposited for any such purpose, or was not intended for the food of man, resting with the party charged; and if any such animal, carcass, meat, poultry, game, flesh, fish, fruit, vegetables, corn, bread, flour, milk, or butter appears to such sanitary officer to be diseased, or unsound, or unwholesome, or unfit for the food of man, he may seize and carry away the same himself or by an assistant, in order to have the same dealt with by a justice; and should he seize the same in a public thoroughfare, may require the person conveying the same to give his own name and address and that of the owner of the article seized, and in default, or if the officer have reasonable ground for suspecting the names or addresses so given to be false, may detain such person and give him into custody until his real name and address be ascertained. Any person giving a false name or address to any officer authorised to demand the same under this section shall be liable to a penalty not exceeding five pounds.

*(To be continued.)*

## TO READERS.

The Editor will feel especially obliged by receiving copies of newspapers which contain any Poor-law or other intelligence of medical interest, in order that he may, if fit, republish it for the benefit of the readers of the *Medical Press*. Although twenty-one of the leading Irish newspapers are received at the Irish office, many things may escape notice which are deserving of attention.

### ON SOME HEART DISEASES IN CHILDREN.

By W. H. DAY, M.D., M.R.C.P. Lond.,

Physician to the Samaritan Hospital for Women and Children.

ALL those affections of the heart that are associated with valvular change occur on the left side of the heart, at least in the first instance (except in cases of congenital disease of the right side), and they are most frequent among girls. That females should be so predisposed to this misfortune is one of those intricate problems which at present must be allowed to pass without hypothesis or explanation.

Endocarditis affecting the valves on the left side of the heart is rare in intra-uterine life, and cases affecting the pulmonary valves only are also seldom met with in extra-uterine life.

"Out of 300 cases of heart disease examined after death in the Berlin Pathological Institution there were only three instances of endocarditis of the tricuspid valve alone, and no case of the same affection confined to the valves of the pulmonary orifice." (*a*)

Possibly, disease of the right side of the heart is more frequent than supposed, for, owing to its reputed rarity, the pulmonary and tricuspid orifices are too often overlooked or carelessly examined during post-mortem examinations. However, as the right side of the heart has less work to perform, and less force to resist than the left, it must be less liable to disease, just as certain well-known affections, varicose veins, aneurism, &c., are more common on the legs than on the arms.

Some of these cases of valvular disease would appear to be congenital where there is no history of rheumatism or fever, and where the disorder has not followed any sudden or lingering illness. The disease has stolen on steadily, or having slumbered from infancy, it remains unsuspected till long after it has taken hold of the patient and made itself manifest by the general constitutional disturbance which it has produced. Disease of the heart, then, may exist in children independent of rheumatism or febrile disorder.

It may announce itself shortly after birth in weakly subjects, as in a case that came under my care many years ago. The valves may become structurally changed independent of endocarditis; indeed from any causes that may be ascertained. Fortunately, in children there is a less liability for valvular disease to increase, and a power of tolerance, and even repair, which is not seen in later life. Indeed, it is difficult to conceive how little disturbance is sometimes created in the general health when the central organ of life is structurally damaged.

The sole explanation of this fact may be that the valves are mechanical arrangements to facilitate the circulation, and are not immediately concerned in the nutritive functions of the body.

Again, there are congenital malformations of the tricuspid, and much more rarely of the mitral valves, causing contraction of the auriculo-ventricular apertures, and such specimens have from time to time been brought before the medical societies of England and the Continent. Seeing that in some cases children have from infancy suffered from dyspnœa, palpitation, and other signs of heart trouble, it is not improbable, according to Louis, Dr. Farre, Dr. Peacock, and others, that these changes may take place during fœtal life ("Malformations of the Heart," Peacock, p. 139). I suspect that this is the cause of many cases of organic disease of the heart in children who have never had rheumatism or any other acute disease.

2. Heart disease consequent on thoracic deformity generally takes place in rickety subjects, but I presume that this is not necessarily so, because the posterior wall

(*a*) *Medical Examiner*, June 6, 1878.

of the thorax is sometimes distorted on the right side, whilst the left side posteriorly, is flattened, and, indeed, in some instances, the right anterior wall of the chest is most prominent and rounded. The distension of the heart's cavities leads to excited action of the heart, even where there is no valvular imperfection, and increased action follows to overcome the impediment. Every time the heart contracts it fills the aorta, which becomes dilated laterally, and elongated at the same time. The elongation drives the heart downwards against the parietes of the chest, and where the ribs are softened, as in rachitis, it not uncommonly produces bulging of the ribs on the left side anteriorly. It is a fact to be borne in mind that a bulging of the præcordial region is one of the accepted signs of dilatation of the heart, just as there is an increase of dulness from the organ displacing the lungs, and coming into closer contact with the chest wall. Balfour speaks of "malformation of the aorta, due to rickets, simulating aneurism" ("Diseases of the Heart," p. 320). In rickety chests, with lateral curvature of the spine, the aorta becomes unnaturally curved, so as to produce increased pulsation and a lengthening of its sounds, which may be mistaken for actual disease, or even for an aneurism in a person who has attained the age when that affection might be expected, and, as this happens on the right side of the sternum, over the position of the arch of the aorta, the inference is not *improbable*, if it is not *conclusive* in many instances.

"Strange things happen to the heart when the chest is deformed. There is an end of our pretending now to calculate what its condition may be by listening, and feeling, and percussing. Its sounds and impulses and resonances, be they what they may, are now worth nothing at all as guides to diagnosis. The heart is dragged from its proper seat and imprisoned in some strange place, and, perhaps, turned almost topsy turvey by the encroachment of the vertebral column and the approximation of the ribs. And thus cramped in and hooped about with bone, at every movement it gives a jar that may be felt, and a sound that may be heard, in every part of the chest. And this sound, which is thus conveyed to a distance, is seldom the natural sound, but a loud whiz—the same in kind, and the loudest in degree, which belongs to mechanical impediment from valvular disease; and mechanical impediment there is, but valvular disease there is none. The weight and pressure which the heart or its large vessels sustain from the hard framework of the chest raise the impediment, and throw it in the way of the circulating blood." (*a*) Such a description as this could only answer to an extreme case, for in the two cases to be quoted the mischief of the valves was owing to rheumatism and other changes having no relation to rickets, and the chest was too prominent and elevated to restrict the natural movements of the heart.

To pass over the region of speculation, and to come to practical details, the following cases significantly elucidate the course and progress of this variety of heart affection. That it is most frequently connected with rheumatism is evident, but it nevertheless may arise independently of that constitutional disorder, though pursuing an identical progress, and involving other organs in a similar manner, and finally leading to equally disastrous consequences. If the enlarged and over-excited heart did not induce this sternal prominence in its area, there ought to be a similar elevation, or convexity on the right side; and this, so far as my experience goes, rarely happens, for in all cases of distorted chest with heart disease which I have seen, the thorax has been most altered in the cardiac region. I have now under my care a girl with mitral stenosis, which cannot be traced to rheumatism, and although the action of the heart is not excited, except under exertion, and the left ventricle is rather dilated than hypertrophied, this side of the chest wall is more prominent than the right, which, below the left nipple, presents a striking depression.

(*a*) Dr. P. M. Latham, "Diseases of the Heart." 1869. P. 37.

CASE I.—*Rickets and Valvular Disease of the Heart complicated with Emphysema and Severe Headache.*

E. K., æt. 11, came under my care at the Samaritan Hospital as an in-patient in January, 1874. She was of rickety constitution, of square build, and short stature, and had been ailing for three years, chiefly with breathlessness on exertion. Five years ago she was attacked with measles and whooping-cough, followed by jaundice, but she never had *rheumatism* or scarlet-fever.

(Scarlet-fever I believe to be by no means an uncommon cause of heart disease. Von Dusch classes it next to rheumatic fever as a cause of endocardial inflammation. In April, 1877, I saw a boy, æt. 14, who was quite well till three years before, when he had a severe attack of scarlet-fever. No dropsy followed the fever. Since then he had never been strong, and at that time there was a bellows-murmur accompanying the first sounds of the heart, loudest at the apex, heard also at the base, and throughout the thorax, but not to be detected below the left scapula. The heart was enlarged and dilated, and the apex was seen and felt in the sixth interspace. The boy was languid, tremulous, and weak, but there was no embarrassed breathing nor sign of obstructed circulation, further than that which belonged to his mitral valve.

Valvular disease of the heart may result from scarlet fever, as it does sometimes from diphtheria. The processes involved in either disease, or those arising from several acute specific diseases, may bring about morbid changes of the endocardium connected with the valves.

Dr. Burdon Sanderson demonstrates what he happily terms "the doubly infectious character" of these forms of endocarditis after acute diseases. They result from specific infection, and the infective material becoming disturbed from the acutely diseased valves, is distributed to the liver, the kidneys, and the lungs.)

To return to the case under consideration. The tibiæ were arched forwards above the ankle-joints, the left half of the thorax was much deformed, and the ribs, both above and below the left nipple, were more prominent than on the corresponding side. Below the right nipple there was flattening, or to speak more accurately, a well-defined hollow, and the liver was pushed downwards below its normal limits. The left side of the thorax, from the centre of the sternum to the spine, measured 15 inches, the right, 14¼ inches. An examination of the heart showed that the apex beat was seen to pulsate for two inches in the seventh interspace and external to the nipple line. The action of the heart was strong and forcibly heaving, raising the stethoscope when placed over its area; with the systole was a loud and harsh bellows-murmur; it grew weaker in the direction of the ascending aorta, the sounds of which it obscured, and the murmur was very audible posteriorly on both sides of the spine, and in the epigastrium, where the impulse was strong. It was perceptible to the hand in the latter situation. The area of præcordial dulness was much increased. At each inspiration the ensiform cartilage was drawn in, and with expiration the heart was seen projecting beneath the left receding ribs, and felt by the fingers. Above the line of dulness at the third costal cartilage on the left side the bellows-murmur was inaudible, but in the course of the aorta it was very audible. The face was bloated and congested, the eyes heavy, the veins of the neck and thorax prominent, becoming full on inspiration. Slight catarrhal sounds were heard throughout the chest, which was hyper-resonant for two inches below the clavicles. Temp., 99·4; pulse 100, regular; respirations 36. The urine was scanty, and contained copious lithates, but no albumen. The patient was kept at rest in bed, and a mixture of tincture of digitalis, citrate of potash and senega was ordered.

On the 18th of March the patient, after an improve-

ment of some weeks, began to suffer headache over the forehead and both temples, the temporal arteries being full and throbbing. The respirations were still hurried and shallow, and over 40 per minute.

The diagram does not show sufficient dilatation on the right side of the heart.

July 16th.—The patient had so far benefited from complete rest and a careful diet that she left the hospital.

In January, 1876, she was re-admitted, after being absent from the institution eighteen months. The chief symptoms were now inability to rest the head on the pillow at night from pain in the chest and dyspnœa. The deformity of the chest was very remarkable. The thorax on the left side having further yielded to the action of the hypertrophied heart, and the left side of the thorax, measured, from the centre of the sternum to the spine, nearly an inch more than the right. The first sound was prolonged over the aorta and pulmonary artery, which was conducted from the mitral orifice; it was also harsh, blowing, and bellows-like over the left apex (mitral); the second sound was obliterated. The murmur was heard over the conus (which, we should remember, is uncovered by lung), and less so over the tricuspid valve. The sound was not so blowing to the inner side of the left nipple. She remained on this occasion six weeks in the hospital, and again left relieved. Rest and a careful diet were more relied on than medicine. Here let me say that the physical signs were somewhat different from those usually met with, for in mitral regurgitation the pulmonary second sound is usually accentuated from the increase of tension in the pulmonary artery, whilst the tension in the aorta is diminished, and the sound is weaker. And yet the sounds are, as I have just mentioned, frequently unchanged or prolonged over the base of the heart, even when there is present a considerable degree of pulmonary hyperæmia. I notice the fact without offering any hypothesis in explanation.

Re-admitted December 1876, with severe frontal headache, heat and fulness of the head. There was now a *set* colour in the cheeks, and the jugular veins and temporal arteries were full and pulsating. She had continual singing in the ears, and if she turned round was afraid of falling. The pulsation over the sixth and seventh ribs on the left side was perceptible for two inches laterally, raising the hand with considerable force when laid across this position. It was exactly over this point that the murmur was so loud, rough, and bellows-like; it was next most audible over the tricuspid orifice; then over the aortic; then over the pulmonary orifice. All the murmurs were from conduction, and all accompanied the first sound. The loudness of the murmur much obscured the respiratory sounds on both sides of the thorax posteriorly. She slept badly and dreamed constantly that she fell from a rock into deep water, and was drowned. As it was important to calm the excitement of the vascular and nervous system, a mixture of hydrate of chloral and bromide of potassium was ordered for the headache, and to procure sleep. A month later, notwithstanding free purgation, the head was hot, and the pain insupportable, so that the child, when allowed to be up, would take herself to some quiet corner of the ward, and sit alone without uttering a word. Formerly, when her nose bled periodically from congestion and coughing, she obtained temporary relief, but since hæmorrhage had subsided her head had been worse. Throughout the posterior lobes of the lungs there was some crackling in respiration from pulmonary engorgement. A mixture of sulphate of magnesia and nitrate of potash was ordered, and two leeches were applied to each temple. Notwithstanding the pain in the head and the lung disturbance, the urine remained clear.

Dr. Mahomed kindly took a sphygmographic tracing of the patient's pulse.

It indicated well marked percussion impulse, produced by the hypertrophied and dilated heart, which was apparently doing its work efficiently, and compensating for the mitral regurgitation, producing, in fact, a normal tracing with but one exception, namely, the undulation in the respiratory or base line, which indicated a variation in arterial tension, produced by each respiration movement, and was due to interference with the pulmonary circulation, and regurgitation through the tricuspid orifice. After staying two months in the hospital the patient again left.

Re-admitted March 15th, 1877, with pulmonary complication. Temp., 101·0; pulse, 120; respiration, 40. There was small crepitant rhonchus in the inferior lobe of the left lung, with bronchophony in the centre of the middle lobe, and dulness on percussion. Four days later the temperature fell to 100·0, but the pulse and respiration were unaltered. There was tearing cough, with bronchial expectoration mixed with streaks of bright-coloured blood. These symptoms disappeared in a fortnight, when few traces could be discovered of any lung affection. The chief feature was the intensity of the mitral murmur, which could be heard all over the chest, under both clavicles, throughout the right lung before and behind, and in the axillary regions. There had been no headache since her admission this time.

Note.—The salient features of this case were subacute congestion, and emphysema of the upper lobes of the lungs, collapse of the lower, cerebral congestion—all these evidences of disturbance originated in the great centre of the circulation, and constituted a condition of no doubtful import, exposing in turn almost every organ to undue excitement and strain, and defeating all attempts to remedy the evil which imperilled the life of the sufferer.

A heart hypertrophied like this, and structurally damaged at its chief apertures, gradually propagates its disturbing influence to the brain. For a variable period the heart and lungs bear the conflict between them, equalising and counter-balancing as far as possible the force of the circulation which neither can control; but sooner or later, if the patient does not succumb to dropsy and anasarca, as happened in the next case, than a state of stupor

and drowsiness, from an overloaded brain, is the consequence, and we have one of the most pitiful examples of human distress and suffering; the eyes are bloodshot and prominent; the veins of the scalp, neck and face are engorged; the head is hot, the vessels throb as if about to rupture at every cardiac systole, and the brain is racked with torture. If the vessels are not relieved of their tension from time to time, either by leeching or cupping, or by epistaxis, if it has happened occasionally, now ceases to recur; then a still worse stage is reached; the brain, oppressed and overcome by the enormous congestion and retardation of the blood within the vessels, and the heart yielding and becoming more attenuated, the nervous structure becomes exhausted from the greater impurity of the blood, and the last perilous stage of apoplectic coma is reached.

The vehemence of the heart's action, and the energy with which the arteries at first conveyed the blood to the brain, inundated or deluged it, if I may be allowed the term, and now that the violence is abated, and the storm is over, the over-stretched and paralysed vessels cannot return to their former state, and the brain is sodden and worn out. A more melancholy picture can scarcely present itself to our minds.

(*To be continued.*)

## ADENOID TUMOURS OF THE NASO-PHARYNX; THEIR INFLUENCE ON HEARING, RESPIRATION, AND PHONATION; AND THEIR TREATMENT.

By Dr. B. LÖWENBERG, Paris,

Translated by H. Macnaughton Jones, M.D., &c., Professor, Queen's University, Ireland.

In 1865 we first proved the direct relation of adenoid tumours of the naso-pharynx to the well-known granulations on the posterior wall of the throat. The view is founded on the observation of a number of cases where both kinds of morbid growths exist in the same individual. We have even been able to show the existence of intermediate degrees, between the one and the other pathological appearance, in the same person.

Case II.—(Taken from the same Memoir, p. 116). A lady, æt. 33, was affected with granular pharyngitis, occupying almost the entire pharynx. The characteristic protuberances were more evident according as they approached the interior of the naso-pharynx. About the posterior nares there are wrinkled folds the size of a pea. (Compare Cases I. and III.)

We can see in these cases that the granulations become larger and bear a greater similarity to adenoid growths, according as they approach the roof of the pharynx. The difference between these two kinds of excrescences consists, according to us, in a more or less considerable degree of development, or rather in the greater or less number of elements of the normal mucous membrane which form the hyperplastic growth. While in granular or glandular pharyngitis (follicular pharyngitis of Virchow) the solitary follicles scattered in the buccal pharynx are alone hypertrophied (Virchow) (compare also Rindfleisch), it is, on the contrary, the entire group of elements of the mucous membrane of the naso-pharynx which combine in the hyperplastic growth to form adenoid tumours of this region. In order to ascertain the causes of this difference in the size of the morbid growths in the one and the other cavity, we should, perhaps, remember that the normal mucous membrane of the naso-pharynx is more vascular and thicker than that of the buccal pharynx, and that it contains more adenoid tissue and glands than this latter, the mucous membrane of which is composed of conjunctival tissue.

Our own observations, made some time since, show us in the naso-pharynx of the same individuals adenoid tumours and simple glandular granulations, at the same time that there exists every degree of transition from the one to the other. These observations have enabled us, first, to deny the opinion of those authors who formerly affirmed that granular or glandular pharyngitis was bounded by the buccal pharynx, and did not attack the superior portion of the organ of deglutition. Thus, in 1862, Stifft says, in his Memoir on Chronic Pharyngitis, "Granular pharyngitis does not affect the naso-pharyngeal cavity." Since then the similarity of structure of these two groups, which has been histologically proved, particularly by B. Wagner, has corroborared our view. It perhaps might be better to give to the entire group one name, but we prefer to reject this innovation, in order not to introduce confusing elements into the question.

Adenoid tumours of the lateral walls are composed of conjunctival tissue, with the simple addition of more or less *of cytogenic elements:* the term adenoid tumours should not be applied, strictly speaking, to the entire group of which we are writing. We can offer the same objection to the expressions "lymphomes, lymphatic tumours, or lymphadenomes," borrowed from the nomenclature of M. Virchow. It might perhaps be better to give to the entire group one name, and to base it on the appearance of the tumours and their pathological *rôle.* We might then call them "polypoid tumours," thus distinguishing them (an important matter), from naso-pharyngeal polypus, to which we shall allude further on. But this expression would have the defect of not including the granulations of the throat, except for which we should prefer it to that of "adenoid tumours." In fact, this last term has been brought into use by Velpeau, to replace "glandular hypertrophy" of M. Lebert, and is meant to designate a totally different thing from that which we intended.

Before we conclude this histological sketch, we must mention *acinous adenomes,* described by MM. Cornil and Ranvier as situated on the soft palate and in the pharynx, and which are really due to simple hypertrophy of the acinous glands of this region. Future study will enable us to decide whether we can assign to this class a place in the group which we are now considering.

### ETIOLOGY.

The number of cases contained in the memoir of M. Meyer (of Copenhagen), and the statements of many authors who have seen adenoid tumours, particularly amongst the inhabitants of the German coasts, appear to imply that the rude climate of the North particularly favours the development of the affection in question. But since our attention was originally attracted to this point in 1863, at the commencement of our otological career, we have sought these tumours in those of our patients who presented symptoms of chronic coryza, or of troubles in the naso-pharynx, and we have often found specimens of this affection, more or less similar to those we have described.

It does not appear that social conditions, any more than climate, favour the formation of these tumours, for we have found them in the highest classes of society, as well as in the lowest.

We must leave these general considerations and examine more closely the special conditions of the development of adenoid tumours in the child. Here we first have to consider the lymphatic temperament, the presence of which we have proved in the great majority of children who suffer from these vegetations. This does not astonish us when we consider the direct relationship of adenoid tissue with that of the lymphatic glands, the enlargement of which is a most characteristic feature of this diathesis; we are surprised that no one has as yet dwelt on this well-marked feature of union, both anatomical and pathological.

In a different manner heredity seems to have a marked influence on the origin of this affection. We have sometimes been able to observe remarkable cases of the transmission of adenoid tumours to all the offspring of one

family by a father or mother who were affected as in the following case.

Case III.—We are, at present, treating a whole family belonging to the highest class of society, in which we are enabled to study the affection in its various symptomatic manifestations. All the children are of the same parents, and all are affected. The examination of the father yields an absolutely negative result, as to the naso-pharynx; but it is otherwise with the mother. Mme. X., about thirty-three years of age, breathes constantly by the mouth, and has a pronunciation slightly *nasonnée*. The rhinoscope shows adenoid tumours not very large, and scattered. There is a slight catarrh of the nasal fossa. The tonsils are normal. It would seem as though the troubles were much greater in the childhood of Mme. X. This is, perhaps, one of those cases of retrograde metamorphoses of the tumours, which we shall treat of in the chapter on prognosis.

Passing now to the children of the marriage—

1. J. X., æt. 6½, was brought to us on April 16, 1877. He was a perfect type of the affection. The face had the characteristic expression of stupidity. The mouth is constantly open, from which flows an abundant secretion of saliva; the parents say, sometimes tinged with blood. The respiration is loud, blowing, and frequently interrupted by an arrest during inspiration. The pronunciation is characteristic—instead of "mama," the child says "baba." The chest is extremely flat (see the special symptomatology).

Local examination shows that the tonsils are normal; the naso-pharynx contains a lobulated tumour very large, and hard to the touch, reaching the free border of the soft palate.

It is surrounded by a number of tumours of more diminutive size. The nasal fossæ are in a state of slight chronic inflammation; there is no polypus. The teeth present, in a striking manner, the defect of formation described by Hutchinson, except the inferior incisors, which are normal. The glands of the neck are enlarged. He snores at night. There is no hæmorrhage, no difficulty in swallowing, and no deformity of the face.

The parents, strange to say, took but little notice of this group of symptoms, although so striking and so painful to see. They brought the child to me for an old and severe bilateral deafness. The ears of the little patient were in this condition:—On the left there was a purulent discharge, with perforation of the membrana tympani; the hearing is very much diminished. The almost complete deafness of the right side is caused by an accumulation of cerumen, and disappeared when this was removed. There is a cicatrix in the membrane in front of, and below the end of the handle of the malleus, caused by an old perforation.

Since then, there have been many intercurrent inflammations of the middle ear, resulting in perforation of the tympanum at the place we have just described, and healing rapidly by cicatrisation under appropriate treatment. (Compare in this respect Case No. IV.

The tumours were successively removed by crushing (the parents refused any other operation.) The microscopic examination of the particles showed characteristic adenoid tissue. At present the constitution of the child is beginning to recover from the manifold troubles which are excited by these growths. This satisfactory result decided the parents to bring their other children, who present the following symptoms.

II.—Mlle. J. X., æt. 5; the hearing is good; the mouth is sometimes open; the pronunciation is slightly defective; she snores often; the vegetations are numerous, but not so large as those of No. I. and No. III.

III.—Mlle. A. X., æt. 4; the mouth is always open; respiration blowing; pronunciation *nasonnée*; she snores. There are many large vegetations, multilobular, filling the naso-pharynx from the roof to the free border of the uvula.

IV.—Mlle. M. X., æt. 8 months; the mouth is always open; it is probable that there exists here also morbid growths like those of her brothers and sisters; but it is, at present, impossible to ascertain by palpation.

We shall conclude this chapter by merely stating that adenoid tumours have been often found in connection with congenital cleft palate.

### Symptomatology.

When adenoid tumours have attained a considerable degree of development, the nasal passage and Eustachian tubes cannot sufficiently discharge their proper functions, so far as their permeability is concerned (in respiration, phonation, and hearing).

The permanent opening of the mouth, and the peculiar pronunciation associated with the deafness, form a type so characteristic, that the attidude and pronunciation of the patient are almost sufficient to form a diagnosis, without having recourse to the two methods of physical examination (the rhinoscope and digital examination), which we shall allude to further on.

But it is otherwise when the affection has not arrived at its height, or that the adenoid growths, thanks to their site, interfere but little or not at all, with the nasal passage, or that of the Eustachian tubes. We must then take our clue from other symptoms; although less strictly characteristic, they will call attention to the naso-pharynx, and induce us to make the special physical examination, which alone will prove the real nature of the affection.

We shall commence by the study of the symptoms, which should guide us in the examination of slightly advanced cases.

1. *Symptoms caused by Adenoid Tumours at their commencement.*—There is naso-pharyngeal catarrh from the commencement of the affection; it is characterised by an abundant secretion in the nasal and pharyngeal cavities. When the mouth of the patient is open, a greyish-green covering is seen, more or less extended, which descends along the surface of the posterior wall of the naso-buccal-pharynx. These masses, often tinged with blood, are expectorated in considerable quantity by the mouth and by the nose. Granulations of the naso-buccal pharynx are often found at the same time as adenoid tumours of the nasal portion; this does not astonish us after what we have previously said of the similarity of these pathological growths to each other.

We have sometimes been surprised to meet with symptoms indicating an impediment to nasal respiration (for instance, the frequent or even permanent opening of the mouth, at an early period of the affection); but usually these phenomena do not become striking until we arrive at an advanced stage of the disease. We shall refer to them, as to the aural troubles, with greater advantage later on.

The symptoms that we have been describing are not of themselves absolutely characteristic, nor can we form so clear a diagnosis as would direct us in our operative measures, save by the confirmatory evidence of the presence of the adenoid tumours themselves.

If, in the meantime, we insist on the *semiology* of the first stages of the affection, it is in order to convince our readers that they must not be satisfied with referring these symptoms to a general cause, such as a lymphatic temperament, as we constantly find done. Frequently also the mistake is made of being satisfied with general treatment, while the symptoms point to a distintly local affection and material impediment. It is necessary, then, to make a special examination to recognise this obstacle, and to check it "*manu armatâ*."

Once we acknowledge this necessity, digital or rhinoscopic examination will quickly recognise the characteristic vegetations. The latter of these two methods will also explain the abundant secretion. Small, or even large, drops are seen to exude from numerous apertures on the pharyngeal tonsil, from the entrance to the Eustachian tubes and the fossa of Rosenmüller, particularly on pressure, or if the patient contracts the muscles of this region.

2. *Symptoms of Adenoid Tumours at advanced periods of*

*the Affection.*—Having attained a certain degree of development adenoid tumours, by the disorders which they cause in the naso-pharynx and the neighbouring organs, give rise to a variety of symptoms dependent on the site of the vegetations. According to their position they interfere sometimes with phonation and respiration, when they obstruct the naso-pharyngeal passage; at other times, by a direct action on the Eustachian tubes, they compromise the functions, and even the integrity, of the organ of hearing. In cases where the vegetations fill the entire of the naso-pharynx all these symptoms exist and are exaggerated to their greatest extent.

To proceed methodically, we shall first consider the closure of the naso-pharyngeal passage, with its direct or remote consequences, and then, separately the disorders to which the organ of hearing is subject.

A.—THE SUPPRESSION OF THE NASAL RESPIRATION AND ITS CONSEQUENCES.

In the cases where adenoid tumours attain so large a size as to obliterate the two posterior apertures of the nasal fossa the air passes during the act of respiration by the mouth; this latter, therefore, remains constantly open. Even an incomplete obstruction of the nasal passages will often render them incapable for their physiological function, for with whatever rapidity the air traverses this contracted space, it will not reach the lungs in sufficient quantity in cases where the aperture leading from the two nasal fossa is too small.

This substitution of the oral passage for that of the nasal fossa entails a series of mischievous consequences, which we shall study one after the other.

The first is (*a*) *the change in expression*, which we have explained elsewhere.

(*b*) *Action on the phargnx.*

In most cases this transference of the entrance of air from one channel to another cannot take place without injury to both the respiratory passages. When we breathe normally—that is, by the nose—the inspired air undergoes a double physical change, while passing through the long and narrow windings of the nasal fossa; on the one hand it is raised, at the cost of that of their walls, to a temperature nearer to that of the interior of the body than is generally that of the surrounding atmosphere; on the other hand, during its passage it is saturated with a greater quantity of watery vapour, simultaneously with this elevation in temperature. Consequently the air reaches the pharynx warmed, and more or less saturated with water.

It is otherwise when the air is inspired by the mouth. After passing over a portion of the superior surface of the tongue and the roof of the pharynx, the atmosphere first comes in contact with the posterior wall of the buccal pharynx, and draws heat and moisture from those portions which form the isthmus and floor of the throat and the commencement of the laryngo-tracheal passage. In other words, it cools and dries them. This affects more particularly the mucous coat of the posterior wall of the buccal pharynx—not alone its epithelium, but even the superficial layers of the mucous membrane itself.

The condition of chronic irritation thus induced and maintained by buccal respiration has been already recognised by many authors, but we consider that it is carrying this point a little too far to impute to the defective respiration the origin of granular adenoid pharyngitis, and we may here with advantage notice the opinion of our friend, the able aurist of Glasgow, Dr. J. P. Cassels, who also expresses doubt on this subject. For our own part, we think that there is here a degree of confusion between cause and effect; that granular adenoid pharyngitis induces buccal respiration (by occluding the posterior apertures of the nasal fossa) rather than that it is the effect of it. Besides, no one will deny that this affection is observed daily in a number of people who breathe by the nose, which considerably lessens the probability of the above-mentioned hypothesis.

At the same time, we do not deny that the dryness and lowering in temperature of the mucous membrane of the buccal pharynx (the result of respiration by the mouth) may, to a certain extent, aggravate a granular pharyngitis which already exists, by interfering with the circulation in the superficial layers of the mucous membrane.

It seems to us to present a certain train of events, to which no one has as yet drawn attention—"granular adenoid pharyngitis, leading to the formation of adenoid tumours in the naso-pharynx; these, intercepting respiration by the nose, induce that by the mouth; from that comes a fresh irritation of the throat and increase of the pharyngitis."

# Clinical Records.

## MEATH HOSPITAL, AND CO. DUBLIN INFIRMARY.

*Brief Notes of Cases of Operation.*

UNDER THE CARE OF

Mr. LAMBERT H. ORMSBY, F.R.C.S.

(For the following notes we are indebted to MR. MACNAMARA WILLIAMSON, Resident Pupil).

OPERATION I.—*Removal of Two Large Glandular Tumours from Region of the Neck, under Lower Jaw.*—J. McGuinness, æt. 40, a fresh looking, healthy countryman, coming from the co. Donegal, suffering from two large glandular tumours situated and growing from the submaxillary region. The tumours were very hard to the feel, and appeared to be very movable under the skin. Mr. Ormsby mentioned, however, that the movability of tumours was extremely deceptive, as in many tumours, particularly in the region of the neck, it was found necessary to use the greatest caution in the removal, owing to deep and posterior attachments. Operation performed on Wednesday, March 19.—Ether having been administered, an incision in the skin was made, vertically. Over the tumours the handle of the knife and finger-nail were then used with very great effect, and the skin and fascia carefully separated from the anterior part of the tumours. It was, however, found that deep posterior attachments extended down, for some distance, in close connection with the carotid vessels. Large veins were met with in this direction, and the operator was very careful to use the point of the knife as little as possible. The tumour, though of stony hardness before operation, were found to be cystic, and to contain a large quantity of thick fluid, of a white pappy-like consistence, which, during the dissection, escaped from the tumour; the tumours were finally removed, together with their cysts. Some small bleeding vessels were commanded, and the incision brought together with interrupted suture, and the patient removed to his bed.

OPERATION II.—*Removal of a large Fatty Tumour from Posterior Part of Neck.*—Mary Roach, æt. 35; domestic servant; a rather thin spare woman; suffering from a large fatty tumour, which had been growing for five years. It was not painful, nor was there any adjacent glands contaminated or enlarged, and when pressure was made with the finger in the centre of the tumour, the scolloped outer edges of the fatty lobules were clearly demonstrated. Operation performed on same day, Wednesday, March 19. The patient, being fully etherised, by means of the operator's "inhaler," an incision was made over the summit of the growth, and the tumour removed, without much difficulty. The wound was brought together with silkworm gut, interrupted sutures, and the patient transported to her bed.

Mr. Ormsby drew the attention of the class to the extreme ease by which this tumour was removed as compared to the great difficulty he experienced in the removal of the tumour in the preceding case, owing to deep attach-

ments. He also briefly mentioned the diagnostic features of fatty tumours as compared with appearance and pathology of other abnormal growths.

Operation III.—*Removal of large Sequestrum in a Case of Necrosis of Tibia.*—John Hagerty, æt. 56, a well-nourished healthy man, suffering from extensive necrosis of tibia, which had lasted for more than two years. Various pieces of dead bone had been removed on former occasions. Operation performed on same day, March 19. Ether having been administered, an incision three inches long was made along the tibia, and the gouge was freely used, so as to allow the loose sequestrum to be removed more easily, which was facilitated by its division with a bone forceps ; the parts were extremely vascular, as is the case in the majority of cases of necrosis. All loose and roughened edges of bone were removed, and the hæmorrhage stopped by plugging the wound with strips of lint. The patient was then sent to his ward.

Operation IV.—*False Anchylosis of Elbow.*—Ellen L., æt. about 25, a rather nervous and possibly hysterical girl, suffering from fibrous anchylosis of left elbow-joint, caused by extra articular fibrous adhesions ; the result of strumous disease of some years' standing. All inflammatory mischief, however, had ceased for some months previously, leaving the joint stiff in an angular useless condition. Operation performed on same day, March 19. Ether having been administered, and the patient thoroughly relaxed, the operator grasped the arm firmly, and set up considerable motion in the direction of flexion first, afterwards extension. The crackling sound of the fibrous adhesions, giving way was clearly audible to those round the operating table. The patient was then sent to her ward, and a cold evaporating lotion ordered to be applied to the joint.

Mr. Ormsby mentioned that it was quite possible he would have to set up passive motion under ether at intervals of a week on many future occasions before he could ensure permanent useful motion to the patient ; and such cases when carefully and diligently attended to, generally turned out remarkably well, so long as there was no actual subacute inflammation going on, in or about the joint, in which case he would patiently wait for complete subsidence of such inflammation and irritation before attempting passive motion.

## ASTHMA : ITS PATHOLOGY AND TREATMENT. (*a*)

So little real knowledge do we have of the pathology of asthma, and so often are the best physicians baffled in either warding off, or mitigating the asthmatic paroxysm, that the disease may be fairly regarded as an *opprobrium medicinæ*. As the prevention and treatment of asthma are still so unsuccessful, notwithstanding all that has been written on the subject, the question naturally arises whether or not this want of success is due to any erroneous opinions which pathologists may have entertained with regard to the causes and nature of the disease. It is quite certain that, rightly or wrongly, the profession have, for a long time, agreed in regarding spasmodic asthma as a purely nervous affection ; but it is equally certain that the prevalent doctrine has done little towards demonstrating the means by which we may successfully cope with this distressing malady. We have undoubtedly been all moving in one groove—but a groove which has not conducted us to the object at which we aimed.

It is no little credit to a physician when he boldly challenges the accepted theory of a disease, and offers another which is, in his opinion, more conformable with the general principles of pathology, and, may be, more practical in its results. The author therefore has, what some authors do not have, a good reason for writing a book ; for whoever, in the true spirit of philosophical inquiry, writes either in favour of, or against, the dominant doctrines of the day, is entitled to a respectful hearing.

For some years Dr. Berkart has been strongly of opinion that spasmodic asthma is not, as is so generally thought, purely a neurosis, but that its main clinical phenomenon—the dyspnœa—is merely one link in a chain of morbid processes ; that it commences with a more or less insidious inflammation of the pulmonary tissue, and terminates with a bronchiectasis and emphysema. The practical importance of duly estimating the conditions on which this intractable and capricious disease depends, cannot be overrated. As the author justly remarks : "The dependence of asthma on definite organic lesions, affords, on the principle that forewarned is forearmed, the best prospects, not only of averting the dyspnœal seizures, but also of arresting the final development of the disease. Neither of these objects was hitherto attainable, because the nature of asthma was supposed to consist of a mysterious derangement of the nervous system, and the exciting causes of the asthmatic paroxysm were generally regarded as inscrutable."

With the view of developing his views on the pathology and treatment of asthma, Dr. Berkart divides his work, which consists of 230 pages printed in a clear bold type, into seven chapters. The first is merely introductory, but the second is an able and learned retrospect of the literature of the subject, a chapter which gives proof of much literary research. In perusing this chapter, in which the various theories of asthma that have been adopted from time to time, are passed in review, the reader cannot fail to notice how much the nervous origin of the disease has dominated the minds of most writers who have devoted their attention to the subject, although there were not wanting those who were of a different opinion, and who regarded asthma as a disease that depended upon some organic lesion of the respiratory organs. Thus, while Lænnec, Andral, Lefevre, C. J. B. Williams, Longet, Bamberger, Lehmann, Sée, Hyde Salter, Duclos, Trousseau, Weber (Halle), F. Haring, Biermer, and others, regarded asthma as some form of neurosis ; Rostan, Louis, Budd, Hirsch, Benvenisti, Bean, Traube, and Villemin, contended that the disease depended upon some structural change or vascular derangement of the lungs, or their bronchi. On the other hand, there were some who, like Canstatt and Wunderlich, regarded the pathology of asthma as an open question, or who believed that the disease was sometimes due to a neurosis, and sometimes to inflammatory, congestive, or organic lesion of the respiratory organs. While, moreover, the majority of the neural pathologists asserted that asthma was chiefly due to bronchial spasm, Budd, Wintrich, and Duchenne, thought the dyspnœa might be owing to a tetanic affection of the diaphragm and the other respiratory muscles.

In the third chapter we have an elaborate "discussion of the prevalent theory" of asthma, and the reasons why the author cannot regard the disease as a pure neurosis. In the first place, the absence of physical signs is no proof, as some argue, that the disease is a functional one, as there are many other complaints depending upon organic lesions which cannot be diagnosed during life. Thus in affections of the heart, the mere existence of certain abnormal physical signs does not warrant the assumption that textural change exists ; and, conversely, the total absence of physical signs does not prove the heart to be in a perfect state of organic soundness. Nor is the freedom of respiration between the attacks inconsistent with the existence of impairment in some part of the respiratory organs. For there are many other diseases, some of which may prove fatal at any moment, in which the patient may present all the appearances of health, and may be able to attend to his usual occupations without any inconvenience. Besides, this freedom of respiration and absence of distressing symptoms are often more apparent than real, as when anything happens to bring the respiratory organs more in to play than usual, the dyspnœa is at once made evident. And then with regard to the evidence from post-mortem examinations, it should be borne in mind that in the vast majority of instances, pathological conditions have been met with after death ; while in many of those cases in which no morbid appearances were found, there is reason to believe that the examination was not sufficiently exhaustive. Besides, it should not be forgotten that there are several morbid conditions capable of producing dyspnœa and other symptoms, but which are so fleeting in their nature as to leave no traces after death. Even the fact that asthma is one of those affections which are most frequently seen in private practice, where post-mortem examinations are seldom performed, should be taken into account, as were such examinations more

(*a*) "On Asthma : its Pathology and Treatment." By J. B. Berkart, M.D., M.R.C.P., &c. London : J. and A. Churchill. 1878.

often made, more evidence of the organic origin of the disease would probably be found. At all events it cannot be contended, as Hyde Salter has urged, that "diseases which leave no traces of their existence produce their symptoms through the nervous system;" and, as regards asthma, though, in a few instances, the lungs *may seem* perfectly sound, still there is no evidence that they *are so*, whereas the symptoms and the results of post-mortem examinations tend to opposite conclusions. What has been called the "capriciousness" of asthma, and the inconstancy of its alleged exciting causes, were regarded by Hyde Salter as a clear proof of the nervous origin of the disease. But in reply to this argument, Dr. Berkart observes that the etiology of disease in general, and especially of asthma, is a very obscure department of medical science, and that there is hardly one instance in which the real cause of the dyspnœal seizure has been ascertained, while doubtless in many instances, the circumstances which accidentally *preceded* were supposed to have produced the attack. Again, the action of certain drugs in the treatment of asthma has been supposed to indicate its nervous origin. But then it should be remembered that the remedies for asthma are of very irregular and uncertain operation, that the "most blind and purposeless treatment may be attended by the happiest result, and that, if narcotics and antispasmodics have given relief in this disease, they have likewise been of benefit in many organic diseases. Nor does our author think that the periodicity of asthma, or the copious discharge of limpid urine during the attack, are always characteristic of a nervous affection, as those phenomena are not incompatible with the presence of structural changes or vascular derangements in the respiratory organs. With regard to the theory of bronchial spasm, Dr. Berkart endeavours to show that such a theory is not merely inconsistent with the clinical aspect of the disease, but actually impossible. The experiments upon which this theory had been based, disprove rather than support that inference; for the distension to which the lungs are subjected in asthma "proves an insuperable impediment to the contractions of the bronchi." In his experiments, Dr. C. J. B. Williams found that when the lungs were inflated, electrical irritation produced no effect; only after a certain volume of air had been expelled from the lungs, did the bronchi exhibit signs of contractility. Moreover, the clinical features of the asthmatic paroxysms afford abundant evidence against that theory. If the bronchial muscles were engaged in respiration, they could be only auxiliaries of expiration; whereas in asthma, inspiration is relatively easy, and expiration laborious and difficult. Then experiments have shown that though the bronchi may be contracted, the elasticity of the air-vesicles is yet able to expel the air. It is, therefore, hardly conceivable that the spasm of the circular fibres of the bronchi should be capable of resisting the united forces of the elasticity of the pulmonary fibrous tissue, the contractions of the auxiliary muscles of expiration, the external atmospheric pressure, the resiliency of the chest walls, and the tension during the previous inspiration. Moreover, spasm of the bronchi would produce collapse of the lungs, whereas, in point of fact, the organ is, during the paroxysm, distended to its utmost limits in all directions. Nor should it be forgotten that in most instances the bronchial muscles are so greatly impaired in nutrition, and the bronchi themselves so permanently dilated, as to be even incapable of contracting. Indeed, the most dilated bronchi Hyde Salter has ever seen, was in a case of spasmodic asthma. We need scarcely remark that the above is merely an outline of some of the arguments by which Dr. Berkart opposes the prevalent theory of asthma. In perusing this chapter the reader will be struck with the able manner in which the author developes his argument in favour of this affection being of a very different nature to that generally supposed. The correctness, however, of some of the author's premises, or the validity of the conclusions he would draw from them, may be fairly doubted, while the argument he draws from the morbid anatomy of asthma is certainly open to criticism. Asthmatic patients are often long-lived, and it could be scarcely expected that they could suffer for years from such a complaint as asthma without leaving behind them some traces of disease, although it would not follow that the morbid appearances were actually the real cause and *prima origo* of the asthmatic attacks with which they had been so long afflicted. In such cases it is not always easy to separate the lesions which have given rise to the symptoms observed during life from those which are of a secondary nature, and which are really the effect or a complication, and not the causal condition, of the complaint. Supposing, for the sake of argument, that asthma is, in the first instance, a purely nervous affection, could it be expected that such embarrassment of the respiration, and such interference with the pulmonary circulation, and with the interchanges which normally take place between the blood and the respired air, could go on for years without doing some injury to the delicate structure of the lungs and bronchioles, or even to the right side of the heart, the action of which must be necessarily taxed in its effort to propel the blood through the obstructed pulmonary capillaries?

While in the third chapter the author has endeavoured, not altogether unsuccessfully, to show the untenable nature of the generally received doctrines respecting the nature of asthma, in the fourth chapter, or that which treats of its pathogeny and etiology, he states in more precise terms his own views of the subject, and adduces several facts which lend strong support to the doctrine that the disease originates in some previous affection of the respiratory organs. Thus, he remarks it is a striking fact that constitutional defects appear to be invariably associated with asthma; and, what is still more to the point, the majority of asthmatic patients have, previous to the appearance of the typical paroxysms, suffered from an acute or chronic inflammation of the lungs or bronchi. Of the 223 cases collected by Hyde Salter, the original cause of asthma was not ascertained in 46, but out of the remaining 183 cases it was found that no fewer than 132, or about 80 per cent., had previously suffered from "chronic catarrh, colds, and catarrhal pneumonia, complicating whooping-cough, measles, and typhoid fever." Only 10 out of the 183 cases were "apparently spontaneous." For this and other reasons to which we have partly adverted, Dr. Berkart concludes that asthma arises from an "insidious inflammation of the pulmonary tissue," that both its "antecedents and sequelæ are one continuous pathological process," and that the process commences "in the interlobular and peribronchial tissue, and thence gradually spreads to the internal surface of the bronchi. From an anatomical point of view, a copious exudation of serum and white blood-corpuscles is the starting point of the affection. The crowding of the leucocytes in the bronchial and interstitial tissue probably not only impedes their development, but tends to compression and obliteration of the adjoining capillaries. An extensive thrombosis of the capillaries, whether from stasis, compression, or endartritis, thus diminishes the supply of arterial blood to the affected parts. The white blood-corpuscles are softened and re-absorbed. The pulmonary and bronchial tissues become implicated in the process of liquefaction. The bronchial muscles, at first paralysed by the previous inflammation, afterwards undergo fatty degeneration. Then follow atrophy of the contractile and elastic element of the lungs, and finally dilatation of the bronchioles and alveoli. Thus," according to this view, "asthma is only one link in a chain of quasi-independent affections, which commences with inflammatory changes of the pulmonary tissue, and terminates with emphysema or bronchiectasis." Thus, moreover, the "idiopathic" asthma of writers corresponds to the dyspnœa, for as the primary lesions above-mentioned neither diminish the volume of air in the lungs, nor impedes its entrance and exit to and from them, the full extent and nature of the disease cannot be recognised at its early stages. On the other hand, the "symptomatic or catarrhal" asthma of the older writers corresponds to the fully developed state of chronic bronchitis and emphysema.

Such, in brief outline, is Dr. Berkart's opinion of the nature of asthma, the only weak point of which appears to us to be its want of anatomical proof. Both from the previous complaints of most asthmatic patients, and from other considerations, it is highly probable that a chronic inflammation or congestion, or hyperæmia of the bronchial mucous membrane, or a chronic and insidious inflammation of the pulmonary tissue itself, may be the starting point of the asthmatic paroxysms, especially in persons peculiarly susceptible to any excentric and reflex irritation of the respiratory nervous centres; but then what post-mortem evidence do we have that it is so? It is very seldom that one has the opportunity of examining in the post-mortem room the lungs of a patient who has not long suffered from attacks of asthma; and in the absence of such evidence we must regard the pathology of asthma as still an open question. Nevertheless, it must be admitted that, could such an examination be made, the probability is that the "prevalent" doctrine of asthma would be in a great measure upset, and that the nervous element of the disease would be found to be only a part, and a very secondary part, of the pathological events which lead up to the disease.

Moreover, from a therapeutical standpoint, the doctrine which our author espouses is a very safe one, and one that is remarkably suggestive with regard to the measures which should be taken to ward off attacks of asthma.

What these measures should be we shall not discuss. We have perhaps partly satisfied, as well as aroused, the curiosity of the reader, and therefore we shall, in consideration of the length to which our review has reached, ask him to consult this very able and interesting work itself, if he wishes to know the treatment which, in accordance with the above views, the author recommends for one of the most distressing and intractable complaints with which the physician has to deal.

## THE BEARINGS OF CHRONIC DISEASE OF THE HEART UPON PREGNANCY, PARTURITION, AND CHILDBED. (a)

THIS is undoubtedly a very interesting work. Dr. Macdonald will carry with him the sympathies of all his readers after they see this passage in the introductory chapter. "It is, I hold, the first duty of every obstetrician to make sure that he is a physician in the first instance, and an obstetrician only in the second place. Unless he does so, he can have only an extremely inadequate idea of the scope and importance of his department of the medical art and science; and he is, at the same time, certain to allow his position in practice to degenerate into the cultivation of what, at best, is only an outpost of applied surgery." It is very desirable, he says, "to be able to predict what are the special additional risks, if any, to which the pregnant, parturient, or lying-in stages, expose a patient who is the victim of a special cardiac lesion." Though this, he admits, is not yet quite possible, "we are a considerable way on the road to it."

In the first chapter, he considers the question of the enlargement of the left ventricle in pregnancy, first propounded by M. Larder, in 1825-6, and supported by the observations of M. Ducrest, in 1843. Other observations corroborate the views of these two Frenchmen. Blot did not go in for measurement of the thickness of the heart walls, but for weighing the heart, and found that the heart of the pregnant female gains quite one-fifth in weight during pregnancy; agreeing with other observers that the hypertrophy is almost exclusively confined to the left ventricle. "The sphygmographic curve of the pregnant female is one of high tension."

As to the effects of pregnancy upon a diseased heart, Hecker and Buhl point out that the diaphragm is pushed up, and the thoracic space diminished, which embarrasses the already crippled heart; while in parturition, "the heart is so used up by the exertions of the labour, that its already disturbed mechanism is brought completely to a standstill, and thereby an end is made of life." As to the diminution of the thoracic space in pregnancy, other observers hold that while the depth of the thorax is diminished, this is compensated by an increase in the transverse diameter. The author agrees with Lebert, that in chronic heart mischief, "if the compensation begins to be imperfect in young girls—if the subjective disturbances have gradually increased—then I *dissuade* from marriage, if I am consulted in the matter, because it is precisely those cases upon which pregnancy and parturition may operate very unfavourably." Fritsch thinks that a diseased heart does not so readily take on the changes usual in pregnancy, or bear the tax of parturition so well as a healthy heart. Recent cardiac disease is especially dangerous, as the compensation by muscular growth is not fully developed; and the puerperal state is very liable to set up ulcerative endocarditis. Spiegelberg thinks the diminished aortic pressure at the moment of delivery a source of danger, while Fritsch holds that the danger arises from the abdominal veins filling, the pressure to which they have been subject being taken off them.

Then a series of cases of mitral stenosis is given—thirteen from the writer's experience, and the rest from other sources, at home and from Germany. Mitral stenosis is the first form of valvular disease encountered and described by the different observers. Three primiparæ all died. The other six fatal cases died, two at the second confinement, and the rest singly at different parturitions. "The deaths occurred usually either suddenly, or within a few days or weeks afterwards." There is no proved death from embolism. A very special tendency to abortion or premature labour is clearly demonstrated with all these patients. Very few are found to carry their children the full time; they do not rally well after parturition; they are liable to congestive bronchitis, pulmonary œdema, apoplexy of the lungs, and dyspnœa.

Eight cases of mitral insufficiency are then given in detail. This is a less dangerous complication of pregnancy than mitral stenosis. Six cases of aortic incompetency follow. Three died. Once delivery is effected, then remissions of the threatening symptoms may be expected with considerable likelihood. In three cases there was also mitral stenosis. Then follow three cases, one of a weak dilated heart, where death followed twelve days after premature delivery at the seventh month. There was old standing kidney disease. Then two cases of acute endocarditis are given from German authorities, both ending fatally. "The most distressing subjective symptoms are found to be dyspnœa, a sense of suffocation, and precordial anxiety, and in aortic cases more especially, a very marked feeling of syncope during delivery. In all the cases of heart disease which has been recorded in this work, it will be observed that if the lesion was at all severe, the labour was found to be invariably accompanied by extreme cardiac irregularity, with also a feeble, irregular, and intermittent pulse, much dyspnœa, and cyanosis."

As to the effects of pregnancy upon the heart, he says, "the evil effects seem to be due mainly to the fact that in the latter part of the period of gestation, more work falls to be done than previously." As to the act of parturition, he recommends the use of chloroform; in almost all his cases he has given it with benefit. He advocates the use of the forceps, or the adoption of version early on, in order to save all bearing-down effort that can be avoided, so as to lessen the tax upon the heart. He concludes by expressing the opinion that the mortality following pregnancy complicated with heart disease, may be greatly lessened by due precautions during pregnancy and delivery, especially during the latter. Premature labour does more harm than natural labour.

The book is a useful addition to the practitioner's library, and will be read with pleasure as well as with instruction by all.

(a) "The Bearings of Chronic Disease of the Heart upon Pregnancy, Parturition, and Childbed; with papers on Puerperal Pleuro-Pneumonia and Eclampsia. By Augus Macdonald, M.A., M.D., Physician and Clinical Lecturer on Disases of Women in the Royal Infirmary, Edinburgh. (J. and A. Churchill, 1878, pp. 281).

# Literary Notes and Gossip.

A FEW days since the Earl of Carnarvon presided at the first annual meeting of the Index Society, held in the rooms of the Royal Asiatic Society, and, in moving the adoption of the report, he observed that the Society proposed to do for the whole student world what each student had now to do for himself—namely, to index the standard works on science, literature and art. They had the further view of making a general reference index, and with such a vast undertaking before them he hoped ensuing generations would thank them for the work they had inaugurated that night. The Society has our thanks in advance, such a work will be simply invaluable.

* * *

OTOLOGICAL literature is likely to be enriched during the present year by a translation of Politzer's celebrated work, "Lehrbuch der Ohrenheilkunde." The first volume has already made its appearance in Germany, and we hear that the second is nearly ready for the press. Dr. Patterson Cassells, of Glasgow, a former pupil of Politzer, is engaged upon the translation in accordance with an expressed wish on the part of the distinguished professor.

* * *

WE had recently occasion to speak very favourably of the eloquent Hunterian Oration which was, this year, delivered by Prof. Humphry, of Cambridge. We are, therefore, glad to see that it has been published by Macmillan and Co. in the form of a neatly bound pamphlet, and in a type which will add to the pleasure both laymen and medical men must

feel in reading it. The oration is by no means a repetition of those that have been delivered before; and the remarks which Prof. Humphry makes on medical education are particularly interesting and suggestive at the present time.

* * *

So little is known about the diagnosis and surgical treatment of dropsy of the gall-bladder, that Mr. George Brown has done well in publishing the paper (Baillière, Tindall, and Cox) which he read at the last Annual Meeting of the British Medical Association. The pamphlet contains some valuable information respecting the pathology and diagnosis of this form of disease, with notes of its successful treatment by operation (cholecystotomy).

* * *

PART. II. of Klein's "Atlas of Histology," has succeeded quickly upon the first issue, and is, in point of artistic excellence, perhaps superior to its predecessor. The work will be a valuable one when completed, and is in every way worthy of success.

* * *

NO. II. of the *Index Medicus* is to hand, and is fully up to its early promise. The editors confess to the many difficulties in compilation which they meet with, especially in the reception of foreign journals, albeit they seem to plod on with that indomitable pluck characteristic of Americans, and the *Index Medicus*, now fairly under weigh, keeps us *au courant* with everything that has been written on any given subject in medicine and the collateral sciences, either in journals, or books, in every civilized country.

* * *

THE death last week of Sir Anthony Panizzi, whose name must be familiar to every lover of literature, has met with very widespread expressions of regret. Long will his name be identified with the British Museum, the Library of which owes so much to his energy and vigilance, while students in that magnificent collection have cause to remember with gratitude the comforts and conveniences he was the means of providing for them. Sir Anthony retired some little time ago, on a full pension, which was granted in consideration of his valuable literary labours, and was at the time of his death in his 82nd year.

* * *

*Cassell's Natural History*, under the editorship of Dr. Duncan, F.R.S., is one of the most complete works of the kind before the public. Natural history is always attractive, and especially in this case, where the text is written in a chatty style, and the illustrations are good. The April number is particularly good, it deals with porcupines, chinchillas, agoutis, hares, rabbits, and the Order Edentata or Bruta (animals without front teeth.) A very instructive chapter is also given on "Fossil rodents."

* * *

NEW editions of the following works have appeared during the past month:—"The Mystery of Pain," by Mr. James Hinton, F.R.C.S. "The Chemistry of Common Life," by Mr. J. W. W. Johnston. "Diphtheria: its Nature, Causes and Treatment," by Dr. R. Hunter Semple. "Diphtheria: its History," &c., by Dr. W. Morgan. "Text-book of Practical Medicine," by Dr. Von Niemeyer (Translation). "The Common Sense Management of the Stomach," by Dr. G. O. Drewry. "Notes on Rheumatism, by Dr. Julius Pollock. "The Diseases of Tropical Climates," by Dr. J. A. B. Horton. "The Pathology of Mind," by Dr. Maudsley. "The Dispensatory of the United States," by Drs. Wood and Bache. "The National Dispensatory," by Drs. Stillé and Maisch. "Fistula, Hæmorrhoids," &c., by Mr. William Allingham, F.R.C.S. "The Elements of the Anatomy and Physiology of Man," by Mr. Bale, M.A.

* * *

THE following new works were published during last month. Dr. Billroth, on "General Surgical Pathology and Therapeutics." 51 lectures. Translated by C. E. Hackley. Dr. Blake, on "Sewage Poisoning." Mr. De Lacy Evans: "Can we Prolong Life?" Surgeon Major A. Gore: "The Story of Our Services under the Crown: an Historical Sketch of the Army Medical Staff." "Health Primers:" No. 5.—Baths and Bathing. No. 6.—Personal Appearances in Health and Disease. Dr. Humphry: "The Hunterian Oration for 1879." Dr. Khory Rustornjee: "Digest of the Principles and Practice of Medicine." Dr. Klein: "Atlas of Histology." Parts I. II. Dr. D. Hayes Agnew: "The Principles and Practice of Surgery," Vol. I. "Plague (The) as it Concerns England. Compiled from Official and other Sources." Dr. Roth: "On the Neglect of Physical Education and Hygiene." "Transactions of the Obstetrical Society," Vol. 20. "Mr. Walter Tyrrell: "On the Use of Strychnine in Epilepsy and Kindred Nervous Affections." Dr. Wood: "On Insanity and Lunacy Law."

* * *

IN order to stem the tide of pernicious literature, which for some years has been steadily increasing, with the inevitable result of debasing the minds of the young in our great cities, the editor of that extremely useful serial the *Leisure Hour*, has started a new magazine for boys called the *Boys' Own Paper*, for which he craves the assistance of the press, and of those who have the welfare of the rising generation at heart. So far as our columns may be of service, he has our heartiest support. The magazine is of high moral tone and healthful reading, and as its "get up" is beyond the chance of profit, the attempt deserves the sympathy of all right-minded people. Our readers can also do their part, when they notice those debasing publications which are legion, in the homes of the poor. Here is a magazine for one penny which they can honestly commend to their poorer patients as a substitute for the wretched trash represented by such publications as the *Boys of England*, *Young Britain*, the *Illustrated Police News*, &c. One of the great religious societies is, we believe, responsible for the venture, and we congratulate that body upon spending a portion of their funds in so useful a way.

# Transactions of Societies.

## MEDICAL SOCIETY OF THE COLLEGE OF PHYSICIANS, IRELAND.

DR. C. J. NIXON exhibited

THE THORACIC VISCERA OF A BOY, ÆT. ELEVEN, WHO SUFFERED FROM CYANOSIS DEPENDING UPON A CONGENITAL MALFORMATION OF THE HEART.

Whilst under observation in hospital a pyrexial condition developed itself, the lung became congested posteriorly, the boy had repeated attacks of general convulsions, with loss of consciousness, during one of which he died. The sounds of the heart were free from murmur, but very markedly accentuated.

The post-mortem examination of the thoracic viscera revealed the following results:—The heart is considerably enlarged; it weighs 8¾ oz. and is somewhat square in shape, there being no distinct apex. The conus arteriosus forms a remarkable prominence which is abruptly constricted by the root of the pulmonary artery. This prominence gives the appearance of great enlargement of the right ventricle. Examining the different cavities in order it is found that the right auricle is very much dilated and that its walls are hypertrophied; the auricular appendix is stunted in appearance, but it shares in the thickening of the walls of the auricle. The fossa ovalis is of an unusually large size; it is minutely cribriform at its upper part, whilst at its anterior margin a longitudinal, oval slit, with finely bevelled margins, exists. The slit can only be observed by traction of the septum in a transverse direction, otherwise it is so completely closed that it would seem not to have been traversed by a current of blood. The opening of the superior cava is of normal size, whilst that of the inferior cava is greatly enlarged and deficient in any trace of a Eustachian valve. The opening of the coronary vein is of normal size, and it is guarded by a fairly-developed valve of Thebesius. The cavity of the right ventricle is greatly enlarged. It presents a very singular appearance from the number of openings in connection with it, and from the hypertrophied condition of the carneæ columnæ and musculi papillares. The auriculo-ventricular opening is of normal size. The column of King and the moderator band are remarkably hypertrophied. The direct continuation upwards of the ventricle ends in the aorta, which, owing to a deficiency in the upper part of the septum ventriculorum may be seen to spring also from the left ventricle. The septum is very much thickened below, gradually becoming thinner towards its upper part, where its margin is smooth and wedge-shaped. A circular aperture, with a smooth, thin margin, admitting of a second communication between the two ventricles, exists at the upper and back part of the septum; it admits with ease the tip of the little finger. What may be

described as a supernumerary ventricle is found springing from the upper part of the great cavity. A smooth, circular aperture, admitting with ease the extremity of the thumb, leads into a cavity about the size of a walnut. This cavity is constricted somewhat at its middle, and posteriorly, by a transverse ridge, partly muscular and partly membranous; the upper portion is rough from the presence in it of corneæ columnæ, the endocardium presenting in parts a white, rugose appearance, from fibroid degenerative change. Above, the cavity ends in front in a muscular cul-de-sac—the conus arteriosus—whilst posteriorly it leads to the root of the pulmonary artery. The orifice of the artery is found to be completely closed by the intimate union of the margins of the semi-lunar valves. There are only two pulmonic valves, one being situated to the right and the other to the left side. The segments are perfectly smooth and form a dome, the convex portion of which projects into the artery. In the centre of the dome there is a deposition of rough lymph which in parts has undergone calcareous degeneration. No communication existed between the artery and the ventricle until a small probe was passed with some force through the fibrinous plug occupying the centre of the diaphragmatic valve. If there have not been complete atresia of the pulmonary artery during life, the opening certainly could not have admitted more than an ordinary-sized pin through it. Beyond the ostium the pulmonary artery is reduced in size, but its divisions are apparently of nearly their normal calibre, but the coats of the vessel are greatly thinned. The ductus arteriosus is a fibrous cord; it is perfectly closed.

The left side of the heart forms apparently about a fourth of the entire organ. The cavity of the left auricle is small, that of the auricular appendix especially so, and the four pulmonary veins are about one-half their usual size. The left ventricle is greatly diminished in size, and its walls are much thinner than those of the right ventricle, in the proportion of about 2 to 3. The aorta is displaced to the right, or rather the left ventricle is pushed to the left by the hypertrophied and dilated right ventricle, so that the aorta seems to spring directly from the latter. The aortic semi-lunar valves are normal in appearance and number. Two of the segments, when turned upwards, cover the mouths of the coronary arteries. The aorta diminishes unusually rapidly in size, the middle portion of the thoracic aorta admitting barely the tip of the little finger. The origins of the great vessels from the arch are peculiar in being quite close to each other. The lungs are small; they weigh 17¾ oz. Both were consolidated at their posterior portions. The right lung has only two lobes. At the roots of the lungs the pulmonary veins are found to be small in size, the pulmonary and bronchial arteries are comparatively large. Looking at the specimens it would seem that the afferent pulmonary circulation was carried altogether by the bronchial arteries. I am unable to say whether there existed any collateral circulation through branches of the subclavian arteries, or through the œsophageal arteries, as has been observed in cases of cardiac malformation similar to this one brought by me before the Society.

Dr. Nixon made some comments upon the etiology of the condition of the heart exhibited, and upon the views entertained as to the cause of cyanosis. He accepted the view of Louis that the latter was due to a blood stasis in the capillary circulation. Attention was also drawn to the absence of tuberculosis in the lungs, although Lebert points out its special dependence upon atresia of the pulmonary artery.

**Stewart Institution for Imbecile Children, Palmerstown, Co. Dublin.**—During the past year the donations and subscriptions contrast favourably with those of the preceding year; while in addition a sum of £440 was obtained from a bazaar held in May, 1878. The new buildings having been finished, the inmates of the institution at Lucan were removed last January to their present locality at Palmerstown. One portion of the building is utilised for the accommodation of imbecile and idiotic children, and the remainder for the reception of lunatics from among the middle classes. This latter has produced a clear profit during the past twelve months of close on £1,000. The institution is a most deserving one, its avowed object being to educate as far as possible a most pitiable class of the community, some of whom must otherwise remain wholly dependent on the assistance of others.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, APRIL 16, 1879.

## DIPHTHERIA AND CROUP.—I.

THE elaborate Report of the Committee of the Royal Medical and Chirurgical Society, the late and prospective debates of the Fellows of this Society, and the sad bereavements which have been experienced by the Royal family in Germany, will probably induce the profession to give more than usual attention to the nature and treatment of croup and diphtheria, and especially to the question of their mutual relationship.

The Report embraces the consideration of the cansation of these diseases, the conditions of their occurrence, the course and symptoms of individual cases, and a summary of conclusions arrived at by the Committee. But not the least valuable part of the Report is the Appendix, wherein the reader will find a digest of replies to queries that were largely circulated by the Committee, the history and early literature of the subject, an historical sketch of anatomical distinctions which have been drawn between croup and diphtheria, a history of the anatomy of diphtheria in England and in Germany, and the tables of cases, with remarks, collected respectively by Drs. Dickinson, Hilton Fagge, and Gee.

We may remark, *in limine*, that it is now long since the doctrine of the identity of the two diseases was first advanced. Bretonneau contended for the diphtheritic nature of croup, and his opinion was afterwards adopted by Trousseau, Guersant, Barthez, and other French physicians. Until recently this doctrine was repudiated by almost every English medical writer. The late Dr. Hillier, however, advocated it in 1862, and since then Dr. Johnson, Dr. Semple, and Sir J. A. Cormack have main-

tained it; while Sir W. Jenner has withdrawn his previously expressed opinion that the two complaints are distinct. But whatever may be the result of the prolonged discussion that is likely to take place at the Royal Medical and Chirurgical Society, a careful perusal of this Report makes it evident to us that the opinion of its Committee, and the balance of opinion among the many practitioners to whom they addressed their queries, are more or less in favour of a distinction between these two diseases. The Committee appear to have shirked the responsibility of giving a very definite opinion on the subject. Their decision is somewhat evasive. Nevertheless, there is, to our mind, only one way of interpreting the following statement. "The most marked division indicated by the facts before the Committee is, that between membranous and non-membranous laryngitis. The Committee suggest that the term *croup* be henceforth used wholly as a clinical definition implying laryngeal obstruction occurring with febrile symptoms in children. Thus croup may be membranous or not membranous, due to diphtheria or not so. The term *diphtheria* is the anatomical definition of a zymotic disease which may or may not be attended with croup." (The italics are the Committee's.)

If this be not virtually admitting that there are two distinct diseases, one of which should be called croup and the other diphtheria, we are, indeed, dull at comprehending language which appears to us sufficiently intelligible. It is true that the Committee in the next sentence proposes that, to avoid confusion, the term membranous laryngitis should be employed where the case allows of its application, but this does not alter the opinion we have just quoted. It is, moreover, to be observed that, in drawing their conclusions on the subject the Committee do not appear to have taken into account those large numbers of cases in which croup is not attended by any membranous exudation, but in which there is undoubtedly an inflammatory condition of the larynx and trachea, accompanied by the well known symptoms of that disease. Had the Committee taken this fact into consideration the decision they arrived at might have been more definite than it is. Whatever may be said to the contrary, we are convinced that the mass of facts and opinions on which the Committee had to base their decision was not such as would warrant them in declaring that so-called croup and diphtheria are one and the same disease.

They have not obtained any evidence that will show that the causes and conditions of the two diseases are the same. With regard to the respective conditions giving rise to croup and diphtheria, the Committee obtained "but little exact information."

Assuming that the two diseases are distinct, hygienic conditions may be presumed to play a very important part in the production of diphtheria compared with their operation in the case of croup. Yet on this question, especially as regards croup, the only information we have is given in the analysis of replies to queries, and this is so meagre as to prove very little either one way or the other. On turning, however, to the analysis we find that while a great many practitioners testify to the promotion of diphtheria by insanitary conditions, there is no evidence adduced to show that these same conditions favour the occurrence of croup. With regard to the influence of exposure to cold and wet, which on *à priori* grounds may be assumed to be an important factor in the production of croup, but not of diphtheria, the Committee state that "notwithstanding urgent and repeated appeals no single case of membranous exudation in the larynx resulting from exposure to cold has been furnished to them." But on turning to the Appendix and Digest of Replies, we find Sir George Burrows stating that he has frequently seen croup arising from a definite exposure to cold. Dr. Long Fox says: "Very many times in my practice has croup been referred to damp and cold." Dr. Grigg expresses a belief that croup always arises from wet and cold. Dr. O'Neil, of Lincoln, states, "that he has generally made out, satisfactorily to himself, that the occurrence of false membrane limited to the trachea was due to exposure to cold or other causes of ordinary inflammation." Dr. Ranke, of Munich, says "that he has seen, in addition to the cases of diphtheritic croup also cases occurring spontaneously and sporadically, where no other cause for the disease could be assigned than exposure to cold." Dr. Trend, of Southampton, says: "To my knowledge I have never seen croup arise from the specific poison of diphtheria, but I have frequently traced it to exposure to cold." Mr. Stretton says: "I never attended a case of croup without clear evidence as to cause in careless exposure or vile dietary errors;" and lastly, Mr. Sansom says that he has never seen evidence which is contrary to the conclusion that false membrane limited to the trachea takes its origin from exposure to cold or causes of ordinary inflammation. With these replies before them, we think the Committee were scarcely warranted in saying "that mere exposure to cold and wet appears to be a remarkably infrequent cause of membranous laryngitis." No doubt it will be said that many of the answers to their queries had reference to cases which were not obviously attended with membranous exudation; but, we would ask who would contend that typical cases of so-called croup should be limited to those cases in which there was ocular proof of this exudation? The exclusion of non-membranous cases of croup, appears to us a serious defect in an otherwise elaborate and able Report, and is, moreover, hardly fair to those who support the dual theory of these diseases.

With regard to the "course and symptoms in individual cases," there was little evidence before the Committee. "Very great difficulty," they say, "has been felt in dealing with the subject on account of the want of any marked symptom or criterion by which provisionally to separate the cases for inquiry." But this statement is rather inconsistent with the fact that in their first circular of inquiries, they had for the guidance of the referees, presented clinical definitions of the two diseases respectively. There was, however, evidence to show that *suddenness* of onset is apparently a characteristic rather of the non-membranous form of laryngitis than of any special class of membranous laryngitis—that although *albuminuria* occurs in both classes of cases, it is relatively much more frequently absent in those of laryngeal exudation only—and that, with respect to paralysis (of the soft palate, &c.), although this symptom is not such a frequent complication of diphtheria as is generally supposed, yet

"no case of paralysis following membranous laryngitis has been reported to the Committee, or come under their notice."

If, however, the facts before the Committee were not so decisive of the question at issue, nor so numerous, as we had reason to expect, we cannot say the same of the majority of opinions expressed by the several medical practitioners to whom the Committee has addressed its queries. To the question, "If you believe the two diseases to be identical in nature, on what reasons do you chiefly rely in forming your opinion?" "only a few state their belief that the two diseases are identical;" while "there is," says the Committee, "a large numerical majority of those who express a belief that membranous croup is not in all cases to be ascribed to diphtheria." With regard to the individual answers, we can now select only one or two from respondents, whose replies are, from their position or their large experience, specially worthy of attention. Dr. A. E. Sansom, who has had large experience at the North-Eastern Hospital for Children, as well as in private practice, with much reason and justice protests against the definition which renders the demonstration of false membrane during life, or after death, a *sine qua non* for the diagnosis of true croup. He regards the two diseases as distinct, and says that the diagnosis of diphtheria from croup is "afforded by—(*a*) the profound adynamia; (*b*) the secondary inflammation and enlargement of the neighbouring lymphatic glands; (*c*) the appearance of diphtheritic false membrane upon any wounded surfaces; (*d*) the infiltration of tissues contiguous to this membrane, with sloughing of the soft parts; (*e*) the occurrence of various nerve paralyses at a later period of the disease—paralyses which I have never seen in the cases which have recovered from imminent death from croup, attended with abundant tracheal false membrane; (*f*) the proved contagiousness of diphtheria; not a single case of contagion has been observed by me in true croup."

It is also held by those who make a distinction between the diseases, that the treatment which is successful in the one class is not so in the other; that the one requires an antiphlogistic, the other a stimulant, treatment. Several practitioners testify to the infectious character of "croup" when of diphtheritic origin, and the comparative absence of infection in other cases. Dr. Wells says that his experience does not lead him to conclude that these diseases are identical in nature, and among other grounds of distinction, states that diphtheria, in contra-distinction to croup, affects subjects of *all* ages, and is exceedingly contagious. The late Dr. Laycock sums up his experience by saying, "I have been Clinical Professor for twenty-one years in the University of Edinburgh, and I have had to weigh the evidence given on both sides of the question. I have come to the conclusion that the two diseases are wholly different . . . . Diphtheria is a highly proteiform disease, and is manifested in every degree of severity according to the state of the individual and his surroundings. On the other hand, croup is not proteiform, but is—croup." The reply of Dr. Wilks to the queries of the Committee are of a very reserved and cautious nature, but he is not prepared to deny the difference between the two diseases. He denies that the proof can lie in the consideration of symptoms or anatomical changes it must be founded on clinical observation over a long series of years. "If it be found that a large number of cases of membranous croup occur in isolated spots without the presence of marked diphtheria in the neighbourhood, and in these cases there be no albuminuria or other marked constitutional disturbance, I see no reason why they should not be regarded as of idiopathic origin."

Such are the main facts and opinions elicited by the Committee of the Royal Medical and Chirurgical Society. That they show, as far as they go, a large balance of evidence in favour of croup and diphtheria being two distinct diseases, no impartial reader would, in our opinion, venture to deny. We have, however, already exceeded our usual limits, and therefore must postpone to another occasion any further remarks we may have to make, either on the Report itself, or on the discussion to which it has given rise.

# Notes on Current Topics.

## The Serious Charge against a Medical Man.

THE profession will, one and all, deeply regret that Mr. Adam Addison has been found by the coroner's jury guilty of wilful murder, and that there are no "extenuating circumstances" which can enlist the sympathy of his professional brethren. Of course, the case is not finally settled, but there is too much reason for believing that abortion was criminally produced, and that the woman Robinson died in consequence thereof. There was not, however, very strong proof that death was caused by the induction of abortion, and therefore, it is to be hoped that a more searching inquiry will throw further doubt upon the supposition that death was directly and solely caused by the performance of that operation. One thing is quite clear, namely, that a post-mortem examination discovered no marks of violence, and that the operation was as skilfully performed as if it had been done by any other practitioner in the conscientious discharge of his duties. To the profession generally the case is interesting as showing that the the mere induction of abortion is in itself by no means free from danger, that it should be practised only under the most pressing circumstances, and when the sole alternative is between that, and a far more dangerous, operation.

## The London Temperance Hospital.

SIR WILFRID LAWSON, M.P., has accepted the invitation of the Board of Directors of the London Temperance Hospital to lay the memorial stone of the new buildings in Hampstead Road, on Thursday, May 8th, and the Directors have received intimation that Sir Wilfrid will be supported on the occasion by Sir T. Chambers, Sir T. Bazley, Sir A. Lusk, Colonel Beresford, Dr. Cameron, Messrs. Barran, Jacob Bright, T. Burt, W. Ewart, J. D. Hutchinson, W. H. James, A. M'Arthur, E. Noel, G. Palmer, W. Rathbone, H. Richard, W. Shaw, A. M. Sullivan, B. Whitworth, and other members of Parliament, Canons Ellison and Fleming, Vice-Admiral Sir W. King Hall, and many other promoters of the temperance cause.

The contract price of the new buildings is £11,835, towards which the Governors have received £9,500, and they have issued an appeal asking the supporters of the movement to enable them to open the building in the next autumn free of debt.

It is evident from the above that the system of treating all diseases on "total abstinence" principles is receiving a good deal of support. No doubt the movement is a great experiment, the very novelty of which is calculated to attract the attention and sympathy of the public. We would also wish it every success, were it not that the prospective results of the experiment must necessarily be of an *ex parte* character. The total abstinence treatment may show what can be done without the use of alcoholic stimulants, but it cannot show what good might result from the temperate employment of such stimulants, simply because the plan pursued at this hospital precludes any comparisons being made between the alcoholic and non-alcoholic treatment of disease. The practice, however, at this institution presents a wide and new field of observation, and we hope that the authorities will profit by the opportunities presented to them.

## Treatment of Asthma by Iodide of Potassium Spray.

Dr. Evrard, of Orsennes, has obtained very satisfactory results, in a severe case of asthma, from the use of a spray of iodide of potassium. The patient, a man thirty years of age, had suffered for eight months from daily attacks of asthma, and had also been subject to chronic bronchitis for five years. At the time the treatment was begun he had three or four attacks a day, and was reduced to a pitiable condition. After assiduous use of the spray for eight days, the asthmatic attacks had almost entirely ceased. Eighteen months have elapsed since then, but the patient has continued to use the spray and the attacks have not recurred. The strength of the solution used was 1 to 20. The periods of inhalation were short, but frequently repeated; the quantity of the drug thus administered by the bronchi being about the same as that given internally by Professor Sée, namely, 1·5 to 3 grams. (23—46 grains) per day.

## The Royal Hospital for Incurables, Putney Heath.

We hope that the charge which has been brought against this institution will not be substantiated by further investigations. The amount paid into the hospital for his maintenance, Mr. Stringer states, was £80 a year, derived out of the interest of a sum of £16,000 invested in the East India Four per Cent. Stock, one-fourth of which he was entitled to. Mr. Stringer positively states he was only informed a few days ago that there was any hitch in regard to the payment for his maintenance, and that he would therefore be required to leave the hospital. He pointed out that he had no funds in his own possession, and asked for a fortnight or even a week's delay in order that he might communicate with his trustees, bnt this was not granted to him. To be turned out of the hosp al under these circumstances and after being an inmate for three or four years is, if true, an act of great inhumanity as well as a great blunder. A long letter has been written to the papers by the secretary of the hospital, but it does not expressly deny the main charges that have been made against the authorities of this charity, and is far from disproving the injustice of the public censure that has been passed upon the board of management.

## False Calabar Beans.

The *Pharm. Zeit.* says that during October last two different kinds of beans were offered in the London market as Calabar beans; one of them was the seed of *Entada scandens*, which are circular, one to two inches in diameter, about one-third of an inch thick, and have a very small hilum; the other was the seed of a species of *Mucuna*, about three-quarters of an inch broad, a quarter of an inch thick, and provided with an extremely large hilum, passing nearly all around the bean. Genuine Calabar beans were scarce.

## Assimilation of Cod-Liver Oil.

Physicians attached to the staff of the Episcopal Hospital in Philadelphia have recently been conducting a series of observations on the assimilation of cod-liver oil, and in cases where no marked effect has followed its use the oil has been found in the fæces; on the other hand, cases in which the oil did not appear in the stools were such as gained flesh under its use.

## A Doubtful Gynæcological Fact.

The Reedville, N. C., *Times* has the following:—Aunt Phillis, an old negro woman, living at Biggus Powell's, six miles below Yanceyville, has just given birth to twins. Phillis is sixty years of age. This remarkable old woman stoutly persists that they had no father. There is an excellent mineral spring on Mr. Powell's land, and the old woman insists that it all came from drinking Mr. Powell's mineral water.—*Medical and Surgical Reporter*, March 8, 1879.

## Homœopathists and the Plague.

At the last meeting of the British Homœopathic Society, Dr. J. C. Burnett, after reading a paper on the plague, moved, "That a committee of this Society be formed to diagnose the medicines most homœopathically indicated for this disease, in order that the profession may be ready for its possible approach." A committee was appointed for the purpose, and it is said that a similar step is being taken by the Homœopathic Society of Paris.

We all hope that the plague will be kept from our shores, but perhaps the homœopathists would regard its presence as a fine opportunity of showing their strength in combatting a disease in the cure of which the regular faculty has confessed its impotence. What, in fact, could be a more crucial test of the superiority of their system than to see the plague-stricken patient, who has only a few hours to live, gradually rally under the magic influence of those little globules—wake up, indeed, like Lazarus from his grave, and confound all the unbelieving allopathists

around him? What a wholesale conversion of the people to the tenets of homœopathy would then take place! Chemists would have to shut up their shops. Conversion to the new faith, or absolute ruin, the only alternative for the allopathist. Anatomy, Physiology, and Pathology, would be at once divorced from practical medicine; and symptomatology alone reign supreme. Verily, we are surprised that some enterprising homœopathists did not long ago pack up their traps and visit those plague-stricken districts where people have perished by thousands, and whole villages have been depopulated by a disease which *we* cannot cure. We are, moreover, astonished that the above philanthropic announcement was not made before. Perhaps the little risk there is now of the plague reaching us has made the homœopathists unusually bold in their pretensions. Perhaps if we had the misfortune of witnessing an epidemic of this formidable malady, a judicious silence would mark the behaviour of these practitioners under circumstances so trying.

## Employment of Crude Petroleum in Affections of the Respiratory Passages.

In the *Journal de Médécine et de Chirurgie*, mention is made of a communication sent to the Société de Thérapeutique by M. Blache, in which he gives the results of certain diseases of the lungs treated with crude petroleum. This remedy is commonly known under the name of *huile de gabian*. The therapeutic properties of petroleum are known in the refineries, and a refiner who used to distribute a medicinal dose of this substance to his workmen, remarked that they rarely complained of thoracic affections, and that the emanations of petroleum affected an amelioration of the symptoms in those who were suffering from lung mischief. In the first place M. Blache remarked upon the innocuity of crude petroleum, and cites as an instance a workman who accidentally swallowed 200 grammes, and who suffered only from nausea and diarrhœa. The workmen who use petroleum regularly take a teaspoonful of it before each meal; a little nausea is experienced on the first day of administration, but toleration of the pseudo-drug is established on the second. Those who take it morning and evening in tablespoonful doses often suffer from diarrhœa, but it has never gone so far as to oblige cessation of the medicine. Refined petroleum, which has been treated with sulphuric acid, and of which it always contains a trace, acts quite differently, having been completely modified in its constitution. M. Blache has administered capsules containing 35 centigrammes of the crude petroleum, with the following results:—In chronic bronchitis, where expectoration is abundant, it rapidly produces an important manifestation; there is diminution in the secretion, and less frequency of the fits of coughing, which result from the disease. In asthma like results are obtained from the disappearance of the dyspnœa. In simple bronchitis *huile de gabian* has produced rapid amelioration of symptoms, and the disease has often been checked before entering into the second stage. In phthisis, there is a diminution and modification of the expectoration, but experiments in these cases have not been made long enough for one to pronounce positively on this head.

## Another Anti-Vaccination Journal.

We have received the first number of another organ of medical dissent, entitled *The Vaccination Inquirer*, to be issued monthly, price 2d., and having for its object the instruction of the public in the iniquities of the Vaccination Laws, and the evils and uselessness of vaccination in general.

There is now-a-days such an abundant supply of cheap literature of all kinds, and so few there are who cannot read and write, that taking human nature as it is, it is not a difficult matter to prejudice the minds of the public against any existing practice, however well-founded and proper that practice may be. Such is the natural credulity of mankind, that it has always been, and always will be, possible to induce a certain portion of a community, whether educated or not, to adopt peculiar views on any subject on which they are not well-informed. It is only necessary that the new movement, dogma, or whatever it may be, should be announced with all the effrontery and confidence of which the enterprising agitator is capable. All the resources of the proselytising enthusiast must be brought to bear upon the ignorant or weak-minded. No exaggeration can be too great, no fact can be too grossly misrepresented, no statement can be too scandalous and unwarrantable, no invective too furious, for those who wish to arouse the indignation, or to work upon the credulity of the public.

Hence, while publications like *The Vaccination Inquirer* can do very little good, they may, we fear, do much harm. Were this journal to confine itself to the question of making some alteration in the penal clauses of the Vaccination Acts, we should have little fault to find with it; but as its object is to get up a public opinion in favour of abolishing the practice of vaccination altogether, we hope that it will be repudiated by all sensible and honest men.

## The Length of the Fœtus.

Dr. Delabout, of Rouen, has found out a rule for conveniently remembering the length of the fœtus according to its age, which, although only indicating the means, is applicable to the great bulk of cases. For the first six months of intra-uterine life the length at different ages is indicated in centimetres, by the square of the numerical figure of the corresponding month. At the end of the first month the fœtus measures one centimetre; the second month, four; the third month, nine; the fourth month, sixteen; the fifth month, twenty-five; and the sixth month, thirty-six centimetres. For the three last months the increase is from four to five centimetres per month. So that at the seventh month it is forty centimetres; at the eighth month, forty-five; and at the ninth month, fifty centimetres.

## An Improved Blister.

The custom of camphorating blisters, with a view of preventing evil consequences from absorption of cantharidin, giving rise to many disappointments, it is pretty certain, by this time, that camphor is useless for such a purpose. Mr. Guyot Dannecy, who has had a large expe-

rience as chief pharmacist of the Bordeaux hospitals, has for several years employed sodium carbonate or bicarbonate in place of camphor, and finds it to be much more effective. He prepares blisters as follows :—

After the blister has been spread in the usual manner, it is sprinkled over with a mixture of equal parts of sodium carbonate and cantharides, in powder, and the mixture caused to adhere by pressure with the palm of the hand (a sheet of oiled paper being interposed) ; the whole blister is then covered with oiled silk.

## Monobromated Camphor as a Hypnotic.

FRANKHAUSER, in the *Deutsche Medicin. Woch.*, recommends monobromated camphor as a hypnotic in cases in which the narcotics proper are not borne, or in which they have lost their efficacy from long use. The doses required to produce sleep (he gives generally 2 to 2½ grains in powder) are entirely harmless ; unpleasant effects—such as a feeling of fulness in the head, nausea, excitement—occur but rarely, and even then are only transitory. In most cases the drug is well borne, even though gastric catarrh, cardialgia, &c., exist. The hypnotic effect follows rapidly, as a rule ; and in many cases, even when the drug has been used repeatedly, lasts for a considerable time. In other cases it passes off in a relatively short period. In some cases these small doses refused to produce sleep, but it is probable that larger doses would have been more successful. Three and three-quarter grains, and even more, have been given without injury.

## A New Remedy for Dysentery.

ACCORDING to the *Indian Medical Gazette* a new and very efficacious remedy for dysentery has been found, which, if somewhat inferior to ipecacuanha, possesses the advantage over it of being free from nauseating effect. It is the root of a plant called Rungun in Bengalee, and found to belong to the genus *Ixora* of the natural order Cinchonaceæ. The species that have been tried are the *I. Bandhuca* and *I. Coccinea* (Rhoxb.). The plant is a very common one, and is most efficacious when employed in its fresh state. An extended trial of its efficacy has been directed by the surgeon-general.

## Iodoform as a Local Application in Syphilitic Ulcers.

DR. MRACEK, of the Vienna General Hospital, recommends the following combinations of iodoform for local use in syphilitic ulcers, mucous patches, gumma, ulcerations, buboes, &c.

℞ Iodoform, spirits vini., of each 1 part ;
Glycerine, 5 parts.

℞ Iodoform, 1 part ;
Vaselini ung., 5 parts. Make a salve.

℞ Iodoform, 1 part ;
Ether, 10 or 15 parts (collodion).

℞ Iodoform, 1 part ;
Sacch. alb., 3 to 4 parts. Make powder.

After applying either of these formulæ the surface is covered with a pledget of lint, held in place by an adhesive strip. The dressing remains twelve to twenty-four hours. The smarting ceases in a few minutes ; in three to four days granulations spring up, and in six days cicatrisation is established.

## Hæmorrhage of the Encephalon assigned to Iodide of Potassium.

WE learn from our contemporary, the *Progrès Medical*, that iodide of potassium has been blamed for producing hæmorrhage. M. Hallopeau relates, that a patient, æt. 30, syphilitic, had been taking for some time the iodide. Purpura hæmorrhagica first came on, then hemiplegia, which M. Hallopeau believes he might attribute to the protracted use of the iodide.

THE rates of mortality in the principal foreign cities, according to the most recent weekly returns, were—Calcutta 31, Bombay 40, Madras 35 ; Paris 34 ; Geneva 26; Brussels 31 ; Amsterdam 29 ; Rotterdam 28 ; The Hague 28 ; Copenhagen 29 ; Stockholm 25 ; Christiania 15 ; St. Petersburgh 51 ; Berlin 25, Hamburg 23, Dresden 23, Breslau 28, Munich 40 ; Vienna 36, Buda-Pesth 48 ; Naples 35, Turin 27 ; Venice 31 ; Alexandria 39 ; New York 26, Brooklyn 20, Philadelphia 16, and Baltimore 19. The 1,297 deaths in Paris included 32 from small-pox, 39 from typhoid fever, 29 from measles, and 28 from diphtheria.

THE death-rate in the principal cities and large towns of the United Kingdom continues to be above the average for this period of the year, which is probably accountable from the prevalence of east winds. Norwich heads the list as the most healthy city, Wolverhampton the most unhealthy with a death-rate of 36 per 1,000, Edinburgh gives an average of 21, Liverpool and Glasgow 26, London 28, Manchester and Bristol 30, Birmingham, 31, Dublin 32 per 1,000 of the population.

DISEASES of the zymotic class are perhaps less prevalent than usual at this season, if we except whooping-cough, which showed last week a serious mortality in Manchester and Sheffield. Scarlet fever is slightly in excess in Leeds, Newcastle and Sunderland, whilst the high death-rate in Wolverhampton is attributable to measles, which may be said to be epidemic in that town. Small-pox caused 9 deaths in Dublin last week, and 17 in London.

DR. RISDON BENNETT was last week re-elected President of the Royal College of Physicians of London for another year.

# Scotland.

(FROM OUR NORTHERN CORRESPONDENT.)

CHAIR OF BOTANY IN THE GLASGOW UNIVERSITY.—For this Chair, vacant by the removal of Professor Dickson to Edinburgh, there are two candidates at present in the field, viz., Dr. Isaac Balfour, who unsuccessfully contested the

Edinburgh chair, and Dr. James Stirton, of Glasgow. Dr. Stirton is well known as an enthusiastic and accomplished botanist, and his numerous friends must wish him success.

THE CURE OF ANEURISM.—At a meeting of the Glasgow Pathological and Clinical Society, held on the 11th ult., a discussion took place on the "Cure of Aneurism." Several speakers testified to the value of the iodide of potassium treatment, and others asserted that cases of aneurism had actually been cured thereby! If this be really a fact, it is difficult to explain the *modus medendi*, and the century has not been passed in vain so far as the science of therapeutics is concerned.

STIRLING PRISON — APPOINTMENT OF SURGEON. — Dr. James Forrest, Stirling, has been appointed surgeon to the Strirling Prison, in room of his late father, Dr. W. H. Forrest.

UNIVERSITY OF EDINBURGH.—At the last meeting of the Senatus of this University, a Scholarship of the value of at least £20 per annum was accepted in memory of the late John Coldstream, M.D., F.R.C.P. Edin., for a medical student destined for missionary service in the home or foreign field. The scholarship will be open to competition to students properly qualified, the students of the Edinburgh Medical Missionary Society, with which the late Dr. Coldstream's name will ever be associated, having a preference. The first competition will be in October next.

GLASGOW DISPENSARY FOR SKIN DISEASES.—The annual meeting of this Institution was held in the new premises, Elmbank Street, on the 9th inst., Dr. John Pirrie presiding. The income for the year was £421 19s. 4d., to which had to be added £466 of subscriptions to the building fund. The total expenditure was £1,185 15s. 4d., leaving a deficiency of £297 15s. 2d. Deducting the amount of deficiency, the reserve fund amounted to £1,028 9s. 3d. The new institution is very elaborately finished, and with an appanage not very usual at charitable institutions—a page—in complete style, to direct the patients. A dispenser attends from one of the fashionable pharmacies of the city to dispense the medicine, which is supposed to be paid for.

ANDERSON'S COLLEGE DISPENSARY.—The first annual meeting of the subscribers to this Institution was held in the Religious Institution Rooms, on the 8th inst., Lord Provost Collins presiding. His Lordship stated that during the year 24,000 patients had visited the dispensary for treatment. The assistance given by the students of the Andersonian during the year was largely taken advantage of. Dr. A. M. Buchanan stated that 1,546 cases had been treated gratuitously in their homes during the year.

HEALTH OF EDINBURGH.—The health of Edinburgh continues favourable. Eighty deaths were registered last week, ending 5th inst., as against 75 of the previous week. No fewer than 13 country cases in the infirmary had to be deducted. No fatal case of infectious disease occurred in the old town, a most unusual occurrence. Of the 141 births 12 were illegitimate.

ABERDEEN UNIVERSITY COUNCIL.—The half-yearly meeting of this body was held in Marischal College Hall on the 9th inst., Principal Pirrie presiding. It was agreed to allow the report of the committee, anent the recent report of the University Commissioners, to lie on the table till next meeting. In referring to the appointment of a business committee, the Principal remarked on the loss the Council had sustained in the death of Professor Nicol, who had long been convener of that committee, and who had proved himself an excellent teacher and a valuable friend. Principal Brown spoke in a similar strain.

# Correspondence.

## ON THE UNITY OF POISON IN SCARLATINA, PUERPERAL FEVER, TYPHOID, DIPHTHERIA, ERYSIPELAS, &c.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—I wish to publish this link in the chain of this great truth. It is contained in a letter to me from a leading physician, who does not wish his name attached to what at present may seem to be heresy:—"In the cases you mention, of which I spoke to you, in which both fevers (scarlatina and typhoid) occurred in the one establishment, perhaps, speaking scientifically, we ought hardly say 'evidently traceable' to the sewage pollution; this might imply that they were actually and definitely traceable. My evidence is not quite complete, and I should not like to be more emphatic than, 'were apparently traceable.' It is, you know, highly important to distinguish between comparatively certain probabilities and actual facts. Although I believe that a close connection is to be traced between scarlatina and enteric, still I do not yet possess sufficient evidence to warrant me forming any very definite belief in a matter of such importance. While I hesitate to commit myself to any definite opinion, I am much inclined to believe that enteric and scarlatina may both arise from defective drainage, or a common source of sewage contamination. My reason for thinking so is, that I have frequently seen enteric appear in households in which scarlatina previously existed, and I have also known the two diseases, on more than one occasion, to exist coincidently in the same house. In some of these houses, moreover, there have been sanitary defects. Again, I have been struck with the great clinical resemblance between the two fevers—for instance, enteric patients frequently present a rash, which is scarcely to be distinguished from scarlatina, and not unfrequently suffer also from sore throat, accompanied by redness and swelling about the soft palate and tonsils; while scarlatina cases often exhibit an affection of the intestines, strikingly similar to that of enteric. I mention these cases as illustrating the difficulty which may exist in the diagnosis of these diseases from the post-mortem appearances."

The experience of many medical men will be corroborative of the above facts, with which are in accord both Dr. John Harley's and my own investigations and observations, carried out clinically and pathologically, and which seem to me day by day, as new facts are accumulated, to evolve the great truth of the unity of poison, differentiation of resultant phenomena or symptoms.

I am, Sir,
Your obedient servant,

G. DE GORREQUER GRIFFITH,
Senior Physician, Hospital for Women, and
Consulting Physician Accoucheur to
St. Saviour's Maternity.

9 Lupus Street, Belgravia.

## THE PROLONGED AND CONTINUOUS USE OF CHLORAL.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—The Committee appointed by the Clinical Society "to investigate what deleterious effects follow the prolonged and continuous use of chloral in ordinary doses," before concluding their report, think it well, in view of the practical importance of the subject, to appeal to those members of the profession who have not as yet assisted in the inquiry to contribute their experience. They would venture to suggest to those who enjoy the special facilities for observation afforded by family practice, that facts bearing upon the question will be particularly acceptable from them.

Provided that the subject of the communication is the result of accurate observation, the mere circumstance that it is isolated, apparently inconclusive, and not of obvious importance, should not stand in the way of its being reported to the Committee. It must be remembered that it is only by the collection and comparison of a large number of such facts

that any useful conclusion can be arrived at, and the Report of the Committee will thus be valuable in proportion to the amount of aid which is rendered by the profession at large.

Printed schedules will be forwarded on application, and information in any form received by the undersigned.

I am, Sir,

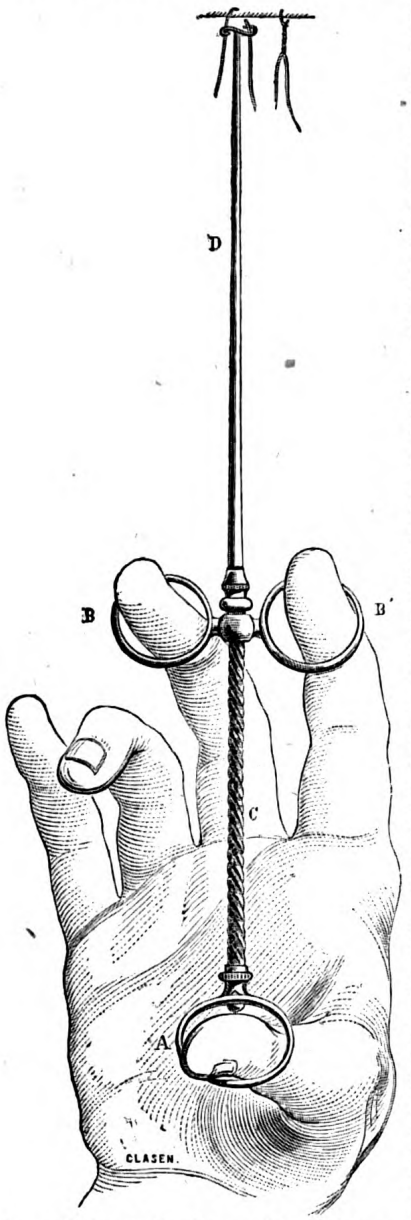
Your obedient servant,

R. FARQUHARSON, M.D., Hon. Sec.

# Novelties.

## FASTENING THE WIRES IN METALLIC SUTURES.

M. G. CLASEN, manufacturer of surgical instruments, Brussels, has laid before the Academy for approval, an instrument invented by him, to facilitate the fastening of the wires in metallic sutures, which may be seen at the establishment of Messrs. Mathieu & Sons, Paris.



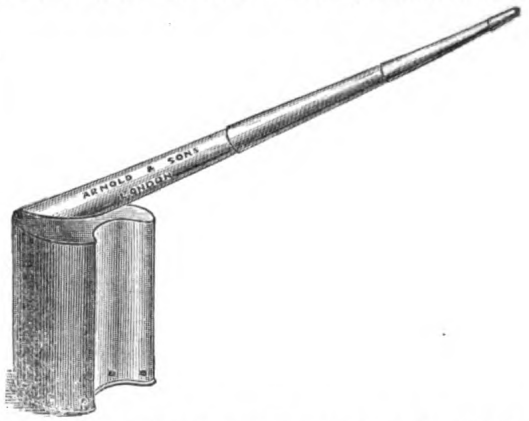
This instrument is composed of a stem, D, the upper portion of which is surmounted transversely either by the S of M. Marion Sims, or by a disc pierced with two holes; the lower part consists of a spiral stem, C, terminating in a movable ring, A. On this spiral stem a hollow screw is fitted, which is furnished laterally with two rings, B and B.

This instrument enables the operator to fasten the wires, both with rapidity and regularity. After having passed the ends of the wires either through the loops of the S, or, if the disc be employed, through the holes, he, while holding them in position with the left hand, draws down with the fingers of the right, the rings already mentioned, this imparts to the stem surmounted by the S, or the disc, a rotatory movement by which the ends of the wire are both drawn out and twisted.

## A NEW VAPORISER.

By W. L. SHEPARD, M.R.C.S., &c.

AN apparatus which can be used, either as a bronchitis kettle, an inhaler, or a portable vapour bath, that cannot get out of order, that can be refilled without moving from the fire, or stopping the generation of steam is, I think, likely to be useful to the profession, especially at this season. The woodcut sufficiently explains its very simple construction—it has no bottom, and when in use,



stands in any ordinary saucepan, so that, should it boil dry, the worst that can happen will be the spoiling of that receptacle. The top of the apparatus is closed, and on its inner surface enclosing the orifice of the steam-pipe, is a movable circular chamber having a perforated bottom, on which any drugs can be placed when it is wished to medicate the vapour. The crescent-shaped front permits of the saucepan being refilled without moving from the fire, and if boiling water be used, the steam is generated continuously. By removing part of the steam-pipe and affixing the mouth-piece, a very handy and efficient inhaler is formed. Placed over a gas stove or spirit lamp it can be used as a portable vapour bath. A not unimportant advantage is its trifling cost. The manufacturers and patentees are Messrs. Arnold & Sons, surgical instrument makers, London.

## WARNER'S SUGAR-COATED PILLS.

IT is of some importance that medicines should be administered in as small a compass, and in as palatable a form as possible. We therefore hail with pleasure any improvement that is made in this department of pharmacy. To some of these pills we have given a fair trial. They are elegantly prepared, the sugar coating being an especially grateful vehicle to fastidious patients, and we have found them to answer every purpose for which they are intended. We can, moreover, recommend the phosphorus pills, provided they are taken only under medical supervision, but venture to remark that some objection may be made to the manner in which Messrs. Warner & Co. have labelled them. To say that they are "a valuable remedy for lapse of memory, *impotency*, loss of nerve power, paralysis, &c.," may induce the public to resort to these pills without medical advice, and to take more than is good for them.

This firm has also prepared from the gizzard of the domestic fowl a new and excellent kind of pepsin, called *Ingluoin*. It is suitable for all those cases of gastric disorder for which pepsine is usually given, and owing to the well-known idiosyncrasy of the stomach, will be found to succeed when other similar preparations have failed.

THE Harveian Lectures will be given this year by Mr. Edmund Owen, "On Certain Practical Points in connection with the Surgery of Childhood."

## GUESS VERDICTS AT INQUESTS.

We referred a few weeks since to a verdict of suicide delivered by a Limerick coroner's jury upon the body of a medical man, there being not a shadow of reliable evidence as to the cause of death, inasmuch as no post-mortem examination was made, and the function of the medical witness was principally the searching for a poison bottle under the bed. We note a somewhat similar case this week at Omagh, where a man was pronounced to have poisoned himself with opium, there being not the least medical proof that he had ever taken an atom of opium. The medical witness swore that, "there was nothing noticeable about the appearance of the body," nor "about the pupils," yet he felt himself justified in giving his opinion, based upon a look at the dead man's body, that he had died of narcotic poisoning. Inquests of this sort are a farce, and their verdicts worse than useless; and we quite believe that it would tend more to the futherance of justice to bury the dead and ask no questions, than to hold a sham inquiry, and pronounce a decision which may serve only as a shield for crime.

## BIRTHS AND DEATHS IN IRELAND FOR 1878.

According to the returns of the Registrar-General just issued, during the year 134,370 births and 99,839 deaths were registered; in the same period 41,124 persons emigrated. A decrease of 6,593 would thus appear to have taken place in the population. The estimated population in the middle of the year was 5,351,060.

The births registered in Ireland during the year number only 134,370, affording a ratio of 25·1 per 1,000 of the population, against an average rate of 26·9 per 1,000 for the previous ten years.

The number of deaths registered amounted to 99,839, equal to a ratio of 18·7 per 1,000 of the population, being 1·5 per 1,000 persons over the average rate for the ten years 1868-77.

During the year 11,059 deaths were returned by the Registrars as having occurred from the eight principal zymotic diseases, being 11·1 per cent. of the total deaths, and equal to 2·07 in every 1,000 persons living. The average annual number of deaths from these diseases during the previous ten years was 11,371, or 2·12 in every 1,000 of the estimated average population, the lowest number during that period being 9,162 in the year 1877.

Of the 11,050 deaths from these diseases last year, 856 were caused by small-pox, 2,017 (or double the average for the ten years, 1868-77) by measles; 1,030 by scarlet fever, being little more than one-third of the average number; 281 by diphtheria; 2,014 by whooping-cough; 2,748 by fever; 2,058 by diarrhœa, and 46 by simple cholera.

There were 2,704 inquests reported to the Registrars, being 1 inquest to every 37 deaths registered.

## THE SANITARY SUPERVISION OF DUBLIN.

It will be recollected that the job which the Public Health Committee of the Dublin Corporation strove to perpetrate, anent the office of medical officer of health, was referred back to them to see what could be done to provide one good, active officer for the duty. Last week the report was again brought up, and Mr. Gray explained that it was the opinion of the committee that they should have a medical superintendent of health who would devote all his time to the business of his office, and give up his private practice, as it would be objectionable for a gentleman who acted as superintendent over fifteen other medical men in the city to be obliged to report unfavourably perhaps on his *confréres*. Dr. Mapother was not prepared to make any proposition as to the resignation of his private practice, but Dr. Cameron was, provided he was allowed to continue his connection with the College of Surgeons, where he had a laboratory at his disposal, which would save the citizens providing him with one, at a salary of £1,500 a year. The Public Health Committee were not prepared to agree to this proposal, as they thought the salary asked too high, and he, as chairman of that committee, therefore was not in a position to move the adoption of the report, but would instead ask the Council to refer the report back to them again for further consideration.

## PRISON APOTHECARIES IN IRELAND.

At the last meeting of the Council of the Pharmaceutical Society of Ireland, two letters were read from Dr. A. H. Jacob, on behalf of the Irish Medical Association, relative to the recent action of the Prisons Board, Ireland, in dismissing the apothecaries or other compounders of the Irish prisons.

Proposed by Mr. Brunker, seconded by Dr. Whitaker, and resolved:—

> "That a Committee be appointed to draw up a memorial to the Irish Prisons Board, protesting against the abolition of apothecary, or pharmaceutical chemist, to the county prisons, and requesting them to reconsider their decision in the matter."

The Rev. Professor Haughton, F.T.C.D., D.C.L., will preside on this (Wednesday) evening in Dublin at a public meeting called to consider what steps should be taken to prevent the further spread of contagious diseases (small-pox, scarlet fever, &c.), through the pernicious system known in the tailoring trade as "sweating."

# Obituary.

## DR. ROBERT PERSSE WHITE, OF DUBLIN.

We have to record with regret the unexpected death of Dr. Robert Persse White, surgeon to the Meath Hospital, which took place at his residence in Harcourt Street, on Sunday morning last. Dr. White had been for many years medical officer to the Terenuse Dispensary, was subsequently appointed to the surgeoncy of Jervis Street Hospital, and afterwards was elected one of the medical staff of the Meath Hospital. About a year since he suffered from a prolonged illness, which necessitated his relinquishing his profession for a time, but had recovered sufficiently to enable him to resume his professional duties. Dr. White was a Fellow o' the Royal College of Surgeons in Ireland since the year 1857.

## NOTICES TO CORRESPONDENTS.

NOTICE TO SUBSCRIBERS.—Subscribers who have not already paid their subscriptions—£1 2s 6d.—for last year, are reminded that they are now due, and should be sent to the publishers, who will be happy to acknowledge their receipt.

DR. DE G. G.—Shall be glad to receive the article.

ANTI-HUMBUG asks, is it right or just that a surgeon-apothecary should "dub" himself "doctor?" It is not right or just, but we have always regarded the title of "doctor" as more or less one of courtesy and equivalent to "medical practitioner," and, therefore, we don't pass unqualified censure upon the use of the word.—ED. M. P. & C.

### PHOSPHITE OF ZINC IN DIPSOMANIA.

*To the Editor of the* MEDICAL PRESS AND CIRCULAR.

SIR,—In your paper some weeks ago I saw *phosphite of zinc* recommended as a most efficient remedy for the removal of the craving for drink which harasses inebriates. Would you kindly inform me, or obtain for me, the information as to dose and form of administration.

Believe me, yours faithfully,
J. M. LYNN, M.D., Surg.-Major.

Armagh, March 1, 1879.

[Our correspondent's previous communication was not received. Valerianate of zinc has been long used for the purpose mentioned. There is a pill in the List of Ferris & Co, Bristol, of the phosphide of zinc; they would be able at once to refer to all known about it.

128. Pil. Zinci Phosphidi—
℞ Zinci Phosphid., ½ gr.;
Ext. Glyc., q. s.
Ferris & Co.]

CLINICAL SOCIETY OF LONDON.—On Friday, April 18, at 8½ p.m., Dr. Allen Sturge, "A Case of Partial Epilepsy, apparently due to Lesion of one of the Vaso-motor Centres of the Brain" (patient to be exhibited); "A Case of rare Vaso-motor Disturbance in the Brain."—Mr. A. P. Gould, "A Case of Amputation at the Hip-joint in which the Iliac Arteries were Compressed per Rectum."—Dr. Crocker, "A Case of Ichthyosis of unusual character."—Mr. Hulke, "A Case of Retention of Urine caused by Impermeable Urethral Stricture, treated by Tapping the Bladder above the Pubes, and later by External Section of the Stricture, a catheter passed through the Bladder and a Staff per penem as far as the obstruction being used as guides."

HARVEIAN SOCIETY.—On Thursday, April 17, at 8½ p.m., Dr. J. W. Langmore, "On Contracted Kidney in Young Subjects" (discussion).—Dr. Buzzard, "Cases of Nerve Disease."—Dr. Cleveland, "Case of Recovery from an excessive dose of Chloral Hydrate."—Dr. Morton, "The Diphtheria Outbreak of last Spring in N.W. London."

A TOOTH-PICK IN THE LIVER.—Dr. Kraus states, in a recent number of the *Allgemeine Wiener Medizin. Zeitung*, that he saw, in the post-mortem theatre at Prague, the necropsy of a man who had died of phthisis under Professor Jaksch's care, and in whose liver a tooth-pick, nearly four inches long, pointed at both ends, was found. The man had been addicted to drink. At the anterior surface of the left lobe of the liver, an abscess of the size of a walnut was found. The posterior surface of the colon was adherent to the liver at this part; and on careful examination, a fistulous opening communicating with the abscess, was found in it. On laying open the abscess, the tooth-pick was disclosed.

EMPROSTHOTONOS would be glad to learn if any provision will be made in the lately introduced Medical Acts Amendment Bill or Bills for students who have commenced attending their studies, or, as in the case of the present writer, are what is familiarly known as "Chronic," having begun qualifying classes years ago? Will they be granted a year or two of grace to conclude at some university or college?

[Section 15, sub-clause 3 of the Bill provides that "the examination rules shall provide for the admission to examination of medical students who have begun their professional studies before the passing of the Act." Therefore, the arrangement will be in the hands of the General Medical Council; but as our correspondent will have at least a year after the passing of the Bill before the Conjoint Examination comes into work he will—let us hope—have deserted by that time from the army of "Chronics," and thus put himself outside the restrictions of the Act.—ED.

INCREASE OF DRUNKENNESS, IRELAND.—The Vice-Chairman of the General Prisons Board, Dublin, in his Report on the state of the County and Borough Gaols in Ireland for 1877, just printed, again calls attention to the alarming increase of drunkenness since 1867, when the commitments for that offence to the county and borough gaols numbered 6,645, but which in 1877 amounted to 18,837, showing, in comparison with 1876, an increase of 1,191. The commitments to bridewells are not included in this number.

### SQUILLS.

*Dedicated to Unhappy Rhymsters in humble token of fellow-feeling the Author.*

THE urginea scilla is a Liliacean plant,
The bulb of which, when sliced and dried, they bring from the Levant;
As stimulant-expectorant, in grains from one to three,
It is, with ammoniacum, the best in the B. P.;
And mixed with ipecac, it will with speed relieve the chest,
While as a diuretic digitalis suits it best.
In grains from six unto fifteen, so Scoresby-Jackson saith,
It may be an emetic, and two dozen caused a death;
For its an acrid-soporofic poison much to fear,
It purges, brings on strangury, and griping most severe.
There's soap and ammoniacum and ginger in the pill,
And treacle, and there's one in five of finely powdered squill.
Acetum Scillæ as to strength is one in eight, or so,
With fifteen minim drops begin and up to forty go;
With it are made the oxymel, so often bad in shops,
And syrup—both from half a drachm as high as sixty drops.
Fifteen drops to half a drachm of tincture is the dose,
And having said it's one in eight, my rhyme is at a close.

A. L.—*Students' Journal*

### BOOKS AND PAMPHLETS RECEIVED.

The Principles and Practice of Surgery. By D. Hayes Agnew, M.D Vol. I. Philadelphia: Lippincotte & Co.
The Diseases of Tropical Climates, and their Treatment. By J. A. B. Horton, M.D. Second Edition. London: J. & A. Churchill
The Pathology of Mind. By Hy. Maudsley, M.D. London: Macmillan & Co.
Klein's Atlas of Histology. Part II.
Fourteenth Annual Report of the Sanitary Commissioner for Madras.
Twenty-seventh Annual Report of the Colney Hatch Lunatic Asylum.
Transactions of the American Dermatological Association.
The Condition of Malta. By S. Plimsoll, M.P.
The Half-Yearly Volume of the Psychological Journal.
Quarterly Journal of Inebriety. Vol. III.
The Quarterly Medical Temperance Journal.
The Hunterian Oration. By G. M. Humphry, M.D., F.R.S. London Macmillan & Co.
Physiological Therapeutics. By T. W. Poole, M.D. Toronto: The News Company.
Elements of the Anatomy and Physiology of Man. By G. G. P. Ball M.A. London: Remington & Co.

### VACANCIES.

Ashton-under-Lyne.—House Surgeon for the District Infirmary. Salary, £80, with board. Applications to the President by May 1.
Castlebar Union, No. 1 Dispensary District.—Medical Officer. Salary, £110, with fees, and £15 as Sanitary Officer, Election, April 19.
Castlebar Union, No. 2 Dispensary District.—Medical Officer. Salary, £110, with fees, and a salary as Sanitary Officer. Election, Apr. 19.
Charing Cross Hospital.—Surgical Registrar. Particulars of the Secretary.
Granard Union, Granard Dispensary.—Medical Officer. Salary, £100, with fees, and £16 as Sanitary Officer. Election, April 26.
Liverpool Northern Hospital.—Assistant House Surgeon. Salary, £70, with board, &c. Applications to the Chairman by April 19.
Nottingham Dispensary.—Assistant Resident Surgeon. Salary, £160 per annum. Applications to the Committee by May 1.
Royal Free Hospital, London.—Physician for Diseases of Women, and an Ophthalmic Surgeon. Both Honorary. Testimonials, &c., to the Secretary before April 30. (See Advt.)
St. Peter's Hospital for Stone, London.—House Surgeon. Board and residence, and an Honorarium at the rate of £50 per annum. Applications to the Secretary.

### APPOINTMENTS.

BURNS, N. W., M.R.C.S.E., Resident House Surgeon and Registrar to the Cancer Hospital, Brompton.
BATES, F. W., a Physician to the Salisbury Infirmary.
BRETON, E., L.F.P.S G., Medical Officer to the Shrewsbury Dispensary.
DAVISON, J. T. R., M.B., House Surgeon to the Wrexham Infirmary.
DUNLOP, A., L.R.C.P.Edin., L.R.C.S.Edin., Junior Resident Surgeon to the Royal Hospital, Belfast.
GILBERT, H., M.R.C.S.E., Medical Officer for the newly-formed Bardney District of the Lincoln Union.
JOLLIFFE, W. J., M.R.C.S.E., Ophthalmic House Surgeon to St. Bartholomew's Hospital.
JONES, R. H., L.R.C.P.L., M.R.C.S.E., Resident Medical Officer to the Royal Infirmary, Liverpool.
KELLY, D. J., L.R.C.P.Ed., L.R.C.S.I., Medical Officer to the Workhouse and Fever Infirmary of the Mullingar Union.
MARTIN, Mr. F. W., House Surgeon to the Royal Westminster Ophthalmic Hospital.
MOOREWOOD, Dr. S. R., Medical Officer, Medical Officer of Health, &c., for the Draperstown Dispensary District of the Magherafelt Union, co. Londonderry.
O'CARROLL, M., L.Med. & L.Surg. Univ. Dub., Police Magistrate and Colonial Surgeon in the Grenadines, West Indies.
ROSS, W., L.R.C.P.Ed., L.R.C.S.I., Medical Officer, Medical Officer of Health, &c., for the Riverstown Dispensary District of the Sligo Union.
WHARRY, A. J., M.R.C.S., Resident Clinical Assistant to the City of London Hospital for Diseases of the Chest, Victoria Park.
WHITE, E. A., L.R.C.S.I., Medical Officer to the Independent Order of Oddfellows Society, Dublin.
WHITTY, P. J., L.R.C.S.I., L. & Lb. K.Q.C.P.I., Medical Officer to the South Dispensary, Waterford Union.
WOOLLETT, S. W, M.R.C.S., Assistant Resident Medical Officer to the Sussex and Brandenburgh House Asylums, Hammersmith.

## Marriage.

ALLEN—LEEPER.—April 9, at Richhill, co. Armagh, John Gower Allen, L.R.C.S.I., to Eleanor, daughter of John Leeper, M.R.C.S.Eng., Keady, co. Armagh.

## Deaths.

BURKE.—On April 7th, at North Great George Street, Dublin, Joseph Burke, Deputy Inspector General of Hospitals, late of the 3rd Buffs.
CASE.—On March 29th, at Fareham, William Case, L.R.C.P.Ed., aged 67.
HARRISON.—On March 25th, at Lancaster, James Stockdale Harrison, F.R.C.S.E., aged 82.
PRESTWICH.—On April 4th, at Sandbach, Joseph Prestwich, L.R.C.P., of Oldham, aged 46.
ROBERTSON.—On March 28th, at Belmont, Bridge of Allen, William Robertson, M.D., Staff Surgeon R.N. (retired).
STEUART.—On April 6th, at Belmont House, Wadhurst, Sussex, Roger St. Clair Steuart, M.D., aged 28.
WESLEY.—On April 5th, at Chichester, William Kerr Wesley, M.R.C.S., the youngest son of the late Samuel Sebastian Wesley.

## FEES AT INQUESTS FOR MEDICAL OFFICERS OF PRISONS.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—With reference to the questions asked in your issue of last week, I enclose a correct copy of a decision bearing on the subject, given by an eminent judge, and from his words it was evident that he felt the law compelled him to decide in our favour.

I should add that, at the Spring Assizes in Derry, before Mr. Justice Keogh, in the year 1876, I obtained from him a similar decision in my favour.

During the previous half-year I had given evidence at *two* inquests in the Derry Jail on prisoners. The grand jury were in doubt on the question, and brought it before the above-mentioned eminent judge, who followed the decision of Judge Ball, and ruled that I was entitled to be paid, as it was no part of my duty to give evidence at inquests. I think these decisions should help to settle the question.

Yours truly,

WM. MILLER, Knt., M.B. T.C.D.,
Surgeon Derry County Infirmary and Jail.

18 Pump Street, Londonderry,
March 31, 1879.

---

(From *The Londonderry Guardian*).

[Before the Rt. Honourable Mr. JUSTICE BALL at Liffard, co. Donegal, Summer Assizes, July, 1861.]

"Mr. Curran, Q.C., asked the court to instruct the grand jury to find a presentment for the sum of £1 1s., being the amount of fee due to Dr. Little, Surgeon of the County Jail. He had given evidence before Dr. Lacy, Coroner, as to the cause of death of an inmate of the prison.

"The grand jury intimated that they merely raised the question in order to get the decision of the court as to whether they were justified in allowing fees to the medical officer in such cases.

"His Lordship said, that on looking at the section of the Act handed to him, he did not find that it was among the duties prescribed for the medical officer that he was to give evidence when called on without the usual fee paid to other medical men. He thought he must decide that *the fee be paid*, though he would rather rule it otherwise. Perhaps the grand jury would fee counsel and have the question argued.

"The grand jury expressed themselves satisfied with the decision given by the court."

---

## CARRICK-ON-SUIR UNION.

NEGLECT OF VACCINATION BY A MEDICAL MAN.

The Clerk read the following letter :—

"Local Government Board,
"Dublin, 26th March, 1879.

"SIR,—The Local Government Board for Ireland acknowledge the receipt of the minutes of proceedings of the Board of Guardians of Carrick-on-Suir Union on the 15th inst., containing an entry of the letter of the previous day's date, relative to the case of a child named Brion, aged 2½ years, stated by the medical officer of the workhouse to be affected with small-pox, and who, it appears, had not been vaccinated ; and with reference to the explanation received from medical officer on the subject, the Local Government Board desire to state that the statement of the medical officer cannot be regarded as affording a satisfactory explanation of omission to vaccinate the child in question, and they request that the medical officer may be cautioned to be more attentive in future to the due discharge of his duty under the Workhouse Regulations, Article 68, No. 6.—By order. "B. BANKS."

## LIMERICK UNION.

SALARIES OF SANITARY OFFICERS.

Mr. Corbett read the following letter :—

"Local Government Board,
"Dublin, 21st March, 1879.

"SIR,—The Local Government Board for Ireland have had before them the resolution of the Public Health Committee, Limerick, of the 11th instant, proposing to increase the salaries of the sanitary officers from £15 to £25 a year each, and I am directed to state that the Board have reported the proposed increase to the Lords of her Majesty's Treasury for approval. I am at the same time to point out that the expense of the attendance of the medical officers at prosecutions instituted by the sanitary authority will have to be provided for when necessary in the manner indicated by the Local Government Board's circular letter of the 11th November, 1878.—By order, "B. BANKS, Sec."

The Chairman said the information contained in the letter from the Local Government Board was such as entitled them to thanks.

Mr. Horsford—Has the letter reference to the question as out of what fund the doctors shall be paid a guinea each for their attendance at court?

Mr. Corbett—It has. They must be paid out of the borough fund.

The communication was marked "read."

THE SANITARY STATE OF THE CITY.

Mr. Corbett next read the following letter :—

"Local Government Board,
"Dublin, 20th March, 1879.

"SIR,—The Local Government Board for Ireland have had before them the minutes of the proceedings of the Public Health Committee, Limerick, on the 4th instant, containing an entry of a report from Dr. Barry, medical superintendent of health, relative to the sanitary condition of the city, and in reference thereto the Board desire to point out that the state of things disclosed appears to call for more active measures than the sanitary authority are taking. The erection of a disinfecting chamber, and the arrangements for purifying premises where disease has appeared, as recommended by the superintendent medical officer of health in a former report, are both of much importance, and call for practical measures. The provisions for filth removal so often urged upon the sanitary authority is also important, and it would be satisfactory to see some progress made in both these directions. The matters in question appear to have been referred to Committees, and the Local Government Board trust that some results will speedily follow their investigations.

"By order of the Board,
"B. BANKS, Secretary.

"Wm. Corbett, Esq., Executive."

---

## MULLINGAR UNION.

SUPERANNUATION.

MR. FARRELL, in moving—"That Dr. Dillon Kelly, late medical officer of the workhouse, be allowed the two-thirds of his salary as superannuation allowance," said that Dr. Kelly had been a faithful officer of the union, both as a dispensary doctor and medical officer of the workhouse, for upwards of twenty-three years, and owing to ill health was obliged to resign his situation in order to proceed to France in hope of recovering his health.

In reply to the Chairman, the Clerk said that Dr. Kelly had been twenty-three years in the service of the union, both as medical officer of the Milltown dispensary and medical officer of the workhouse.

Colonel Cooper inquired what would be the two-thirds of the medinal officer's salary?

Mr. Harton said it would amount to £83 6s. 8d.

There being no opposition the motion was unanimously carried.

## WATERFORD DISPENSARY COMMITTEE.

THE Chairman stated that the meeting was called for the purpose of electing a medical officer for the south district, for which position there were two candidates.

Dr. Whitty and Dr. Hartland were then proposed, and a poll was taken between the two, when Dr. Whitty was almost unanimously elected, the voting being—for Dr. Whitty, 28 ; for Dr. Hatland, 3.

## PUBLIC HEALTH (IRELAND) ACT, 1878.

(*Continued.*)

133. (*Verb.*) *Power of Justice to order Destruction of Unsound Meat*, &c.—If it appears to the justice that any animal, carcase, meat, poultry, game, flesh, fish, fruit, vegetables, corn, bread, flour, milk, or butter so seized is diseased, or unsound, or unwholesome, or unfit for the food of man, he shall condemn the same, and order it to be destroyed or so disposed of as to prevent it from being exposed for sale or used for the food of man ; and the person to whom the same belongs or did belong at the time of exposure or conveyance for sale, or in whose possession or on whose premises the same was found, shall be liable to a penalty not exceeding twenty pounds for every animal, carcase, or fish, or piece of meat, flesh, or fish, or any poultry or game, or for the parcel of fruit, vegetables, corn, bread, or flour, or for the milk or butter so condemned, or at the discretion of the justice, without the infliction of a fine, to imprisonment for a term of not more than three months.

134. (*Verb.*) *Penalty for hindering Officer from Inspecting Meat*, &c.—Any person who in any manner prevents any sanitary officer or other person duly authorised by the sanitary authority of the sanitary district from entering any premises in such district and inspecting any animal, carcase, meat, poultry, game, flesh, fish, fruit, vegetables, corn, bread, flour, milk, or butter, exposed or deposited for the purpose of sale, or of preparation for sale, and intended for the food of man, or who obstructs or impedes any such officer or person, when carrying into execution the provisions of this Act, shall be liable to a penalty not exceeding five pounds.

135. (*Verb.*) *Search Warrant may be Granted by a Justice.*—On complaint made on oath by a sanitary officer, or other person duly authorised by a sanitary authority, any justice may grant a warrant to any such officer or person to enter any building or part of a building in which such officer or person has reason for believing that there is kept or concealed any animal, carcase, meat, poultry, game, flesh, fish, fruit, vegetables, corn, bread, flour, milk, or butter which is intended for sale for the food of man, and is diseased, unsound, or unwholesome, or unfit for the food of man ; and to search for, seize, and carry away any such animal or other article in order to have the same dealt with by a justice under the provisions of this Act.

Any person who obstructs any such officer or person in the performance of his duty under such warrant shall, in addition to any other punishment to which he may be subject, be liable to a penalty not exceeding twenty pounds.

136. (*Verb.*) *Grand Juries may present in Advance for the purpose of Providing for the execution of* 38 & 39 *Vict., c.* 63.—The grand jury of any county may, for the purpose of providing for the due execution of the Sale of Food and Drugs Act, 1875, from time to time, without previous application to presentment sessions, present in advance such moneys as may in their opinion be necessary, and the treasurer, or any person discharging the duties of treasurer, or finance committee of such county may, out of any money in his or their hands raised in pursuance of any such presentment, from time to time advance to any inspector of weights and measures or police constable such sums as he or they may think necessary for the purpose aforesaid.

### INFECTIOUS DISEASES.

*Provisions against Infection.*

137. (*Verb.*) *Duty of Sanitary Authority to Cause Premises to be Cleansed and Disinfected.*—Where any sanitary authority are of opinion, on the certificate of their sanitary officer, or of any legally qualified medical practitioner, that the cleansing and disinfecting of any house or part thereof, and of any articles therein likely to retain infection, would tend to prevent or check infectious disease, it shall be the duty of such authority to give notice in writing to the owner or occupier of such house or part thereof, requiring him to cleanse and disinfect such house or part thereof and articles within a time specified in such notice.

If the person to whom notice is so given fails to comply therewith, he shall be liable to a penalty of not less than one shilling and not exceeding forty shillings for every day during which he continues to make default ; and the sanitary authority shall cause such house or part thereof and articles to be cleansed and disinfected, and may recover the expenses incurred from the owner or occupier in default in a summary manner.

Where the owner or occupier of any such house or part thereof is from poverty or otherwise unable, in the opinion of the sanitary authority, effectually to carry out the requirements of this section, such authority may, without enforcing such requirements on such owner or occupier, with his consent cleanse and disinfect such house or part thereof and articles, and defray the expenses thereof.

138. (*Verb.*) *Destruction of Infected Bedding*, &c.—Any sanitary authority may direct the destruction of any bedding, clothing, or other articles which have been exposed to infection from any dangerous infectious disorder, and may give compensation for the same.

139. (*Verb.*) *Provision of Means of Disinfection.*—Every sanitary authority may provide a proper place, with all necessary apparatus and attendance, for the disinfection of bedding, clothing, or other articles which have become infected, and shall cause any articles brought for disinfection to be disinfected free of charge, and may provide for the conveyance of such articles to such place.

140. (*Verb.*) *Provision of Conveyance for Infected Persons.*—Every sanitary authority shall provide and maintain a carriage or carriages suitable for the conveyance of persons suffering under any infectious disorder, and shall pay the expense of conveying therein any person so suffering to a hospital or other place of destination, and shall keep such carriage or carriages properly disinfected.

141. (*Verb.*) *Removal of Infected Persons without Proper Lodging to Hospital by order of Justice.*—Where any suitable hospital or place for the reception of the sick is provided within the district of a sanitary authority, or within a convenient distance of such district, any person who is suffering from any dangerous infectious disorder, and is without proper lodging or accommodation, or lodged in a room occupied by other persons not so suffering, or is on board any ship or vessel, may, on a certificate signed by a legally qualified medical practitioner, and with the consent of the superintending body of such hospital or place, be removed, by order of any justice, to such hospital or place at the cost of the sanitary authority ; and any person so suffering, who is lodged in any common lodging-house, may, with the like consent and on a like certificate, be so removed by order of the sanitary authority.

An order under this section may be addressed to such constable or officer of the sanitary authority as the justice or sanitary authority making the same may think expedient ; and any person who wilfully disobeys or obstructs the execution of such order shall be liable to a penalty not exceeding ten pounds.

(*To be continued.*)

## TO READERS.

THE Editor will feel especially obliged by receiving copies of newspapers which contain any Poor-law or other intelligence of medical interest, in order that he may, if fit, republish it for the benefit of the readers of the *Medical Press*. Although twenty-one of the leading Irish newspapers are received at the Irish office, many things may escape notice which are deserving of attention.

### ON SOME HEART DISEASES IN CHILDREN.

By W. H. DAY, M.D., M.R.C.P. Lond.,

Physician to the Samaritan Hospital for Women and Children.

(*Continued from page* 302.)

The following is another case of mitral disease of the heart, of great interest, occurring in connection with rickets and rheumatism.

Case II.—J. P., æt. 10, was admitted into the Samaritan Hospital in December, 1877, with mitral regurgitation and hypertrophy of the heart. The mother stated that two years previously he had rheumatic fever, and that a year after, he had a second attack, and was treated for it in one of the London hospitals. The father and mother were healthy, and the rest of the family, consisting of four children, were all well. The chief symptoms for which the patient sought admission were breathlessness and pain in the cardiac region. The chest was much distorted through rickets; the lower part of the sternum corresponding to the right side of the heart was much elevated, and the heart was seen and felt pulsating in the epigastrium distinctly. From the appended sketch it is evident that the diaphragm was much depressed.

Along the edge of the left receding ribs, 7th and 8th, the right border of the heart was felt very plainly. These lower ribs were expanded outwards, whilst immediately above, and nearly as high as the nipples there was a distinct depression or flatness, which probably arose from pulmonary collapse, as in the former case.

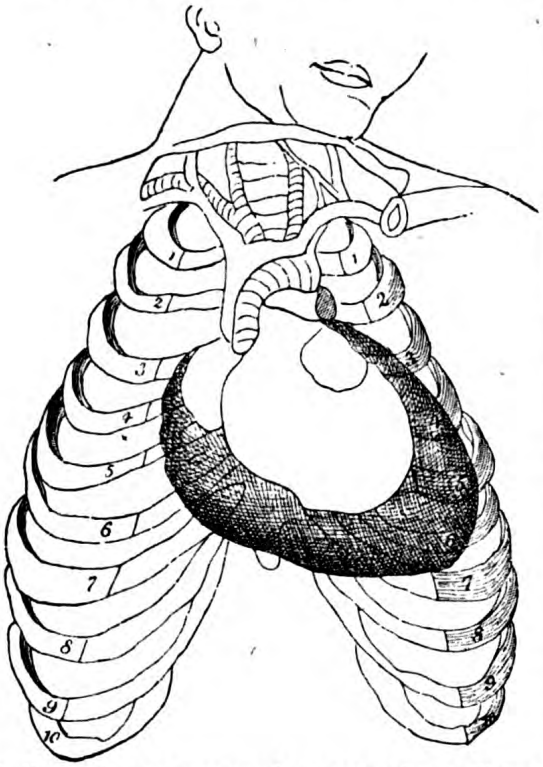
The thorax was peculiar in shape, inasmuch as the left cardiac region was prominent and convex over the left nipple, and for two inches below it. The right side was flattened below the nipple. Posteriorly the right thorax below the scapula was prominent and arched, the left below the angle of the scapula was flattened. Left shoulder much rounded. Owing to this alteration from rickets, the left side of the thorax, although so convex over the cardiac region, measured 12½ inches, whilst on the right side it was 13 inches, so that the convex or heart side was a trifle less in circumference. The heart's apex, much rounded, beat in the seventh interspace, three inches below the nipple, and immediately above the free border of the left costal cartilage.

The heart's movements were seen occupying a large space beneath the integument from the right side of the sternum on one side, to the axillary border on the other, to the third rib above, and the eighth below. Throughout the thorax could be heard a loud systolic bellows murmur, even posteriorly on both sides.

The hand placed over the epigastrium and left receding ribs was forcibly elevated by the laboured action of the heart. There was no distortion of the spine. The chest was resonant in front; posteriorly in the lower lobes of the lungs there was some slight crepitation. Temp. normal; pulse 96; resp. 36; urine turbid, acid, non-albuminous. The apex beat was below, but not much external to the nipple line, which did not indicate much hypertrophy or dilatation of the left ventricle. It reached low down, but was more diffused in the right lateral direction. The visible pulsation was chiefly to the right, but could be seen over a space corresponding to the whole cardiac enlargement below the nipple line, and in a slanting direction from a line drawn below the left axilla to the edge of the receding cartilage over the ninth rib. There was a loud systolic murmur in this situation, of rough bellows-like character; it did not obliterate the second sound.

In the epigastrium, as well as immediately below the left nipple and over the conus, this murmur had the same characteristics. The sounds were quite distinguishable at the base of the heart; the second pulmonary sound being rather prolonged and sonorous. The second aortic sound was long and sharp in this situation. The dulness began at the third left rib, and extended down-

wards to the free border of the left costal cartilages in the left hypochondrium. Laterally, the dulness did not exceed the vertical line of the left nipple. Internally the dulness extended across the mid-sternum and to the epigastrium. The liver was pushed slightly downwards. There was no orthopnœa. The pulse was 100, weak, small, and regular, though the impulse of the heart below the nipple was fairly strong and heaving, as is common in hypertrophy; every contraction raised the hand when placed over the heart, but was not strong enough to move the head when the stethoscope was applied over the cardiac region. There was, probably, more dilatation than hypertrophy. When the patient's hand was raised vertically above the head, the pulse could scarcely be felt, and it was irregular; some of the beats not being detected.

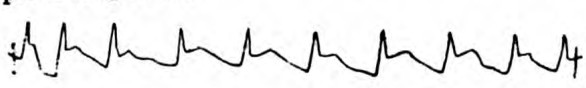


This diagram does not represent the apex of the heart sufficiently low.

The dilatation in this case was accompanied with a fair amount of hypertrophy, as evidenced by the freedom of the lungs, and the systemic circulation from congestion. In this way the dilated heart was capable of contracting sufficiently on its contents, so as not to become over-distended and paralysed. If the disease goes on long enough, the right side of the heart will further fail, and there will be hæmoptysis, or pulmonary congestion and œdema of the lower limbs.

*Treatment.*—As to the treatment in this case, it may be considered fairly successful whilst the patient was watched. Absolute rest in bed, and a diet of milk, eggs, white fish and fresh meat. In the shape of medicine a mixture containing strychnia, iron and digitalis, was given three times a day. At the end of six weeks the pulse became regular, steady, equable, and of good volume; it averaged 72 per minute, and the respirations 24; the improvement became very manifest after the digitalis had been increased to ℥x. three times a day, and it was maintained during his stay in hospital.

Dr. Mahomed was kind enough to take a sphygmographic tracing for me.



The tracing has no very striking characteristics, but it is of interest, as in some measure, elucidating the actual condition of the circulation, and its amount of efficiency. It is a form of tracing often seen in mitral disease, where there is a good deal of hypertrophy and dilatation. The blood stream is as full as normal, notwithstanding the regurgitation which is owing to the hypertrophy and dilatation, while the pulse does not present the usual signs of hypertrophy, owing to the regurgitation. The two conditions fairly balance each other at present, and an efficient circulation is maintained, though the heart is doubtless hard taxed to effect it. The arterial tension or fulness varies very greatly with the movements of respiration, if these are the least increased, though it is only slightly, still perceptibly, affected by them when the patient is at rest. This accounts for the slight difference in form in the waves of one of the tracings taken. This "respiratory undulation" indicates a dilated and overtaxed right heart. The primary uprise is not so high as in the former case, but the tidal wave is much smaller, and the main blood stream is distinctly less. It is probable that the mitral regurgitation is less pronounced than the tricuspid, and occurs occasionally only under excitement or exertion.

I saw this patient in July, 1878, when he was extremely pallid and thin; the heart's action was tumultuous, and the murmurs less pronounced, but his chief trouble now was inability to lie down at night, and with great anasarca of the feet and legs extending to the knees. Soon after this he expired suddenly at his own home.

As regards this question of tracing, Dr. Handfield Jones has recently published some interesting remarks, and given some tracings before and after exercise. The behaviour of the heart under these different conditions, presents a striking contrast. He says "it seems hardly to admit of question that the real efficiency of the heart is to be judged much more by its capacity of endurance under fatigue, than by the force of its contractions when at rest. A heart during repose may be acting languidly, but immediately after, during exertion, may put forth very much force, and continue to do so for a considerable time. On the other hand, a heart during repose may be acting quite normally, but under bodily exertion may soon falter and act defectively."—"The Dynamic Test in Examinations of the Heart," *Lancet*, p. 761. Nov. 30, 1878.

*Remarks.*—So much then for these terrible cases of heart disease, with which we are all too well acquainted. Attended, as they are, with a burden of misery appalling to witness, and hopelessly impotent as we are effectually to deal with the disease, we may draw from it this important lesson, and impress it on the minds of parents, that every case of heart disease in a young child, whether following rheumatic fever, or associated with a rickety constitution, in which the evidences of organic change have once been established, demands long and careful treatment in its early stages.

When it has once reached a certain point we can do little more than look on, and that with a degree of sadness, because in many cases, particularly in the rickety, the patient after a time loses flesh, although he expresses himself better, and is able to enjoy food, and to be up and about; his temples gradually shrink, his malar bones become prominent, and his face sharp and anxious, whilst the pulse and respiration are habitually accelerated, and he grows pallid, stoops in his gait, and becomes round shouldered. Then there is cough accompanied by signs of pulmonary congestion, and later on the systemic circulation is oppressed, and œdema of the ankles and other grave indications of the disease are permanent and irremediable.

Resistance, so far as is possible, should be offered to the entreaties of parents to remove their children from the wards of a hospital, whilst there is any chance of the disease being relighted up under the exhausting influences of their home life, and thus entailing misery on themselves, and adding to the list of pauperism and dependence on the state.

Heart disease in children, whilst it is one of the most frequent of their disorders, is, at the same time, one of the most grave. When congenital, it limits their development and cripples their power, and when, moreover, it is the result of acute rheumatism, it often interferes with their growth, and still more with their capacity to learn. A child with mitral disease requires frequently to remain in bed, or to take great rest for some weeks together, especially during periods of growth. This interferes with his attendance at school. By care, including appropriate treatment, he may be enabled to get over the period of growth, and even puberty, and maintain himself in some occupation which does not too greatly tax his power.

Remarkable instances of quiescence of all the cardiac symptoms are now and then presented, as in the case of a lad who came under my notice when sixteen years of age. He had been the subject of rheumatism and mitral disease of the heart four years before, I saw him, and the degree of breathlessness on exertion and liability to attacks of faintness and prostration had impressed his parents with the conviction that he had only a short time to live. Under almost absolute rest, and a tonic course of treatment, this lad was filling a sedentary occupation four years later, and earning a moderate competence. We should not, therefore, allow a mitral murmur when organic to affect our prognosis when debility is the leading feature ef the illness, and the heart's valves are not permanently crippled in their work.

Notwithstanding the presence of a mitral murmur, we cannot be too cautious in the significance we attach to it in young and weakly subjects, in the absence of a rheumatic history and endocarditis. A murmur hearn at the apex of the heart and occupying the first sound, an immediately following it, has been almost invariably accepted as of organic origin, and ascribed to regurgitation through the mitral orifice. When in young subjects, as I have sometimes heard it, this murmur is audible at the angle of the left scapula, or at the back on both sides, and the heart is large, then, whether there is a history of rheumatism or not, we may be pardoned, at least in the first instance, for ascribing the physical signs to organic change. The accentuation of the pulmonary sound, so common in these cases, is not to be absolutely relied upon for diagnosis, because any degree of pulmonary congestion may increase the fulness of the artery, and if the aortic sound is weak, the pulmonary may appear all the louder. In mitral regurgitation, the left auricle of the heart and the lungs generally contain a larger quantity of blood than they do when the valve is healthy, and in consequence of this, there is an increase of tension in the pulmonary artery, and its valves are forcibly closed. The second sound becomes loud and intensified. Some change in the aorta may therefore be expected, and what happens is a diminution of tension in the vessel, and the feeble closure of its valve. As the mitral valve becomes more and more crippled in its work, the right side of the heart dilates from the additional labour imposed on it through the increasing capillary congestion of the lungs.

Now a word or two about cardiac murmurs generally. It does not seem difficult to account for non-regurgitant murmurs at the cardiac apex, when we remember how the blood undergoes change in its composition, how slight may be the modification necessary to alter the ventricular lining how a point of roughness may spring up, a vegetation grow on the curtain of a valve, and relaxation or alteration in the muscular structure of the heart may arise, so as to alter or modify the normal sounds. Local pressure we know will do this. It is evident that we may have an endocardial murmur, resembling in all respects one due to valvular disease, which is simply owing to some impediment offered to the blood as it circulates through the various cavities of the heart; and this circumstance should, I think, induce us to consider very carefully in cases of rickets, whether the deformed chest may not have altered the position of the heart, and the great vessels have sustained pressure. "Can the heart," says Dr. Latham, "by the force of its contraction produce a murmur exactly resembling that which proceeds from valvular impediment? Perhaps it can. A young woman, herself in perfect health, nursed an infant, to whom she was greatly attached, in an attack of hydrocephalus. The infant died, and she was seized with violent hysterical emotion. I did not see her till the nervous struggle had come to an end, and she was lying in bed apparently free from present excitement. But the heart was still contracting with excessive force, and with the loudest possible bellows murmur. The next day the heart was beating quietly, and the murmur was gone." (*a*) A little girl, lately under my care with chorea, had an excited action of the heart, and a soft apex murmur when she first came under treatment, which I was inclined to attribute to organic origin. Under rest in bed, the muscular movements subsided, the heart became steady, and the murmur disappeared entirely.

I may also mention how the heart's sounds are modified in some cases of *ovarian tumour* when the abdominal distension is considerable, and the heart is pushed upwards or otherwise displaced.

Pulmonary murmurs are not unfrequently met with in this condition. I have met with several. My colleague, Dr. Percy Boulton, showed me a patient in the Samaritan Hospital in October last who had a very loud murmur over the pulmonary artery, with a soft short murmur at the apex, accompanying the systole, and also occasional irregularity of the pulse. As the patient was suffering from an abdominal tumour, and her nervous system was a good deal upset, I think we were most probably correct in assigning the physical change to pressure. If ovariotomy should ever be performed, and the patient recover, the pulse will become regular and the murmur cease.

A case presenting some difficulties for diagnosis came under my notice at the Samaritan Hospital in April, 1876. The patient, æt. 32, was suffering from an ovarian tumour, Before the operation of ovariotomy, which was performed by Mr. Spencer Wells, I was requested to examine her thorax. to ascertain the state of her heart and lungs. Over the pulmonary area was heard a loud and rough murmur, and the heart's action could be seen tremulously beating from the lower border of the second rib to the upper border of the fourth rib. When the patient took a full inspiration, or held her breath, the murmur disappeared, and it was therefore attributed to retraction of the lung, so that it did not cover the pulmonary artery and adjacent portion of the heart.

The patient died, and at the post-mortem examination the left lung at the upper part did not approach the median line, but it slanted off at the second rib to the outer border of the third. The heart did not extend below the fourth rib at its lowest border. The organ laid somewhat transversely across the thorax between the second and fourth rib, the apex was pushed up, and so tilting the base of the organ a little further to the median line under the emphysematous border of the right lung, hence there was no increased area of præcordial dulness during life.

Just as the muscles which supply the limbs are sometimes weak and flabby from disease or disuse, so the heart in states of profound anæmia, or from loss of blood, as in purpura, becomes dilated and relaxed, the two conditions are sufficient to generate a murmur at any of the heart's orifices.

The openings in such instances may become too large for the valves to close effectually upon them, and thus at each contraction of the ventricle a certain quantity of blood oozes back through them and generates a bruit—a bruit which is not organic. "At the same time, however, it must be borne in mind that the presence of a bruit with the heart's sounds in the child depends more invariably on organic disease than in the adult, inasmuch as those endocardial, arterial, or venous murmurs which are produced by an impoverished state of the blood are very rarely indeed heard in children under seven years of age, and are by no means common until that age is attained

(*a*) "Diseases of the Heart." New Syd. Soc., vol. i., p. 37, 1869.

at which the changes that take place as puberty approaches have begun, or are on the eve of beginning."

"I think that I can speak with confidence as to the rarity of such murmurs in childhood, though I cannot venture to assign a reason for it, since the very slight difference between the composition of the blood in early life and in after years can scarcely be alleged as affording an adequate explanation of the fact" (West, "Diseases of Infancy and Childhood," 1859, p. 494). From my own experience I should say that altered or modified sounds of the heart in young children can often be detected if carefully sought for. They frequently amount to a bruit, which is expressive of a state of spanæmia and constitutional debility, sooner or later terminating in a very distinct bruit as growth proceeds, and the health remains delicate. These exaggerated and altered sounds are significant. I had an opportunity of watching a boy, æt. 7, whose case has in some degree furnished these remarks. He came under my care in 1876, suffering from general debility, lassitude, inability to attend school, headache, palpitation, and with that condition of the heart we may describe as neurosal. There was exaggerated impulse of the heart when he ran across the room, or was excited, or woke up suddenly, or after food, but no bruit. Two years later the anæmia increased, and then a loud endocardial bruit was heard throughout the præcordial region, and a venous murmur in the neck, both of which still remain.

On the prognosis of these cases of heart disease, our literature is so defective that it has failed to establish any principles to guide us. Cases, either organic or functional, are brought before us from time to time, and after being submitted to treatment, they are discharged from the institution into which they are admitted, and if we hear of them again it is only by chance or accident. On several occasions I have made a diligent search after patients, in whom I have felt interested, one or two years after leaving my charge, and in some cases the surprise has been great that the disease which has assailed a weak constitution, and struck at the vital energies of the sufferer, should ever have been rallied from. No facts, as they appear to me, and no records of clinical experience, can explain this mysterious tendency to recover from some of these functional disorders, and we are driven in the present state of our knowledge, to draw our inferences from statistics and the collected observations of various authorities.

Two cases apparently identical, running a similar course, and attacking persons of the same age and strength, ending in recovery in one case and death in the other, represent a mystery so inscrutable that in our inability to discover a more satisfactory cause we fall back on the qualities of resistance and vitality.

"Many people (it is well known) have an habitually feeble circulation and an occasionally irregular or intermitting pulse all their lives. Yet they pass for well, and really are well in their own consciousness, and live as long as other people. In several such I have convinced myself (in as far as it is possible to be convinced about such a matter) that their heart has been weak of structure, and of small size in proportion to their stature; and it is a curious fact that most of those in whom I have found this condition of heart have told me that they were always short-winded, and that at school they could not exert themselves like other boys; they were accounted bad runners." (*a*)

How long will this disease last? How will it end its course? What symptoms are likely to arise, and what precautions shall we take in order to ward them off? Will the disease terminate in temporary recovery or in death? These are some of the questions which the friends of the patient will often ask when we have to contend with a chronic malady lasting over months and years.

## INTRINSIC ENLARGEMENT OF THE CONDYLES OF THE FEMUR IN CERTAIN DISEASES OF THE KNEE-JOINT. (*a*)

By B. WILLS RICHARDSON, F.R.C.S.I.

MR. VICE-PRESIDENT,—I have two specimens to exhibit this evening, but as they both bear upon an interesting point (leaving the chronic rheumatic affection out of consideration) in connection with joint disease, the only point to which I intend to refer, I must ask you to consider them a single exhibition.

The members present are aware that there is a difference of opinion regarding the capability of the articular ends of the bones to enlarge, some writers holding what seems to be an enlargement is apparent and not real, caused by thickening of soft structures forming part of, and investing, the joint, and by wasting of the adjoining soft tissues. Others, on the contrary, believe there is a real enlargement, two views being held on its pathology, one that there is an intrinsic enlargement, as I shall call it; the other, that the enlargement is not intrinsic, but is caused by the deposition of osteophytes or layers of new bone on the walls of the articular extremities.

The condyles of the femur being probably the source whence this controversy has arisen, and as my specimens have been taken from the knee, I shall limit myself to this joint.

Billroth thinks, or rather is positive, that the intrinsic enlargement does not occur. "You will now and then," he observes, "hear and read of enlargements of the articular extremities of the bones in tumor albus," the name he gives to white swelling, "but the expression is an incorrect one; the bones never swell up in caries of the joints. If they appear to be thickened this depends upon thickening of the soft parts or upon the deposition of layers of osteophytes."

Whether he attributes the following development to osteophytes he does not say, but it looks like an admission on his part of a swelling in a downward direction. Indeed, it is difficult to believe that osteophytes are deposited on the articular surfaces as long as the cartilage is intact, in which case the downward enlargement would be intrinsic.

"In like manner," he states, "the tibia in caries of the knee may be displaced outwards and backwards, the condyles of the femur remaining free, appear to develope, so that the surfaces of the joint are no longer capable of interlocking."

The specimens that I now exhibit throw a little light on this disputed question, and have tempted me to venture upon occupying your time for a few minutes.

The first specimen, the condyles of a left femur from a suppurating knee-joint, having a synovial membrane much pulpified and thickened, the cartilages in some parts also pulpy, and in others altogether removed, the bones being carious, conditions necessitating amputation of the thigh of Samuel Bradley, æt. 15, which I performed by Teale's method in the Adelaide Hospital on the 15th March.

Now, the longest transvere diameter from the most prominent point of one condyle to the most prominent point of the other, is 3 inches 5-16ths, whereas the corresponding diameter of the boy's opposite knee, with its investments, is 3 inches 7-16ths, being a difference of 1-8th of an inch in favour of the sound knee. But as the investments of a healthy knee average at the outer side 3-10ths of an inch in thickness, and at the inner exceed this by about 1-15th of an inch, making altogether more than half an inch, I think it is evident that the condyles have enlarged, and as their walls are exceedingly thin it may fairly be called intrinsic. I must not omit to mention that I am indebted to Professor MacAlister for notes on the average measurements of the soft parts investing healthy knees which

(*a*) Read before the Surgical Society of Ireland.

were of much use to me in putting together this short communication.

A horizontal section of the condyles having been made at their widest part, I took the following measurements of the outer wall of the external condyle and the inner of the internal condyle, both these walls being still cartilaginous, when I found the thickest part of outer wall a little anterior to centre, to be 1-12th of an inch, while the thinnest portion of this wall is so thin it can scarcely be measured with accuracy, but it may be taken as about 1-48th of an inch in thickness or width. The other portions of this wall are 1-20th of an inch in width.

The inner wall of the internal condyle was destroyed by disease in one or two spots, which of course left us without measurements corresponding thereto; but at the most prominent point of this wall, where the transverse diameter was taken, there is scarcely a trace of the wall. A little behind this point the width of the wall is 1-12th of an inch, its thickest part. It can scarcely then be said that these walls are abnormally thickened, so that the slight increase in diameter of the articular end of this femur ought fairly to be attributed to intrinsic enlargement rather than to the thickening of the cartilaginous walls.

The next specimen is a portion of the lower end of the left femur I removed by excision of the knee of Patrick Harding, a boy, æt. 8, in the Adelaide Hospital on Tuesday, the 18th March. In this case, one of some standing and apparently much neglected, the tibia was dislocated backward and a little outward, drawing the outer facet of the patella forcibly against the anterior and inner surface of the outer condyle, leading to absorption of the cartilage corresponding to it. The greatest transverse diameter of these condyles, carefully stripped of all soft parts, is 2 inches 6-8ths, whereas the same diameter of the opposite knee, covered with its soft parts is also 2 inches 6-8ths, showing that in this specimen, likewise, enlargement of the diseased articular end of the femur had taken place. Now, on examining the section, and carefully measuring the thickness of the free lateral walls of the condyles, cartilaginous also, I found that the thickest portion of the outer wall, where the transverse diameter was taken, is 3-16ths of an inch, its thinnest portion being 1-8th of an inch, and that the thickest portion of the inner condyle, where the transverse diameter was taken, is 1-8th of an inch, its thinnest portion being 1-16th of an inch. It will be observed that these walls are a little thicker than those of the elder boy's condyles, so that possibly it may be thought that the enlargement in this case should be attributed to thickening of the walls rather than to an intrinsic enlargement of the condyles. Be this as it may, the condyles have enlarged, and clearly show that those who hold there is no real enlargement of the condyles in either the strumous or allied diseases, are completely mistaken.

Although the specimens throw only a gleam of light on this question, I was induced to bring them before the Society in the hope that those who have opportunities for doing so may elucidate it at some of our future meetings.

## ADENOID TUMOURS OF THE NASO-PHARYNX; THEIR INFLUENCE ON HEARING, RESPIRATION, AND PHONATION; AND THEIR TREATMENT.

By Dr. B. LÖWENBERG, Paris,

Translated by H. Macnaughton Jones, M.D., &c., Professor, Queen's University, Ireland.

(*Continued from page* 304.)

### Influence on the Nasal Fossa.

No organ is subjected with impunity to a permanent interference with the discharge of its function; this principle, which regulates the entire organism, applies equally to the nasal fossa, in cases where an impediment, of whatever kind, has deprived them for some time of the passage of atmospheric air. Under these circumstances we observe considerable degeneration of the pituitary membrane. In reference to this, our friend Professor Stœrk, of Vienna, says, "When the nose has ceased for some time to take its part in the respiration, the Schneiderian membrane becomes dropsical, and loses its normal structure, its mucous follicles, as well as their contents, undergo colloid metamorphosis. The covering of the turbinated crests finally appears like yellowish colloid sacs which never regain their normal structure, even with the most active treatment. From our point of view we cannot but think that some authors appear to carry these attempts at explanation too far; we consider that, in this instance also, they have confounded cause and effect in regarding the impediment to respiration as primary, and the hypertrophy or degeneration of the pituitary membrane as secondary in cases in which, on the contrary, this latter has caused the nasal occlusion, instead of being the result of it. Others have previously noticed that, in the case of adenoid tumours, the nose appears as if it were diminished in size, pinched, with a narrow bridge, and the alæ contracted (Robert "On the results of Buccal Respiration in Hypertrophy of the Tonsils").

We may remark that we have not observed this as an invariable symptom.

In a large number of cases of adenoid vegetations there is chronic rhinitis, with increase of the secretion. The mucous membrane is found swollen; that which covers the inferior turbinated crests is sometimes so much enlarged that the posterior extremities of these organs form actual tumours projecting into the naso-pharynx, and requiring special operations. The swelling of the mucous membrane further impedes the expulsion of the masses so abundantly secreted in these cases.

### The Sense of Smell.

The sense of smell is generally diminished, and often even destroyed in very advanced cases. We consider that two causes here act conjointly: the degeneration of the mucous membrane and the naso-pharyngeal occlusion. There is no necessity to point out the hindrance which the thickening of the Schneiderian membrane and its epithelium offers to the action of odorous substances on the terminal filaments of the olfactory nerve. It is likewise with a too abundant secretion, or the opposite state, a well-marked dryness of the pituitary membrane in the olfactory region.

With reference to the occlusion posteriorly of the nasal fossa, physiology shows us that there must be a certain impulse, a current of air, to bear the volatile substance to the region where the terminal ramifications of the special nerve are distributed. This current of air is furnished by nasal inspiration, and cannot, therefore, exist when this has become impossible. Every one knows, without any special acquaintance with the subject, that, to arrest the sensation of any odour, it is sufficient to hold the breath or to breathe exclusively by the mouth.

It is thus evident that the two causes which we have enumerated, the abnormal state of the mucous membrane and the naso-pharyngeal obstruction, combine, in the adenoid affection, to arrest the sense of smell. There is no necessity to point out the dangers to which the privation of this sense exposes us.

We must here refer to the direct, though obscure, relationship of the senses of taste and smell, all diminution in the sense of smell affecting also that of taste.

We have attempted to study more closely these relationships of the physiological conditions by experiment on ourselves. Let me briefly give the result of our researches. The sense of smell assists that of taste in the following manner: We gently lower the soft palate, and in this way establish a communication between the buccal pharynx and naso-pharynx. We then expire a current of air, which, in passing behind the isthmus of the throat, attracts and draws to the nasal fossa the air

of the buccal cavity impregnated with the effluvia of the substances. We can verify this statement in different ways. By closing the nose, for example, or by making inspiratory, instead of expiratory, movements, the sense of taste becomes immediately blunted, and there remains only the perception of such simple flavours as sugar, salt, &c.

It would be desirable that other observers should experimentally prove on themselves the value of our hypothesis.

### Influence on the Purity of the Air Inspired.

Besides their other important functions, the nasal fossa insure the purification of the inspired air; during its passage in the numerous windings of these cavities, the atmosphere is filtered, and deprived of the impurities which it so often contains, such as dust, smoke, &c., a portion of which is retained in the mucus which lines the interior of the nose.

We have only to recall the researches of Tyndall, and those of Pasteur, who have shown the quantity of dust, whether organic or inorganic, which is contained in the air we breathe. Of the latter, the greater proportion is composed of mineral detritus; the organic particles consist chiefly of spores. MM. Smith and Davis calculate at 37½ millions the number of spores contained in the volume of air inspired during ten hours. A very approximate estimate, we need not say.

When we wish to ascertain the degree of pollution of the air which we breathe in certain conditions, and the quantity of substances injurious to the organs of respiration with which it is charged, we have but to examine the nasal mucus after an evening spent at a ball, a theatre, or in a crowded café. We can also appreciate the advantages of respiration by the nose in a different manner, that is, by examining the respiration of those who dwell in an atmosphere polluted by smoke or other injurious substances—for instance, in workshops full of the fumes of chromic acid, or its salts, of flower, or nap, &c. This contaminated air has little or no effect on those who breathe by the nose, while, when it enters by the mouth, it produces painful and disordered respiration. Dr. Cassels strongly emphasises the importance of the nasal passage to purify the inspiratory air, in a memoir to which he has given as title an ingenious application of the English proverb, "Shut your mouth, and save your life."

We must here remark that the physical conditions of the air which reaches the lungs should not be lightly regarded. As we have stated previously, nasal respiration renders the inspired air not alone purer, but also moister and warmer, than buccal respiration. This latter theory has been verified by M. Grébant, who, at a surrounding temperature of 22° (Cent.), has found 33·9 for the air expired, after having been inspired by the mouth, and 35·3 for that expired after having been inspired by the nose. (The expiration in both cases was made by the mouth.)

### Influence on the Development of Young Children.

If nasal respiration is of importance to the health at every age, it is especially so in infancy—particularly in the first years of life, as the important researches of our distinguished teacher, M. Rayer, and of Billard, have shown us. At the commencement of life, the child absolutely does not know how to breathe by the mouth, even when the nose is obstructed. M. Kussmaul has pointed out that infants at the breast, even when they sleep with the mouth open, do not the less breathe entirely by the nose. These details, apparently insignificant in a healthy child, acquire a vital importance when the nose is obstructed by any cause. There is nothing so painful to witness as an infant sucking, who cannot breathe by the nose. It is obliged constantly to loosen its hold on the breast, to attempt to breathe by an unusual channel. There is an unpleasant disturbance, sometimes interrupted by actual attacks of asthma. M. Kussmaul even admits that the movements of inspiration, the nose being impermeable and the mouth closed, may cause acute congestion of the lungs.

According to M. Bouchut, buccal respiration may incite still more serious accidents. "In these cases," he says, "respiration can only be effected by the mouth, which remains constantly open for this purpose. The current of air draws the inferior lip backwards like a valve, and also the tongue, which is drawn up and bent, with its inferior surface applied against the soft palate, so as to obstruct the buccal cavity.

When the infant has finally learned to breathe by the mouth, it is a victim to all those injurious consequences of this habit which we have already referred to, and also to others peculiar to infancy. Thus Dr. Paul Niemeyer attributes to buccal respiration certain attacks of false croup, which have been noticed in the early hours of the night. They proceed from the constant drying of the glottis in respiration by the mouth.

### Snoring.

Amongst the persons we have met with, affected with adenoid tumours, all those in whom the affection was far advanced were subject to this disagreeable habit,

*Snoring at Night.*—In examining those who snore, while they emit their peculiar sound—so much dreaded by persons who sleep lightly—we can prove that they always breathe with the mouth open. Similarly, in attempting to imitate snoring, it will be seen immediately that it is impossible to produce this sound with the mouth closed. Since we thus see that buccal respiration is the condition, *sine qua non*, of snoring, we are not in the least surprised to meet with this bad habit in persons breathing by the mouth on account of adenoid tumours. We should be the less so, as the thickening of the entire of the pharyngeal mucous membrane, and the abundant secretion so frequent in this affection, combine to still more contract the channel for respiration, and by increasing the rapidity of the current of air, making it more liable to throw into sonorous vibrations the uvula and soft palate of the patient, particularly in the dorsal decubitus, if the tongue falls backwards and encroaches still more on the passage already so narrowed.

### Arrest of Development and Deformity of the Thorax.

We have found in many young people affected with very large adenoid vegetations, not alone an extremely imperfect development of the thorax, but also a marked deformity of its walls, a peculiarity little known, and which it appears to us very important to point out. In all these patients the chest had a marked flatness quite at variance with the general development of the individual. In some there was also a striking deformity. As a rule, it consisted of a great depression of the central portion. In one case, a young man, æt. 18, very healthy otherwise, we found, on the contrary, the *pectus carinatum* the characteristic, pigeon-chested deformity of rickets, recognised by the two vertical channels, as also by the prominence of the *chondro-sternal cartilage*. However, neither the antecedents of the patient, nor the most minute inspection of his body, could discover anything indicating a formerly rickety condition.

In considering the origin of this condition we do not think it will be found in habitual buccal respiration, since this offers to the air inspired and expired a sufficient channel not to interfere in any way with the normal development of the thorax. It seems to us rather to point back in the history of each patient to a period when he had not yet exclusively breathed by the mouth, to a period which may be called one of transition and struggle. This is the probable manner in which these occurrences take place. The tumours only slowly reach their full development. A time must of necessity arise when the obstruction of the posterior nares, which is habitually incomplete, becomes still more impeded during certain

attacks of greater swelling, or of more copious secretion, which are peculiar to the affection. At these times nasal respiration is insufficient, but as the patient has not yet exclusively breathed by the mouth, from time to time he involuntarily closes it, and attempts to breathe by the nose. This latter being closed, the thoracic cavity cannot be enlarged. In consequence of this there is lowering of the diaphragm and contraction of the intercostal muscles—particularly the external—which tend to enlarge the thorax during the passage of air through the glottis ; for the same reason there is also flattening of it. This flattening proceeds from the predominance of the atmospheric pressure on the one hand, and on the other the elasticity of the pulmonary tissue, which tends to diminish the volume of the lung in proportion as the intra-pulmonary pressure diminishes. At length, in these cases, under the influence of atmospheric pressure, the intercostal spaces are deepened, and even the costal cartilages are deformed. There would be a similar result if the mouth was closed during sleep, or that the soft palate of the sleeper, yielding through fatigue of the muscles which elevate it, were to fall down, thus leaving but an inefficient approach into the obliterated nasal fossa, while it closes the entrance into the cavity of the mouth.

# Clinical Records.

## LONG ISLAND COLLEGE HOSPITAL.

*A Unique Case of Complete Outward Dislocation of the Forearm.*

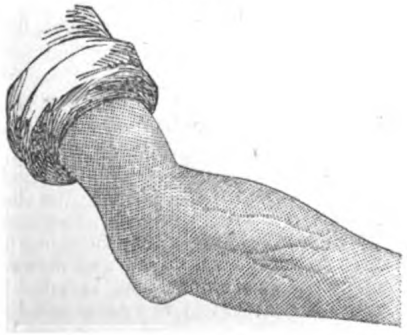
Under the care of Dr. FRANK H. HAMILTON.

Reported by Dr. WINFRED WYLIE, House Surgeon.

"The large majority of outward dislocations of the forearm are incomplete ; indeed, only nine examples of a complete dislocation have been collected by Denner, including two seen by himself. Malgaigne has since added two more, making in all eleven cases. All these examples have occurred in the practice of French surgeons. So far as I am able to discover, no American or English surgeon has ever reported a single example."—*Prof. Frank H. Hamilton.*

*History.*—Edward Baker, æt. 38, native of St. John's, Newfoundland ; occupation, sailor. *Service of Dr. S. D. Mason.* Patient was engaged in a fishing enterprise in 1862. While fishing, standing on a staging formed of three-inch sticks, laid crosswise, three inches apart, he

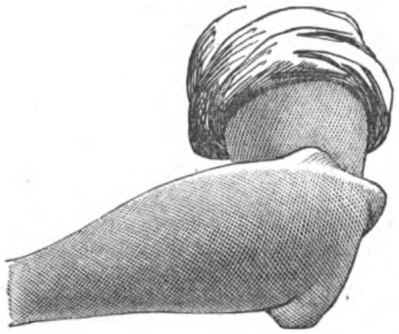
FIG 1.



fell, with one arm raised, striking on the inner side of the elbow. At the same moment a barrel of fish weighing two hundred and fifty pounds, fell over, striking the arm about three inches above the external condyle. Upon rising he found the arm flexed at a right angle and pronated, and that he could not move it. No attempt at reduction was ever made, nor was there any retentive apparatus applied. He put the arm in a sling, and after a couple of months he commenced using it a little. At the end of two years his arm was sufficiently recovered to permit him to return to his sailor life, which he followed up to six months ago, when he was admitted to the Long Island College Hospital for other injuries.

Condition of the arm now, seventeen years after the accident. The inner border of the olecranon process rests upon the external border of the humerus, two inches above the external condyle (Fig. 2), where probably an articular faucet has been developed ; external to this is the head of the radius, which can be recognised by sight, but more surely identified by touch. The internal condyle of the humerus projects nearly two inches from the inner surface of the forearm (Fig. 1). When extended,

FIG. 2.



the radial border presented a gentle outward inclination from the elbow down (Fig. 1). This may be greatly increased or decreased by manipulation.

This extremity is about three inches shorter than its fellow, measuring from the tip of the acromion to the styloid process of the radius, and the forearm is nearly three inches shorter than the opposite one, measuring from the internal condyle to the pisiform bone. The patient has full control of this limb, can reflex or extend, pronate or supinate it, as easily as the other arm, and he thinks it is in every particular as serviceable as the other. The accompanying cuts illustrate the deformity at the elbow, but as he is a very muscular man the malposition is not so patent to the eye as to the touch. The subject of this sketch has been repeatedly examined by the members of the hospital surgical staff, and their examinations confirm the above statements.

# Transactions of Societies.

## CLINICAL SOCIETY OF LONDON.

FRIDAY, APRIL 18TH.

Dr. GREENHOW, President, in the Chair.

Dr. STURGE

ON A CASE OF RARE VASO-MOTOR DISTURBANCE IN THE LEG.

The patient, a man æt. 29, began to have attacks of redness and swelling, with a feeling of heat, in the right great toe about four years ago. They came on after he had been standing some time, lasted for two or three hours, but went off more quickly if the foot were kept elevated ; they increased in severity, and eventually reached thigh and buttock. Eighteen months after the first onset the burning pain felt when the foot was put to the ground obliged the patient to give up work. The left foot and leg have begun to feel hot during the last six months. The attacks are brought on by hanging the leg down, sitting near the fire, wrapping it up warmly, or by much excitement. When first admitted to the Royal Free Hospital he rarely passed twenty-four hours without one. For more than two years the right leg has been wasted. The circumference of the right thigh was 1¾ in. less than that of

the left; that of the right calf 1½ in. less. There was marked increase in the reflex irritability of the muscles. Their electrical reaction was altered; there was great diminution of reaction to both constant and induced currents, when the rheophores were applied to the muscles, but when to the nerves both currents produced good reaction. Now in atrophy from disease of the spinal cord there would be loss of reaction to the induced current in both positions, and to the constant and induced current in both positions, and to the constant current when the rheophores were applied to the nerves; good, or even increased reaction when they were applied to the muscles. The surface temperature, taken by Stewart's surface thermometer, was below 75° (the lowest point on the scale); in the attacks it was about 93°; always lower on the dorsum than on the sole. Dr. Sturge remarked that this belonged to a class of cases of which a description was published by D. Weir Mitchell in the *American Journal of the Medical Sciences* for July, 1878. Dr. Mitchell had seen five cases, and quoted six from other sources. He states that the disease nearly always occurs in men, following some constitutional disease, or after much walking. It begins usually in the ball of the foot, and gradually extends to the rest of the limb. The course of the disease described by Dr. Mitchell much resembles that above given. Two of his cases were associated with spinal symptoms, such as weakness of the legs, atrophy of muscles, &c. But Dr. Sturge pointed out that in this case the atrophy was shown by the electrical reaction to depend on a local rather than a spinal cause. He suggested that the disease had been brought on by the prolonged over-excitation of the vaso-motor centre, resulting from long exposure of the feet and legs to wet and cold, and that the condition was thus allied to the irregular action excited in other centres from over work, as in the case of writers' cramp.

Dr. Stephen Mackenzie said that he had observed a similar case. The patient, an engine-driver, was exposed to great variations of temperature, in consequence of his occupation; his feet were chilled, and his lower limbs and abdomen heated. Two years and a-half ago he began to complain of pains in the feet on walking, and this increased to such a degree as to prevent his walking for more than half-an-hour; he was then compelled to rest with his feet raised. The muscles were wasted, but there was good tendon reflex. A difference between his patient and that of Dr. Sturge was that the lower extremities did not redden much after he had been standing, though the veins were much filled; otherwise there was a strong resemblance between his condition and that of the patients described by Dr. Weir Mitchell.

Dr. Poore thought Dr. Sturge's theory of the production of such a condition by repeated stimulation of the vaso-motor system both interesting and probable. In writers' cramp, a disease to which he had paid some attention, it was common to meet with vaso-motor disturbances. The arms were alternately hot and cold; and another point of resemblance was that the electrical reaction of the muscles in such a case was the same as that described by Dr. Sturge; when the electrodes were placed on the muscles, neither Galvanic nor Faradaic currents would produce contraction, though they would do so when applied over the nerves. He asked whether there were any hyperæsthesia in this case, or any sign of neuritis.

Dr. Sturge, in replying, stated that there was no hyperæsthesia, nor was there any tenderness of nerves present. Dr. Mackenzie's case appeared to him to be one of those which Dr. Mitchell distinguished, without separating them, from the severer cases.

Dr. Sturge

ON A CASE OF PARTIAL EPILEPSY APPARENTLY DUE TO LESION OF ONE OF THE VASO-MOTOR CENTRES OF THE BRAIN.

The child was now seven years old; the family history was good, no history of hereditary nervous diseases. There was an extensive mother's mark on the right side of the head and neck, and one patch over the left frontal and temporal region. All the parts affected on the right side were larger than on the opposite; the right eye was affected; and he read notes taken by Mr. Nettleship on the condition of this eye, from which it appeared that the palpebral fissure and the pupil on this side were larger than on the other, the sclerotic more vascular, a state of sclero-nævus. This eye was myopic, probably because of its increased size, the lens presumably being adapted for a smaller eye; the choroid and optic nerve were redder than on the other side. The epilepsy began by twitching, lasting for ten or twelve minutes, at first confined to the left side. Several such fits occurred every day, but there was at this time no loss of consciousness. Gradually the fits spread to the other side, and in eighteen months or two years the child began to lose consciousness after the attacks. The fit began with a peculiar sensation in the left palm, followed by convulsions which soon became general. The left side remained weaker than the other. This state of things was considerably improved by bromide of potassium. In order to explain his theory about this case, Dr. Sturge gave a summary of his views as to the mechanism of an epileptic convulsion, and concluded that in this case the epilepsy proceeded from and depended upon a condition of the left hemisphere, comparable to that observed in the right eye, and the skin and mucous membranes of the right side of the head.

Dr. Glover objected that the existence of a port wine mark on the cerebral hemisphere was theoretical, and hardly worthy of discussion. Besides, there was a mark on the left side of the head, and the unilateral commencement of epilepsy was common. In reply to Mr. Heath he said he had questioned the mother on her idea of the origin of the mark, which she attributed to a fright she had experienced in her last month of pregnancy.

Mr. Gould mentioned a case of extensive port wine mark which he had formerly observed, where there was considerable increase in bulk on the affected side. Fits were also common in this patient, but he could not describe their nature, the nævus having chiefly occupied his attention.

Mr. Furneaux Jordan thought that in these conditions a member or viscus might sometimes become enlarged, with being itself nervous, as a result of the more vigorous circulation present; and described a case where the radius, thumb, and index were much hypertrophied, as he believed, from this cause. It was fair to add that from some communications he had received from Mr. Hutchinson, who had also observed a similar condition, he found that Mr. Hutchinson did not agree with him as to the means in which this hypertrophy was produced.

Dr. Poore, while thanking Dr. Sturge for bringing forward this case, felt that fits were so common in children, with or without port wine marks, that he should be unwilling to agree to Dr. Sturge's theory on the strength of this case alone. Was any such port wine mark of the brain known to exist? He would further ask whether in the present case there was any change in the vessels of the nævus during the convulsion? and lastly, whether the supposed affection of the brain had to any extent interfered with the growth of the opposite side of the body?

Dr. Sturge, in replying, said that he should not have ventured to suggest this explanation of his case if it had not been for the unusual extent of the nævus. It should be remembered that all the accessible parts on the right side of the head were involved, including the deeper parts of the eye. The mark did just extend over the median line, as was so common in anæsthesia of one side. Otherwise the mark on the left side of the head was unimportant. He had never observed a fit in this patient, but just after one, the mark was rather darker than usual.

Mr. A. Pearce Gould

ON A CASE OF AMPUTATION AT THE HIP-JOINT, IN WHICH THE ILIAC ARTERIES WERE COMPRESSED BY DAVY'S LEVER.

The patient, a man æt. 28, was admitted into Westminster Hospital with advanced disease of the hip. Excision of the head of the femur, which was separated from the neck, was performed, but it afterwards became necessary to remove the limb. Mr. Gould did this by prolonging his excision wound downwards a short distance and then severing the thigh circularly—an oval amputation, in fact. He claimed for this method that it considerably lessened the extent of the cut surface, and the uninjured inner part of the thigh was very useful in supporting the posterior flap, and in aiding the nutrition of the flaps. He recommended it especially in cases of amputation following excision. The iliac vessels were controlled by Davy's lever passed into the rectum. There was no flow of blood during the amputation, only that lying in the severed vessels escaping; at the end of the operation the blood in the tray, mixed with serum and sawdust, measured less than 3 oz. In comparing Davy's lever with Pancoast's tourniquet, which is usually employed, Mr. Gould held that it had the following advan-

tages :—1. It disturbed the circulation less ; 2. It did not interfere with the respiratory movements, nor was it interfered with by them ; 3. Its use was not prevented by obesity, rigidity of abdominal walls, or the existence of abdominal tumours ; 4. The pressure required was less ; 5. Less liability to injury of viscera and peritoneum ; 6. greater ease and security in application ; 7. Greater cheapness and durability ; 8. If the lever were not at hand its place could be more easily supplied. The lever was first suggested and used by Mr. R. Davy in a young child in January, 1877, then by Mr. Gould in Dec., 1878, and since then by Mr. H. Marsh, Mr. Johnson Smith, Mr. Davy, and Mr. Cadge, and in every case successfully. Mr. Gould showed some deep sutures which he had employed to maintain the flaps in exact apposition ; they were steel pins rivetted at one end to a flat oval disc of vulcanite ; this pin is passed through the flaps up to this disc, and then a similar disc of pure black rubber is slipped down over the pin on to the other flap ; by its elasticity it grips the pin. Three of these were used, and held the flaps so firmly that the patient was able to turn in bed and move his stump without assistance. The patient progressed very favourably for 40 hours, but died at the end of 68 hours ; and at the autopsy all the veins of the left foot, leg, and thigh were found to be filled with black coagulum which reached just into the common iliac vein. There was no sign of injury of the rectum, peritoneum, or arteries.

Mr. MACNAMARA said it was the second time he had seen the lever used ; the first time was in a child, who was very anæmic ; here he thought not more than 1½ oz. of blood was lost, and the child made a good recovery. The lever, however, had some disadvantages, its length was a source of danger, and it required extreme care on the part of the assistant. The amount of damage that might be done, too, was considerable, when the force of such a lever was recollected. In one case, after death it was found impossible to introduce the lever at all, and this, of course, might sometimes happen during life. He allowed, however, that the successful instances of its use which had been brought forward inclined him to think more favourably of the method.

Mr. MARSH had used the lever in one case ; there had been no difficulty in introducing it nor in controlling the vessel, and the amount of blood lost in the amputation of the limb was under 1 oz. he thought. The means seemed to him very fairly successful and worthy of a trial, for there were undoubted disadvantages in the use of Lister's tourniquet, particularly if the patient happened to faint during the operation. He had had once to amputate the upper part of the thigh for a case of secondary hæmorrhage after ligature of the femoral artery, and the patient died after losing more blood than he could afford in his enfeebled state. Such a case would have been very suitably treated with the lever, which also might be used in the treatment of aneurisms of the common femoral.

Mr. JORDAN thought Davy's lever would prove an effective, simple, and valuable addition to the surgical armamentarium. In the manner of removing the limb at the hip-joint which he had recommended he thought there were several advantages, the muscles quickly contracted and the skin fell together, less surface for absorption was exposed, the vessels were divided transversely, and far from the pelvis. Only last Tuesday he had occasion to do this operation in a case where gangrene had followed a previous operation. He had removed the limb and the lad was now fairly well and expected to recover. With Davy's compressor, Esmarch's bandage, and his operation, he thought amputation of the hip would be far less dangerous than formerly. He would add that this operation had lately been done by Mr. Littlewood and Mr. Beddard at the Nottingham Hospital, in both cases successfully.

Mr. BAKER remarked on the thrombosis, and asked if there were any signs of injury to the veins at the seat of compression. Personally, he had found no special difficulty in amputating in the old way at the hip-joint, with the help of the tourniquet. How long did Mr. Jordan's method take ; and would not the shock following such a prolonged operation be greater ? He could not help feeling that in this case a share in the result must be laid to the carbolic acid.

Mr. HEATH observed that he had helped Mr. Swayne to amputate in the oval method in the autumn of 1866. Mr. Jordan's method appeared to be an elongation of this, and no doubt was suitable for cases of excision, but it was not adapted for those serious cases where amputation at the hip-joint was required for the removal of tumours in the upper part of the thigh. These were the fatal cases. In reply to Mr. Macnamara he said there was often a great difference in the facility of passing an instrument in the dead and the living subjects.

Mr. HOWSE thought the question did not lie so much between Davy's compressor and Lister's tourniquet, as between the compressor and digital compression. In two of the cases Mr. Baker had mentioned, it was this method of compression that was practised, and no doubt it was a great strain on the muscles and fingers of the compressor. An objection to Mr. Jordan's operation was that all the old sinus tissue was left, a great disadvantage in his opinion. He was in the habit of making a skin internal flap, which folded at right angles to the buttock flap, and allowed more easily the use of antiseptics.

Mr. BARWELL had found no difficulty in treating such cases antiseptically. He used a spiral flap, and removed the limb rapidly, trusting to Lister's tourniquet, nor did he quite understand the advantages of Mr. Jordan's operation over this one.

Mr. G. BROWN asked as to the cause of the thrombosis. It appeared reasonable to suppose that carbolic acid might have caused it. Pressure would have produced a one-side thrombus.

Mr. HULKE had listened with pleasure to the discussion. He would wish, however, to say that the oval method was a favourite of Guthrie's in 1849 or 50. He had helped C. Guthrie to do it. An internal and external skin flap were made, and the muscles cut short. In military surgery it was especially advantageous, for heavy baggy flaps rendered transportation difficult. In advocating the use of the lever, it should not be forgotten that bad results had followe only a prolonged use of the tourniquet.

Mr. GOULD replied to Mr. Macnamara that the cause of the difficulty of passing the lever in the case referred to had been a stricture of the rectum. The thrombosis, he felt bound to say, he was inclined to attribute to carbolic acid poisoning. The oval method was as rapid in performance as the other.

## SURGICAL SOCIETY OF IRELAND.

SESSION 1878-79.

FRIDAY, MARCH 28TH, 1879.

THE Last Meeting of the Session was held in the Albert Hall of the Royal College of Surgeons,

Dr. EDWARD D. MAPOTHER, Vice-President of the College, in the Chair.

There was a large attendance of members and visitors.

Mr. B. WILLS RICHARDSON (hon. sec.), read the minutes of the previous meeting, which were signed.

Mr. B. WILLS RICHARDSON submitted specimens of

ENLARGEMENT OF THE CONDYLES OF THE FEMUR FROM DISEASED KNEE-JOINTS,

description of which will be found on page 009.

AMPUTATION OF LEG.

Mr. HENRY GRAY CROLY exhibited a leg amputated on the previous Tuesday by the rectangular flap method for acute suppuration of the joint. He said : The child is æt. 6. About six months ago it got a fall on the knee. When admitted into hospital there were all the symptoms of acute inflammation of the joint, and very soon it became evident that the joint was full of purulent matter. At first, I made an incision into the joint, and let out a large quantity of pus ; and everything was done with a view, if possible, to save the limb. However, symptoms of hectic setting in, the limb was removed. The synovial membrane is greatly thickened, and the joint completely disorganised.

Mr. THORNLEY STOKER submitted a

DERMOID CYST OVARY

removed by his prosector on the previous Saturday, from the body of a female subject in the dissecting-room attached to the College. He said : It affords an example in one sac of all the different contents that may occasionally be found in

cysts of this character. The woman was æt. about 35; and from the condition of the uterus, and the marks on the abdominal wall, I should say she had borne children. The wall contained an intramural myoma. The left ovary was in an atrophic condition, and contained two rudimentary teeth in a very elementary condition indeed; while the right ovary was much larger, nearly as big as an ordinary fist. When opened, the cyst was found to contain a large quantity of well developed hair of a light brown colour, a quantity of fatty matter not yet submitted to microscopic examination, but which was apparently mingled with a quantity of epithelium; and finally, a bit of alveolus containing four teeth of different degrees of perfection undeveloped, one being like a premolar or first molar tooth. I have not caused the soft tissue covering the gum-like structure to be removed yet; because I wish to exhibit the specimen in its integrity.

DISEASE OF BONES OF FOOT.

Mr. WHEELER submitted a foot which he had removed on Tuesday last, from a girl, æt. 14, admitted under his care on the 1st inst. He said: The history of the case is this, about a year ago she suffered from inflammation of the ankle-joint and the smaller joints of the foot consequent on a strain she had received. The acute inflammation was subdued, but it ran into a chronic state, and she never properly recovered; some pain was felt when pressure was made against the tibia, or the astragalus was pressed up. A sinus was situated over the superior surface of the astragalus. I removed the foot by Syme's method, with the exception that, on account of the disease I cut more of the tibia off than is recommended by Syme. The os calcis was considerably diseased, more between the os calcis and astragalus than between the os calcis and the tibia. The three cuneiforms and the scaphoid were also diseased. There is one remarkable point I wish to notice. Supposing we had not got an amount of disease in front, and that it was merely located posteriorly, there was no sinus to indicate disease of the os calcis, no reason to believe what is here present, for by pressure on the malleoli and on the tibia and fibula no pain was evidenced. Externally the appearance was healthy; but the medullary canal of the tibia was slightly diseased. It was exactly analogous to a case I brought forward here of a girl, named Davidson, in whom there was no reason to believe it would not be advisable to resect the knee-joint on account of external appearance. Although to manipulation and pressure the tibia was healthy, yet when I amputated the limb there was disease of the tibia four inches down. That could not possibly be diagnosed before the operation was performed. In this case, if resection of the ankle-joint had been thought of, there was no way of knowing that the tibia was diseased from an examination of it. In that respect alone, the case is interesting. We have also got the disease between the astragalus and os calcis, and yet not between the astragalus and tibia, the astragalus itself being sound.

Mr. HENRY GRAY CROLY exhibited

PORTIONS OF BONE REMOVED BY SECONDARY RESECTION OF THE ELBOW-JOINT.

The boy, he said, from whose elbow the portions of bone were removed on last Tuesday, had disease of the joint. I had resected the joint some months ago. At the time I observed, on laying open the joint, the disease was more in the synovial membrane than in the bones. At the same time I removed the condyles of the humerus, making the usual section of the ulna and radius. The wound healed, everything went on favourably, and the boy is in excellent health, even now; but he came back with sinuses. I determined on performing the operation again by cutting out the diseased bone. I was induced to do that from the fact that last Summer I performed a secondary resection of the elbow of a little boy, where the disease returned; and the limb is now an extremely useful one. The elbow is such a favourable joint for excision it is well, before thinking of removing the arm, to adopt the method which I have done in this case of taking away the diseased bone a second time.

*(To be continued.)*

MR. W. F. TEEVAN, B.A., F.R.C.S., has been appointed to give the Lettsomian Lectures by the Council of the Medical Society of London.

# Scotland.

(FROM OUR NORTHERN CORRESPONDENT.)

SCOTCH REGISTRAR'S RETURN FOR MARCH.—During March there were registered in the 8 principal towns in Scotland the births of 3,799 children, of whom 8·3 per cent. were illegitimate. In Greenock 2·8 per cent. of the births were illegitimate; in Perth, 5·5; Dundee, 9·0; and in Aberdeen 11·4 per cent. Five-hundred-and-eighty-four marriages were registered, being 75 under the March average of the last ten years. The deaths of 2,488 persons were registered. This is the lowest number registered during the month for the 5 last ten years. Of the deaths 41 per cent. were of children under five years of age. Whooping-cough continues to be the most fatal of the epidemics, having caused 143 deaths. Sixty-one deaths resulted from violent causes, of which six were suicides. One death was caused by delirium tremens, and six by the direct effects of intemperance. Three males and three females were aged 90 years and upwards, the eldest of whom was the widow of a master baker, and was aged 96 years. The month of March has been cold, wet, and windy. The lowest mean temperature was observed at Greenock, 37·2, and the highest at Glasgow, 39·2. The greatest rainfall was at Greenock, 64·5 inches, and the smallest at Leith, 2·20 inches. Wind equally divided between East and West.

GLASGOW PHILOSOPHICAL SOCIETY.—At the fortnightly meeting of this Society, held on the 16th inst., Dr. Fergus in the chair, Herbert Spencer was elected an honorary member. The Philosophical Society of Glasgow is far from free from the Sabbatical taint of the country, and it is not a little strange that Mr. Spencer was unanimously elected. We presume he was not asked, however, to swallow Jonah nor his whale! The Glasgow Philosophical Society in conferring its honorary membership on one of the clearest thinkers of the day has done itself an honour; it can affect Mr Spencer in no way. It is Haeckel's turn next. We shall be glad indeed to have the genial professor of Jena as a *confrère*.

THE LATE SURGEON-MAJOR DOUGALL.—Intelligence was lately received by his friends of the death, at Port Blair, in the Andaman Islands, of Surgeon-Major Joseph Dougall, M.D., F.R.C.P.Edin., a gentleman, who in the course of twenty years' medical service in the East, had won golden opinions alike by his professional skill and his personal worth. Having graduated in Edinburgh in 1858, Dr. Dougall was appointed to the Madras Medical Service on 10th February, 1859. He saw service in China under Sir Hope Grant in 1860, and received the Chinese medal and clasp for Taku. He subsequently served in various parts of India, and while acting as civil surgeon at Vizagapatam in 1865, operated successfully in several difficult cases of elephantiasis. In 1866, at the request of the Government, he undertook an investigation into the febrifuge properties of the cinchona alkaloids, cinchonia, quinidia, and cinchonidia; and after six months experience in the most malarial districts, gave in a report on 108 cases very carefully tabulated, with the results as to the comparative value of these alkaloids, which report gained the gold medal at Edinburgh University in 1872, on his graduating M.D. He was in medical charge of the Political Agency at the Court of Burmah in 1869, and in 1873 was senior medical officer in Andaman and Nicobar Islands, a post of great importance and heavy work. Here he made his important discovery of the

treatment of leprosy with Gurjunbil, for which he received the special thanks of the Government of India. He presented two skeletons of Andamanese, a diminutive and little known race, to Edinburgh University, and ten skeletons to the Royal College of Surgeons, London. Professor Flower has written a memoir on the osteology of this race, chiefly founded on these specimens, which is said to be nearly ready for presentation to the Anthropological Institution for publication.

Death of Dr. Charles Still, of Smoogrow.—Dr. Charles Still, of Smoogrow, Orkney, died at Ophir, on Friday, 11th inst. In 1852, Dr. Still stood as the conservative candidate for parliamentary honours for Orkney and Shetland, along with Mr. Dundas, and Lord President Inglis; but in 1863 he acted as chairman of Sir Peter Tait's committee in the contest with Mr. S. Laing, the present member. He leaves a widow but no family.

Extraordinary Case of Accidental Poisoning in Aberdeenshire.—An alarming and curious incident occurred the other day at the farm of Cairnbrogie, Tarnes, Aberdeenshire. Mr. George Marr, the tenant, Mrs. Marr, and Miss Eliza Marr, and two domestic servants, were seized with severe sickness and violent vomiting shortly after dinner on Saturday last. Mrs. Marr and one of the servants continued sick until next day, and though not in a dangerous condition, they are still confined to bed. The others soon recovered. Dr. Walker, Tillymann, was called in, and his inquiries led to the idea that her sudden illness was caused by poison. It seems that on Friday night Mrs. Marr had placed a mixture of vermin poison, suet, and oatmeal in the pantry, for the purpose of destroying rats, and that in the pantry there were some potatoes which were used at dinner next day, and amongst which it was supposed the rats had carried some poison.

Edinburgh University Court.—The University Court met on the 14th inst., present Principal Sir Alexander Grant, Bart., in the chair. Lord Curriehill, the Lord Provost, Mr. Clark, the Rev. Dr. Lindsay Alexander, and Professor Campbell Fraser. *Inter alia*, there was laid before the Court the order of Her Majesty in Council approving of the Court's report in favour of Professor Balfour's petition for permission to retire on a retiring allowance; and it was reported that according to the Court's instructions, Her Majesty's decision was published when received; that the usual official intimations had been made. Mr. John Symington, M.B., was recognised as a Teacher of Medicine in Edinburgh, whose course of instruction in Practical Anatomy should qualify for graduation in medicine in the University, in terms of Ordinance, No. 8, sec. 6. The following arrangements with regard to the April examinations were approved of, viz.:—Dr. Blair Cunninghame to act for Mr. J. F. Payne, as Examiner in Pathology, and Dr. Hugh Cleghorn to act as one of the Examiners in Botany, in place of Professor Balfour, whose resignation has been accepted.

Edinburgh College of Surgeons.—At a meeting of the College on Wednesday last Mr. William Bowman Macleod was recognised as "Lecturer in Dental Mechanics," in connection with the Edinburgh Dental School in Chambers Street.

Playing at Hanging.—A little boy named Penman, living at Kirkaldy, while "playing at hanging," on the evening of of the 15th, became entangled in the noose, and was found by his brother a short time afterwards quite dead. No wonder! When *will* newspapers cease, or will they ever, to poison the minds of youths with descriptions of every abomination which disgraces and befouls human nature? Government should really interfere.

A New Chair in Edinburgh University.—Dr. Clouston has been appointed Lecturer on Mental Diseases in the University of Edinburgh by the Senatus Academicus. This is a new lectureship, instituted in accordance with the recommendation of the Universities Commission, the subject having been taught previously by the Professor of the Practice of Physic, in conjunction with Dr. Clouston.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, APRIL 23, 1879.

## MEDICAL ASPECTS OF THE FAMINE IN INDIA.

When Mr. Bright a few days ago delivered before his well-tutored constituents a philippic in disparagement of our possessions in India, he was no doubt perfectly blind to the many blessings which our dominion in that country has cast upon the subject race. He was blind to the fact that, if India has not added much to our material prosperity it has at least given us the opportunity of increasing the general welfare and happiness of many millions of our species. Among the advantages which the natives of India have experienced from our rule, and which they are likely to feel more and more as time rolls on, is that extensive system of relief in periods of famine which has been recently adopted by the Indian Govern-

ment, as well as the efforts we are continually making to bring our knowledge of Preventive Medicine to bear upon the origin and propagation of the endemic diseases of India. The money, the labour, the literature, the research spent upon this one small department of our public polity in that country would astonish any one not accustomed to peruse the able and elaborate reports that periodically issue from the Government press. In the "Fourteenth Annual Report of the Sanitary Commissioner for Madras" there is an interesting account of the sanitary and medical aspects of famine, to which we propose to draw the attention of the reader.

The report of Surgeon-Major W. R. Cornish is all the more valuable from the fact that the medical and sanitary literature of famine is not so voluminous as might be wished, especially as regards the nature and prevalence of disease in times of great scarcity and want. Even with regard to the ordinary food of the native Indian very wrong notions are, and have long been, entertained. Every reader of Buckle's "History of Civilisation" knows what stress he laid upon the generally supposed fact that the people of India are a grain-eating people, and that rice is the principal staple of their food. In Northern India the *pulses* are somewhat largely eaten to compensate for the deficient nitrogenous matter in cereal grains; but the lower and labouring classes of Southern India prefer animal food when they can get it. Some writers, remarks Mr. Cornish, have said too much about the simplicity of the diet of the native Indian. The Brahmans, who do no work requiring physical exertion, have been usually taken as a type of the labouring classes, but their diet is by no means simple, and, as a matter of fact, there are no classes of the population who are strictly "vegetarians" in their food. "The very best workers we have in Southern India, the 'Wuddahs,' or tank-diggers, an aboriginal tribe, are omnivorous in their diet, and eat meat (chiefly pork) freely, a day seldom passing that they do not use animal food." During the early months of the famine many thousands subsisted on the flesh of bullocks and animals that died. In the famine camps, where the poor came in by thousands to be kept alive, "their great cry and longing was for a meal of animal food." It was further remarked that in the early period of famine the meat-eaters presented a superior physique to those whose diet was chiefly farinaceous. There appears, moreover, some misconception with repect to the quantity of food consumed in ordinary years by the labouring classes. Sir Richard Temple has stated that the labouring man in Southern India could not afford to eat more than a pound of grain a day. But this statement is, observes Mr. Cornish, without any foundation in fact. "The agricultural labourer may be badly off. He is certainly not a free agent, but in matter of material to fill his stomach, he is, in seasons of ordinary prosperity, just as well off as the agricultural labourer in Dorsetshire or Devon." Even the "Padial," or permanent farm labourer of the South is, according to another authority, better off with his comparatively scanty wage than the farm-labourer at home with his 9s. or 10s. a week. It is, however, admitted that low living is the rule among those who have no regular agricultural or other employment, and at the commencement of the famine the pinching in the daily supplies began with this class of people, as well as with the old and young who had no settled occupation.

We need scarcely remark that the late famine in India gave medical officers a good opportunity of studying the physical signs of chronic starvation. The chief symptoms noticed were anæmia, undue waste of tissue, and the consequences resulting from these conditions of the system. These were pallor of the external mucous membranes, feebleness of the circulation, and palpitation; extreme emaciation, with a characteristic flattening of the nates; great lethargy and indifference as to their fate; a scorbutic state of the system, with a deep purplish blue discolouration and thickening of the gums, in some cases, ulceration, bleeding, and loosening of the teeth, followed by dysentery or diarrhœa, or general anasarca. Also a peculiar dirty appearance of the skin; discolouration of the ends of the hair; in the young arrest of growth and development; a torpid condition of the reproductive system of both sexes, with diminished fertility in the female, and loss of sexual appetite in the male. Surgeon-major Cornish draws special attention to the anæmia, the flattening of the nates, the extreme lethargy and mental hebitude, the diseased condition of the gums, the "famine skin," the failure of reproductive power, and a peculiar condition of the tongue. The languor and apathy of the famine-striken people were very remarkable. The desire for life had gone out of them, and they lay perfectly still, apathetic, and indifferent, as if all earthly considerations had ceased to trouble them. Their utter helplessness and disinclination to avail themselves of the means of living, were attributed by some to laziness or obstinate determination to die, but the pathological investigations of Dr. A. Porter, render it probable that these symptoms may be ascribed to a diseased condition of the brain and nervous system, as the brain was found to waste in starvation like other tissues of the body, though in a much less degree.

It will excite no surprise that many marvellous examples of extreme wasting were noted—hundreds of instances in which the skin appeared to be tightly stretched over the bony frame-work of the body, and in which no muscle whatever could be traced. The condition of the skin, known as "famine skin," was well described many years ago in the *Medical Press* by Dr. Donovan in his account of the Irish famine. It is owing to the presence of a scaly and degenerated epithelium, adhering tightly to the living skin beneath. Hence the skin loses all its gloss and smoothness, looks dirty, and feels harsh and dry. Lastly, it may be mentioned that in all bad cases of chronic starvation the tongue was coated with a thick white fur, but in many cases this fur was seen to crack and peel off in strips, leaving a raw red glazed and painful surface underneath.

It was also evident that the ordinary causes of mortality in India, such as cholera, small-pox and fevers, are aggravated in times of great scarcity of food, either by the depraved condition of health, or by the circumstances of the food-dearth bringing the people under peculiar insanitary conditions. With regard to small-pox, it is, says Mr. Cornish, curious to note that in every great famine, small-pox has been a natural concomitant,

During the siege of Paris, small-pox became exceedingly virulent and fatal. The herding of the people in crowds, their bivouacking in infected places, and their enfeebled condition of body, all tended to aggravate the intensity of the disease. During the year 187-78, 321 deaths from small-pox were registered in the Presidency against an average number of 29,301 in the previous eleven years. With regard to fevers, it should be remarked that during the early period of famine, and, indeed, as long as the drought continues, there is an absence of the usual amount of this class of disease. But after the wet weather sets in, malarious fevers become very prevalent and fatal. Again, relapsing fever has been generally considered as specially connected with famine, but according to the experience of the Indian surgeons, this fever must be regarded as an accidental circumstance ; the herding together of the people in towns and food-centres favouring, as in the case of cholera, the epidemic spread of the disease.

There are, moreover, certain diseases directly attributable to want of food, of which, in the case of the Indian famine, an intractable diarrhœa of partially digested food and watery mucus, complicated in some instances with dysentery and symptoms of ulceration of the lower bowel, was the most common. During the worst period of the famine, and before rain fell in quantity sufficient to cause malarious exhalations from the soil, three-fourths of the mortality of the famine-stricken might be ascribed to diarrhœa or dysentery. At a later period febrile diseases and lung complications were among the causes of death. According to the observations of Dr. D. D. Cunningham, whose detailed report on the minute pathology of famine diseases has not yet appeared, the local origin of this fatal bowel affection is a degenerative wasting of the complex structure of the intestinal mucous membrane, due apparently to a process of fatty degeneration of the tissues, and leading to destruction of the apparatus provided for the absorption of nutritive material. Next to diarrhœa and dysentery, the most common condition of the famine-stricken in hospital was that of dropsy. From the infant in arms to the old man tottering to the grave, anasarca was common. Intestinal parasites—especially the round worm—unhealthy ulceration of the legs, and scabies, were also very prevalent during the famine ; but ulceration of the cornea, which is usually regarded as a common result of insufficient nourishment, was not often met with.

We cannot now say much about the good results that are likely to follow the careful study which Surgeon-Major Cornish and others have made of the last great famine in India, but we may conclude this brief and imperfect sketch of the subject by quoting an important statement of this surgeon, the due appreciation of which might be turned to good account should ever our Indian authorities have again to deal with these terrible famines :—"Any scheme of general assistance to the poor, to be of use, must be set afoot before these symptoms of impoverished blood and tissue waste have become general. . . . . In this matter the great error of the past has been in confounding the effects of *acute* with those of *chronic* starvation. In acute starvation there is no time for the fatal degenerative changes of the assimilating structures, and nutriment judiciously given even in the last stages of exhaustion will be absorbed and restore the waning vitality. In chronic starvation the victims die, because the structural changes dependent on long continued wasting of tissues, prevent the conversion of food into force and energy."

## THE WORKING OF THE ADULTERATION ACT.

In the last issue of the *Analyst*, Mr. Wigner, F.C.S., publishes a statistical account of the working of the Sale of Food and Drugs Act, and its effect upon adulteration during the past year. The percentage of adulterated articles detected in the whole number of samples analysed in Great Britain and Ireland was, for successive years, as follows :—

| | |
|---|---|
| 1872 . . . . | 65·0 |
| 1875-6 . . . . | 26·0 |
| 1877 . . . . | 18·1 |
| 1878 . . . . | 16·58 |

It is satisfactory to find that there is a steady and marked decrease in the proportion of falsified articles. As to the relative number of adulterated specimens of various articles examined, it appears that in the returns for 1877 the worst place was occupied by wines and spirits, but this year drugs appear as the worst on the list. It appears too probable that this is not by any means the fault of the chemists and druggists, but it arises from some inspectors having purchased samples of so-called drugs from grocers' shops, or at other places where drugs had no business to be sold.

Next on the list this year comes wines and spirits, but with a very great reduction from the figures of last year. Milk also shows a reduction of more than 7 per cent., and for the first time since returns of this kind have been collected it falls below 20 per cent., or one-fifth of the samples purchased. Butter appears to be fractionally worse, but it seems not at all improbable that this slight increase may be due to the more universal adoption of efficient methods of carrying out the analysis. Bread and flour and groceries show a decrease, but it is even now a very serious thing that on a standard article of food like bread 3 per cent. of the samples examined should be found adulterated.

We will next look at the percentage of adulterated samples in different districts. Southampton heads the list with 53·4 per cent. of the samples purchased. Yorkshire (East Riding) and Hull and Liverpool follow closely after, each of them having more than 40 per cent. Preston and North Derbyshire are between 40 and 30. Lancashire, Warwickshire, Londonderry and Yorkshire (West Riding) have more than 25 per cent. Antrim, Belfast, Donegal, and Tyrone more than 20 per cent. Cork and Sheffield more than 16 per cent.; Dublin, on ly 2·6 per cent.

The good which has resulted fro m the operation of the law, however feebly it may be carried out—is sufficient to make us regret that there are so many localities in which it is wholly ignored, and adulteration is permitted to proceed unchecked. In no less than 10 counties and 27 towns, containing 2,000,000 inhabitants, the law against adulteration is systematically neglected But one of these counties (Cavan) is Irish.

In 23 more towns, with a population of about 850,000, only 271 samples, or an average of less than 13 per town, have been examined, although these include such populous places as Edinburgh and one of the London districts.

There are also 13 counties, with a united population of about one and three-quarter millions, in which only 205 samples have been analysed, or an average of about 16 per county.

In Scotland hardly anything has been done, owing to the decision given there on the "prejudice" question. Only 96 samples were examined as against 350 in 1877.

The magistrates at Cardiff have given the unique decision that the exact price of the article purchased must be tendered by the inspector, and no change be required, and as another amusing illustration of magistrates' wisdom, we may mention that in Cornwall, a case was dismissed because the certificate stated that the "sample of milk" was marked, and the Bench decided that it was impossible to mark a sample of milk, but only the bottle containing it!

In the discussion upon Mr. Wigner's paper, which ensued, Dr. Bartlett said they might consider that for some time past the Act had been a dead letter where it had previously been an advantage, and adulteration was now more or less in the ascendant in consequence. He thought the returns showed the advantage that a better constituted Act would create, and also the necessity for making the Act compulsory.

On the whole, the statistics given by Mr. Wigner are satisfactory and encouraging, but they go to show that the Adulteration Act is, after all, only an emasculate measure and that its efficiency has been sacrificed to fear of the shopkeeping interest on the part of the Government of the day.

# Notes on Current Topics.

## The Carmichael Prize Essays.

THE adjudication upon the essays sent in for the Carmichael Prize is proceeding, and the award will probably be made on the 5th of May.

It will be recollected that prizes of £200 and £100 (or larger sums if there are funds in hand), were established by the bequest of Dr. Richard Carmichael, who died in 1847, the subject being the Reform of Medical Education. These prizes were to be awarded by the Council of the Royal College of Surgeons in Ireland each third year. Already awards have been made to Dr. Mapother, now Vice-President of the College, and twice to Dr. Isaac Ashe, now Resident Medical Superintendent of the Dundrum Central Criminal Asylum. Hitherto, the competition has been small, not more than four essays having been ever submitted for any one competition, but the adjudicators have now before them no less than thirteen essays, some of them, we understand, of great merit. The Council of the College had been placed in a serious difficulty as to the appointment of judges, for it has been decided by the Master of the Rolls that those gentlemen could not be remunerated from the Carmichael Fund, and the Council did not consider themselves authorised to vote the College money for such purpose. The Council was relieved of this difficulty by the commendable *esprit de corps* of three of its own members, viz., Dr. Mapother, the vice-president, Dr. McClintock, and Mr. Stokes, than whom three more competent critics or more reliable judges could not have been selected. These gentlemen have undertaken, without any payment whatever, the most arduous and responsible task of reading the thirteen essays, and deciding upon their respective merits, and there can be no doubt that their verdict will be accepted with complete confidence by the essayists and by the profession.

## The Visit of the British Medical Association to Ireland.

ONCE again this year the British Medical Association visits Ireland. We have every reason to believe that the Southern Metropolis will maintain its character for hospitality in the cordial reception there being prepared for our English and Scotch colleagues. It is the first assemblage on so large a scale of any scientific body which has occurred south of Dublin for more than a quarter of a century, and, with the exception of the Belfast meeting of the British Association, in the provinces of Ireland.

Of the social success of this coming meeting, from our knowledge of Cork and Cork people, we have little fear. We would, however, make a few suggestions on the details of the work to be done in the sections. First, we may observe that a better and more careful codification of the papers sent in should be aimed at; a more systematic grouping of allied topics for discussion and original contributions; a more judicious sifting of the chaff from the wheat, so as that some really valuable seed may be sown, and that some permanent fruit be reaped from these, our great national professional congresses. Above all we would press for the formation of a sub-section in the special branches of ophthalmology, otology, and laryngoscopy. The crowding of miscellaneous groups of papers together, dispirits men who in these special branches take pains to send in an original communication. It is often listened to in a sectional meeting of those who take little or no interest in ophthalmic and otological work. Often the communication is heard without a practical comment or suggestion, it is passed aside, or taken as read. Therefore, we trust that the plan adopted in America and on the Continent, of having special discussions on subjects previously notified for debate, will be as far as possible followed out at the Cork meeting. Distinguished men in the legitimate specialties, both at home and abroad, would then be more likely to be induced to take part in such discussions. This plan would add a special feature of attraction to the meeting. It would also tend to leave a permanent record, to be afterwards referred to, on some disputed points of theory or practice. The annual meeting would then be characterised by the addition of new material, and have a scientific historical value, not to be acquired by routine addresses and threadbare disputations about subjects on which little that is new can be advanced. We are pleased to learn that it is the intention of the Local Committee to work actively

the Public Health Section. The example set by Manchester in having a Sanitary Museum as a distinct feature of the meeting, and to which the public were admitted, will be followed.

## The Plague.

According to the *Echo*, news is daily reaching St. Petersburg of outbreaks of the disease in remote parts of the Empire, and it is suspected that it exists in others, though the authorities do not care to communicate the unwelcome tidings, or, with characteristic apathy, have lost any interest in what, a few months ago, they were in fever-heat excitement over. Indeed, in many districts, the only representative of medical science is an old soldier, who had been attached to the Red Cross Society, or who had served as a hospital steward. The winter has not yet broken up, and under the snow lie heaps of filth which, it is feared, aided by the extreme dirt of the peasants' dwellings, and the entire disregard of sanitary application in the town, will cause a fresh outbreak as soon as the hot weather comes. Even in the capital the death-rate is prodigiously high—45 to 50 per 1,000. According to official statistics, the deaths in St. Petersburg exceeded the births up to 1873, so that the population must have increased solely by arrivals from without. So unhealthy are some of the gaols that Count Melikoff threatened the governor of one of them with death should the state of the place not be quickly improved; and in the Kharkoff House of Correction the *Golos* affirms that 200 out of 500 persons died of scurvy during four months of last year.

## Irish Coroners' Grievances.

Last week a deputation, representing the County Coroners' Association of Ireland, waited on the Attorney-General for Ireland for the purpose of laying before him the grievances of which the body have to complain as judges between the Crown and the people, and to impress on him the necessity of having some clauses inserted in the English Coroners Bill before Parliament so as to make it applicable to Ireland. The deputation was received at three o'clock, and was introduced by Mr. Swanzy, the chairman, who is coroner for the co. Monaghan. Mr. Fitzgerald, hon. secretary, read a memorial adopted at a meeting of the coroners of Ireland.

The memorialists set forth that the salary of each coroner should in no case be less than £100 a year, and that, as in many large counties and populous districts the duties of the coroner far exceed those performed in other and smaller districts, the salary should be increased in such proportions as to his Grace the Lord Lieutenant should seem fit. The mileage allowance payable to each coroner attending an inquest should be similar to that allowed to English coroners—that is, ninepence per statute mile going to and returning from inquests. After the age of sixty years the coroner should be entitled to receive a superannuation allowance equal to two-thirds of his salary, provided he shall have served as coroner for a period of twenty years, and to a sum equal to his full salary after he has arrived at the age of seventy years, having served twenty-five years, or at an earlier age if he be incapacitated from accident, disease, or natural infirmity. The memorialists further sought powers to enable them to appoint a deputy, as practised in England, the coroner paying the deputy. As to the matter of taking bail, that the same powers should be exercised by the coroners as allowed to justices of the peace in cases of homicide. Further, that schedule C, 9th and 10th Victoria, chapter 37, be revised, as the sum for incidental expenses is therein too small.

Mr. Swanzy represented that the claims of the coroners had been supported by nearly every member of Parliament in Ireland, their grievances and claims on the Crown being of long standing. There were eighty-six coroners in Ireland, all of whom felt the hardships which had been imposed on them by the law, and while their duties were very extensive, and in every instance critical and onerous, their salaries were not in any way commensurate with these duties. The necessity of giving the coroners powers similar to those performed by magistrates in admitting prisoners arrested on charges of homicide to bail was fully brought before the Attorney-General.

Mr. Gibson is stated to have consented to use his endeavours on behalf of the memorialists.

## A New Trick of the Anti-Vaccinators.

We hear that the local branch of the anti-vaccinators at Banbury have hit upon a novel plan of opposing the Vaccination Acts. They have opened an office a few doors from the vaccination station, where they will supply gratis borax and hot water, for the purpose of washing out the vaccine matter immediately after the operation has been performed. This is certainly a very determined attempt to frustrate the provisions of the Acts, but perhaps the tactics of these zealots will not be so successful as they expect. The absorption of the lymph into the system takes place much quicker than they imagine, and some time must necessarily elapse between the performance of the operation and having recourse to the expurgatory process of the anti-vaccinators. It is, however, evident that the opposition to vaccination is gaining ground among a certain class of people. Perhaps it would be as well if, after all, they were allowed to have their own way, with the proviso that, in the event of their unvaccinated children dying from small-pox they should be considered to be guilty of "manslaughter."

## Death from Glanders.

The death from glanders recently reported in the papers shows the necessity of keeping a close vigilance over the sanitary condition of the London mews and stables. The jury did well in expressing their opinion that the provisions of the Contagious Diseases (Animals) Act of 1878, with respect to the outbreak of glanders, and to the disposal of the carcases of horses suffering from that disease, have not been carried out. The jury also very properly recommend that the facts given on evidence should be brought before the Privy Council, and that steps should be taken to avoid, if possible, the recurrence of such accidents in future. It appears that after the deceased, a servant, aged eighteen, had been living a week over the stables she complained that there were very bad smells; but she contracted the disease from a child which she had been nursing, and upon which the affected horse had blown some of the secretion from his nostrils. It further appeared that

the provisions of the Slaughter House Act of 1874 have been violated by the carrying on of a trade by an unlicensed knacker.

## Transfusion.

Another case, perfectly successful, of transfusion has occurred in Dublin under the care of Dr. Kidd, and with the aid of Dr. Robert MacDonell. The patient was a woman of about thirty-five years of age—the mother of three children—an out-patient of the Coombe Lying-in Hospital. There was hour-glass contraction of the uterus, retained placenta, and excessive hæmorrhage, which had reduced the patient to a condition of complete prostration and unconsciousness, and rendered her almost pulseless.

The transfusion was effected with defibrinated blood, according to Dr. MacDonell's method. the placenta having been previously removed, and the bleeding checked, and the operation was followed by a very satisfactory and permanent reaction, which has ended in the convalescence of the patient.

## A Quack in Trouble.

The notorious quack, "Dr. John Sutton, M.D.," was last week interviewed by the police, and subsequently by a magistrate, and is at present the subject of further enquiries. His considerate attentions to erring youth do not seem to have prospered of late, notwithstanding the unauthorised use of Sir William Gull's name. He has, therefore, started in a line of business of a more lucrative nature, if it could be carried on for a lengthened period. At present, however, the authorities do not seem inclined to grant the necessary time, Dr. (?) Sutton having obtained a bicycle and other articles, for which he forgot to pay, and furthermore raised money on the same, the owners are not unnaturally anxious to obtain a legal definition of their position, and the police are not unwilling to aid them in the matter.

## Evasion of the Adulteration Act.

The ingenuity of publicans has placed another impediment in the way of the proper working of the Adulteration of Food and Drugs Act. At the recent quarter sessions held at Knutsford, the Chief Constable of Cheshire called attention to the difficulty which the police have in carrying out the Act. The publicans of the district have adopted the practice of posting notices, in not always very conspicuous positions, in their establishments, stating that their liquors are all mixed with water. When the police make purchases with a view to analysis, the publicans produce these notices; and although the liquors are found to be largely adulterated, the magistrates have, in many cases, felt powerless to convict.

## Closing of Small-pox Hospitals in London.

At the fortnighly meeting of the Metropolitan Asylums Board on Saturday, under the presidency of Dr. Brewer, a report was presented from the General Hospitals Committee, which stated that they had carefully considered the subject of the propriety of closing some of the small-pox hospitals under the charge of the managers. They had observed that during the last ten weeks there had been a considerable progressive diminution in the number of admissions, more especially at the Hampstead hospital, where 19 patients only had been admitted during the last four weeks, and where there were now but 31 patients remaining under treatment. The committee had therefore concluded to recommend that no more patients be received, and that as soon as the present inmates were convalescent the Hampstead hospital, with the sanction of the Local Government Board, be closed, the subject of the reduction of the hospital staff being left in the hands of the Hampstead Hospital Committee. During the last four weeks the patients received into the Fulham hospital had been 87, and there were now remaining 97. At the Deptford hospital during the same period there had been 80 admissions, and there were 148 under treatment. It was obvious, therefore, that these two establishments could not be closed; but the committee recommended, as an initiatory step towards their closing, that inasmuch as the Homerton and Stockwell hospitals, which had undergone thorough cleansing, repairs, and additions, were now ready again for the reception of patients, no more patients be sent to either Deptford or Fulham hospitals, but that all new cases be at once sent to the Stockwell and Homerton hospitals, and that the Local Government Board be requested to give their sanction to that step being taken. The report was adopted after some discussion.

## Domestic Poisoning.

Under the title of "Our Domestic Poisons; or, the Poisonous Effects of Certain Dyes and Colours Used in Domestic Fabrics," Mr. Henry Carr, M. Inst. C.E., has published a pamphlet, in which he adduces a good deal of evidence to show that chronic poisoning by the presence of arsenic in wall-papers and other domestic fabrics, is more prevalent than is generally supposed. There is a popular impression that green papers are the only papers which contain this metal. But, as Dr. Lauder Brunton and others have pointed out, colour is no guarantee of freedom from arsenic, light and dull greens, and certain blue, drab, and even white colours being in some cases loaded with this poison. Many of the aniline dyes may contain arsenic in quantities that are very injurious to the health, although the symptoms come on so insidiously, and are sometimes so anomalous, that their real cause may escape detection. Inflammation or irritation, and smarting of the eyes and nostrils, a feeling of debility and general *malaise*, headache, catarrh, dry cough, griping in the bowels and tendency to diarrhœa, are among the chief symptoms that have been observed in those who have suffered from this form of arsenical poisoning. It may be that the evil complained of is not so great as it has been represented. Nevertheless, after making due allowance for a little exaggeration, the propriety of putting a stop to this wholesale impregnation of wall-papers and other materials with arsenic, cannot be questioned. We are, therefore, glad to hear that the Medical Society of London has appointed a committee to consider the evidence that has been brought forward on the subject, and to report as to what measures should be taken to secure the interference of the Legislature.

## Royal Society Elections.

Among the fifteen candidates whose names have been submitted to the Royal Society by the committee of selection, are Professor Francois de Chaumont, of the Army Medical School, Netley, well known as a zealous promoter of hygienic reform, and Mr. G. J. Romanes, who has devoted himself largely to the study of the comparative physiology of the nervous functions. The veteran biologist Theodor Schwann, whose name is intimately familiar to the histologist, has obtained the distinction of the Foreign Membership of the Society—a similar honour being likewise conferred on M. J. L. A. de Quatrefages, of Paris, the biologist and naturalist.

## Recent Researches on Digestion.

Herr Heidenham's researches on the digestive functions are familar to every physiologist; particularly well known are his observations on the active changes of the pancreatic cells, and the suggestions which they afford in explanation of the functional changes of the cells contained in the gastric follicles. Further experiments of Heidenham's have been recently described in Pfluger's *Archiv*. In these, portions of the stomach were isolated in living dogs, and then stimulated. It was found that the secretion of gastric juice immediately following on the application of the stimulus was purely local; but that subject to absorption taking place at any point of the surface beyond, the secretion of the digestive fluid also takes place there under influence of a stimulus spreading from the original limit of irritation, and inducing a secondary secretion. The primary secretion following on the primary stimulation is small in amount; the secondary secretion is copious, and is directly dependent on absorption consequent on digestion taking place *in* the stomach.

## New British Hospital in Paris.

Through the generosity of Sir Richard Wallace, a great boon has been conferred upon the British sick poor of Paris. The Hertford British Hospital has been built entirely at the expense of its liberal founder, who, during the siege of that city, found the want of such an institution so urgent that he at once opened temporary wards for the reception of poor British subjects. The hospital is a fine building, and the patients will be under the care of experienced physicians, a lady superintendent, and nurses of their own country. There is also a department for out-patients, besides a very complete hydropathic establishment.

## Great Changes of Temperature.

Last Thursday morning the register at the Royal Humane Society's Receiving House, London, was 38 deg. At noon it was 41 deg., but the sun broke out at 12.30, and the thermometer suddenly rose to 60 deg., the highest point it has reached this year. Within twenty minutes a storm of sleet and hail fell, and the thermometer fell to 40 deg.; but within half an hour the sun again shone out, and the thermometer rose rapidly to close upon 60 deg. Such rapid changes as these are very trying to the constitution, even of those who are in a fair state of health. It is at this time of the year, and in seasons like the present, that the female portion of the community is particularly apt to suffer the many and often heavy penalties incurred by "catching cold." Owing to their very natural and even laudable love of finery, our fair patients are frequently induced to throw off their winter wraps too soon. This would not so much matter were they always to wear plenty of flannel and other warm underclothing; but the dictates of modern fashion forbid them in too many cases doing even this, and consequently, they run the risk of contracting those diseases which, like rheumatism and consumption, cripple or kill so many of our countrymen and women.

## Alleged Neglect.

With regard to a charge of neglect which was recently brought against Dr. Raitt, of Woolwich, we abstained from making any comments, well knowing that very one-sided reports are apt to creep into the columns of the daily press. It is, therefore, with great pleasure we hear that both the local authorities and the local press have entirely exonerated him from all blame in the matter. Dr. Raitt was for a few days placed in a false position, and through no fault of his own, incurred that unenviable publicity which a charge of this kind, even if unjust, must necessarily bring upon a medical practitioner. It appears that Dr. Raitt was not only very kind to his patient, but supplied him with medical comforts from his own house; and it is evident that he deserves all the sympathy which has been shown him by those who are best able to judge of his conduct.

## Health and Climate of Sidmouth.

Dr. Thos. H. S. Pullin, Member of the Société Française d'Hygiéne, has just issued a very favourable report of the sanitary condition of the Sidmouth district. The mortality for the year 1878 was at the rate of 18 per 1,000, which compares well with the death-rate (21·7) for all England. He also draws attention to the equable character of the Sidmouth climate. The mean daily range was only 10·7, the mean of eight years being 11°. This fact, which is partly owing to the extensive seaboard of this district, cannot be too well known to invalids and others seeking a cool summer health resort.

## The Assistant Mastership of the Coombe Lying-In Hospital, Dublin.

This office has become vacant by the resignation of Dr. Hearn, the period of that gentleman's term of office having expired. The Master, Dr. Kidd, will give all particulars as to the appointment.

The death-rate from the seven principal zymotic diseases averaged 2·7 per 1,000 in the large towns last week. Measles showed fatal prevalence in Norwich, Wolverhampton, and Newcastle-upon-Tyne; and whooping-cough in Manchester and Leeds. Scarlet fever was proportionally most fatal in Nottingham, Oldham, and Newcastle-upon-Tyne; and enteric fever in Portsmouth and Bradford. Small-pox caused 12 more deaths in London, 4 in Dublin, but not one in any of the other large towns.

The Committee of the Royal Medical Benevolent Fund Society of Ireland are anxious, if possible, to complete some additional sets of this Society's Annual Reports for preservation; for this purpose the following early numbers are wanted, and the Committee solicit the co-operation of the profession to obtain any of these Reports. The Reports wanted are those for 1843, 1844, 1845, 1846, 1847, 1848, 1849, 1850, 1853, 1858, 1860, 1861, 1873, and we shall be glad, if any of our readers can send us any of these reports, to see them safely transmitted to the Secretary of the Society. They thankfully acknowledge kind and valuable help in this matter from J. F. Duncan, M.B., Dublin; W. Arnold, M.D., Belfast; H. H. Boxwell, M.D., Wexford; M. C. Bernard, M.D., Dundrum, Dublin; W. Carroll, M.D., and J. Cavit, M.D., Waterford; W. H. Lawlor, M.D., Tralee; J. Grey, Esq., Roscrea. Address in reply to A. H. Marks, M.D., Acting Secretary, 26 Hatch Street, Dublin.

---

In the principal foreign cities the rates of mortality according to the most recent weekly returns, were—Calcutta 30, Bombay 35; Paris 31; Geneva 28; Brussels 39; Amsterdam 27; Rotterdam 27; The Hague 28; Copenhagen 28; Stockholm 20; St. Petersburgh 53; Berlin 27, Hamburg 26, Dresden 28, Breslau 32, Munich 34; Vienna 32, Buda-Pesth 45; Rome 27, Naples 33, Turin 25; Venice 27; Alexandria 34; and New York 26. Small-pox caused 27 deaths in Paris and 32 in St. Petersburgh. In Paris 29 deaths from typhoid fever were also recorded.

---

The body which was found on Hampstead Heath on Good Friday morning, with a pistol-shot wound through the right temple, and a six-chambered revolver close at hand, has been identified as that of Dr. Frederick Lyndon Attwood, aged about 35. The deceased left Cambridge for London a day or two before the boat-race, and was last seen alive on Thursday. Deceased had for some time past suffered extreme nervous depression. There was a considerable sum of money found on his person.

---

Last week the mortality was lower throughout the United Kingdom than it has been during the last six months. The rates of mortality per 1,000 in the principal towns were—Portsmouth 15, Edinburgh 20, Leicester 21, Brighton 21, Newcastle-upon-Tyne 21, Salford 21, Sheffield 22, Sunderland 22, Glasgow 23, Hull 23, Bristol 23, Leeds 23, Liverpool 24, Birmingham 24, Nottingham 24, London 26, Bradford 27, Oldham 27, Manchester 27, Dublin 28, Wolverhampton 29, and the highest rate during the week, 32 both in Norwich and Plymouth.

---

Rumour has it, that it is the intention of Her Majesty to mark the anniversary of her birthday this year by the bestowal of a large number of ribbons of the order of knighthood; the names of one or two members of the medical profession are currently mentioned in connection with the announcement.

# Medico-Parliamentary.

## HOUSE OF COMMONS—Friday, April 18th.

### THE PUBLIC HEALTH ACTS.

Mr. A. Brown called attention to the incidence of rating, for certain sanitary purposes, under the Public Health Acts of 1875 and 1878; and moved that a Select Committee be appointed to inquire into the incidence of rating for water supply and sewerage, and report what amendments, if any, it is advisable to make. He pointed out that under the existing unsatisfactory law, sanitary improvements were retarded on account of the arbitrary restrictions of areas. Two years ago he had addressed inquiries to the various medical officers in the rural districts, and those who answered his inquiries had jurisdiction over two millions of the population and an area of more than six millions of acres. From their answers it appeared that special drainage districts had not been extensively created over the country. If a special drainage district was wanted it could not be got for one purpose, unless it was taken for all other purposes. There was, therefore, no wonder that these special drainage districts, hedged round with many difficulties as they were, had not, after they were formed, become popular in the rural parts of the country. It was said that a parish must be treated as a whole, but he wished to point out that many villages did not depend on the labour of the agricultural population round them, but they had, in many cases, industries of their own. But opposition to sanitary improvements would be disarmed if some scheme could be devised by which those who benefited by the improvements were to pay them.

Sir B. Leighton seconded the motion.

Mr. Sclater-Booth (Local Government Board) thought that the House would do well to pause before embarking on so extensive a subject as this, especially considering the scanty attendance of hon. members. The Public Health Act of 1875 was by no means a final measure, and was not brought in as such. He admitted that it was capable of amendment as time went on, and that the question of incidence of charge for sewerage and other sanitary matters might be now, or at some future time, inquired into. The Sanitary Acts had not long been in operation, large and increasing sums were spent in carrying them into effect, and there was, in his opinion, no sufficient reason for calling upon Parliament to stimulate a further enormous expenditure, especially if it were incurred for improvements in certain localities at the expense of other districts.

The motion was negatived.

---

## PARLIAMENTARY BUSINESS ON THE NOTICE PAPER.

### Wednesday, April 23rd.

Dr. Lush's Medical Bill.—Adjourned Debate on Second reading. Mr. Mills's Medical Bill.—Second reading. Mr. Errington's Medical Bill.—Second reading. On these Bills.—Mr. Surgeon Simon—to move their rejection. Mr. Errington and Dr. O'Leary to move their reference to a Select Committee.

### Tuesday, April 29th.

Dispensaries (Ireland) Bill.—Second reading. Mr. Bruen.

### Friday, May 9th.

*On going into Committee of Supply.*

Dr. Cameron,—To call attention to animal vaccination; and to move, That, as cowpock lymph direct from the calf, commonly known as animal vaccine, is of at least equal value as a prophylactic against small-pox with the ordinary humanised lymph, and as the use of animal vaccine affords an absolute guarantee against the propa-

gation of those human diseases occasionally invaccinated with humanised lymph, this House is of opinion that, to meet objections to vaccination founded on the possible communication of other diseases through that operation, a supply of animal vaccine should be provided by the National Vaccination Establishment for the use of those who prefer it to the ordinary lymph.

Mr. P. A. Taylor,—As an amendment to Dr. Cameron's motion on Animal Vaccination, to move, that in the present unsettled condition of medical opinion in regard to the safety of using ordinary humanised lymph, as also of the safety, effectiveness, and practicability of the use of animal vaccine, it is, in the opinion of this house, inexpedient and unjust to enforce vaccination, under penalties, upon those who regard it as undesirable or dangerous.

TUESDAY, MAY 13TH.

Mr. Meldon,—To call attention to the administration of the Army (Medical Department), especially to the supersession of Surgeon-Major Clarke; and to move a resolution.

WEDNESDAY, MAY 14TH.

County Infirmaries (Ireland) Bill.—2nd reading.

## THE MEDICAL BILLS.

THE Bill of the Duke of Richmond has come down from the Lords and stood for its second reading in the Commons last night. Its amendment in the upper House has made it a very acceptable measure—not so comprehensive as it might be, but nevertheless an excellent proposal for the reform of medical education and qualification. It is admittedly defective in that it does not contain any provisions for the reconstruction of the Medical Council, without which no Bill can be even moderately satisfactory; but we have the promise of Government to deal with that question by Select Committee, and—if the Committee so advises—to insert clauses with that object in the Bill before it becomes law. With this pledge as our guarantee that this most vital point will receive due attention, we urge upon the profession at large to redouble their efforts in support of the Bill, and not only to aid the Government in passing it, but to agitate with persistence and energy lest its progress may be delayed, and its final accomplishment endangered.

We are entering into a legislative contest between the Government, supported by the profession at large, and striving to reform medico-educational abuses on the one side, and a vigorous coalition of teachers and diploma giving bodies on the other side, desiring to perpetuate the abuses which have proved so lucrative to them. It is the professional organisations—the British and the Irish Medical Associations—who must turn the scale in favour of the Bill, and we urge these bodies to put forth their whole strength to beat down the opposition of the Scotch bodies, whose desire is to prevent all reform.

The attitude of the Medical Reform Committee of the British Medical Association is, we apprehend, one of practical inactivity. The Committee sticks to Mr. Mills's Bill, and in order to concentrate their influence in favour of that measure, gives no active support to the Government Bill. Now, if we assume that reconstruction of the Medical Council will be eventually included in the Government Bill, there is really no material difference between the two measures, save that the Duke of Richmond's Bill has an immeasurably greater chance of success.

It seems to us a doubtful policy to refrain from supporting the more promising measure, because it is not the law projected by the Association; and we greatly fear that between the rival stools Medical Reform may come to the ground. The Government is fighting the battle of the profession, and it will have good cause to complain if the profession does not give a hearty support.

We learn with satisfaction that the Royal College of Surgeons in Ireland has pronounced an official and unqualified approval of the Government Bill.

We congratulate this College on having been the first of the Licensing Corporations to separate itself distinctly from the party of obstruction, and to express definitely its readiness to meet the public feeling, and co-operate in schemes for improvement. The adoption of such an attitude entitles the College to every consideration in the ultimate settlement of these matters, and it raises it, at once, out of the ranks of those bodies which hanker after a little longer enjoyment of the old qualifying system which has met with such universal condemnation.

## NOTICES TO CORRESPONDENTS.

☞ CORRESPONDENTS requiring a reply in this column are particularly requested to make use of a *distinctive signature or initials*, and avoid the practice of signing themselves "Reader," "Subscriber," "Old Subscriber," &c. Much confusion will be spared by attention to this rule.

NOTICE TO SUBSCRIBERS.—Subscribers who have not already paid their subscriptions—£1 2s 6d.—for last year, are reminded that they are now due, and should be sent to the publishers, who will be happy to acknowledge their receipt.

TANDEM.—The appointment lies with the Board of Governors, and the Government have nothing to say to it.

L.R.C.S.I.—The investments are, we believe, so far *bonâ fide*, that large prizes may be won, but the chances are so distant that the capital invested is really almost thrown away.

CLINICAL SOCIETY OF LONDON.—On Friday, April 25, at 8½ p.m., Dr. Sémon, "On the Question of Tracheotomy in Bilateral Paralysis of the Posterior Crico-arytenoid Muscles" Patient to be exhibited).—Dr. Tilbury Fox, "On a Case of Lichen Scrophulosorum."—Mr. Morrant Baker: "Removal by Operation of a large Rodent Ulcer of the Scalp." Mr. Bryant: "A Case in which a Biliary Calculus was removed by operation from the Gall-bladder, and a Cure resulted."

MR. BERRIDGE.—Wilson's "Naval Hygiene" in English, and Fonssagrive's "Hygiene Navale," are the two best, in fact, almost the only works on the subject.

DR. GORDON.—1. With pleasure. 2. Would like further information before giving an opinion.

DR. HAMILTON.—Probably in our next.

DR. G. DE G. GRIFFITH.—Your letter will appear in our next.

### SUGAR-COATED PILLS.

*To the Editor of the* MEDICAL PRESS AND CIRCULAR.

SIR,—Referring to your very impartial "critique" on the Sugar-Coated Pills of Messrs. W. R. Warner & Co. in your last issue, will you allow us to explain that the inconvenience which, as you justly point out, would arise from the indiscriminate use of phosphorus as a restorative, *without medical advice*, has been foreseen by Messrs. Warner & Co. In proof of this we hand you a bottle of their Phosphorus Pills, which is thus labelled:—

"Phosphorus should be administered with care, *and only by direction of a physician*," &c.

It may remove misconception if we further state that in one case a sufferer asked us to supply him with Warner's Phosphorus Pills (explaining his symptoms), and we declined to do so, referring him at the same time to his medical attendant—"the remedies being only for the use of physicians."

We are, Sir, yours faithfully,
F. NEWBERY & SONS,
Wholesale Agents for Messrs. Warner & Co. for the United Kingdom.

37 Newgate Street, London, E.C.

[*** We are pleased to find that the phosphorus preparations are thus labelled; and commend the practice of Messrs. Newbery to other druggists, of refusing to supply medicines to the public upon a statement of their ailments, unless with the advice of a medical man.—ED.]

### SHEPHERD MEMORIAL FUND.

THE numerous friends of the late Surgeon-Major Peter Shepherd, who was killed in the performance of his duty at Isandula, Zululand, on the 22nd January, 1879, consider it desirable by public testimony to record their estimation of his worth, and it has been decided to perpetuate his memory by a suitable monument. Marischal College, Aberdeen, where he studied and received his medical education, is thought the most appropriate place for the erection of a fitting memorial of this kind.

The following have formed themselves into an Executive Committee for the furtherance of this purpose:—

Major F. Duncan, President; Dr. Robert Farquharson (late Coldstream Guards); J. Keith Angus, Esq.; Capt. L. Carmichael, Deputy-A.-Q.-M.-G.; Deputy-Surgeon-General W. Snell; and Wm. Snell, Esq., Hon. Sec. and Treasurer.

The Committee are of opinion that the contributions should not exceed 10s. 6d. for each subscriber. Messrs. Cox & Co., Craig's Court, S.W. (H.P.D.), have kindly consented to receive subscriptions. Subscriptions will also be received by the Hon. Sec. and Treasurer. In-

quiries and communications to be addressed to W. Snell, Esq., Army and Navy Club, S.W.

DR. J. W. H.—We do not quite understand if you wish your letter to appear, and have held it over in consequence.

## VACANCIES.

**Ashton-under-Lyne.**—House Surgeon for the District Infirmary. Salary, £80, with board. Applications to the President by May 1.

**Drogheda** Union, Monasterboice Dispensary.—Medical Officer. Salary, £110, with fees, and £20 as Medical Officer of Health. Election, Apr. 29.

**Dudley** Dispensary.—Resident Medical Officer. Salary, £120. Applications to the Hon. Sec. before Apr. 26.

**Edenderry** Union Workhouse.—Medical Officer. Salary, £90, and £10 Consulting Sanitary Officer. Election, Apr. 26.

**Granard** Union, Granard Dispensary.—Medical Officer. Salary, £100, with fees, and £16 as Sanitary Officer. Election, April 26.

**Nottingham** Dispensary.—Assistant Resident Surgeon. Salary, £160 per annum. Applications to the Committee by May 1.

**Royal Free Hospital, London.**—Physician for Diseases of Women, and an Ophthalmic Surgeon. Both Honorary. Testimonials, &c., to the Secretary before April 30. (See Advt.)

**Royal London Ophthalmic Hospital.**—Clinical Assistants and Dressers. For particulars see Advt.

**St. Bartholomew's Hospital, Chatham.**—Assistant House Surgeon. Salary, £80, with board, &c. Applications to the Clerk of the Trustees before May 12.

**St. Patrick's Hospital for Insane, Dublin.**—Master to the Hospital. Salary, £200, with allowances. Election, May 5.

## APPOINTMENTS.

**CONRY, J.**, L.K.Q.C.P.I. & L.M., L.R.C.S.I., Medical Officer, Medical Officer of Health, &c., for the Kilkelly Dispensary District of the Swinford Union, co. Mayo.

**FOWLER, W. C., M.D., M.R.C.S.E.**, Medical Officer for the Parish of Craymond, Edinburghshire.

**FULLER, J., L.K.Q.C.P.I. & L.M.**, Medical Officer and Public Vaccinator for the No. 3 District of the Bedminster Union.

**HARRISON, A., M.R.C.S.E., L.R.C.P.Ed.**, Medical Officer for the Stockport Infirmary, to visit patients at their homes.

**JALLAND, W. H., F.R.C.S.**, Surgeon to the York County Hospital.

**LEATHAM, H. B., M.R.C.S.E.**, Resident Clinical Assistant to the East London Hospital for Children.

**MAHONY, L. F., M.B.**, House Physician to the London Hospital.

**O'DOWD, J.. L.F.P.S.G.**, Medical Officer for the Dudley South District of the Dudley Union.

**PIERSE, T., L.R.C.S.I., L.A.H.Dub.**, Medical Officer to the Wexford Dispensary, Wexford Union.

**THOMPSON, Dr. A.**, Medical Officer of Health for the Cosford Rural Sanitary District, Suffolk.

**THOMPSON, J., M.B., M.Ch. Univ. Glasg.**, Medical Officer to the Articlave Dispensary, Coleraine Union.

# Births.

**BLAKELY.**—On April 14, at Fivemiletown, co. Tyrone, the wife of S. Blakely, M.D., of a daughter.

**CORE.**—On April 14, the wife of W. Scott Core, M.D., of a daughter.

**KISCH.**—On April 17, at 46 Portsdown Road, London, W., the wife of Albert Kisch, M.R.C.S., of a son.

**MADIGAN.**—On April 9, at Dromcollogher, co. Limerick, the wife of John F. Madigan, L.R.C.P.Edin., of a son.

# Marriages.

**ARMSTRONG—ARMSTRONG.**—On April 9, at Castlederg, co. Tyrone, John Armstrong, L.R.C.S.I., to Adelaide Kate, daughter of the Rev. John Armstrong, Castlederg.

**DABBS—PEET.**—On April 19, at Bonchurch, Isle of Wight, G. H. R. Dabbs, M.D., to Nina, widow of John Peet, M.D., Surgeon-Major Bombay Army.

**PYE—M'CREA.**—On April 15, Prof. Pye, M.D., Queen's College, Galway, to Mary, third daughter of the late James M'Crea, M.D.

# Deaths.

**ANDERSON.**—On April 3, at Askam, William Anderson, M.R.C.S.E., aged 36.

**ATTWOOD.**—Found dead, on April 11, on Hampstead Heath, Frederick Lyndon Attwood, M.R.C.S.E., aged 35.

**BEAVAN.**—On April 5, James Beavan, F.R.C.S.E., of Commercial Street, Hereford, aged 49.

**DE WILTON.**—On March 3, at Madras, Gerald de Wilton, M.R.C.S.E., Surgeon-Major, Madras Service, aged 48.

**HUNTER.**—On April 1, John M. Hunter, M.D., of Clapham Common Gardens, aged 41.

**IRELAND.**—On April 17, at Hume Street, Dublin, Arthur J. Ireland, M.D., late Staff-Surgeon R.N.

**JOHNSON.**—On April 6, at Watlington, Norfolk, Frederick Wm. Johnson, M.R.C.S.E., aged 59.

**LYELL.**—On April 7, at Perth, John Lyell, M.D., late of Newburgh, aged 71.

**O'GRADY.**—On April 5, at Hyde, Thomas Standish O'Grady, L.R.C.P., aged 42.

**PARR.**—On April 18, at Rathgar, John King Parr, Surgeon-Major Army Medical Department.

**SMYTH.**—On April 3, at Dublin, Ralph Smyth, M.R.C.S.E.

**STUART.**—On April 13, at 59 King Street, Woolwich, William Stuart, M.D., aged 67.

**WILLAN.**—On April 13, at Worcester, R. M. Willan, M.R.C.S.

# UNIVERSITY of EDINBURGH.

## SUMMER SESSION, 1879.

The Classes for the different Branches of Study will be opened as follows:—

Botany, Thursday, 1st May, Eight a.m.—Prof. Dickson.

Botanical Demonstration (Friday), Friday, 9th May, Nine a.m.—Prof. Dickson.

Practical Botany and Vegetable Histology (Monday, Tuesday, Wednesday, and Thursday), Monday, 5th May, Nine a.m.—Prof. Dickson.

Field Demonstrations on Saturdays.—Prof. Dickson.

Obstetrical and Gynæcological Operations (Tuesday and Friday), Friday, 2nd May, Ten a.m.—Prof. Simpson.

Practical Materia Medica (including Pharmacy), Thursday, 1st May, Ten a.m.—Prof. Thomas R. Fraser.

Practical Chemistry, Thursday, 1st May, Ten and Eleven a.m.—Prof. Crum Brown.

Practical Morbid Anatomy and Pathology, Thursday, 1st May, Eleven a.m.—Prof. Sanders.

Anatomical Demonstrations, Monday 5th May, Eleven a.m.—Prof. Turner and Demonstrator.

Practical Anatomy, Thursday, 1st May, Prof. Turner and Demonstrator.

Natural Philosophy (short Course for Medical Students), Thursday, 8th May, Eleven a.m.—Prof. Tait.

Medical Jurisprudence (for Law and Medical Students), Thursday, 1st May, Eleven a.m.—Prof. Maclagan.

Clinical Surgery (Monday and Thursday), Thursday, 1st May, Twelve noon.—Prof. Annandale.

Clinical Medicine (Tuesday and Friday), Friday, 2nd May, Twelve to Two p.m.—Profs. Maclagan, Sanders, Grainger, Stewart, and Fraser. Prof. Simpson on Diseases of Women.

Chemistry, Advanced Class, Organic Chemistry (Tuesday, Wednesday, and Thursday), Thursday, 1st May, One p.m.—Prof. Crum Brown.

Mineralogical Chemistry (Monday, Wednesday and Friday), Monday, 5th May, Twelve Noon.—Prof. Crum Brown.

Technological Chemistry (Tuesday, Wednesday), Tuesday, 6th May, Three p.m.—Prof. Crum Brown.

Natural History, Thursday, 1st May, Two p.m.—Prof. Sir C. Wyville Thomson.

Practical Natural History, Thursday, 1st May, Three p.m.—Prof. Sir C. Wyville Thomson.

Practical Physiology, including Histology, Thursday, 1st May, Three p.m.—Prof. Rutherford.

Operative Surgery (Monday, Tuesday, Thursday, and Friday), Thursday, 1st May, Four p.m.—Prof. Spence.

Royal Infirmary, Daily, at Noon.

Mental Diseases, with Practical Instruction at Morningside Asylum (Monday, Wednesday, and Friday), Monday, 5th May, Three p.m.—Dr. Clouston.

## FACULTY OF MEDICINE.

The following means are afforded for Practical Instruction:—

The Dissecting Rooms are open daily, under the superintendence of the Professor, asssisted by D. J. Cunningham, M.D., C.M., and F. W. D. Fraser, M.B., C.M.

The Tutorial Class of Clinical Medicine in the Royal Infirmary, under the superintendence of the Clinical Professors, assisted by J. Murdoch Brown, M.B.

The Tutorial Class of Clinical Surgery in the Royal Infirmary, under the Superintendence of the Clinical Professor, assisted by J. M. Cotterill, M.B., C.M.

The Royal Edinburgh Asylum is open to Members of the Class of Mental Diseases, exclusively for Practical Instruction by the Physician Superintendent, Dr. Clouston.

Chemical Laboratories—The Laboratory for instruction in Analytical Chemistry and for Chemical Investigation, under the superintendence of the Professor, assisted by R. M. Morrison, D.Sc., and G. C. Robinson, is open from Ten to Four. The Class of Practical Chemistry is conducted by A. P. Aitken, M.A., D.Sc., under the superintendence of the Professor.

The Physiological Laboratory is open daily for Physiological Investigation, under the superintendence of the Professor, assisted by De Burgh Birch, M.B., C.M.

The Physical Laboratory is open daily, from Ten to Three, under the superintendence of Prof. Tait.

The Medical Jurisprudence Laboratory is also open daily, from Ten to Three, under the superintendence of the Professor, assisted by J. O. Affleck, M.D.

The Practice of Obstetrical and Gynæcological Operations is carried out in the Obstetrical Museum and Gynæcological Ward, under the superintendence of the Professor, assisted by David Derby Hart, M.B., C.M.

The Pathological Laboratory is open daily for Pathological Investigation, under the superintendence of the Professor, assisted by D. J. Hamilton, M.B., C.M.

The Natural History Laboratory is open daily, under the superintendence of the Professor, assisted by George Leslie.

The Natural History Museum, in the Museum of Science and Art, Chambers Street, is accessible to the Students attending the Natural History Class.

The Royal Botanic Garden, Herbarium and Museum, are open daily.

The Materia Medica Laboratory is open daily, under the superintendence of the Professor, assisted by Matthew Hay, M.B., C.M.

JOHN WILSON, Sec. Sen. Acad.

March, 1879.

NOTICE.—The SUMMER SESSION Announcements of the other Medical Schools will be found on pages X., XI.

# IRISH POOR-LAW INTELLIGENCE.

## PUBLIC HEALTH (IRELAND) ACT, 1878.

(*Continued.*)

142. (*Verb.*) *Penalty on Exposure of Infected Persons and Things.*—Any person who—

(1) While suffering from any dangerous infectious disorder wilfully exposes himself without proper precautions against spreading the said disorder in any street, public place, shop, inn, or public conveyance or enters any public conveyance, without previously notifying to the owner, conductor, or driver thereof that he is so suffering; or

(2) Being in charge of any person so suffering so exposes such sufferer; or

(3) Gives, lends, sells, transmits, or exposes without previous disinfection any bedding, clothing, rags, or other things which have been exposed to infection from any such disorder; or

(4) Exposes or conveys without proper precaution the body of any person who has died of any dangerous infectious disorder; or

(5) Wakes, or permits to be waked, in any house, room, or place, over which he has control, the body of any person who has died of any dangerous infectious disorder,

shall be liable to a penalty not exceeding five pounds; and a person who, while suffering from any such disorder, enters any public conveyance without previously notifying to the owner or driver that he is so suffering, may be summarily ejected therefrom, and shall in addition be ordered by the Court to pay such owner and driver the amount of any loss and expense they may incur in carrying into effect the provisions of this Act with respect to disinfection of the conveyance.

Provided that no proceedings under this section shall be taken against persons transmitting with proper precautions any bedding, clothing, rags, or other things for the purpose of having the same disinfected.

143. (*Verb.*) *Penalty on Failing to Provide for Disinfection of Public Conveyance.*—Every owner or driver of a public conveyance shall immediately provide for the disinfection of such conveyance after it has to his knowledge conveyed any person suffering from a dangerous infectious disorder, or any bedding, clothing, rags, or other things which have been exposed to infection from such disorder, and which have not been previously disinfected, and if he fails to do so he shall be liable to a penalty not exceeding five pounds; but no such owner or driver shall be required to convey any person so suffering, or any such bedding, clothing, or other things, until he has been paid a sum sufficient to cover any loss or expense incurred by him in carrying into effect the provisions of this section.

144. (*Verb.*) *Penalty on Letting Houses in which Infected Persons have been Lodging.*—Any person who knowingly lets for hire any house, room, or part of a house in which any person has been suffering from any dangerous iufectious disorder, without having such house, room, or part of a house, and all articles therein liable to retain infection disinfe cted to the satisfaction of a legally qualified medica practitioner, as testified by a certificate by him, shall be liable to a penalty not exceeding twenty pounds.

For the purposes of this section, the keepers of an inn or school shall be deemed to let for hire part of a house to any person admitted as a guest into such inn or school respectively.

145. (*Verb.*) *Penalty on Persons letting or taking Houses making False Statements as to Infectious Disease.*—Any person letting for hire or showing for the purpose of letting for hire any house or part of a house who, on being questioned by any person negotiating for the hire of such house or part of a house as to the fact of there being or within three months previously having been therein any person suffering from any dangerous infectious disorder, or any person hiring or negotiating for the hire of any house or part of a house, who, on being questioned by any person letting, or showing for the purpose of letting, such house or part of a house as to the fact of any of the persons for whose use the said house or part of the house is about being hired being or, within three months previously, having been affected by any dangerous infectious disorder, knowingly makes a false answer to such question, shall be liable, at the discretion of the Court, to a penalty not exceeding twenty pounds, or to imprisonment, with or without hard labour, for a period not exceeding one month.

146. (*Verb.*) *Infection in Schools.*—Any person who shall knowingly or negligently send a child to school who, within the space of three months, has been suffering from any dangerous infectious disorder, or who has been resident in any house in which such dangerous infectious disorder shall have existed within the space of six weeks, without a certificate from some duly qualified medical practitioner that such child is free from disease and infection, and unless his or her clothes have been properly disinfected, shall be liable to a penalty not exceeding forty shillings.

147. (*Verb.*) *Justices may make an Order for the Vaccination of any Child under* 14 *Years.*—If any registrar, or any officer appointed by the guardians to enforce the provisions of the Acts relating to vaccination in Ireland, shall give information in writing to a justice of the peace that he has reason to believe that any child under the age of fourteen years, being within the union or district for which the informant acts, has not been successfully vaccinated, and that he has given notice to the father or mother of the said child, or to the person having the care, nurture, or custody of such child, to procure its being vaccinated, and that this notice has been disregarded, the justice may summon such father or mother or person to appear with the child before him at a certain time and place, and upon the appearance, if the justice shall find, after such examination as he shall deem necessary, that the child has not been vaccinated, nor has already had the small-pox, he may, if he see fit, make an order under his hand and seal directing such child to be vaccinated within a certain time; and if at the expiration of such time the child shall not have been so vaccinhted, or shall not be shown to be then unfit to be vaccinated, or to be insusceptible of vaccination, the person upon whom such order shall have been made shall be proceeded against summarily, and, unless he can show some reasonable grouud for his omission to carry the order into effect, shall be liable to a penalty not exceeding twenty shillings.

Provided that if the justice shall be of opinion that the person is improperly brought before him, and shall refuse to make any order for the vaccination of the child, he may order the informant to pay to such person such sum of money as he shall consider to be a fair compensation for his expenses and loss of time in attending before the justice.

148. *Power of Local Government Board to make Regulations.*

PREVENTION OF THE SPREAD OF INFECTIOUS DISEASES.

149. (*Abs.*) *Power of Local Government Board to make Regulations for Prevention of the Spread of Diseases.*—Whenever any part of Ireland appears to be threatened with or is affected by any formidable epidemic, endemic, or infectious disease, the L. G. B. may make, and from time to time alter and revoke, regulations for all or any of the following purposes; namely,

(1) For the speedy interment of the dead; and
(2) For house to house visitation;
(3) For the provision of medical aid and hospital accommodation; and
(4) For the promotion of cleansing, ventilation, and disinfection, and for guarding against the spread of disease;

and may by order declare all or any of the regulations so made to be in force within the whole or any part or parts of the district of any sanitary authority, and to apply to any ships, for the period in such order mentioned; and may by any subsequent order abridge or extend such period. For the purpose of any regulations to be made under this section any ship or vessel lying in any river, harbour, or other water within the district of a sanitary authority shall be subject to the jurisdiction of that authority in the same manner as if it were a house within such district.

150. (*Abs.*) *Boards of Guardians to see to the Execution of Regulations.*—The board of guardians of any union within which, or within part of which, regulations so issued by the L. G. B. are declared to be in force, shall superintend and see to the execution thereof, and shall appoint and pay such medical or other officers or persons, and do and provide all such acts, matters, and things as may be necessary for mitigating any such disease, or for superintending or aiding in the execution of such regulations, or for executing the same, as the case may require. Moreover, such board of guardians may from time to time direct any prosecution or legal proceedings for or in respect of the wilful violation or neglect of any such regulations.

Any such expenses incurred with respect to any ship or vessel lying in any river, harbour, or water shall, in case the L. G. B. shall so direct, be defrayed out of a common fund to be contributed by the sanitary districts.

151. *Power of Entry.*

152. (*Verb.*) *Poor-law Medical Officers entitled to Costs of Attendance on Board Vessels.*—Whenever, in compliance with any regulation so issued by the L. G. B. as aforesaid, the medical officer of health of any sanitary district performs any medical service on board any ship or vessel, he shall be entitled to charge extra for such service, at a rate to be fixed by the L. G. B.; and such charges shall be payable by the captain of such vessel on behalf of the owner thereof, together with any reasonable expenses for the treatment of the sick.

Where such services are rendered by any medical practitioner who is not a medical officer of health of any sanitary district, he shall be entitled to charges for any service rendered on board, with extra remuneration on account of distance, at the same rate as those which he is in the habit of receiving from private patients of the class of those attended and treated on shipboard, to be paid as aforesaid. In case of dispute in respect of such charges, such dispute may, where the charges do not exceed twenty pounds, be determined by a court of summary jurisdiction; and such court shall determine summarily the amount which is reasonable, according to the accustomed rate of charge within the place where the dispute arises for attendance on patients of the like class as those in respect of whom the charge is made.

153. *L. G. B. may Combine Board of Guardians.*

154. *Penalty for Violating or Obstructing the Execution of Regulations.*

155. (*Verb.*) *Hospital Accommodation.*—Any sanitary authority may, with the sanction of the L. G. B., provide for the use of the inhabitants of its district hospitals or temporary places for the reception of the sick or convalescent, and for that purpose may itself build such hospitals or places of reception, or contract for the use of any existing hospital, or part of a hospital, or place for the reception of the sick or convalescent, or may enter into an agreement with any person or body of persons, having the management of any hospital for the reception of the sick or convalescent inhabitants of the district, on payment of such annual or other sum as may be agreed upon.

156. *Recovery of Cost of Maintenance of Patient in Hospital.*—Any expenses incurred by a sanitary authority in maintaining in a hospital, or in a temporary place for the receptioon of the sick (whether or not belonging to such authority), a patient who is not a pauper shall be deemed a debt due from such patient to the sanitary authority, and may be recovered from him at any time within six months after his discharge from such hospital or place of reception, or from his estate in the event of his dying in such hospital or place.

MORTUARIES, ETC.

157. *Power of Sanitary Authority to Provide Mortuaries.*

158. *Justice may in certain cases order Removal of Dead Body to Mortuary.*

159. *Power of Sanitary Authority to provide Places for Post-mortem Examinations.*

PART III.—BURIAL GROUNDS.

160. Sanitary Authority to be Burial Board.

161. Vesting of Burial Ground by Church Temporalities Commi sioners.

162. On Representation duly made L. G. B. may restrain the Opening of New Burial Grounds.

163. Power to Direct Local Inquiry.

164. L. G. B. may Postpone Order for Discontinuance of Burials, &c.

165. Order not to Extend to Burial Grounds of Quakers.

166. Or of French Protestants.

167. (*Verb.*) *Penalty on Persons Burying Contrary to the Provisions of Order.*—If any person, after the time mentioned in any order under this Act for the discontinuance of burials, knowingly and wilfully buries any body, or in anywise acts or assists in the burial of any body, in or under any church, chapel, churchyard, burial ground, or place of burial or elsewhere, as the case may be, within the limits in which burials have by such order been ordered to be discontinued, in violation of the provisions of any such order, every person so offending shall, upon conviction thereof before a court of summary jurisdiction, forfeit a sum not exceeding ten pounds.

168. Saving of Certain Rights to Bury in Vaults.

169. New Burial Ground not to be Opened Contrary to Order.

170. No Corpse to be Buried in Private Grave without Consent.

171. No Animal to be allowed to Graze in Burial Places.

172. Upon Requisition, Meeting of Board to be Convened to determine whether Burial Ground shall be provided.

173. When Burial Grounds are Closed by Order, Board to provide Suitable Burial Grounds, &c.

174. Consent of Owners of Houses to New Burial Grounds where necessary.

175. Board may Purchase Land for Cemeteries, or Contract with Cemetery Companies.

176. Liabilities of Old Burial Grounds Transferred to New Burial Grounds.

177. Management to be Vested in Burial Boards.

178. Boards may sell Exclusive Rights of Burial, and Rights to erect Monuments, &c.

*(To be continued.)*

## TO READERS.

THE Editor will feel especially obliged by receiving copies of newspapers which contain any Poor-law or other intelligence of medical interest, in order that he may, if fit, republish it for the benefit of the readers of the *Medical Press*. Although twenty-one of the leading Irish newspapers are received at the Irish office, many things may escape notice which are deserving of attention.

## FEES FOR MEDICAL EVIDENCE AT INQUESTS UPON PRISONERS.

The following letter has been forwarded to the Medical Officers of Prisons in Ireland :—

Irish Medical Association, Dublin.
April 12, 1879.

Sir,—The attention of the Council of the Irish Medical Association has been called to questions which have arisen respecting the payment of fees to medical officers of prisons for expert evidence given at inquests upon prisoners who have died in gaol. The law as to medical testimony at coroners' inquests is set forth in the following section of the Coroners' (Ireland) Act, 9 and 10 Vict., cap. 37, Sec. 33. (See "Irish Medical Directory," page 525). :—

"Be it enacted, that from and after the passing of this Act, in all cases where any coroner shall hold an inquest upon any dead body, and shall deem the attendance of some medical witness to be necessary at such inquest, he shall summons as such witness any legally qualified medical practitioner, being at the time in actual practice at or near the place where such death happened; and it shall be lawful for the coroner, at any time between the issuing of such summons and the termination of such inquest, to direct the performance of a post-mortem examination by such medical witness, provided that any person shall state upon oath before the coroner that in his or her belief the death of the deceased individual was caused partly or entirely by the improper or negligent treatment of any medical practitioner or other person, such medical practitioner or other person shall not be allowed to perform or assist at the post-mortem examination of the deceased."

From the operation of this provision medical officers of hospitals, "or other public medical institutions," are exempted by the 32nd section of the same Act, which runs as follows :—

"And be it enacted, that when any inquest shall be holden on the body of any person who has died in any public hospital or infirmary, or in any building or place belonging thereto, or used for the reception of the patients thereof, or who has died in any county or other lunatic asylum, or in any public infirmary or other public medical institution, whether the same be supported by endowments or by voluntary subscriptions, then and in such case nothing herein contained shall be construed to entitle the medical officer whose duty it may have been to attend the deceased person as a medical officer of such institution as aforesaid at the fees or remuneration herein provided."

The Council understands that it had been originally the custom to remunerate medical officers of prisons for their testimony in such cases, and that the fees so paid were always allowed by grand juries, and by the fiating judges; but that system had been altered some years ago, and fees since then refused apparently without any legal authority.

The subject having now attracted the attention of Council in connection with the duties of medical officers under the new Prisons (Ireland) Act, it is thought desirable that the Council should inform those officers as to the law and precedent affecting the matter. It will be observed that the 32nd section of the Coroners' Act, quoted above, withholds a fee for medical evidence from "the medical officer whose duty it may have been to attend the deceased person as medical officer of such institution." The institution here referred to is defined by the section to be either—*a.* "A public hospital or infirmary;" or *b.* "A county or other lunatic asylum;" or *c.* "Any public infirmary or other public medical institution."

The Council conceive that the sick ward of a prison is not included, or intended to be included, within the operation of this section, and that the medical officer of a prison is therefore entitled to the statutory fee payable for medical testimony. The Council is borne out in this view by the words of the Act, which restrict the gratuitous testimony of medical officers to institutions "supported by endowments or by voluntary subscriptions"—which definition clearly excludes prisons—and by a judgment given at the Lifford Assizes in July, 1861, by the then Mr. Justice Ball, now Lord Chancellor of Ireland.

On that occasion Mr. Curran, Q.C., asked the court to instruct the grand jury to find a presentment for the sum of £1 1s., being the amount of fee due to Dr. Little, Surgeon of the County Jail. He had given evidence before Dr. Lacey, coroner, as to the cause of death of an inmate of the prison.

The grand jury intimated that they merely raised the question in order to get the decision of the court as to whether they were justified in allowing fees to the medical officer in such cases.

His Lordship said, that on looking at the section of the Act handed to him, he did not find that it was among the duties prescribed for the medical officer that he was to give evidence when called on without the usual fee paid to other medical men. He must decide that the fee be paid.

The grand jury expressed themselves satisfied with the decision given by the court.

In view of this decision by the highest legal authority in Ireland, the Council has not considered it necessary to take legal advice, but has instructed me to lay the facts before you to be used as you see fit.

Your, &c.,

John William Moore, M.D.,
Secretary of the Council of the Irish Medical Association.

## BALLYMORE EUSTACE DISPENSARY.

The following letter was read at the Naas Board of Guardians :—

"Dear Sir,—I regret very much to have to request the attention of your honourable board to what seems to me a grievous violation of duty on the part of the medical officer of this district of the union, and to request on behalf of all concerned that steps will be taken to prevent a recurrence of such neglect in future. On Wednesday, the 9th inst., a poor man watched for the doctor's arrival at the dispensary, Ballymore Eustace, to present to him a duly issued ticket requiring his attendance on the poor man's sick and very aged father. According to the printed regulations over the dispensary the doctor should attend from ten to twelve o'clock every Wednesday and Friday, but he has habitually disregarded this rule; and the result has been the greatest inconvenience, if not absolute increase of disease, to the sick poor awaiting his arrival on these days in the cold damp dispensary hall. On the day in question—the 9th inst.—the doctor did not arrive until 11.35 o'clock. The poor man presented his ticket. After some grumbling the doctor promised to visit the patient. He did so, and ordered that some one would go to Blessington before four o'clock that afternoon for the medicine he would prescribe; but to effect this was impossible, as the sick man and his aged wife lived alone in an isolated place, and their son was not able to come to them until late that evening. He consulted me on the subject. I advised him to go to Blessington for the medicine early next morning. He did so. The doctor would not see him, but sent him word that as he failed to be at Blessington dispensary before four o'clock the preceding day, he should not get the medicine until the Saturday following, when he might apply for it at the Ballymore dispensary. I will not offend the cause of justice which I am sure animates every member of your board by attempting to demonstrate to them the great injustice in this case. I will only say that a dispensary system so conducted would seem to me 'a mockery, a delusion, and a snare'—a mockery to the poor, and a delusion and a snare to the ratepayers.—I have, &c.,

"Joseph Horgan, P.P."

Mr. Mansfield said this was a matter for the consideration of the dispensary committee, to whom he suggested it should be referred.

Mr. Driver said a special meeting of the committee had

been summoned for Monday to investigate another complaint against the doctor.

Mr. Fenelon observed that the doctor should be made aware of this charge.

Mr. Driver—He is quite aware of it.

The letter was referred to the dispensary committee.

## LIST OF ENTRIES IN THE REGISTER OF THE BRANCH MEDICAL COUNCIL (IRELAND) FOR THE MONTHS OF FEBRUARY AND MARCH, 1879.

FEBRUARY 27th.—O'Connor, George Anthony; Spiddal, co. Galway; Lic. R. Coll. Phys. Edin. 1878, Lic. R. Coll. Surg. Edin. 1878.

MARCH 1st.—Chestnutt, John; The Manse, Tralee, co. Kerry; Lic. R. Coll. Phys. Edin. 1878, Lic. R. Coll. Surg. Edin. 1878.

3rd.—Lentaigne, Henry Westenra; 1 Gt. Brunswick St., Dublin; Lic. R. Coll. Surg. Irel. 1878.

6th.—Wilson, West Wheldale; Harvest Lodge, Lorrha, Roscrea, co. Tipperary; M.B. 1879, and B.Ch. 1879 Univ. Dub.

7th.—Mason, Thomas; 92 Harcourt Street, Dublin; M.B. Univ. Dub. 1879, Lic. R. Coll. Surg. Irel. 1877.

9th.—Moore, Robert; 2 Carlisle Terrace, Belfast; M.D. 1875 and M.Ch. 1875 Q. Univ. Irel. (Restored per order of Council).

11th.—Smith, Henry Wm.; Kilgobbin, Sandyford, co. Dublin; Lic. R. Coll. Surg. Irel. 1878.

11th.—Quin, John Dominick; 6 Berkeley Street, Dublin; Lic. K.Q. Coll. Phys. Irel. 1879.

15th.—Butt, Edward; Virginia, co. Cavan; Lic. K.Q. Coll. Phys. Irel. 1878, Lic. R. Coll. Surg. Irel. 1878.

15th.—Atkinson, William Theodore; Lenamore, co. Longford; Lic. R. Coll. Surg. Irel. 1878, Lic. R. Coll. Surg. Edin. 1879.

15th.—Moran, John Patrick; Dromgrana, Ennis, co. Clare; Lic. R. Coll. Surg. Irel. 1878.

20th.—Broe, John Joseph; Celbridge, co. Kildare; Lic. R. Coll. Phys. Edin. 1878, Lic. R. Coll. Surg. Edin. 1878.

26th.—Westrop, Cecil George; 7 Eden Terrace, Limerick; Lic. R. Coll. Phys. Edin. 1879, Lic. R. Coll. Surg. Irel. 1878.

## REPORT OF HEALTH OF DUBLIN AND SUBURBS FOR WEEK ENDING APRIL 12, 1879.

| | | | | |
|---|---|---|---|---|
| Total registered deaths in Dublin and suburbs* | | | | ... 168 |
| Ten years average of same week | | | | ... 177 |
| Decrease of mortality below average | | | | ... 9 |
| 10 weeks' ratio of deaths | | Rathmines | 29·2 | per 1,000 |
| " | " | " | Donnybrook† 31·6 | " |

| COMPARATIVE RATIOS— | | London ... | 25·7 | " |
| " | " | Glasgow ... | 22·9 | " |
| " | " | Edinburgh ... | 19·8 | " |

* District extends over 10,050 acres, and contains 314,666 persons.

† This district includes City of Dublin and Incurable Hospitals.

Only 25 deaths from zymotic diseases were registered, being the lowest number recorded since the week ending 30th November last, and 9 under the average for the 15th week of the ten years 1869-78; they include 4 from small-pox, 5 from scarlatina, 3 each from measles and fever (typhoid), 2 from whooping-cough, &c.

The deaths from small-pox are 5 under the number in the preceding weez, and are less than in any week since that ending 9th November last; 26 new cases of the disease were admitted into the Dublin Hospitals during the week, being 5 less than in the previous week; 33 patients were discharged, 1 died, and 99 remained under treatment on Saturday last, being 14 less than in the week ended 5th inst.

There were but few cases of the various fevers admitted into the principal hospitals during the week.

Thirteen children died from convulsions.

Forty-six deaths resulted from diseases of the respiratory organs; they comprise 32 from bronchitis, 9 from pneumonia, 1 from asthma, and 4 from lung disease undistinguished.

## ON BRAIN INJURY.

By A. T. NORTON, F.R.C.S.,
Surgeon to, and Lecturer on Surgery at, St. Mary's Hospital.

AMONG the number of cases of injuries to the head which have recently been admitted into the hospital, I have selected the following, as especially instructive forms which may occur :—

G. E., was struck by a railway engine whilst shunting. On admission, on the 9th Oct., there was a scalp wound more than two inches long on both sides of the head, and a third over the occiput. The left eyelid was torn, and there was a compound fracture of the left femur. The patient struggled violently during the setting of the limb, though he was suffering from concussion, and gave no answer when spoken to or shaken. Both pupils were dilated, though later in the night the right pupil contracted. On the following day he was still unconscious, with a full irregular pulse of 99, temperature 100°.

On the 12th the pulse was 96, temp. 99, he was more conscious and took nourishment freely, and the wounds were doing well. Thus far he might be said to have progressed, though the return to consciousness was but slight.

On the 14th the pulse rose to 116 and the temp. to 100·9°, and still no improvement as regards consciousness.

Three days later the pulse was 126, fluttering ; respiration irregular, 25 in the minute. The pupils answered to light, but he was comatose.

On the 18th pulse 130, intermittent, temp. 102°, respiration laboured, gasping, and in this condition he remained till the following morning, when he died, ten days after admission.

The symptoms were clearly those of concussion. There was no sign of hæmorrhage into the skull nor of other form of compression. He had command over the bladder and the sphincter ani, but the brain shock was severe ; he would distort his face, if pinched, expressive of pain, but could not be made to use the voice.

During the last three days the symptoms more approached those of compression, inasmuch as he took no further notice of being pinched or put to pain, appeared comatose, passed the motions in the bed, and also the urine ; but on the other hand he moved himself frequently on the bed and took fluids when put to the mouth. Nor can it be said that there was any symptom of inflammation of the brain, for the temp. was scarcely above 100°, until the day previous to his death, when it rose to 102 for a few hours. The diagnosis formed was that the case was one of concussion with severe shaking of the brain, and possibly some slight extravasation of blood into the substance of or upon the posterior lobe of the cerebrum, that being the region upon which the injury was inflicted.

The post-mortem records state : no fracture of the skull, no hæmorrhage between the membranes, no plastic exudation, a proof that there was no inflammation, engorgement of the posterior cerebral veins, scattered slight spots of extravasation in pia mater scarcely to be recognised amidst the engorged vessels ; no laceration of brain substance, no intra-cerebral hæmorrhage ; brain substance, posterior lobes more vascular than normal. Occupying the testis of right corpora quadrigemina was a greyish-brown softening, surrounded by a zone of congested vessels.

As regards the compound fracture of the left femur, I need say no more than that the flesh wound, which had been covered by collodion, now presented a thick adherent scab, and that the fracture was thus converted into the simple variety, so that this injury, though in itself serious, had no influence in bringing about the fatal result.

The post-mortem report shows the diagnosis to have been correct. The brain substance, though so far as could be detected, it was not lacerated, yet was severely

injured, as proved by injury to the small vessels, from which slight extravasation had taken place. From this injury the brain was unable to recover itself, and death ensued. There was no evidence of any other cause of death.

There was, however, an injury recognised after death, of the existence of which we had no means of judging during life, owing to the almost complete unconsciousness of the patient. I refer to the softening of the posterior lobe of the corpora quadrigemina. That this body is connected with the sense of vision in the lower animals has been sufficiently attested, but as regards man the question is still an open one; and as a point of science it is to be deplored that we had not the opportunity of questioning the patient as to the visionary power. All that we could ascertain on the point was that the pupils both contracted under the influence of light.

Now as regards the treatment of this case, do we gather from the conditions of the brain, as proved post-mortem, that we could have done anything more for our patient? I think not. When brought in under the shock of the accident external warmth was applied, and afterwards a croton oil purgative administered. The head was shaved and ice-bags applied to the head to limit the quantity of blood, and to prevent inflammation.

On the fourth day, as consciousness did not return, and as I told you at the time I concluded that there might be slight local extravasation, with engorgement, I applied leeches to the neck, and again administered purgatives, but, as you have seen, without success.

The exact state of the brain was recognised during life, a condition of congestion, and had the pulse been full and hard, it would have determined me to employ venesection, but as such was not the case, but as on the contrary the pulse was soft, and the tongue coated with a brown secretion—a sign of asthenia—I preferred to use local depletion in the form of leeches, and constitutionally alcoholic stimulant.

The next case which I shall recall to your minds is that of Frederick C., æt. 3, who was supposed to have been run over by a brick-cart, but as this injury was entirely on the head, and as there was no scratch nor wound, I think it more probable that he received a severe blow from the horse's knee, than that he was run over by the wheel, for such a weight must have assuredly crushed in the skull of a child so young.

F. C. was then, immediately after the accident on the 9th October, picked up, screaming, by a neighbour, and was at once brought to the hospital. On admission he was apparently comatose, but from time to time aroused himself to utter a cry of pain. His head and face were smeared with blood, but there was no external wound. A bruise on the zygoma, and a swelling upon the ramus of the lower jaw, were all that could be discerned externally. There was, however, bleeding from the left ear, bleeding from the nose, and the little patient also vomited blood. The left eyelid was ecchymosed, and on opening the lids the *right* pupil was widely dilated, whilst the *left* was contracted. There was no paralysis of the limbs nor of the face. The pulse was 100 full, occasionally intermittent; temp. 96°. Forehead cold and bathed in a cold sweat. The face was pale, and the lips light blue, as of collapse.

At four o'clock in the morning he became conscious and spoke to the nurse, but was fidgetty and restless all night.

After re-action from the collapse, an icebag was applied to the head, and a purgative (calomel) was administered.

On the following morning he was quite conscious and in good spirits. Both eyes were ecchymosed. Temp. 98·4°. Pulse very irregular, fluttering and intermittent. In successive minutes the pulse was counted, 132, 96, 108, 86, sometimes intermitting with the loss of two beats. His water had been passed without trouble.

On the 11th October temperature was 99°. There was a discharge of serous fluid from the left ear, and the ecchymosis in the right eye was more marked. The right pupil was dilated to nearly full extent, and the movements of the right eye did not correspond with those of the left eye. Food, entirely milk, taken well.

It was now evident that there was partial paralysis of the third nerve, for the pupil was dilated, and refused to act under the stimulus of light. The eye was turned outwards, and when acting with the left eye would only move inwards as far as the middle line. By closing the left eye, and asking the boy to take a penny, it could be recognised that he could see, but could not focus the eye, for his hand was not put directly upon the object.

I need refer to but few of the notes taken daily upon this case. The temperature remained normal, but the pulse was variable, generally quick and weak. The tenderness over the left zygoma continued till about the 25th of the month. The ecchymoses gradually subsided and disappeared by the 28th. The focussing power daily appeared to improve, and the iris to regain its power of contraction, until on the 5th Nov. the notes state, right eye still slight external strabismus, but moves inwards well at times. The running from the left ear ceased on the 24th October. On November the 7th he was discharged well.

I saw the patient about a month after discharge, and found that his hearing power in the left ear was not affected; that he had entirely recovered the power of vision, and that the organ of smell was not affected.

Now this case presents several remarkable points for consideration. The symptoms of compression were absent, and the symptoms of concussion disappeared after a few hours, notwithstanding the severity of the accident; but it must be remembered that he was not under the influence of concussion immediately after the accident, for the neighbour who brought him from the spot said that he cried lustily, and that he had become unconscious on his way to the hospital. I must recall to your minds that concussion is the *immediate* effect of the injury, and does not come on after a lapse of time, so, though for a few hours symptoms very much resembling concussion were present, yet we must conclude that this was not a case of concussion. Was it, then, one of compression? The term compression seems to be accepted in different senses, but in applying the term in injuries of the head, I employ it only when there is unconsciousness with paralysis. Assuredly the term compression cannot be used to mean any series of symptoms unless with that rendering; for compression of the brain, in the strict sense of the word, may occur as the result of growths or of inflammatory products, without the development of that series of symptoms which we designate compression.

This case, then, was not one of compression, for there was not paralysis; the boy turned in his bed, and though quite unconscious, yet from time to time uttered cries. We have fortunately not had any opportunity of verifying any diagnosis that might be made, but I gather from the symptoms that there was fracture of the skull without displacement, and that the loss of consciousness was due to a small quantity of blood retained upon the brain. Perhaps the chief evidence of the fracture was the bleeding from the left ear, followed by a flow of serous fluid for three weeks after the injury. This apparently serous fluid is now known to be cerebro-spinal fluid, and may come from that process of the membranes of the brain which surrounds the auditory nerve, or any fracture may bring about direct communication with the brain membranes. The bleeding, as we have seen, was excessive, for it flowed freely from the ear for two days, and was vomited in large quantity; the left lid was ecchymosed, and the right orbit contained blood, and on the following day the ecchymosis had extended into the right lids. Such bleeding would be indicative of fracture through the ethmoid or sphenoid or the orbital plates; but I think with such comparatively slight symptoms as those which presented themselves in this case, and in a child of such tender age as the subject under consideration, we might more reasonably suppose that the bleeding was due to laceration of vessels in those regions from the

concussion or contre-coup than from fracture, for it must be remembered that the bones at so early an age are very yielding, and therefore not so likely to fracture; whilst, on the other hand, the delicacy of the tissues and the thinness of the walls of the vessels would account for their easy laceration, as the result of a blow or severe shake, without actual fracture of bone. The paralysis of some fibres of the third nerve we must consider due to compression of those fibres by the blood effused around them, rather than to direct injury of the nerve; for after the complete absorption of the blood the nerve regained its power about the fifth week after the injury.

Whilst on the subject of concussion I will refer, in a few words, to one more case—that of M. M., a girl, æt. 8, which, though unimportant as regards concussion, may, in virtue of its complication, impress you with the necessity of carefully weighing the value of symptoms which may appear foreign to the case.

M. M. was knocked down against a doorstep, striking the head on the occipital region, and was brought into the hospital unconscious. The house surgeon applied an ice-bag to the head and administered a purgative. The next morning I saw her and found the face flushed, the tongue raw, and the temperature 102°. She kept her hand to the head as though in pain, and when questioned appeared stupid rather than semi-conscious from concussion. The scalp in the occipital region was bagging with effused blood. I remarked at the time that the symptoms were not such as we might expect from concussion. The temperature should never be 102° on the second day; such a temperature would certainly indicate inflammation, and had the injury been inflicted some seven or eight days previously the symptoms would have suggested inflammation of brain substance. I could only conclude that some complication was developing itself, and you may recollect that I gave my opinion to that effect. The following day it was found that the temperature rose more than two degrees each night and descended to the same extent each morning. An examination of the abdomen was now made, and the spots of typhoid fever discovered.

You may be inclined to say that I ought to have looked for the spots on the first day: perhaps so, and had I done so a correct diagnosis could have been made at the first examination; but the evidence of the injury was clear before me, and caused me to look only for such complications as I might expect to be associated with that particular form of injury; whilst, on the other hand, the typhoid fever which, though it must have existed for nearly a fortnight, had crept on so insidiously that even the parents of the child had not recognised any indisposition.

# Original Communications.

## SOME RESULTS OF THE CONTAGIOUS DISEASES ACTS. (a)

By WILLIAM THOMSON, A.B., F.R.C.S.,
Surgeon to the Richmond, Whitworth, and Hardwicke Hospitals, Dublin.

ALTHOUGH most frequently we are engaged in this Society in the discussion of purely surgical questions, there are other subjects to which we cannot be indifferent, and concerning which it is necessary that we should give some expression of our belief. Such a one presents itself in the operation and results of the Contagious Diseases Acts. Sanitation has grown from a rough mass of facts into a very definite science, with rigid principles and laws. Its highest aim is the security of the public health, and its powers are always directed against whatever tends to deteriorate the population, and to increase the national mortality. Thus the law controls the employment of children in factories, compels vaccination as a safeguard against small-pox, and exercises such authority as will prevent the spread of zymotic diseases in general. The law, it will be seen, is quite impartial. Its repressive hand falls equally upon men who, hasting to be rich, make children slaves; and upon that prejudice, the offspring of indolence and ignorance which encourages the spread of disease. It only sees in both a curse upon the present and the future race, and tries to mitigate its intensity.

This recognition of the importance of guarding the public health in every possible way once established, it was not to be expected that one serious group of diseases, known as venereal, would long escape the operation of the law. It was well known that the efficiency of the army and navy was gravely compromised; and beyond this it was generally admitted that, while there was present disablement, there was in some forms of disease the probability of an infected offspring. The Acts which we are now considering were passed, as in some shape a remedy for a great evil.

Various bills have from time to time become law, and are now known as the Contagious Diseases Acts. They have hitherto been confined to garrison towns; and the meetings recently held in this city were not only to protest against their possible extension, but to demand their repeal. The public of Dublin in the greater part had not heard of them before, and it was owing to the activity of a noisy and mischievous English association, that the Irish people first learned that their liberties were imperilled. Gathering around them a few apostles of a reform that does not always mean progress, a band of those agitators who flit about society, improving everything and everybody, and, I am sorry to say, some good men and women who were quite ignorant of what they were asked to advocate, the Society began its mission here. The story of its failure is known; but it is to be observed, as an instance of strange inconsistency, that those who were the advocates of free trade for prostitutes one day, were, the next, the loudest in calling for the repression of whisky-sellers, on the score of the moral and physical injury they inflict upon the people.

A subject, then, which has excited so much interest, and which involves so many important considerations from a medical point of view, is one upon which we may express some opinion.

The Act of 1864 was succeeded in 1866 by another, providing for the periodical examination of the prostitutes in certain garrison towns, and their detention in hospital, if necessary. Taking the navy, we find that in the year 1865, before the Act had produced any marked effect, the cases of syphilis on the home stations were 108·7 per 1,000; in 1866 the ratio had fallen to 76·3; in 1869, when the periodical examination had been nearly completed in the sea-ports, the ratio had fallen to 59·5; while in 1874 it had fallen to 48. In Devonport and Plymouth the Acts were applied with great care. In 1864 there were 274 cases of primary syphilis in 2,481 men; in 1865, 342. Then gradually there followed a decrease, until in 1869, the figures increased from 159 to 162; and in the following year were reduced to 85, or nearly one-half.

If we take the aggregate of 28 stations of troops in the United Kingdom, at which the average strength amounted to 500 men and upwards, the ratio of primary venereal sores in 1865 was 120; in 1867, it had fallen to 86; and it continued to decrease to 72 and 60, until in 1870, the ratio had fallen to 54.

Comparing the protected with the unprotected group, the numbers are, in the first, from 1864 to 1870, 120, 90·5, 86·3, 72·1, 60·9, 54·5 per 1,000. In the unprotected group there is an actual increase for the same period—thus, 108·6, 99·9, 90·9, 108, 106·7, 111·9, 113·3 per 1,000.

If we compare the reports of 1871 with those of 1864, there is a decrease in the constitutional form of 56·6 per 1,000. As contrasted with results at stations not under

(a) Read before the Surgical Society of Ireland.

the Acts there is a difference against the latter of 41·4 per 1,000.

In 1876 at fourteen stations under the Acts the average annual strength of troops was 48,620 men, among whom admissions for primary venereal sores averaged 33 per 1,000; the admissions for gonorrhœa, 68 per 1,000, or equal to 50·5 per 1,000. At fourteen unprotected stations, with 18,790 troops, the ratio of admissions was 82 per 1,000 for primary sores, and 89 for gonorrhœa, or together, an average of 85·5 per 1,000 in unprotected, against 50·5 per 1,000 in the protected stations. The case of Portsmouth, and the now celebrated statement of the Rev. Mr. Grant in defence of the Acts, are well known.

Let me just add one other proof, given by Surgeon-Major Vigers, of the Coldstream Guards. The regiment moved from London (unprotected) to Windsor (protected), and remained there from 20th April to 1st October. During the first two months, 14 cases of primary syphilis were admitted, in 13 of which the disease was contracted in London; and 13 cases of gonorrhœa, in 11 of which the disease was contracted in London. In the following three months, only 3 cases of syphilis were admitted—viz., 2 of primary sores, contracted in the district, and 1 of gonorrhœa, contracted out of the district. Thus, during the whole period, only 4 cases of one disease, and 3 of another, were contracted in Windsor.

The 34th regiment, as reported by Dr. Albert Gore, a Fellow of this College, came to Ireland from Shorncliffe, a protected district, and was distributed among unprotected stations. In 320 men there were 69 cases of venereal disease in six months. The regiment moved to the Curragh (protected), the average number being 272·71. Here the cases in six months were 38, and of 13 cases of primary syphilis only 2 were contracted at that station. The left half-battalion, 374 men, moved to Dublin, and in one month there were 20 cases of venereal out of a total of 35 admissions; while in 380 men remaining at the Curragh, there were only 4 cases out of 13 admissions.

In 1874, the 50th regiment came to Dublin, an unprotected station, having been previously at Colchester and Aldershot, protected stations. Professor de Chaumont, of Netley, commenting on this report from the pen of Surgeon-Major Ffolliott, says: "If we compare the seven months of 1874 at Colchester and Aldershot under the Acts with the six and a-half months at Dublin (1874-5), not under the Acts, we shall have two periods of almost the same length, and very fairly comparable:—

| | Average strength. | Admissions per 1,000. Gonorrhœa. | Syphilis. | Recruits. |
|---|---|---|---|---|
| 1874 (7 months under Acts). | 573 | 71·80 | 11·97 | 44 |
| 1874-5 (6½ months *not* under Acts). | 550 | 81·93 | 118·81 | Nil. |

"Here we have most telling figures, for the mean strength is almost the same, as well as the length of the periods, and we have a rise of 14 per cent. in the gonorrhœa, and no less that 900 per cent. in the syphilis, although the first period was under the adverse influence of 13 per cent. fresh recruits, while none were enlisted in the second."

And next let me call attention to a return which was issued in 1878. It contrasts the results at 28 large troop stations in the United Kingdom, being all at which the force was 500 men and upwards, when the first Act was applied. The figures relate to admissions into hospitals. (*a*)

(*a*) In this return, for the years 1860-66 inclusive, Windsor has been omitted from the group of stations under the Act, and London from that *not* under the Act, as the returns for those years do not afford the necessary information.

For the eight years 1870-8 the ratio of men per thousand always in hospital with primary venereal sores at fourteen stations under the Acts was 3·51, as compared with 7·85 at fourteen stations not under the Acts, the average rate of the subjected group being less than the half of that of the other.

In reading the above table it is to be remembered that the Act was not in operation at all the stations at the same time. In 1865 only three stations were subject to it; in 1866 four; in 1867 five; in 1868 eight; in 1869 ten, and it was not until 1870 that the fourteen were brought into the subjected group.

I could multiply evidence of the successful operation of these Acts, but I have said enough to show their beneficial results. In face of such facts, and contrary to all experience, it is curious to be told that not only has disease not diminished, but that it has actually increased. But then there are some men who argue that the earth is flat, and others that the sun moves round the earth.

There is one group of statistics to which the opponents of the Acts direct special attention—those of cases of gonorrhœa. The returns show a larger number in some cases than before the passing of the Acts, although I do not admit that there is in this fact any proof of a real increase. Mr. Stansfeld, when in Dublin, made much use of this return in a speech professedly delivered in reply to me, although I was not there to answer him. He quoted with apparent effect the statement of Inspector-General Balfour that, so far as gonorrhœa is concerned, the Act has not reduced the number of cases. But he ought to have been fair, for he must have known that an explanation had been given in the navy returns, which is also applicable to the army. Sir W. Armstrong writes—

"It is necessary to note the fact that previous to the time of passing the Contagious Diseases Acts it was not the practice of the navy to place cases of gonorrhœa,

| Year. | Fourteen Stations successively brought under the Acts. | | | Fourteen Large Stations not under the Acts. | | |
|---|---|---|---|---|---|---|
| | Average annual strength. | Ratios per 1,000 of strength. Primary venereal sores. | Gonorrhœa. | Average annual strength. | Ratios per 1,000 of strength. Primary venereal sores. | Gonorrhœa. |
| 1860 | 49,387 | 146 | 139 | 16,100 | 134 | 139 |
| 1861 | | 142 | 139 | | 120 | 118 |
| 1862 | | 117 | 139 | | 100 | 138 |
| 1863 | | 107 | 120 | | 107 | 120 |
| Average. | ... | 130 | 135 | ... | 116 | 129 |
| 1864 | 41,295 | 102 | 118 | 16,899 | 111 | 110 |
| 1865 | | 95 | 115 | | 101 | 140 |
| 1866 | | 87 | 116 | | 79 | 114 |
| 1867 | | 91 | 132 | | 115 | 130 |
| 1868 | | 83 | 133 | | 109 | 115 |
| 1869 | | 66 | 106 | | 128 | 105 |
| Average. | ... | 87 | 120 | ... | 108 | 119 |
| 1870 | 49,037 | 55 | 98 | 19,235 | 113 | 96 |
| 1871 | | 51 | 116 | | 93 | 107 |
| 1872 | | 54 | 104 | | 123 | 106 |
| 1873 | | 50 | 82 | | 102 | 95 |
| 1874 | | 42 | 62 | | 88 | 77 |
| 1875 | | 35 | 58 | | 79 | 72 |
| 1876 | | 33 | 68 | | 82 | 89 |
| 1877 | | 35 | 68 | | 91 | 117 |
| Average. | | 44 | 82 | | 97 | 95 |

unless severe ones, upon the sick list; thus the majority of cases were not recorded. Since the passing of the Acts the attention of the medical officers has been more closely directed to the registration of venereal diseases, and a large number of cases of gonorrhœa have been entered on the sick list and recorded, and now appear in the returns, which would not have been shown formerly. The apparent increase of gonorrhœa, which, it may be remarked, has taken place at all the stations, whether under the Acts or not under the Acts, is probably due to this cause, and not to any real increase of disease."

But beyond this the statistics in gonorrhœa must always be, to a certain extent, an inaccurate representation of results. We know that it is a disease which, apparently cured, may return in a few days, the re-entry of the patient for treatment being entered as a new case. This does not happen with a local venereal ulcer, which, once healed, remains healed, except under the very rarest circumstances. One other important fact was suppressed by Mr. Stansfeld which it would have been damaging to mention in this connection—that Mr. Balfour was originally one of the strongest opponents of the Acts, but that, coerced by facts he became their advocate. He is asked —"Then your experience of the working of the Acts has induced you to think they have been beneficial?" He answers, "decidedly." Yet there can oe no doubt that a directly opposite impression is conveyed as to Dr. Balfour's opinion.

Such are some of the results of these Acts. They have been denied, it is true; but if there is any weight in evidence at all, the results must be accepted. But even if the assertions of opponents were to be received, they would only show that the Acts are not efficiently administered. The law has not increased either small-pox or typhoid because it insists upon vaccination and cleanliness. There may be inadequacy in the machinery, but the universally accepted principle that we diminish disease by destroying the foci of it still stands untouched.

Perhaps, in strictness, I ought to stop here, but there is an aspect in which these Acts have been viewed that demands an observation. It is said that the Acts make sinning safe, and that the very existence of disease is a protection to men's virtue. But complete immunity can never be secured. There will always be a residue whom the Acts cannot reach, and who will serve to perpetuate disease. No man can cohabit with this class, and be certain that he will escape unscathed. Nor is it a protection to virtue. Everyone here knows of numerous cases in which patients, fully aware of all the perils, have not been deterred from running the risks. If disease deters from vice, and is a bulwark of virtue, as is alleged, it ought certainly to be encouraged until it is made a certainty that infection will follow contact. The conclusion is one from which there is no escape.

Reading the publications of the opponents of the Acts, one would believe that the promotion of morality and the protection of virtue were their special prerogative, and that, on the other hand, those who see in the Acts great actual and possible good, are encouragers of vice. The charge is more than insinuated, but it is some satisfaction to know that with us there are clergy representing all religious denominations in the country, from the Archbishop of Canterbury down; for the results of the Acts have not been confined to the diminution of disease, and the protection of the future men and women of our country from a shocking inheritance, but they include the saving of girls, children, and women from a life of degradation. The report of Col. Henderson for 1870 shows that in the protected districts, 385 impure women had married, 451 entered homes, 1,249 were restored to their friends, 2,558 left the district, leaving 3,016 on the registry. The report for 1877 shows that during that year 81 married, 241 entered homes, 626 were restored to friends, 75 young girls between the ages of 12 and 18 were rescued, and 27 of the same ages, and 91 between 18 and 30, were warned, and abandoned their immoral life before their names were placed on the registry. Since the Acts were passed there has been a total decrease of 3,028 women on the registry. Is not this good work done? Can results as effective be pointed to by the agitators against these Acts?

It has always seemed to me that the people who take the ground of opposition are of the impracticable class. They will not see with their eyes. They are in an upper heaven, where they wrap themselves up in ideal purity. If they would only come down from their stand-point of transcendental morality, and look at things in the light of ordinary every-day humanity, they would see that prostitution and its accompanying diseases are, unfortunately facts. They exist, and have existed from the earliest ages, and the question which at once suggests itself to practical minds is—What are we to do with them? What do our opponents suggest as a remedy for the present urgent evil? In the Lock Hospital connected with St. George's Union, in London, sixty-five per cent. of the inmates suffer from true syphilis. They go there voluntarily, and they leave when they like—cured or uncured. Do people realise what possibilities of wide-spread disease—what legacies of misery—there are from this one hot-bed? Do they know that untold numbers of innocent women and children may be made the poor victims of men's sin? Is their welfare of so little importance that we are to raise no voice or arm for their protection? Or are they to be doomed to pain and misery while enthusiasts are dreaming over schemes of impossible perfection?

I am glad to say that in spite of reproaches the medical profession stand, with but few exceptions, upon the side of those who approve of the Acts. What opposition there is is more remarkable for its pertinacity than its reasonableness, or the reliability of its facts. Thus you will, perhaps, be surprised to be told that syphilis is by no means a very terrible disease, and that, as a rule, "prostitutes are longer lived and healthier than women who are engaged in an honest course of life." As a specimen of the evidence which goes to form opinion, I ask attention to this:—Dr. Taylor is asked if he is aware that Dr. Thomas Ballard had never seen a case of inherited syphilis, and he replies that he is; and then—"Did he not say on that occasion that he had taken very great pains in order to get a case of inherited syphilis, and failed? Yes, and I wrote to him, not mentioning my views upon the matter at all, but merely saying, 'Is it true that you have not found a single case of inherited syphilis;' and he wrote back and said, 'It is, and if you can show me one I shall be obliged, and glad to go and see it.'" If that is a true represention of Dr. Ballard's experience, London is to be envied; but I can only say that in Dublin we could unfortunately produce a good many specimens without any difficulty.

These Acts are not the best that could be devised, I do not doubt. There is room for improvement. Their provisions might be extended in some degree to sailors arriving from abroad, who are frequently the spreaders of contagion, and there are probably many suggestions that might be made and carried out if the opposition would only consent to work in the same lines for the same object.

That wrong has been done to innocent women may be true, but in very rare instances. The wholesale charges made failed when brought to the test before the Commission, who absolved the police, and reported that most of the "inflammatory statements" as to the character and operation of the new law, "so far as they had any foundation whatever, were perversions of truth." There is no law that has not been sometimes misapplied, but because innocent men have been arrested as pickpockets we do not hear of anyone claiming that thieves should have complete licence.

Of the objections to the Acts on the score of outrage to women I will let a woman (Mrs. Hoggan) speak. At one of the recent meetings to further the repeal of the law she said:—

"I believe that if care were taken in the choice of medical inspectors, and that if evidence of an unquestionable kind were required as to the fact of prostitution in the women, those latter ought not to be regarded as aggrieved persons. The womanly sensibilities of prostitutes are blunted, and it is an indubitable fact that women of the class referred to have already lost that delicacy of feeling which it is customary to speak of as being violated by the examination to which they are forced by law to submit themselves. The examination is not designed to be an outrage, but is the natural and ordinary method of ascertaining the presence of disease, and applying the remedies prescribed for its cure. Respectable women who innocently become infected with these diseases are obliged to put themselves voluntarily under the same treatment.

"It is agreed that the compulsion exerted here is the grievance, but it seems to be forgotten that the women in question are exercising a lucrative trade, which, to respectable women, is repulsive beyond the power of words to express, but which, in the majority of cases, is not repulsive to themselves. In as far as it is a trade which may spread disease, these carriers of disease naturally fall within the jurisdiction of good government, just as persons carrying on offensive trades, such as chemical works, are likewise placed under control, and they have, therefore, no claim to escape control of a reasonable nature, and to injure with impunity the health of the community."

These are the words of a woman who is brave enough not to be ashamed of her common sense. These Acts are undoubtedly a misfortune in the sense that they are necessary, but it is a libel to say that they are immoral. All the machinery for good, all the practical philanthropy, all religious schemes, have failed to extinguish the evil. The law has come in to help our holiest workers—not to supplant them. Its object is to deal with, and at least to diminish a terrible disease, and to assist in the rescue of the fallen; and in so far as it aims at and achieves these purposes it deserves support not only on scientific grounds, but on those of the highest morality and of religion.

# Clinical Records.

## CAUTION IN THE USE OF VASELINE AND SIMILAR PETROLEUM DERIVATIVES.

By W. FRAZER, F.R.C.S.

Recently some persons using Vaseline were affected with eruptions on the face resembling eczema and causing rather persistent scabs; as all the persons thus affected got their remedies from a common source, inquiry was made whether any accidental circumstances could account for this unusual accident; fortunately, the vessel in which the substance was contained was preserved. It had been sent from a wholesale druggist with a covering of red paper, from which the dye was dissolved in great measure by the mineral oil. In fact, the irritation resolved itself into another example of the well-known action of an arsenical colouring matter of the magenta class upon the human skin.

In the principal foreign cities the rates of mortality according to the most recent weekly returns, were—Calcutta 30, Bombay 34; Paris 29; Geneva 26; Brussels 36; Amsterdam 39; Rotterdam 28; The Hague 21; Copenhagen 29; Stockholm 25; St. Petersburgh 53; Berlin 24, Hamburg 31, Dresden 24, Breslau 33, Munich 38; Vienna 34, Buda-Pesth 45; Rome 24, Naples 32, Turin 28; Venice 27; Alexandria 34; New York 28, Brooklyn 22, and Philadelphia 18 per 1,000 of the populations. Small-pox caused 24 deaths in Paris.

# Transactions of Societies.

## CLINICAL SOCIETY OF LONDON.

Friday, April 25th.

Dr. Greenhow, President, in the Chair.

### DEATH OF DR. MURCHISON.

On taking the chair, Dr. Greenhow said that he wished to advert in a few brief words to the great loss the profession had sustained in the death of Dr. Murchison, more particularly because Dr. Murchison had been one of the first physicians to co-operate in founding this Society, and one of the first members of the Council, on whose energy so much of the success of the Society depended. He had also acted as Vice-President, a post which he only resigned last year, and the able manner in which he filled the duties of this office would be in the recollection of the members of this Society. Referring to Dr. Murchison's indefatigable energy he alluded to the numerous contributions which he had made to this Society as well as in other places, and especially referred to a paper on the subject of "Death from High Temperature in cases of Acute Rheumatism," which had been read at the second meeting of the Society, after a paper on the same subject by Hermann Weber, and which was the first contribution from an English physician on this subject. Dr. Murchison had also acted as one of the Committee to investigate the action of quinine in reducing temperature, and one of the last papers in the latest volume of the "Transactions" was also from his pen, on the question of the "Incubation of Scarlet Fever." He was a specimen of the fully educated man, who had built up a splendid edifice upon a solid foundation. He had obtained the gold medal for his graduation thesis at Edinburgh, and it was remarkable that this thesis was founded on surgical cases, perhaps an unusual instance of early distinction in a line which the author of the thesis had not afterwards pursued. He was indeed an eminent pathologist, not only thoroughly conversant with the appearances of the post-mortem room, but with their causes before death. In fact, he was a most intelligent and admirable observer, the notes on his cases were concise, clear, and contained all the essential point with a complete absence of surplusage. He was an admirable clinical teacher, and had the art of ever imparting fresh interest to a familiar subject. Of Dr. Murchison's professional labours ample evidence remained in the records of the Pathological Society, and in his classic work on Fevers. He had thought it his duty, as it was his privilege to say these few words, and while holding his example up to his younger brethren, as a model of reality and excellence of performance, he warned them against what he feared had perhaps hastened Dr. Murchison's death, the indefatigableness of his labours.

Dr. Crocker exhibited a case of "Lichen Scrophulosorum," and Mr. Parker a case of "Bromide of Potassium Rash, exhibiting some unusual features."

Mr. Hulke

### ON A CASE OF RETENTION OF URINE CAUSED BY IMPERMEABLE URETHRAL STRICTURE, TREATED BY TAPPING THE BLADDER ABOVE THE PUBIS, AND LATER BY EXTERNAL SECTION, A CATHETER PASSED THROUGH THE BLADDER, AND A STAFF PER PENEM, AS FAR AS THE STRICTURE, BEING USED AS GUIDES.

The man, an upholsterer, æt. 40, was admitted on the 29th of November last, with retention of urine, which had begun early the same morning. There were frequent efforts at micturation which were futile. Twelve years before he had been treated in Australia, but he neglected himself subsequently, and the stricture closed; the usual methods were employed to relieve the bladder without avail, and at 10 p.m. Mr. Hulke aspirated the bladder above the pubis. At 1 p.m. the following day no urine had been passed, and the bladder was again distended, so a long trocar was introduced above the pubis, and on the third day was replaced by a firm elastic catheter. Two slight attacks of pleurisy followed, but on Jan. 3, all attempts to pass a catheter having failed, a No. 10 silver catheter was introduced through the prostatic urethra from above, as far as the obstruction, a staff was passed along the urethra as far as

the anterior face of the stricture, and the urethra was opened between the two, the lips of the incised part held open, as in Wheelhouse's operation, and the staff was slipped into the bladder, over this a soft catheter was passed into the bladder, and the staff was withdrawn. Some bleeding followed the incision, requiring the temporary use of a plug; the supra-pubic hole soon closed, and in a short time the perineal wound contracted, the patient was now convalescent, and a 10 catheter could be easily introduced. Cock's operation had not been used, because the urethra was deflected to one side, and the proceeding described was employed instead. It was one suggested by Hunter, and adopted by Dittel of Vienna. The risk of extravasation was small, in 17 cases recently reported no such result had followed, and the merits of the operation were its ease, and the facilities for later treatment of the stricture, as for antiseptic treatment of the wound. He alluded to "Hunter's suggestions," to be found in a footnote at vol. 2., p. 292, Palmer's edition.

Mr. MARSH mentioned that, in looking over an old volume of the *Lancet*, he had met with a description of a similar treatment in a case of Mr. Houslip's. Mr. Hulke was to be thanked for adding this method of treatment to our resources in these often difficult cases.

Dr. CROCKER

ON A CASE OF ICHTHYOSIS

which had been already exhibited. The patient was a boy æt. 10, in delicate health; the mother was also delicate, there was no history of syphilis. Several raw patches had been seen at birth, these healed in seven weeks, and warty growths began at once to appear in their neighbourhod, but for the last three years they had been stationary. The body was thickly covered, not symmetrically, but extensively, with these growths. The soles of the feet and one palm were free; in places they were almost horny. Ung. picis co. had been used freely, and there had been some improvement although it was not very marked, A portion had been examined microscopically and the growth proved to be ichthyotic; the appearances were described, and the differences from a warty growth pointed out. He had to thank Dr. Duckworth for a reference to a similar case published in the "St. Bartholomew's Hospital Reports," where, however, xeroderma had co-existed. The want of symmetry in this case was chiefly remarkable.

ON THE QUESTION OF TRACHEOTOMY IN BILATERAL PARALYSIS OF THE POSTERIOR CRICO-ARYTÆNOID MUSCLES, AND SOME REMARKS ABOUT THIS DISEASE.

Dr. SEMON read the sequel of a case which he had brought under notice of the Society in the spring of last year. Although he had then expressed himself strongly in favour of the *early* performance of tracheotomy, he had given his patient a fair trial with the direct application of electricity to the paralysed muscles. This treatment, which had been daily executed from April of last year until the 17th of February of this year, had afforded considerable subjective relief to the patient, who had never since had any of the suffocative attacks to which he had been formerly subjected, but there was only very little, if any, improvement in the actual stenosis of the glottis. On the morning of February the 20th a message was brought to Dr. Semon that the patient, who had been well up to the foregoing evening, had come home from his duty at midnight with some dyspnœa, and that this had increased during the night; that he had become insensible in the morning, and that he was evidently dying when the messenger left his house. A neighbouring practitioner had been called in, but had stated that he could not do anything for the patient. Dr. Semon hurried at once to the house and found the patient in extremis, evidently dying from carbonic acid poisoning, produced by the insufficient entry of air into the lungs. He immediately performed tracheotomy, cutting with one incision through all the tissues and through the trachea, inserted a large tube, and started artificial respiration. It was, however, not till after three and-a-half hours permanently and laboriously thus keeping up the respiration that the patient commenced breathing spontaneously. The blood which had run down from the wound into the trachea and the bronchi was repeatedly sucked out by means of an elastic catheter passed down through the silver tube. Ultimately, the patient recovered, but his convalescence was retarded by the effects of the carbonic acid intoxication. Dr. Semon had brought the case forward mainly because it raised the large question, "Under what circumstances, and at what period of the disease is tracheotomy to be performed in these cases?" It had been lately stated by Mr. Lennox Browne that tracheotomy could be probably often avoided in these cases, because relief was afforded by milder remedies and methods. However, in Mr. Browne's own case illustrating this view, there was still considerable actual stenosis of the glottis in spite of the disappearance of the subjective symptoms, and thus the patient was, as Dr. Semon's case clearly proved, far from being out of danger. With regard to the facts, 1. That a mere *subjective* improvement gives no guarantee against a sudden fatal aggravation of the present state from quite trivial causes, such as a slight laryngeal catarrh. 2. That even the presence of a medical man, if he be unaware of the nature of the disease, does not give material guarantee for the saving of the patient's life. 3. That the chances of the operation become the worse the longer it be postponed. Dr. Semon finally proposed the following general principle for the treatment of these cases: "In a case of bilateral paralysis of the posterior crico-arytænoid muscles, in which a considerable stenosis of the glottis has taken place, and marked dyspnœa is present, unless *within a short time*, not only *subjective* relief, but an *actual* enlargement of the glottic opening has been obtained by whatever method might be employed, then tracheotomy ought to be performed without delay, not as a means of cure, but as a prophylactic measure with a view to the subsequent removal of the tube, in case any later therapeutical efforts should produce a real cure of the affection." In illustration of the disease Dr. Semon showed another instance of the same affection in which a hitherto undescribed laryngoscopic appearance is to be noticed. The vocal cords come completely together during vocalisation, but during deep inspiration the anterior two-thirds of the vocal cords remain close together, and the posterior thirds only separate, leaving a triangular space between their borders and the inter-arytænoid fold. Thus the bilateral paralysis is incomplete. In accordance with some recent physiological observations of Ruhlman, Dr. Semon explained this appearance as being due to the fact that most likely only the *outer* fibres of the posterior crico-arytænoid muscles, which remove the arytænoid cartilages in their entirety from the inner surfaces of the crico-arytænoid articulations to the outer ones, were paralysed, whilst the inner ones could still exercise their function of outwards rotating the vocal procession of the arytænoid cartilages. If then, secondarily, a paralytic contraction of the antagonistic muscles set in, the result would be that seen in this case. This explanation was only offered as a hypothetical one, but its possibility was demonstrated on Professor Bertel's, of Munich, model, illustrating the movements of the laryngeal muscles. Dr. Semon further said that he had seen this incomplete paralysis but twice, viz., in this and in Mr. Browne's case. The dyspnœa had been sufficiently great as to induce him also in this case to perform tracheotomy, the electric treatment having proved useless. In conclusion, the lecturer stated that since their convalescence he had treated both his patients with daily subcutaneous injections of sulphate of strychnia, but without any subjective or objective success. Opportunity was given to the members to examine themselves the laryngoscopic appearances in both cases.

Mr. LENNOX BROWNE thanked Dr. Semon for bringing forward this case, which, as he had expected, had been a practical commentary on one which Mr. Browne showed last year. In his patient he had employed strychnia hypodermically, with both subjective and objective relief. He doubted as to the possibility of curing these cases, and he was quite alive to the advantages of tracheotomy. But when the patient receives considerable benefit from treatment, it is difficult to persuade him to submit to operation. Perhaps, too, there was a tendency to put aside the use of therapeutics after the operation, which was a disadvantage. In a later case that he had treated he had used strychnia only; the patient was very ill, but with the exception of a slight relapse from catching cold he had steadily improved. He quite allowed the difficulty, which was, that a patient might at any time suddenly be suffocated.

Dr. HALL added his testimony as to the marked improvement which had followed the use of galvanism in this case, but he agreed as to the advisability of tracheotomy, as w

general rule. He would wish to ask Dr. Semon what relationship existed here between the paralysis of the glottis and the locomotor ataxy from which the patient was suffering.

Dr. SEMON, in reply, said that after the operation, strychnia had been fairly tried, in doses of from 1-30th to 1-10th of a grain; the results had been negative, at which he was not surprised. Sometimes electricity, sometimes iodide of potassium were beneficial, and hollow bougies had been recommended, but he did not anticipate any permanent benefits from these remedies, and when there was no objective improvement after a fair trial, operation should be performed. He did not recognise any connection between this disease and locomotor ataxy; they so very frequently existed independently.

Dr. TILBURY FOX

ON A CASE OF LICHEN SCROPHULOSORUM,

a case of which disease was shown by Dr. CROCKER.

One of his patients was a lad, æt. 17, delicate, and tuberculous; he had had hemiplegia, and suffered from enlarged lymphatic glands. Four years ago he came to the hospital with ill-developed lichen circumscriptus, but improved under treatment; but six weeks after his return from the sea-side, he came back to the hospital with the disease in its present condition. The follicles were raised over large surfaces, but here and there were patches more raised than the rest, varying from a threepenny-piece to a five-shilling-piece in size, of a faint red colour, and occasionally crusted; there was no itching, but after a time acne spots appeared. In these cases it was usual to find some pulmonary complication. They corresponded to Hebra's lichen scrophulosorum, but Hebra did not describe any disseminated papules. The acne spots came on later. In Dr. Crocker's case there were none. The great point was to recognise its amenability to cod-liver oil, and these were his reasons for introducing the subject.

Dr. CROCKER had met with his case a few days before. The disease, though slight, corresponded in all respects with Dr. Fox's description, except that there was some itching.

Mr. MORRANT BAKER

ON A CASE OF RODENT ULCER OF THE SCALP TREATED BY EXCISION.

The patient had first been seen in July, 1873. There was at that time a painful ulcer over the left parietal bone. It had begun in a pimple three years before. It was treated with nitric acid, and later with Vienna paste. In 1877 the ulcer had much increased in size, and the patient was exhibited at the Medico-Chirurgical Society by Mr. Gaskoin. After this, in 1878 he was re-admitted to St. Bartholomew's Hospital, and Mr. Baker excised half the ulcer in April, when the pericranium was involved. The gouge was applied a month afterwards; the other half was similarly treated, and the resulting sore dressed with iodoform. Chloride of zinc paste was afterwards applied to a few superficial patches, but by December 12th the greater part was healed. Over the centre of what had been the ulcer were some suspicious points, and under the sterno-mastoid was a painless enlarged gland. The microscopical appearances had been already recorded by Dr. Thin, in the Medico-Chirurgical *Transactions*. He recorded this case because he had hardly expected to do so much good by excision. The wound was not healed, it is true, but the patient was placed in the condition in which he had been five or six years ago.

Dr. THIN advocated the employment of the knife on pathological grounds, as less likely to leave a soil favourable for the recurrence. The spoon was well adapted for lupus, but hardly so well for the disease in question. There was no reason why enlargement of the lymphatic glands should not follow rodent ulcer, just as it followed epithelioma. Besides, the diseases were often confused with one another.

Mr. BRYANT dwelt on the importance of destroying the ulcer, and it did not matter, in his opinion, whether a blunt knife or a sharp spoon were used, if the disease was removed thoroughly. He, perhaps, was hardly satisfied about the distinctive points between rodent ulcer and epithelioma; but in cases that were clinically rodent ulcer, his results after scraping had been satisfactory.

Mr. BAKER replied, and

The Society adjourned.

## SURGICAL SOCIETY OF IRELAND.

SESSION 1878-79.

FRIDAY, MARCH 28TH, 1879.

THE Last Meeting of the Session was held in the Albert Hall of the Royal College of Surgeons,

Dr. EDWARD D. MAPOTHER, Vice-President of the College, in the Chair.

There was a large attendance of members and visitors.

Mr. B. WILLS RICHARDSON (hon. sec.), read the minutes of the previous meeting, which were signed.

(*Continued from page* 328.)

Mr. W. THOMSON read a paper

ON SOME RESULTS OF THE CONTAGIOUS DISEASES ACTS,

which will be found on page 341.

Dr. M'CLINTON (H.M. Ironclad *Belleisle*)—I may mention some results of the working of the Acts as contained in my reports to the Admiralty. I was on the *Minotaur*. She was commissioned 6th August, 1875. She remained four months in Portsmouth. There were 826 men on board, 509 aged 17 to 25; 249, aged 25 to 35; 59, aged 35 to 45; and 9, aged above 45. This is the report I made: "Syphilis, primary, 8 cases; and only three of these contracted the disease at Portsmouth. Considering that the men had night leave every evening, I think the number of cases of this disease exceedingly small. I do not attribute this to the better *morale* of the men; but to the almost complete absence of this form of disease in the Portsmouth district." Next, H.M.S. *Topaze*—She was commissioned July 17th to Dec. 31st, 1877, with a crew of 400. In my report, I stated: "Syphilis, primary. The few cases of this disease under treatment speaks well for the Contagious Diseases Acts. Although the ship's crew was at Portsmouth for three months, and had unlimited leave, during all that time not a single case of this disease was contracted there. Two of the three cases placed on the sick list were contracted in Dublin, and one case at Exeter. The *Topaze* was only ten weeks in Kingstown Harbour." Of the same ship, commissioned 1st January, 1878 to 2nd July, I reported: "Syphilis, primary. Sixteen cases under treatment; average days on list 30. Thirteen cases had their origin in Dublin; two in Kingstown; and one in Plymouth." That does not speak well for Dublin and Kingstown. H.M.S. *Belleisle*, commissioned 2nd July, 1878, to 31st December, 1878. "Sixteen cases under treatment. Only 9 weeks in Kingstown Harbour; 8 weeks in Belfast Lough; and 9 weeks at Portsmouth and Chatham. Of these cases, five were contracted at Belfast; six at Kingstown; and two in Dublin; and but one each in Weymouth, Portsmouth, and Plymouth." I think these facts speak well for the protected ports.

Dr. JACOB—I do not think it necessary to offer many observations as to the general scope of the very forcible paper of Mr. Thomson. In fact, it seems to me that the statistics which he has laid before the Society require no further comment. In reading the literature of the opposite side of the question, I do not know that I have ever come across any facts which would go the slightest distance towards unseating the conclusions at which he has arrived. I rise now to remove from the minds of the members of the Society and any others who hear me, and not be acquainted with the circumstances, the impression that there is any force whatever in the statement sown broadcast through the newspapers, that the effect of these Acts is to outrage innocent women, and hence that the evil which they do in that respect far transcends the good. This statement has been made on public platforms in Dublin and elsewhere, and also within the House of Commons. Having investigated the question, read all the Acts of Parliament thereon, and visited the Lock Hospitals to make myself acquainted with the systems there pursued, I have arrived at the most firm conviction that the circumstances under which an innocent woman could be suspected, and subjected to outrage, even of examination, are hedged round with such precautions that such a case would be almost impossible. The *modus operandi* is this: The police sergeant charged with the duty of inspecting the district, keeps a list of all the prostitutes plying their trade within the district. Supposing he suspects a woman of carrying on prostitution, it is his business to watch for some circumstances, such as being about late at night in the company of soldiers, or others, to confirm

his suspicion. It is then his duty to address the woman, explain the suspicious circumstances under which he has seen her, tell her she is suspected of prostitution, and ask her if his suspicions be correct, whether she will make a voluntary submission, by presenting herself for examination. At the same time he serves her with a paper, called a requisition for a voluntary submission. She may tear it up and treat it with contempt, while the sergeant has no power of coercing her to submit, nor can he fasten upon her any allegation of prostitution without taking further steps in a roundabout way. In the first place, he has to search out evidence sufficiently strong to convince a bench of magistrates of the actual guilt of the woman; and it is all but impossible to get such evidence, being confined, as it usually is, to the participators in the offence. So great is the difficulty of obtaining evidence sufficient to convince a bench of magistrates that forced submission is almost an unknown thing. Such evidence as the sergeant obtains he must bring before his superior officer, to get his sanction to institute a prosecution. That done, information is laid against the woman as if she had committed a petty larceny, or any other crime. She is served with a summons to appear before the magistrates. Here, again, the law steps in, and lest she might be fastened with an allegation of prostitution the case is heard with closed doors, while it is competent for her to appear, either by herself or her solicitor, and free herself from the imputation cast upon her. The magistrates are bound to act upon the evidence, and presuming it to be sufficiently strong, they issue an order directing the woman to attend for the purpose of examination. Still she goes out of court perfectly free not subject to insult in the custody of police; but at a given time she attends at the examining station, and there is examined. If found to be untainted she is allowed to go away, and it is perfectly open to her then to cease from the course which brought her under suspicion; and if she does, she is free from any interference whatsoever. If, on the contrary, she is found to be infected, the evidence is strong that she is guilty of prostitution, and it is competent to restrain her until the disease be cured. When cured, she is served with a paper declaring she is free from disease; and being then allowed to go free the whole proceeding must be commenced *de novo* if considered necessary to bring her under the operation of the acts. What I have said proves that the contingencies under which an innocent woman could be subjected to outrage or injury are so remote that practically the compulsory clauses are but seldom enforced. I was informed that at the Lock Hospital, Kildare, there had not been a single case of compulsory enforcement for a year and a half, and that in fact 99 in 100 of the patients occupying that hospital were well-known, voluntary, avowed prostitutes, who came voluntarily for examination and treatment. Such a thing as the possible application of the Acts to an innocent person within that or any of the neighbouring districts had never been heard of, nor had such an allegation been made. I think, therefore, that the law has fenced round the liberty of the subject in this matter with the utmost care, and that there is not the remotest ground for the statements made that innocent women have been subjected to outrage. These statements have been, as Mr. Thomson said, entirely refuted before competent tribunals; but from what I know of the machinery of the system, it strikes me that they would hardly need refutation. I have studied a good deal the literature of those who condemn the Acts, and anything more completely inconclusive or unconvincing than the facts which they desire to sustain their case, or the arguments which they put forward, I have never read. I have been in epistolary communication with the conductors of this agitation, and never yet succeeded in getting from any one of them an answer to such facts as Mr. Thomson has brought before the Society. I think there can be no doubt whatever that the views which he has expressed are founded on truth and justice, and such as will commend themselves to the good sense and approval of the Society.

Mr. TUFNELL—There is no argument to displace what has been said by Mr. Thomson. The united opinion of the Surgical Society of Ireland that the Acts are for the good of mankind, is sufficient to establish these Acts against anything that silly people may say.

Dr. M'CLINTOCK—At the risk of being looked upon as a crazy enthusiast, and one of those remarkable mortals who are wrapped up in transcendental morality, I must express my own difficulty in accepting the moral basis of those Acts. The whole question of the propriety and morality of the Acts is considered in the paper brought before us by Mr. Thomson, and I frankly and freely admit it is a most able and elaborate paper, and I presume is intended as a refutation of what was said in Dublin some months ago by Mr. Stansfeld and others. But the question that I would ask in reference to the Acts is one that affects purely my moral sense. "Have these acts tended to diminish the crime of prostitution?" I would like to know that. I believe the direct tendency of the Acts is to afford, as far as the law can go, every encouragement to illicit sexual intercourse by divesting it as far as possible of those penalties and restraints which certainly are attached to it by nature. That the amount of disease among soldiers and sailors is diminished where such rigorous and expensive machinery is at work to restrain and cure venereal disease among the prostitutes, might have been foreseen *a priori*, as in accordance with common sense and reason. But after this wholesale parliamentary sacrifice of moral principle what have we gained—what is the enormous result achieved for it? There is an increase every year in gonorrhœa.

Mr. THOMSON—I beg your pardon. There is a decrease.

Dr. M'CLINTOCK—Except in the last line of figures in your tabular statement, the number of cases of gonorrhœa has increased. There are many surgeons who hold that the remote effects of gonorrhœa are more troublesome and lasting than those of syphilis. Speaking on a subject like this one should be prepared with data and authorities. I am wholly unprepared, and it is presumptuous of me perhaps to say anything on that account, but it is only on the one phase I have ventured to intrude my observation. At the same time I readily and willingly bear testimony to the ability displayed in this paper—the elaboration and collation of data, and the excellence of its composition.

Dr. DOYLE—In reference to the remarks of Dr. Jacob, I have the authority of Dr. Morgan for stating that it is a well-known fact that no medical man can tell whether a woman is suffering from syphilis or not. She may have apparently no local sore or secretion at the time of examination. Therefore, as medical men, we ought to be opposed to the carrying out of the Acts in Dublin. The fact of the Acts being enforced would be injurious to families. I have had cases where married men went to protected districts for prostitution, expecting they would not get the disease. That is one of the proofs against the carrying out of the Acts. I do not think we are justified by the figures of Mr. Thomson in coming to a universal conclusion, and as to the justice or injustice of the Acts, we cannot form an opinion in this respect until they are applied all through Great Britain.

Dr. ROBERT MONTGOMERY—I chanced to be on the platform in the Rotunda the evening Mr. Thomson got up to refute the arguments brought forward by some ladies and fanatics, and I must say he deserved credit for facing the enormous uproar, which was the only argument used on the occasion. He was not permitted to state the facts which he so admirably stated to-night. My object in rising is to say that I am a great admirer of these Acts. I think they are most beneficial, and it would be a great matter if there were any means of bringing Mr. Thomson's observations before the public at large.

Mr. WM. STOKES—After hearing Dr. M'Clintock's observations, I feel constrained to say a few words. Though sympathising very deeply with the objects that the promoters of those Acts have in view, I must say that I would join those who wish to see the Acts in their present form repealed. As long as they exist in the condition that they are in now, the promoters will always be open to the charge of licensing vice, and encouraging prostitution. But the reason why I would like to see those Acts repealed is that, notwithstanding the undoubtedly good effects with which they have been attended they do not go at all far enough; just like the man who, having property to guard against thieves, bolts and bars and barricades the windows at one side of his house, and leaves them open at the other. Until the Acts are framed so as to include both sexes, I think the promoters of those Acts will always be open to the charge of licensing vice. This should not be at all looked upon as in any way a local question, or a question that affects merely one country. It is an international question, and I fully endorse the opinions put forward by the illustrious American surgeon, Marion Sims, who thinks that no satisfactory results will be obtained in stamping out syphilis until all civilised nations join in stamping that disease out; and the eminently satisfactory results obtained even by the Acts as they are at present in force, show that the disease is essentially a preventable disease. Though the members here present may be aware of what the suggestions are that have been made by Marion Sims, it

would not be out of place, as Mr. Thomson did not allude to them, to mention one or two. One was that in every seaport town the surgeon of the vessel, be it steamer or sailing vessel, should certify to the authorities of the town, before the crew landed, the sanitary condition of the crew, and that if there were any cases of syphilis on board, those cases should be taken charge of, and put into hospital, and kept there until they were cured. Another was that in large towns they should be put under the same restrictions as in cases of cholera or small-pox, and in America, of yellow fever; they should be all dealt with by a board of health, and looked after, and put into hospital for treatment until the disease is cured. Until some such restrictions as these are made, I look upon the present Acts, no matter how beneficial the results may be in the few places where they have been tried, as only half meeting the difficulty; and, therefore, it would be well that this Society, through Mr. Thomson, if he agrees with what I say, express an opinion endorsing the views of Marion Sims, in reference to those points I have mentioned. Dr. M'Clintock's question—"Has it diminished prostitution?"—can be easily answered. I have not directed as much attention to the subject as Mr. Thomson, but I have seen it stated, and the statement has not been contradicted, that in the protected districts prostitution has been very largely diminished. Of course, I speak under correction. If that be true, it is a sufficient answer to the query put with such force by Dr. M'Clintock at the commencement of his observations.

Dr. Chas. Moore—As I have belonged to the mercantile marine, I may make one or two remarks. The mercantile marine has suffered very considerably from syphilis. In fact, this very day I got a communication from a distant part of the globe, complaining of the terrible extent of the disease among merchant sailors, and the want of a provision something similar to that in the army and navy. I know what has been done in America in protecting sailors from disease. A British ship-owner is jealous of any law interfering with his ship or crew, even though it may be for the protection of his own men, and therefore of his own property. If a sailor is not in good health, he is unable to protect the ship from storm. In consequence of this, many things have been done by the Government to protect sailors from syphilis and other diseases, which must materially interfere with their efficiency. The effect of protection has been to put down almost entirely the dancing houses in garrison towns, which were resorted to by girls of tender years from the country. These girls, even of ten, eleven, and twelve years of age, the daughters of respectable farmers and others, used to be decoyed into dancing houses by the old prostitutes, having come into the garrison towns from the country to see the amusements. In every respect I believe the Act has been beneficial, and I should be glad to see a system such as that recommended by Dr. Sims carried out. Our sailors have got the credit of propagating the disease, and many Continental nations have more strict laws as regards sailors than ours.

Dr. M'Clinton, R.N.—We are far in advance of Dr. Sims in defence of sailors. No English man-of-war from an infected port is allowed to land her crew. The men who have disease are sent to hospital. That has been the rule in the navy for the last ten years.

Mr. Wm. Stokes—My observations applied more to the mercantile navy.

Mr. Thomson, in reply, said, Dr. M'Clintock and Mr. Stokes are the principal speakers who have taken rather an opposite view to that which I have endeavoured to advocate. I am glad to find, however, that Dr. M'Clintock admits at once that, *à priori*, those Acts are calculated to diminish disease. As to the number of gonorrhœal cases being increased, I called attention to the table giving the number annually detected in the last ten years, and that shows a gradual diminution. On the question of morality, Dr. McClintock put the very strong question, "Do the Acts diminish prostitution?" and he maintained that they rather increased and encouraged it. I thought I had sufficiently referred to that in my paper by giving Col. Henderson's statistics. The report for 1870 shows that in the protected districts 385 prostitutes had married, 451 had entered homes, 1,249 had been restored to their friends, and 2,500 had left. If I take up the whole series of years we have this result:—"The total number of prostitutes in the districts under the Acts continues to decrease. If the numbers of women discovered by the police to be common prostitutes at each station when the Acts where first set in force are added together, the total amounts to 4,286. On the 31st December, 1877, it was 1,824, or less than one-half. The Acts, however, attack the evil in other ways. There were 1,694 houses of ill-fame open when the Acts came into force. In 1877 there were only 526." So, upon the score of encouraging prostitution, Dr. M'Clintock's position is untenable. Mr. Stokes has admitted also the beneficial results following the operation of those Acts. His objection is that they do not go far enough, and that both sexes ought to be examined. My answer to the universal application of such a law as this is, that there is a great difference between the woman and the man—namely, that the woman is a prostitute and the man is not. If there were such beings as male prostitutes I would be entirely in favour of the application of the Act to them. I agree with Mr. Stokes that those Acts should be further extended, and I suggested in the course of my paper that there were various improvements that might be made, and also in the direction of examining sailors. I am glad to hear that in the case of the navy the men are examined approaching port to weed out those that are diseased. Dr. Tufnell has reminded me that that habit existed in the case of the army. I do not think it is universal now. Perhaps it is not done at all; but at one period it was the habit. Dr. Doyle has raised a point with reference to the difficulty of detecting syphilis in a woman. Of course, in certain cases, there is difficulty; but men as distinguished as he has mentioned (specially Mr. Berkley Hill, London), who are largely engaged in the treatment of syphilis, and have great experience, say that with care, although there is sometimes a difficulty, so far as it is possible to make anything sure, they can detect whether or not a woman is suffering from syphilis. Altogether I feel very well pleased with the tone of the discussion, which, while in some respects differing from the arguments I have endeavoured to urge, is entirely in favour of the good results that have accrued from the Acts in diminishing disease.

### THE VICE-PRESIDENT'S ADDRESS.

The Vice-President—Gentlemen,—The President being absent on official business—namely, the visitation of the Queen's College of Cork, it devolves on me to close the Session with some remarks. They will be brief and hasty, as my spare time for the last fortnight has been occupied with duties relating to the Medical Bill. That measure to-night leaves the House of Lords, and if a Conjoint Examination is expedient in the interests of the public and the profession (which many wise men doubt), it cannot be established in any way less hurtful to our College than by the Government proposals as amended at the suggestion of the Dublin University and Colleges of Physicians and Surgeons. Uniformity of curriculum, examination, and fee in each part of the United Kingdom is now provided for in the Lord President's Bill. I can congratulate you on at least three points—1st. The attendance of members, which for each night averaged 37, while other medical societies fell considerably below us in this respect. 2nd. The number of recent pathological specimens, of which 22 were exhibited and described; one at least of these was worthy of more lengthened consideration and discussion, that shown by our unequalled Secretary, Mr. Richardson, the parts amputated at the hip-joint in which he had used Davy's wooden lever for compressing the common iliac artery, through the rectum. You will be glad to learn that the patient progresses most favourably. And 3rd, the excellence of the written communications. They were as follows: Mr. Thomson, "The Treatment of Croup by Tracheotomy;" Mr. Wheeler, "Fracture of Patella;" Dr. Atthill, "Removal of a Calculus from the Female Bladder;" Mr. Kelly, "Notes on Dislocations;" Dr. Atthill, "Four Cases of Ovariotomy, with remarks;" Prof. Stokes, "Cases of Ovariotomy;" Mr. Kilgariff, "Case of Genu Valgum successfully treated by Ogston's Method;" Mr. Swan, "Intra-Uterine Fractures;" Dr. Brereton's invention, a Surgeon's Vice, exhibited, and its application demonstrated, by Mr. McDonnell; Mr. Corley, "Abdominal Section for Intussusception;" Dr. Kennedy, "Effects of Posture in altering a Bruit-de-soufflet;" Mr. Richardson, "Fibroma removed from the Back" (sections exhibited); Mr. J. E. Little, "Excision of Ankle-joint." To these are to be added the valuable papers read to-night. It would be invidious to particularise any of these essays; but that all were worthy of notice the interesting and high-toned discussion which followed each sufficiently proves. Although there was good matter for every meeting, it may be desired that a larger proportion of our metropolitan and provincial members should contribute to the proceedings. Lastly, I recall the mournful reflection that death has been very busy amidst your Council, on the list of which the names

of B. Francis McDowell, John Barker, and Henry Tyrrell, heretofore following each other, will appear no more. We have also to deplore the loss of Mr. Ledwich, who, although not active in the Society, was one of the most trusted Councillors of the College. The careers of our deceased friends, successful though most diverse, afford many lessons worthy the consideration of our younger members, which I hope to point out if I have the honour of filling this chair next Session.

# Department of Lunacy.

## MR. DILLWYN'S LUNACY BILL.

We have been looking forward for some information in reference to what Mr. Dillwyn proposes to introduce into his "Lunacy Bill." We are not surprised that this member should have taken the initiative in the matter, for he is alone responsible for the Lunacy Committee held last year, and for the mode in which it was conducted, and for the evidence which was deemed as admissible. The member for Swansea has at various times during his parliamentary career occupied the attention of the House by asking questions relative to lunacy matters which from time to time have cropped up, and one of the last that we remember was in reference to the confinement of Miss Wood, one of the Shaker Community, who was placed under certificate in a private asylum in the country. The question asked in the House was indeed an extraordinary one, and proved that the honourable member was ignorant of the very elements of the Lunacy Laws. He asked by what clause in the Lunacy Act the incarceration of a person in an asylum could be allowed, who was not dangerous to herself or others? and as it was not shown that Miss Wood was so, whether she was not confined illegally? The House evidently could not answer the question, but next day a letter appeared from Dr. L. Forbes Winslow in the *Times*, drawing the honourable member's attention to the fact that it was not necessary for a person to be either dangerous to herself or others to be placed in an asylum, and there was no clause which could be so construed. The various questions asked by the Lunacy Committee proved that most of the members were lamentably ignorant of the subject they had under their consideration. When we find the leading members of the specialty asked whether it is not possible to place a sane person in an asylum, and whilst there drug him with certain medicines until he becomes insane, and this question asked over and over again, we shudder to think that men of high calibre who composed this committee should have tolerated such preposterous nonsense. Why did not the members of the Lunacy Committee visit all the private asylums near London, or some of them, instead of listening to the "hair-brained chatter of irresponsibility," and believing the insinuations made by discharged lunatics? In such a question, affecting as it does the management of asylums and the care and treatment of those mentally afflicted, we state that the proceeding of the Committee in general was badly regulated and utterly failed in its *modus operandi* to arrive at a right or just conclusion on the subject. We propose in a subsequent number to discuss Mr. Dillwyn's Bill in detail.

Traumatic Insanity. — Dr. D. R. Brower read an interesting paper before the last meeting of the West Chicago Medical Society on this subject and reported three cases. The first case was that of an army officer, who, before injury, was noted for his kindliness of disposition, temperance, and affection for his friends and family. He received an injury of the head, a scalp wound, with possibly a slight injury to the skull, from which he apparently recovered. Afterward, his emotional disposition began to change; he would have cephalagia, at times very severely, and soon got to taking liquor to intoxication at these times. At such times he was suspicious, vindictive, and brutal, and would beat his wife and children. These attacks were fits of mania. They continued at intervals as long as the case was kept track of. The second case was that of J. K., lately tried in a local court for murder. He was an Irishman of middle age. Had been educated by a brother who was a priest of the Catholic Church, to which the patient was devotedly attached. He was naturally kind and peaceable. He received, while in the army, a head wound, involving the skull in a depression. Some months afterwards he began to be suspicious of those about him at times; to have severe attacks of cephalalgia. Finally, he would have attacks of *petit mal*, and the reporter thought there was, from the evidence, no doubt he had had two fits of *grand mal*. He had become estranged from most of his old friends; repeatedly left situations for the sole reason that he thought his employers and comrades were "down on him;" had acquired a mortal enmity toward the Catholic Church and the members of its orders. In his attacks of cephalalgia he was often thought dangerous by those about him, who kept out of his way. He had camphor about him constantly to keep evil spirits away. He woke out of a sleep one night and shot his wife who was beside him, and then shot himself. The wife died. He recovering, was tried for murder. The verdict was that the prisoner was guilty of murder, but that at the time of the trial he was insane. Shortly afterwards he cut his throat in his cell and died.

The third case was of a man also tried in the local courts for the murder of his wife, but who, at the time, and at the time of the murder, was so unmistakably insane that nobody doubted it, and he was sent to the asylum. In this case the insanity was clearly traceable to an injury of the head, received years before, and which was followed slowly by, first, headache, then inattention to business, then by other more positive symptoms of insanity.

Periodical Mania.—Dr. J. H. Salisbury read the history of a case of this character that recovered while taking anti-periodic doses of quinine. The patient was a man of twenty-five, a teamster, temperate, and healthy previous to the present illness. It was reported that two weeks before admission to hospital he had fallen from his waggon and was injured to the extent of scratches about the head. That night he had vomited. He was sane six days, although not well. On the seventh day he had a chill, followed by fever, and an attack of delirious mania. This subsided, to be repeated in two days. When brought to the hospital he was in a state of wild delirium, and had to have a strait-jacket. On admission his temperature was only 100° F., and the pupils were slightly dilated and alike. Bromide of potassium and chloral were given to quiet him, and he slept. Next morning he was quiet, but not entirely rational. He had no symptoms of acute meningitis afterward, but had several slighter attacks of maniacal delirium, occurring with no particular regularity. He was given five to ten grains of quinine each day. In a few days he had entirely recovered.

Of the 213 candidates examined at the Royal College of Surgeons of England, during the past fortnight, 45 failed to reach the required standard, and were referred for three, and 7 candidates for six, months' further anatomical and physiological study.

## THE PROSPECTS OF MEDICAL REFORM.

ON Monday week (the 21st) the Medical Bill of the Government appeared in the notice paper of the Commons for its second reading, but it did not come under discussion, and we understand that its appearance there at all was the result of an error in the printer's office. It is, however, set down now for Thursday, May 1st, when it will be met by the opposition of Dr. Lyon Playfair, who, on behalf of the Scotch colleges, will move that the whole question be submitted to a select committee. If the Government put the Bill high up on the notice paper it will no doubt be debated, and we should presume that Dr. Playfair's opposition will not avail to defeat the second reading. If it is preceded by other measures, which cause it to be delayed beyond half-past twelve, it cannot then be taken, for opposed orders are not permitted to be discussed after that hour. Meanwhile, the profession in Ireland is making strong efforts to support the Bill. The Council of the Royal College of Surgeons in Ireland has presented the following petition :—

That your petitioners, having had under consideration the Medical Acts (1858) Amendment Bill, as brought from the House of Lords to your honourable House, are of opinion that the object which the Bill seeks to attain, the principles upon which it is framed, and the methods by which it proposes to effect its purpose, are such as to deserve approval.

That your petitioners are of opinion that the competency of medical practitioners may be effectually secured, as proposed in this Bill, by the establishment of Conjoint Examining Boards, which shall grant certificates of competency upon equal terms throughout the United Kingdom, whether as regards curriculum, standard of examination, or fee, the person so examined being subsequently attached to a medical authority by being granted a diploma.

Your petitioners, therefore humbly pray that your honourable House may be pleased to pass the said Bill.

The Council of the Irish Medical Association has also adopted a series of resolutions in favour of the Bill, subject to amendment, in the following terms :—

That the Council of the Irish Medical Association, having had under consideration the Medical Acts Amendment Bill of the Lord President as amended and passed by the House of Lords, is of opinion that, in respect of the object which it seeks to attain, the principles upon which it is framed, the Bill is—so far as it goes and subject to amendment of detail—deserving of the unanimous and earnest support of the medical profession.

That inasmuch as the principle of perfect uniformity in the education and minimum qualification of medical practitioners has been assented to by the vast majority of the profession, and as the suggestion to obtain that uniformity by means of conjoint examination has been fully discussed, and almost unanimously approved by medical teachers and practitioners, the Council is of opinion that further investigation of this portion of the subject by a Select Committee is unnecessary and undesirable.

That this Council, believing that the constitution of the General Medical Council—to whom the administration of the system proposed by this Bill is entrusted—is intrinsically faulty, and that the circumstances which have rendered necessary a measure of medical reform are the direct result of such misconstitution, is of opinion that no Bill for the regulation of medical education can be effective which does not provide for a reconstruction of the General Medical Council, and for the direct representation of the general medical practitioner therein.

That, considering the Bill of the Lord President seriously defective in that it does not arrange for such reconstruction, the Council warmly approves of the proposal of the Government to submit that question—and that alone—to a Select Committee, upon whose report the Bill may be amended in this respect before it becomes law.

That the Council declares, emphatically, its opinion that the existing system of education and qualification of medical practitioners urgently needs amendment in the interest both of the public and the medical profession, and deprecates therefore any proceeding which might tend to impede a satisfactory settlement of the question within the present session of Parliament.

These resolutions, when embodied in a suitable form of petition, will be laid before Parliament, and they ought to have great weight, as emanating from the professional organisation which is recognised as representing the profession in Ireland.

It is right to explain that, in thus pronouncing their approval of the Government Bill (subject to obvious improvement) the Irish professional bodies do not ignore the merits of the other Bills now before the House—especially that of Mr. Mills, which represents the views of the British Medical Association. This latter Bill is quite acceptable, and—in that it contains provision for direct representation, which the Government Bill does not—is even preferable to the Lord President's Bill. The profession would, therefore, be very glad that it should become law, and only withholds support because of the obvious prudence of helping the Bill which is most likely to succeed. If any Bill passes, no doubt it will be that of the Government, and we therefore think that the Irish Medical Association has been wise in linking its destinies with that Bill rather than with the equally acceptable, but weaker, measure of the British Medical Association.

## HEALTH OF LONDON FOR THE YEAR 1878.

THE low rate of mortality in London, if we take the density of its population into consideration, is, says the Registrar-General, more striking than its magnitude. The mortality increases with density of population in 593 districts of England and Wales; and the law of increase is such that for every increase of density the mortality increases nearly as the 8th root of the density. With a density of 29,322 persons to the square mile, the mortality of London should be 35·2 per 1,000. Were not special systems of drainage and cleanliness in use in this metropolis, by which the mortality in the years 1874-8 is reduced to 22·8? The consequence is that the deaths are so low as 83,695, and the births being 129,184, the registered births exceed the deaths by 45,489. The density of the population is continually increasing. Thus, while in 1842 there were 16,367 persons to a square mile, there were 28,602 to a square mile in 1876. This alone would have caused an increase of mortality had it not been for the many sanitary improvements that have been made since then. In 1840-5 the water supplied to London was taken partly from the Thames at Hungerford Bridge and Battersea, where it was mixed with the sewage of London, while in 1874-8 it was taken from the Lea, the New River, and a purer portion of the Thames. The great system of sewerage has been carried out, and the whole of South London has been drained. All this has reduced the mortality from 24·5 in 1840-4, and from 26·2, the corrected rate, as the increase of density would imply, to 22·8 per 1,000. Much, however, remains to be done. According to Dr. Frankland's report on the water supplied to London during the year 1878, the inner circle was supplied during the year by eight companies with a daily average of 138,657,848 gallons of water. Of these more than 65,000,000 were often much polluted with organic matters of animal origin, and upwards of 56,000,000 occasionally so polluted, while only 8,092,987 gallons were uniformly delivered in a pure and wholesome condition. Besides, the Registrar-General lays it down as a principle that the mortality of healthy districts should not exceed 17 per 1,000. We have it on record that in the ten years 1861-70, the mortality was, in 53 districts in England and Wales, as low as 16·75 per 1,000. The mortality in this metropolis was 25—it has been reduced to 23—and 6 per 1,000 remains to be reduced before 17 is attained. The Registrar-General refers to the advantages that would result from the present water companies being bought up by the Government. Mr. Bateman, who constructed the Manchester waterworks, and the waterworks of Glasgow, which is supplied by Loch Katrine, says that "If no waterworks existed in London, 100 million gallons of fresh water a day could be supplied from Wales for an annual expenditure of £470,000, covering interest on capital (4 per cent. on £8,000,000), and working expenses at an annual charge of £150,000. This estimate is satisfactory proof that London could be supplied on the constant system, by which fires are so readily extinguished, for £470,000, whereas £1,283,548 is now paid for water polluted more or less by the sewage of innumerable towns. No doubt the chalk stratum round London contains a vast store of water, which would furnish a large portion of the supply required.

The deaths in the 52 weeks were 83,695, which were 1,000 in excess of the average. Of these about one-half (42,099), were at ages under 20, and of these again 21,176 were of children under one year of age. The causes of death include 18,220 by zymotic diseases, 15,509 by constitutional diseases, 37,825 by local diseases, 8,695 by developmental diseases, and 3,310 by violent deaths. It is curious to observe that the deaths from ovarian dropsy were 60, whereas the average annual number of deaths in the previous ten years was 33. This, observes the Registrar-General, is singular, considering that Mr. Spencer Wells has shown that ovariotomy can be performed in the great majority of cases with safety. To our mind the fact is rather ominous as showing that the prevalence of this disease is, from some cause or other, decidedly on the increase. The mortality of 23 great towns in the United Kingdom was 24·4. The mortality in the five years 1874-8, was below this average in Portsmouth (19·), Brighton (20·), Edinburgh (22·), Plymouth (22·), Nottingham (22·), Sunderland (23·), Bristol (23·), Norwich (23·), Leicester (23·). It was above the average in Oldham (26·), Glasgow (26·), Salford (27·), Dublin (27·), Liverpool (28·), and Manchester (29·). The sanitary condition of Liverpool has greatly improved in recent years. In the two years 1865-6, the mortality was 40·2; but it has fallen to 27·8 in the four years 1875-8. We may also briefly remark that the mortality was remarkably low in Dover (16·2), Chatham, Rochester, Maidstone, Hastings, Barrow-in-Furness, Cheltenham, Halifax, and Cardiff, whilst it was very high in Wigan, Bury, Ashton-under-Lyne, Blackburn, and Preston, being as high as 30 in two or three of these places.

Taking a glance at the health of other large towns, we notice that the rate of mortality was 37·7 in Calcutta, 45·4 in Alexandria, and 48 in Madras. Among European towns the mortality was low or moderate in Christiana, Copenhagen, Stockholm, Geneva, Amsterdam, Paris, Dresden, the Hague, Hamburg, Rotterdam, Brussels, and Venice, ranging in these towns from 18·5 in Christiana, to 28·7 in Venice. On the other hand, it was high in

Vienna (29·), Rome (29·), Berlin (29·), Turin (31·), Naples (33·), Munich (34·), Trieste (36·), and St. Petersburgh (47·). Moreover, while the mortality was 24·8 in New York, and 30·9 in Montreal, it was only 20·1 in Brooklyn, and 18 in Philadelphia.

## THE IRISH CORONERS.

In our last issue we referred to the recent large meeting of the Irish Provincial Coroners in Dublin, and of the subsequent interview that a certain number, forming themselves into a deputation of their body, had, with the Attorney-General for Ireland, Mr. Gibson, to whom they fully detailed their grievances, did not hesitate to assert that he considered that their statements were such as would cause him to recollect them, and that he hoped to see their grievances very soon brought before the Committee investigating the English Coroner's Bill now before Parliament.

Several of the Irish Coroners, being members of our profession, in fact, the position of the coroner and the medical man being very closely linked together, we may be excused for again devoting further space in our columns to the present appeal of the Irish Coroners to England's law makers.

Doubtless there are some who may consider that the ancient office of Coroner is but a relic of bygone ages, and that the statute which created it might safely occupy a place in the pigeon hole, amidst the crumbled dusts of statutes which had their origin about the same period, and which, in the age of advancement of legal reform, have become things of the past. The office of Coroner has, however, outlived all, and has thereby unmistakeably proved its importance by its long vitality. The abolition of the office cannot therefore be entertained. It is quite reasonable that the Government should make an effort to improve the position of the office and officer, and that the very modest request of the Irish Coroners should be complied with, namely, to extend to Ireland by legislation some of the privileges that are enjoyed by the English Coroner for discharging duties in no degree more efficiently than are being performed by the Irish Coroner. The English Provincial Coroner has, on an average, a salary of three hundred pounds per annum, and in addition to that has ninepence a mile to and from the inquest; his Irish *confrère* is ruled by special legislation, 9th and 10th Vict., cap. 37, which does not confer on him a fixed salary, but tells him he must hold sixty-seven inquests in the year, otherwise he will not receive one hundred per annum, and that if he holds say six hundred inquests or any number over the sixty-seven, he will not receive any payment for his loss of time in doing so, and that instead of receiving ninepence per mile to and from the inquest, he must be satisfied with sixpence per mile to the inquest, and nothing for the home journey. The Coroner in England is empowered to appoint a deputy to act for him in illness or unavoidable absence. The Irish Coroner requests the same privilege. We may here parenthetically observe that recent legislation has raised the salary of the Coroner of Dublin City from one hundred and thirty pounds to five hundred pounds per annum, with an additional one hundred to provide himself with a clerk, and whilst the Metropolitan County is provided with two energetic, efficient and intelligent coroners, whose functions embrace nine or ten townships thickly inhabited and studded with public institutions, having jails, asylums, hospitals, reformatories, &c., the City of Dublin Hospital, being one of the public institutions, the number of inquests held each year is far in excess of the required number to bring the limited salary, and yet these two functionaries have not had any special legislation in their behalf. The present Government have, we presume, been made aware that Parliament was on two occasions, within some years past, asked to improve the position of the Irish Coroner. In 1870 the Irish Coroner's Bill was introduced by Mr. Vance, M.P., when on a division for its second reading, Ireland spoke in its favour; it was strenuously supported, not less than one hundred of the Irish M.P.'s voting for it. The Government then interposed and promised to bring in on the following session a satisfactory measure, a promise never since realised. In 1874, Messrs. Sir John Gray, the late M'Carthy Downing and Mr. Vance, brought forward the Irish Coroner's Bill when it obtained a second reading, Parliament thereby admitting that the office was one which required reform, and the country demanded, as it now demands, that the time had arrived when such an important functionary as the Irish Coroner should be treated with the same justice as his brother Coroner in England, who neither in education nor social position is his superior. The Irish Coroner, who is elected by a large constituency, an election which very often entails on him very great expense, is a very influential and popular person in his district, and by his voice or quiet advice can, as is often very well proven, secure numberless votes to a candidate for a Parliamentary seat, and may thus weaken or strengthen the Government of the day.

As the Chief Secretary has given evidence of his desire in some instances of assimilating the laws of England and Ireland, he has now a well-deserved opportunity of extending to Ireland in its full entirety, and with the amendments submitted by the Irish Coroners' Asssociation, the English Coroners' Bill. We will, therefore, look forward with the greatest interest to this being accomplished, and the pledges of former Governments thus realised by removing the grievances of the worst paid, and yet the most responsible, officials in Ireland.

# Notes on Current Topics.

## Pasteur on Septicæmia.

At the discussion on "Septicæmia" at the French Academy of Medicine, March 11th, 1879, Pasteur contributed a very important statement of his opinions on the cause of this condition. According to M. Pasteur, there is not a sanitary state, or an epidemic state, and he did not believe in epidemic conditions, outside of the presence of germs: this opinion, this conviction even, being the result of the studies he had made on silkworm disease. The prejudice for infected or epidemic centres had never been sustained with more vigour than at the epoch when this disease reigned in the South, in the department of

the Gard. It raged there for seventeen years. In 1855, M. Pasteur went down to study it. The innumerable works which were published on this question all spoke of infected centres. In the year following, and also in 1867, M. Pasteur demonstrated that nothing was easier than to prepare, to make a seed of the silkworm perfectly healthy, and this seed brought up the year following, would not die of the disease. For instance, M. Pasteur referred to a seed, which afforded an example of the corpuscle which caused the disease. Though you bring up this seed in this *soi disant* infected medium, almost always a great number of the *papillons* are attacked, but none of the worms ever suffer. At the present day, the disease of silkworms in the department of the Gard has completely disappeared.

M. Pasteur did not believe that there was a sanitary condition properly so-called—"tout est sain ou tout est infecté!" As regards the malady of the silkworms, there was not infection, there was only an abundance of germs.

At the Maternity, where the evil state existed, about which M. Herdieux had just spoken, M. Pasteur believed there was an abundance of germs, determining puerperal infection. The conditions for the development of these particular germs are yet unknown, and like many other points in connection with the germ theory, are yet unexplained. At the present time Pasteur is cultivating the organism which constitutes the disease called *cholera des poules*, and about which he had previously spoken. If we inoculate a guinea-pig with this it will not die, it will be covered with abscesses; if we take a microscopical drop of the pus of this abscess, and after cultivating it, inoculate a hen it will die, but if we inoculate, under the same conditions, a guinea-pig it will not die.

Pasteur did not desire to say that he yet knew the organism which produced puerperal fever, but he knew one, which he had met with under different circumstances, and which he strongly believed was the one which produced puerperal fever. In the service of M. A. Guérin he had seen a young woman who, after a prick in the foot, had a series of angeioleucitic abscesses on the leg and thigh, and he tried whether he could really find organisms in abscesses protected from contact with air. In one of the abscesses of this young woman he found an organism presenting a particular form. He had since found the same organism in an abscess opened by M. Bouley in a horse. Finally, in the service of M. Vulpian a woman had suffered from uterine hæmorrhage, she was subsequently taken with fever, and had some abscesses, and on examination, he found in the blood and in the abscesses of this woman, the same organism which he met with in the patient of M. Guérin and the horse of M. Bouley. Since that time M. Pasteur has been investigating whether this organism was not the same organism as that of puerperal fever.

Returning to the most favourable media for the development of these organisms, Pasteur observed, that they varied for each organism. Thus the water of beer-yeast was an excellent media for the development of the bacteria of charbon, though it was absolutely impossible to cultivate in it the organism of fowl-cholera. From these facts it will be seen that the study of the development of these organisms is yet surrounded with obscurity, but we should have none the less respect for the germ theory. Seeing physicians and surgeons habitually applying this theory, and seeing there was also a wide field for study, he, in spite of his ignorance of medicine, had devoted his researches to the elucidation of the following question: Can we demonstrate that such or such a disease can be explained by the presence of infective germs? In effect, has it not been proved from the researches of Devanie, that charbon depends on the presence of bacteria.

In conclusion, Pasteur referred to three terrible diseases the productive organism of which he had found, and positive proof of which had been given that they depended on the presence of these organisms alone. He did not despair of finding the germ of puerperal fever.

## The Largest Infant on Record.

Mrs. Capt. N. V. Bates, known as Annie Swan, the Nova Scotia giantess, was lately delivered of a child which weighed 23¾ lbs.; height 30 inches; breast measure, 24 inches; head, 19 inches. The child and mother are both doing well. Mrs. Bates' height is 7 feet, 9 in.; while the little captain measures only 7 feet, 7 inches in stature.

## Belladonna in the Treatment of Intestinal Obstruction.

Dr. Norman Kerr reports five cases of intestinal obstruction which have been cured by the administration of large doses of belladonna. One or two grains were given every hour, together with warm opiate fomentations to the abdomen. The cause of the obstruction is not stated, but all the patients are described as being in a dangerous condition, but were entirely cured—the remedy taking effect in six or nine hours. It is to be regretted that in these cases the cause of the obstruction is not, when it can be ascertained, carefully noted, or at least, the clinical history of the case, as by such omission the reader has no guide as to the peculiar conditions in which the belladonna treatment is likely to be serviceable. From our own experience of this drug we should strongly recommend the reader to use it in many cases of intestinal obstruction, for if it does nothing more, it often, as Dr. Brinton said long ago, relieves the tormina and tenesmus with which this affection is generally accompanied.

## The Size of London.

"London is the greatest city in the world." If we include its suburbs in the Outer Ring, its population is four millions and a half—a population which equals the aggregate populations of Paris, Berlin, Vienna, and St. Petersburgh. The area of this great city is 122 square miles, or a square of a little more than 11 miles to the side; the density of the population being 29,322 to the square mile. The length of the streets and roads is about 1,500 miles. The sewers have a length of about 2,000 miles. At the Census of 1871 there were within this area 417,767 inhabited houses, containing an average of 7·8 persons to a house. The population of London resides at a mean elevation of 39 feet above Trinity high water mark; the elevation varying from 11 feet below high

water mark in Plumstead Marshes, to 429 feet above high water mark in Hampstead.

That a town so large and so densely populated should be so comparatively healthy, says much for the progress that has been made in sanitation within the last few years. When all possible sanitary improvements have been carried out throughout the whole of the metropolis, and when the working classes have become more temperate and more provident than they are at present, London will become the healthiest and most prosperous, as well as the largest, city in the world, and show what may be done when good government, industry, temperance, and attention to the laws of health, conspire to promote the happiness of a people.

## The Dispensary Houses (Ireland) Bill.

THIS measure, which is promoted by Mr. Bruen, M.P. for Carlow, will be before the House of Commons for its second reading on the 29th. It deserves the best support of the profession in Ireland, for, while it affords facilities for providing proper dispensaries and suitable residences for the medical officers in districts where neither now exist, it does not enforce the alteration of the existing system in ary districts in which the necessity for such supervision does not exist. The Irish Medical Association had already adopted and approved of the Bill, and, on the motion of Dr. Brunker, seconded by Dr. Chaplin, the Council of the Royal College of Surgeons in Ireland adopted the following petition to Parliament in its favour :—

"That your petitioners, having a knowledge of the working of the Acts for the relief of the sick poor in Ireland, are aware that, in certain districts, the medical officers are subjected to great inconvenience, and are seriously hindered in the efficient discharge of their duties by the fact that suitable residences for them do not exist, and that the dispensary depôts are entirely unfit for the proper care of medicines, and the reception and treatment of persons suffering under sickness or accident.

"That your petitioners, having considered the Bill introduced into your honourable House for the purpose of providing houses suitable for these purposes, are of opinion that, if passed into law, it will provide an effectual remedy for this deficiency above pointed out ; and your petitioners do, therefore, pray that the Dispensary Houses (Ireland) Bill may be passed into law."

We hope that the measure may meet with the approval of the House, and we think that Mr. Bruen deserves that each medical officer should exercise personal influence with his local representative to obtain support for it.

## The Pharmaceutical Society and Co-Operative Associations.

THE Pharmaceutical Society will be congratulated by the profession, if not by the public, on their having successfully appealed against the decision which the Judge of the Bloomsbury County Court recently gave in favour of the London and Provincial Supply Association, against whom the Society had brought an action to recover penalties for the sale of poisons and drugs in open shops. The Lord Chief Justice was of opinion that the Company did come within the scope of the Pharmacy Act. The question was whether, as the department, which was carried on in an open shop, was conducted by duly qualified persons, the Company were or were not liable in the action. If they were not, then any number of unqualified persons might set up an establishment for the sale of poisons, and carry it on by granting to a qualified person one or two shares, and thus set the Act at defiance. In the present case the qualified shareholder did not conduct the department as a shareholder, but as a paid servant of the Company. If he were not liable to the penalties provided by the Act it was clear that the unqualified directors were, but so long as any member of a corporation was liable all the members must be held to be so, and therefore the qualified chemist was liable with the other members of the Company. He was therefore of opinion that the appeal must be allowed, and the decision of the County Court judge reversed.

There can be no doubt that the charges which chemists make for dispensing medicines are often much greater than they should be, but that is no reason why the proprietors of co-operative stores should add poisons and drugs to the other multifarious articles they are in the habit of selling. Were this practice once allowed, even the "duly-qualified shareholder," or "assistant," might be conspicuous by his absence, while the facilities for purchasing poisons would be certainly greater at these stores than they are at the shop of the pharmaceutical chemist. It would, however, be advisable if chemists took a hint from this attempt of the co-operative companies to sell drugs, and to carry on a trade which, for the good of the community, should be always a specialty conducted by duly-qualified persons, and apart from any other kind of business. By making their charges more moderate, they would still realise a good profit, while they would increase their returns, conciliate the public, and give no excuse for the trade passing into other hands.

## The Contagious Diseases Acts.

THE Government has resolved to appoint a Select Committee to inquire into the operation of these Acts, and the Chancellor of the Exchequer will nominate the members at once. We are more than doubtful as to the existence of any circumstance to justify the reopening of a question which, in the minds of scientific thinkers has been long since settled, but as we are quite confident that an unprejudiced and exhaustive inquiry will result in a sweeping verdict of approval which may, perhaps, militate towards a much needed extension of the law to the civil population, we do not regret the decision of Government. As regards the opposition to the Contagious Diseases Acts, we quite expect that the inquiry will produce no result at all. As are the anti-vivisectionists and anti-vaccinators, so are the pro-syphilis fanatics utterly impervious to reason, and incapable of any idea but their own craze. They will, of course, swear to a series of the most preposterous ststements ; fail completely to prove any one of their assertions, and "being persuaded against their will, will hold the same opinion still."

Assuming that the Committee will prove the falsity of their case, we anticipate that they will protest that the Committee was packed ; will continue to promulgate the disproved statements ; will fall back upon the unanswerable argument that syphilis and gonorrhœa ought to be fostered as taxes on immorality, and will get Sir Harcourt Johnston to re-introduce their yearly Bill in the next session. We don't suppose that any Government enter-

tains a glimmer of hope that it will succeed in convincing the agitators to whom this inquiry has been granted; but we do hope that when the verdict of the Committee has been given, the Government of the day will steadily refuse to reopen the subject at a future time, or to listen to the delusions of syphiliphobic minds.

## Shameful Sanitary Neglect.

THE recent inquest held by Dr. Diplock at Green Street, Chelsea, reveals a state of things that should be scarcely possible in these days of inspectors of nuisances and medical officers of health. On the same day that the first child died five other children of the same family and the mother were attacked with diphtheria and sewage poisoning of the most malignant type, the result being that in a few hours three more deaths occurred. The mother and one child were still in a somewhat critical state. On inspecting the drains it was found that one situated at the back of the house was stopped up, and a most offensive smell arose from it. There was another drain in a side passage near the back of the house, and that was also in a very offensive state. The water used for drinking purposes was very bad, and smelt strongly. The cistern was not properly covered in, and was lined with cement, which was coated with green filth to the extent of from ¼in. to ½in. in thickness. It had evidently not been cleansed for a long period. There could be no doubt that the death of the deceased was caused by diphtheria and sewage poisoning. The malignant character of the disease was shown by the fact that it proved fatal within a few hours of seizure. In one case the child was running about playing at three o'clock in the afternoon, and in the evening was dead. The actual cause of all the deaths was poisoning by sewer gas and bad water.

The jury censured the owners of the house for not having the drains put in proper order; but surely they were not the only persons to be blamed in the matter. Of what use are our recent Sanitary Acts, and our local sanitary organisations, if no plan can be adopted to prevent the occurrence of such a deplorable incident as that just described. As to the filthy state of the cistern, we expect that a searching investigation would show that five out of every ten cisterns used in London were in a very foul state, for there are hundreds of people who never think of having these reservoirs of water cleansed out from one year's end to another.

## Testimonial to W. P. O'Brien, Esq., late Inspector under the Local Government Board for Ireland.

WE are glad to learn that the testimonial to the above gentleman speeds well, and that the several medical officers of Mr. O'Brien's late districts are about to prove how they can appreciate courtesy in a public official. The subscription has been limited to a guinea, an amount which doubtless each of the medical officers with whom Mr. O'Brien was connected will cheerfully subscribe. Dr. Davys, of Swords, consents to act as hon. secretary, and Dr. W. B. Jennings, of Upper Merrion Street, as hon. treasurer.

THE death-rate from the seven principal zymotic diseases last week, averaged 3·0 per 1,000 in the principal towns, and ranged from 0·0 and 0·5 in Portsmouth and Brighton, to 4·5 and 4·6 in Leeds and Sheffield. Scarlet fever showed the largest proportional fatality in Leeds, Sunderland, Nottingham, and Liverpool. Measles was again fatally prevalent in Wolverhampton and Newcastle-upon-Tyne. In London whooping-cough caused 72 deaths, and small-pox 13. Since the beginning of this year only one fatal case of small-pox has occurred in the other large towns.

LAST week the rates of mortality in the principal large towns were—Portsmouth 15, Brighton 19, Edinburgh 19, Leicester 20, Sunderland 23, Nottingham 23, Norwich 24, Bradford 24, Oldham 24, London 25, Sheffield 25, Glasgow 25, Bristol 26, Newcastle-upon-Tyne 26, Leeds 26, Hull 27, Wolverhampton 27, Salford 27, Birmingham 28, Plymouth 29, Manchester 30, Liverpool 32, and the highest rate, Dublin 33 per 1,000 of the population.

The Senate of the Queen's University in Ireland, at a meeting held at Dublin Castle on the 18th inst., elected Professor James Cuming, A.M., M.D., of Belfast, an examiner in medicine, in the vacancy caused by the resignation of Dr. Bastian.

THE Council of the Royal College of Surgeons of England have awarded the Jacksonian Prize to Mr. J. Priestly Smith, M.R.C.S., Ophthalmic Surgeon at the Queen's Hospital, Birmingham, for his dissertation on Glaucoma.

# Scotland.

(FROM OUR NORTHERN CORRESPONDENT.)

THE MEDICAL ACTS AMENDMENT BILL.—A statement has been prepared on behalf of the Scotch Universities with respect to the Medical Acts Amendment Bill, and other bills now before Parliament on the same subject. It is contended that the kind of "uniformity" proposed under the Duke of Richmond's Bill is undesirable, and besides, not likely to be attained. That as regards the Scottish Universities a general high level of qualification has already been secured in a manner much to be preferred to that proposed in the Bill, and that the true object of medical education ought not to be uniformity but efficiency, together with an elastic capacity of gradual development, as regards both education and examination. Nothing could more clearly show the moral serfdom into which the profession in Scotfand had sunk, than the fac that while the Universities are thus straining every nerve as obstructives to enlightened legislation, neither memorial has been signed, nor meeting convened to give support to the Bill of the Government. Perhaps little else could be expected from the great bulk of this *learned* profession.

PROFESSOR MUIRHEAD ON DR. ANDREW WOOD, LL.D.—At the public ceremony of conferring honorary degrees at the Edinburgh University the other day, in presenting Dr. Andrew Wood for the Degree of LL.D., Professor Muirhead indulged in rhetorical flights worth referring to. He stated that Dr. Wood's "eminence as a physician is well

known, and he has not unsuccessfully found occupation for his leisure hours in various departments of letters; but it is to his service as a Member of the General Council of Medical Education, that at this moment I would particularly allude. . . . To have studied theory and practice under their teachers, to have gone through their curriculum, to have passed their examination with success, and eventually to have obtained their degrees or diplomas, have been esteemed ample guarantee of the possession of satisfactory qualifications for the practice of the medical profession;" and then alluding to the Medical Reform Bill, which all sensible men hope soon to be law, Professor Muirhead said, "against this scheme as at once degrading to the schools, and fraught with possible danger to the progress of science, Dr. Wood in his place in the Medical Council has argued with an energy and a cogency, which we trust will ultimately prove successful." We do not grudge Dr. Andrew Wood all the compliments which he merits. We may concede that he is an eminent physician, a fair versifier, and is possessed of a tolerable acquaintance with his Latin grammar—no mean accomplishment in these times—but we unhesitatingly assert that the "services" for which Professor Muirhead lauded him are unworthy a man of culture who looks beyond the narrow limits of the academic purse. That Edinburgh has deservedly occupied a high position in regard to medical science and teaching all will admit; and that this has been mainly due to the number of extra-mural teachers, and the wise liberality of the University in recognising their teaching, cannot be gainsaid. Recent exhibitions at Glasgow, and every day experience amply demonstrate that to possess the social and political influence necessary to secure a professorship, and to be possessed of the most moderate intelligence, are not synonymous propositions. What matters it to the public where, or from whom, a man derives his informtion, providing it is the best; then let the best teacher and the best man survive.

St. Andrew's University.—The Guthrie Scholarship. We have much pleasure in recording that "the Trustees of the Guthrie Scholarship," in the United Colleges of St. Andrews, have awarded it this year to Mr. Leonard Huxley, son of Professor Huxley. The scholarship is tenable for four years, value £100 for the first year, and £50 for each of the three following years. The conditions of the scholarship are that the successful student prosecutes his studies at Oxford or Cambridge, or, with the consent of the trustees, at a foreign university.

The Rise and Progress of Legal Medicine.—On the 22nd April Professor P. A. Simpson delivered the first of a course of lectures on Forensic Medicine which he has arranged to give to his class of students, who are studying in order to graduate in law. The lecture was given in the Hall of the Faculty of Procurators, and was well attended. Professor Simpson, in the outset of his remarks, sketched the rise and progress of legal medicine. Traces of the principle of medical jurisprudence, he said, were to be found in the far remote ages. It was to be met with in the Mosaic institutions and in the legislative laws of the Egyptians, but it did not seem to have been applied to legislation in ancient Greece except in rare instances, neither were the Romans far advanced in the science, which, indeed, could not be said to date further back than the sixteenth century. The first lecture on medical jurisprudence in Scotland was delivered in Edinburgh in 1801, by old Dr. Duncan, and the first professorship was established in that University in 1803, when the chair was given to the son of the gentleman already mentioned, Dr. Andrew Duncan. The corresponding chair in the University of Glasgow was not founded until 1839. Professor Simpson next proceeded to note the progress which had been made in the several departments of medicine during the past one hundred years, and communicated some very instructive and interesting information. In one of these he took occasion to refer to the improved treatment which was now extended to the imbeciles and lunatics as compared with that which obtained in what might even be called recent times, and expressed a hope that the feelings which had led us to act more humanely to the insane might yet induce an extension of the law, so as to cover another, but no less distinct, form of disease—that of habitual drunkenness. In conclusion, Professor Simpson started several questions which relate particularly to medico-legal matters, and which he purposes to deal with particularly in subsequent lectures.

The Edinburgh Royal Infirmary and Wood Pavement.—An interesting discussion took place at a special meeting of the Edinburgh Town Council, held on the 23rd April, for the purpose of considering a recommendation from the Streets and Buildings Committee to the effect that the part of Lauriston Street in front of the New Royal Infirmary be laid with wood pavement instead of causeway blocks. The Lord Provost stated that the idea of substituting wood for stone pavement opposite the Infirmary, had been suggested by the managers of that institution, and that the use of wood was the more desirable from the circumstance that the surgical wards occupied the portion of the building next to Lauriston Street. The Lord Provost moved accordingly, and Treasurer Harrison moved to the contrary effect, stating that in frosty weather it had been impossible to bring lorries to his warehouse over the wood pavement of Chambers Street, and submitted that the object to be gained could be attained by carefully macadamising the roadway in front. Mr. Sutter indicated that his observations in London had led him to form a favourable opinion of wood paving, while Bailie Colston maintained the contrary. Facility of progression in London has to be looked at, however, from various points of view, particularly if "Alexander" has been up "on a deputation!" The Lord Provost's motion was ultimately agreed to. The New Royal Infirmary is a really palatial building. There is one thing, however, wanting to modernise it; where are the billiard and smoking-rooms?

Glasgow Maternity.—We have been favoured with the Forty-Fourth Annual Report of the Glasgow Maternity or Lying-in-Hospital, issued a few days ago. From this document it would appear that during the past year 193 women have availed themselves of the benefits of this institution, while 954 have been attended to at their homes by students and nurses in training. Of the women delivered in hospital 75 were confined for the first time. On comparing the present with the report of last year, there is an increase of 73 over the whole number. The increase is due to the larger number in the out-door department who have availed themselves of this charity, and as this increase chiefly took place during the past six months, it has been attributed to the depressed state of trade, and the inability of the poorer classes to secure a paid attendant. There were six fatal cases in hospital during the year, unfortunately for the therapeutic triumphs which have made this hospital somewhat celebrated. There was but one case of puerperal fever during the year, and strange to say the result was fatal! The directors have prudently resolved on the rebuilding of the hospital on its present site; and it is gratifying to report, with so much war abroad, that Mr. Donald Munro has, meantime, ceased from troubling, and the directors are at rest.

# Literary Notes and Gossip.

THE *Medical Register* for 1879, under the able editorship of Mr. Miller, the Registrar, which was published at the beginning of the present month, presents some noteworthy improvements on its predecessors. Compared with the edition for 1876—the last of what may be called the inedited series—we see that this year's *Register* has, prefixed to it, a copious table of contents, setting forth, in summary by sections, an analysis of the twelve Medical Acts passed from 1858 to 1878, whereof the full text is given in the introductory matter. The introduction contains, moreover, a complete list of data in regard to the appointments of members and officers of the General Medical Council, from its formation down to the present time, with an appended table showing all the meetings of the General Council, of the Executive Committee, and of the three Branch Councils. The Returns to Parliament of the Council's accounts, which were aforetime printed on a huge sheet that, once opened, could never be returned to its proper place, are now clearly printed in a paged form, easy to read and refer to. These accounts are all presented herewith in an exact form, after examination by professional auditors, and free from what these auditors designate "the gross blunder of bringing forward" certain balances formerly "on the *wrong side.*" The names and dates of registration are now punctuated throughout the volume, thus correcting a cheap and slovenly style of printing wholly unbecoming in twenty editions of an official volume such as this; and, lastly, there is for each of the last three years, a summary of the number of persons registered, or restored to the *Register*, or removed from the *Register*, under the *Medical Acts*, of which we intend giving a *resumé* in our next.

* * *

MESSRS. RICHARDSON and Co., the well-known manufacturing druggists of Leicester, have just favoured us with a copy of their new "Price Current." To our minds the title is not sufficiently broad or explanatory, as it contains many things of greater moment to the profession than the price of drugs. For instance, one part of the work is devoted to "medical annotations," in which the busy practitioner will find recorded, in an exceedingly useful and abbreviated form, notes and experiences of the various new drugs, or combinations, culled from the leading journals of the preceding year; such a chapter alone should insure success for the work, and make it an acceptable compendium for the study table. Then we have carefully prepared "Posological Tables" and various formulæ, with a Dispensatory Register and Diary for 1879. Altogether we are highly pleased both with its appearance and utility, and feel assured that the reputation of the firm will be further enhanced by such an issue.

* * *

WE hear that among the persons who have fallen under the displeasure of the Russian authorities at St. Petersburg, is Dr. Ivan Tourguenieff, the popular author and professor in the University. It appears that the police were offended with him because the students gave him an ovation, and he was ordered to leave the country. M. Ivan Tourguenieff is a naturalised Frenchman. Strange to say, it was he who, in one of his works, coined the term "Nihilist" to characterise the Revolutionary sect in Russia. The word has, unfortunately, become during the last few days one of terrible significance in that unhappy country.

* * *

AT a recent meeting of the Paris Académie de Médecine, Prof. Lasèque announced that a reprint of Laennec's celebrated "Traité d'Auscultation," which has been out of print for so long, would shortly be published by M. Asselin, of Paris. We can only express surprise that such a work should have been allowed to slumber at all, considering that modern science has scarcely added a fact not included in Laennec's original treatise. "They do these things differently in France," thus it is that the Minister of Public Instruction has provided the funds necessary for the undertaking.

* * *

THE monthly issues of Cassell's excellent publications for March and April are before us. "Science for All" (Nos. 16 and 17), gives us admirably written popular papers on "Protective Colours of Animals—Great Sea Reptiles;" Shooting Stars;" "Continental Islands and how they were Found;" "Teeth;" "What is Power?" "History out of Refuse Heaps;" "What is in the Interior of the Earth?" "How Sunshine Warms the Earth;" and "What are the Stars made of?"

* * *

"THE Countries of the World" (Parts 31 and 32) commences a new volume with a description of "Oceania and the Pacific Islands," which promises to be one of the most interesting divisions of the work, full of narrative and of instructive anecdote, and profusely illustrated.

* * *

"THE Great Industries of the World" (Parts 14 and 15) is devoted to the Biography of Sir Joseph Whitworth, continuations of articles on "The Manufactures of Hemp, Flax, and Jute," "Gun-barrel Making," "Cotton Weaving," "Ship Building," "Pottery," and the "Steam Engine." The articles are in a form to be not only comprehensible but interesting and instructive to the general reader.

* * *

THE style of issue of Messrs. Cassell's works is—as in the case of all their publications—admirable. There would seem to be no limit to the expenditure of the firm upon these serials so long as the article most suited to the public tastes and wants can be produced. The educational work which is done by them is of the greatest service to the public, and they deserve the credit of doing that work thoroughly well, never sacrificing accuracy for the sake of sensation, and putting science and the arts in a thoroughly intelligible and attractive form.

* * *

THE following new books and new editions have been published during the past few days:—"Bright's Disease of the Kidneys," by Professor Charcot. Translated by Hy. B. Millard, M.D. London: Baillière, Tindall, and Cox. "A Guide to the Practical Examination of the Urine," by J. Tyson, M.D. 2nd ed. London: Baillière, Tindall, and Cox. "Modern Medical Therapeutics," by G. H. Napheys, M.D. 6th ed. London: Baillière, Tindall, and Cox. "Bronchial Asthma: the Lettsomian Lectures for 1879," by J. C. Thorowgood, M.D. London: Baillière, Tindall, and Cox. "Fistula, Hæmorrhoids, and other Diseases of the Rectum," by W. Allingham, F.R.C.S. London: J. and A. Churchill. "A Dictionary of Chemistry," by Hy. Watts, F.R.S. Part I. Supplement. London: Longmans, and Co. "On the Nature of Life," by Ralph Richardson, M.D. London: Lewis. "Notes for Students," by R. J. Lee, M.D. London: Richards. "Fasting Girls: their Physiology and Pathology," by W. A. Hammond, M.D., New York. Putnam and Sons.

* * *

THE following pamphlets have been received during the past few days:—"Infectious Diseases in the Army," by John James, M.B. "Fifty-eighth Annual Report of the Seaman's Hospital Society." "Ringworm in Public Institutions," by J. V. Shoemaker, M.D. "The Nature and Treatment of Neurasthenia," by G. M. Beard, M.D. "Reports by the Medical and Surgical Registrars of the London Hospital for 1877." "Annual Report of the Stirling District Lunacy Boards."

* * *

IN our last column of "Literary Notes and Gossip," we gave the titles of the new books and new editions published during the month, mentioning under the latter heading the work of Drs. Stillé and Maisch. We are, however, informed by Messrs. J. and A. Churchill that the "National Dispensatory" (United States) is a new work not a new edition. We are glad, therefore, to make the correction.

# Obituary.

## DR. CHARLES MURCHISON, F.R.S.

IT is with great regret that we record the sudden death of Dr. Murchison. Dr. Murchison, who had been twice a victim to scarlet fever, had suffered somewhat severely from aortic disease of the heart for some six or seven years past, a sequel upon the fever. He often referred to his death in conversation, remarking that his disease was such as to lead him to anticipate that he would one day be driven home lifeless from his daily round of visits. On Wednesday last, after parting with a patient he stooped to open a lower drawer in his consulting-room, and without any immediate premonitory symptom his heart ceased to act, and within a few minutes he was found dead.

Dr. Murchison had achieved both a splendid professional position and a lucrative practice. His writings on continued fevers and on diseases of the liver, both of which have run through two editions, are standard works upon the subjects.

He was educated in Edinburgh, and on coming to London he became attached to St. Mary's Hospital, as lecturer on botany, when that school was first opened. Subsequently, he was connected with King's College, Middlesex Hospital, and finally, as physician at St. Thomas's Hospital, after its removal to its present site.

His clinical lectures were a great attraction, not only to the students of the school but to numbers of the medical profession, who were always anxious to hear whatever he had to say. He held the post of Examiner in Medicine at the University of London, and during the last two years President of the Pathological Society. His work at this society, and the interest he took in it is known to everyone. The attendance at the meetings during his presidency, and the introduction of special discussions, and various improvements in the working of the society made by him, have been a topic of conversation. Dr. Murchison, whose opinion was little short of unerring, was respected by all, and his early death constitutes an irreparable loss, not only to a large circle of professional and other friends, but also to the cause of science.

### DR. BRADY, M.P.

We learn with much regret of the sudden and very alarming illness of Dr. Brady, M.P. for Leitrim. We believe the cause to be acute bronchitis, but his state leaves little hope of recovery. Dr. Brady's services have always been most heartily rendered to his profession, and it will be an unmistakeable loss if medicine should be deprived at the same moment of one of its representatives and of a friend whose influence is much needed.

We understand that the vacancy in the staff of the Meath Hospital, created by the death of the late Dr. Robert Persse White, will probably not be filled for some months.

## Medical News.

**Royal College of Physicians of London.**—At a quarterly Comitia held on Thursday, the 24th inst., at 5 p.m., the following Members were admitted to the Fellowship of the College :—

Bagshawe, Frederick, M.D. Camb., St. Leonard's
Bright, George Charles, M.D. Oxf., Cannes, France.
Edis, Arthur Wellesley, M.D. Lond., Wimpole Street.
Gowers, Wm. Richard, M.D. Lond., Queen Anne Street.
Greenfield, Wm. Smith, M.D. Lond., Palace Road, Lambeth.
Irvine, James Pearson, M.D. Lond., Mansfield Street.
Mackenzie, Stephen, M.D. Aberd., Finsbury Square.
Sparks, Edward Isaac, M.B. Oxf., Cannes, France.
Squire, William, M.D. St. And., Orchard Street.
Stevens, Henry, M.D. Lond., Sutton, Surrey.
Taylor, Frederic, M.D. Lond., St. Thomas Street.
Williams, John, M.D. Lond., Harley Street.

The following gentlemen having passed the required examinations were duly admitted Members of this College on April 24th :—

Burnett, Robert Wm., M.D. Aberd., 10 Nottingham Pl., W.
Drewitt, Fred. Geo. Dawtrey, M.B. Oxon., St. George's Hosp.
Mickle, William Julius, M.D. Toronto, Grove Hall, Bow, E.

The following were admitted Licentiates on April 24th :—

Atkey, William Thomas, Chichester.
Baines, Allen Mackenzie, M.B. Toronto, 2 Storey's Gate, S.W.
Balls, James, King's College Hospital, W.C.
Barron, Herbert George, Southport.
Batson, William Lascelles, 68 Guilford Street, W.C.
Biggs, John Maundy, Dallington, Hawkhurst.
Birch, Richard Charles, Royal Infirmary, Manchester.
Boissier, Arthur Henry, Clifton.
Bousfield, Edward Collins, Bedford.
Corder, Sheppard Ransome, 12 Percy Circus, W.C.
Gardner, John Twiname, Ilfracombe.
Milles, Walter Jennings, 6 Wyndham Place, W.
Poland, John, Blackheath, S.E.
Smith, Ernest Frederic, Torpoint, Devonport.
Wadham, Frederick, 10 Milner Street, S.W.
Warwick, Percy, St. Helen's Road, Hastings.
Williams, Miles Melbourne, Royal Infirmary, Manchester.
Williams, William Roger, Enfield.
Williamson, Robert Isherwood, St. Thomas's Hospital, S.E.
Wood, Percy Moore, 6 Eglantine Road, S.W.
Woodcock, Robert Fraser, University Hospital, W.C.

## NOTICES TO CORRESPONDENTS.

Mr. Carr.—The *Annuaire Thérapeutique*, referred to in a leader, is a most indispensable companion to all who take an interest in the progress of materia medica, hygiene, pharmacy, and allied sciences. The present is its thirty-ninth annual issue. The price is, we believe, eighteenpence.

Harveian Society.—On Thursday, May 1, at 8½ p.m., Dr. Cleveland, "On a Case of Excessive Dose of Chloral Hydrate."—Mr. A. J. Pepper, "On Tubercular Testis."—Dr. Day, "On Diseases of Children."—Mr. Walter Pye, "On a Case of Nerve-Stretching."

Royal Institution.—On Friday, May 2, at 9 p.m., Professor John G. M'Kendrick, "On the Physiological Action of Anæsthetics."

Mr. C. G. C.—Your book was duly received, and will be noticed in due course ; we are somewhat behind-hand with our reviews in consequence of great pressure on our space.

### VACANCIES.

St. Bartholomew's Hospital, Chatham.—Assistant House Surgeon. Salary, £80, with board, &c. Applications to the Clerk of the Trustees before May 12.

Westminster Hospital.—House Surgeon. Board and lodging, no salary. Applications to the Secretary by May 3.

St. Leonard, Shoreditch.—Medical Officer for the Infirmary. Salary, £120. Applications to the Clerk of the Board, Kingsland Road, E.

Stockton Hospital.—House Surgeon. Salary, £200. Non-resident. Applications to the Secretary, Stockton-on-Tees, by May 14.

Denbigh Infirmary.—House Surgeon. Salary, £85, with board, &c. Must understand Welsh. Applications to the Secretary.

Tuam Union, Abbey Dispensary.—Medical Officer. Salary, £120, with fees, and £20 as Sanitary Officer. Election, May 12.

Dundalk Union, Ravensdale Dispensary.—Medical Officer. Salary, £100, with fees, and £25 as Sanitary Officer. Election, May 14.

Enniscorthy Union, Enniscorthy Dispensary.—Medical Officer. Salary, £100, with fees, &c.

### APPOINTMENTS.

Copley, W. H., M.R.C.S.E., House Surgeon to University College Hospital.

Creswell, W. G., L.R.C.P.Ed., L.R.C.S.Ed., Medical Officer for the No. 5 District of the Aston Union.

Cuming, J., M.D., F.K.Q.C.P.I., Examiner in Medicine at the Queen's University in Ireland.

Fennell, D., L.K.Q.C.P.I., L.R.C.S.I., Medical Officer for the Dudley North District of the Dudley Union.

Heath, H. T., L.R.C.P.Ed., L.R.C.S.I., a Medical Officer to the Mansfield Woodhouse District Hospital.

Hobson, L. J., M.B., B.S., F.R.C.S.E., Acting Medical Officer to the Royal Northern Sea-bathing Infirmary, Scarborough.

Lyden, M. J., M.D., M.Ch., Q.U.I., Medical Officer to the Castlebar No. 1 Dispensary, Castlebar Union.

McCracken, J., M.B., C.M., Assistant Medical Officer to the Glamorganshire Lunatic Asylum, at Bridgend.

O'Connor, G. A., L.R.C.P.Ed., L.R.C.S.Ed., Medical Officer to the Castlebar No. 2 Dispensary, Castlebar Union.

Wood, C., M.R.C.S.E., Junior Resident Medical Officer to the General Hospital for Sick Children, Pendlebury, Manchester.

## Births.

De Chaumont.—On April 22, at Woolston Lawn, Southampton, the wife of Surgeon Major De Chaumont, M.D., of a son.

Ffrench.—On April 19, at Glasson, co. Westmeath, the wife of Edward T. Ffrench, F.R.C.S.I., &c., of a daughter.

## Marriage.

Browne—Costello.—On April 24, at Dublin, Thomas H. Browne, L.R.C.S.I., &c., Frankford, King's County, to Annie Elizabeth, only daughter of the late Thomas Costello, Esq., Frankford, King's County.

## Deaths.

Brady.—On April 21, at 35 Rathmines Road, co. Dublin, Patrick Brady, L.A.H.

Goodisson.—On April 22, at Enniscorthy, co. Wexford, Samuel Goodisson, M.R.C.S.E., aged 71.

Jameson.—On April 14, at Caistor, William H. Jameson, M.D., Surgeon-Major, Army Medical Department, aged 40.

Low.—On April 16, at Le Coin, Jersey, Alex. Low, M.D.

Marsh.—On April 15, at Marshfield, Gloucestershire, William Marsh, M.R.C.S.E., aged 71.

Martyn.—On April 14, at Martock, Richard W. Martyn, M.R.C.S.E., aged 86.

Newman.—On April 10, at Grouville, Jersey, William John Newman, M.R.C.S.E., aged 47.

Price.—On April 14, at Deptford, Allin Poord Price, M.D., aged 75.

Rhodes.—On April 16, at New Clee, Grimsby, Clement Rhodes, L.R.C.P.Ed., aged 25.

Wybrants.—On April 23, at 19 Upper Street, Dublin, Joseph H. Wybrants, L.R.C.S.I.

# IRISH POOR-LAW INTELLIGENCE.

## CORRESPONDENCE.

### MEDICAL RELIEF TICKETS AND THEIR GRANTORS IN IRELAND.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—If it be a fact, *as I believe it is*, that members of dispensary committees and wardens are *assumed* to know their duties, and all about the objects and uses of the Medical Charities Act; that they never receive instructions; that their duties are never explained to them; that the ticket-books are sent to them, and they are simply informed that they are to fill and sign them, is it any wonder that the Act is abused, and dispensary surgeons imposed on? Would it not be right for the Local Government Board to issue a circular giving instructions, plain and concise, to the issuers of tickets as to who are and who are not entitled to relief under the Medical Charities Act? The clerk of the union, when sending ticket-books to members of committees and wardens should send the circular with the books or the circular could be printed on the covers of the books.

The other day I chanced to come in contact with a warden of my district, and he began to talk about giving tickets. He said he was sure he gave them to people who did not deserve then, but, said he, "*I suppose you are aware that I dare not refuse a ticket to any person*"! I said I was not aware of that; on the contrary, I was aware that he should be very careful in giving tickets, as if he gave them to persons who could pay a doctor he would be wronging the ratepayers. I found this warden had no correct ideas as to his duty; he never had been given any information on the subject, and he never sought any. He is as intelligent and respectable as the average of wardens. In my district each committee-man and warden acts on his own notions as to his duty. They get no instructions from the board of guardians, or any official. If the wardens *generally* think that they *dare not refuse a ticket to any person*—as they may for aught I know—they should be enlightened soon on their duties.

RED TICKET.

[We have frequently noticed the complete ignorance displayed by many committee-men and wardens as to their duties, and, undoubtedly, that ignorance explains much of the abuse which attends the issue of these tickets. We entirely concur with our correspondent in the suggestion that it is the duty of the L.G.B. to provide for its ticket-granting officers the information necessary to the execution of their duties, but as the department has not done so it strikes us that the subject would fall properly within the scope of the Irish Medical Association.—ED. M. P. & C.]

### BLESSINGTON DISPENSARY.

A SPECIAL meeting of the above committee was held to consider a letter from the Local Government Board respecting the complaint made against Dr. Leslie Maturin, the medical officer, for alleged neglect of duty in not attending a patient on a red ticket, and also a complaint preferred by the Rev. Mr. Horgan, to the effect that the doctor had habitually disregarded the rule of attending at the dispensary between the hours of ten and twelve o'clock, and that having directed that some one would go to Blessington for medicine, which he prescribed for a patient on a certain evening, which was impossible, he refused to give it next morning, and told the person he might apply for it at the Ballymore dispensary on the following Saturday.

It appeared from the statements made that previous to the issuing of the red ticket a fee of £1 was offered to the doctor to attend the patient, the distance to where the patient lay was stated to be ten miles, and the doctor declined to go under a fee of two pounds; a red ticket was then issued on the following day, and he also declined to attend upon it; this constituted the charge in the first case. The Local Government Board called on the doctor for an explanation why he did not attend. He made a statement in reply which was not deemed satisfactory, and the Local Government Board held that on the doctor's own admission he was guilty of a grave dereliction of duty, and directed the hon. secretary to summon a special meeting of the committee for the purpose of receiving the doctor's resignation: no resignation, however, was sent in by Dr. Maturin, and after an animated discussion the committee adopted a resolution in reply to the direction of the Local Government Board, to the effect that they had considered the case and censured the doctor for what he had done, and thought that the circumstances were such as to call for no further action on their part.

With reference to the second charge, as contained in the Rev. Mr. Horgan's letter, Dr. Maturin was requested to furnish a written explanation by the next meeting of the committee.

### GALWAY UNION.

SMALL-POX GRATUITIES.

SIR VALENTINE BLAKE, in accordance with his notice of motion, moved that the medical officers, Drs. Colahan and Clayton, be paid a special gratuity of £100 each for the extra labour imposed on them during the nine months of the epidemic in Galway,

The Chairman deprecated any such movement; he thought, considering the extraordinary high salaries, the doctors were sufficiently remunerated.

Mr. Redington considered the doctors entitled to special remuneration for their zealous services during the epidemic, but he considered £100 too much; he would move as an amendment that they get £75 each.

Mr. Redington's amendment was put and carried by 11 to 8.

Mr. Davis moved a second amendment that £50 be paid instead of £75.

The Chairman ruled that he would only put the amendment as a distinct resolution, £50 or nothing. The £50 was carried by a large majority.

## MOUNTMELLICK UNION.

### FEES FOR EXAMINING DANGEROUS LUNATICS.

LETTER received from Dr. Tabuteau, inquiring why he had not received a fee of £2 for examining a dangerous lunatic, for which the magistrates had certified.

The Clerk said the board had refused to pay Dr. Tabuteau more than £1.

Mr. Cobbe—Let him process the board ; that is all he can do.

Mr. Gare—There were two processes at the last sessions, and there were decrees against the board in both.

Mr. Thomas Cobbe thought any doctor would make these examinations for £1.

The Chairman thought that £1 would have been sufficient remuneration ; but as the magistrates had certified for £2, he thought they should pay the amount.

The Clerk thought it right to inform the board that he heard it was Dr. Tabuteau's intention to fight the matter. He (Dr. Tabuteau) would apply for a *mandamus*, and anyone who voted against paying the £2 would have to pay the costs.

Mr. Thomas Cobbe said that if the magistrates went on granting certificates for such large amounts, the guardians should grant out-door relief to every one who applied for it. The magistrates were showing them an example of wrong doing.

Mr. J. Dunne, jun., thought £2 was too much, but then they had no right to refuse to pay it when the magistrates had certified for it.

Mr. Cobbe—We protest against it, and we won't vote.

An order was then made for the payment of the amount.

## ARMAGH BRANCH OF THE MEDICAL BENEVOLENT SOCIETY.

THE annual meeting of the subscribers to County-Armagh Branch of the Royal Medical Benevolent Fund Society was held at Surgeon-Major Lynn's, on Tuesday, the 22nd inst. Dr. Cuming, President in the chair. A satisfactory report was read by the Secretary, by which it appears that £18 were sent to the parent society last year from twenty-four contributors ; one of whom is a lady well known in this county for her Christian liberality, and who in this, as in many other respects, is a pattern to the landed proprietors of Ireland. This branch has had to lament the loss by death of two highly valued subscribers during the past year—namely, Doctor Alexander Robinson, of the County Infirmary, and Dr. White, of Richill dispensary.

## PUBLIC HEALTH (IRELAND) ACT, 1878.

*(Continued.)*

179. Boards may make arrangements for facilitating the Conveyance of Bodies to Burial Grounds.

180. Places may be Provided for Reception of Bodies until Interment.

181. L. G. B. may make Regulations as to Burial Grounds, &c.

182. Exemption of Burials from Toll.

183. Board may Lay Out and Embellish Burial Ground.

184. Provisions of Act extended to additions to existing Burial Grounds.

185. When Burial Ground not fenced or kept in decent order by Owner Burial Board may serve a Notice requiring same to be fenced, &c.

186. Burial Board empowered to fence Burial Ground, and keep the same in order.

187. Burial Boards my accept the Management of Burial Grounds.

188. Board to fix Payments for Interments in Burial Ground.

189. Minutes of Board and Acounts shall be open to inspection.

190. Board may appoint and remove Officers, &c.

191. Register of Burials in every ground provided under this Act to be kept by Burial Board.

192. Lands for purposes of Act.

193. Provisions of 10 & 11 Vict., cap. 65, incorporated with this Act.

194. Assessment to local rates not to be increased for the purposes of this or any former Act.

195. Burial Board may let land not required for Burials.

196. Burial Board to keep in order closed Burial Grounds, &c.

197. Burial Ground, Waterford.

198. Certain plot of Ground to be deemed within the limits, ditto Limerick.

199. Not to apply to Private Mausoleums.

PART IV.—GENERAL PROVISIONS.

CONTRACTS.

200. Power of sanitary authorities to Contract.

201. Provisions as to Contracts.

PURCHASE OF LANDS.

202. Power to Purchase Lands.

203. Regulations as to Purchase of Land.

204. Power to let Lands.

POWERS OF BOARD IN RELATION TO LOCAL ACTS.

205. Power to Repeal and Alter Local Acts.

206. Transfer of powers of Grand Jury.

207. Transfer of Burial Grounds.

208. (*Verb.*) *Powers of Inspeciors of L. G. B.*—Inspectors of the L. G. B may attend any meetings of sanitary authorities, or of committees of sanitary authorities, during the transaction of business arising under any of the provisions of this Act.

209. (*Verb.*) *Power of Board to Direct Inquiries.*—The L. G. B. may from time to time cause to be made such inquiries as are directed by this Act, and such inquiries as they see fit in relation to any matters concerning the public health in any place, or any matters with respect to which their sanction, approval, or consent is required by this Act.

210. (*Verb.*) *Orders as to Cost of Inquiries.*—The L. G. B. may make orders as to the cost of inquiries or proceedings instituted by, or of appeals to the said Board under this Act, and as to the parties by whom or the rates out of which such costs shall be borne ; and every such order may be made a rule of one of the superior courts of law on the application of any person named therein.

211. (*Verb.*) *Proceedings on Complaint to Board of Default of Sanitary Authority.*—Where complaint is made to the L. G. B. that a sanitary authority has made default in providing their district with sufficient sewers, or in the maintenance of existing sewers, or in providing their district with a supply of water, in cases where danger arises to the health of the inhabitants from the insufficiency or unwholesomeness of the existing supply of water and a proper supply can be got at a reasonable cost, or that a sanitary authority has made default in enforcing any provisions of this Act which it is their duty to enforce, the L. G. B., if satisfied, after due inquiry, that such authority has been guilty of the alleged default, shall make an order limiting a time for the performance of their duty in the matter of such complaint. If default is made to obey such order and to perform such duty by the time limited in the order, such order may, in the case of an urban authority, be enforced by writ of mandamus, and in the case of a rural authority making such default as is last mentioned, such rural authority shall be deemed to have made default in the execution of their duties as a board of Poor-law guardians under the Poor-law Acts, and thereupon it shall be lawful for the L. G. B. to dissolve them as such board and to provide for the execution of their duties under the Poor-law Acts and this Act in manner prescribed by the Poor-law Acts in the case of the dissolution of boards of guardians of Poor-law unions.

212. Orders of Board under this Act.

213. *Powers of Inspectors of L. G. B.*—Inspectors of the L. G. B. shall, for the purposes of any inquiry directed by

the Board, have, in relation to witnesses and their examination, the production of papers and accounts, and the inspection of places and matters required to be inspected, similar powers to those conferred upon Poor-law inspectors by the Poor-law Acts.

PROVISIONAL ORDERS BY BOARD.

214. As to Provisional Orders made by L. G. B.
215. Costs of Provisional Orders.

ARBITRATION.

216. Mode of Reference to Arbitration.
217. Regulations as to Arbitration.
218. Claims under £20 may be referred to Court of Summary Jurisdiction.

BYELAWS.

219. Authentication and Alteration of Byelaws.
220. Power to Impose Penalties on Breach of Byelaws.
221. Confirmation of Byelaws.
222. Byelaws to be Printed, &c.
223. Evidence of Byelaws.
224. Byelaws made under s. 125 of 3 & 4 Vict., c. 108, to be submitted to L. G. B.
225. As to Regulations of Sanitary Authority.

## PART V.—FINANCIAL.

EXPENSES OF URBAN AUTHORITY.

226. Expenses of Urban Sanitary Authority.
227. Statutable Limit of Rating not to apply to Expenses for Sanitary Purposes.
228. Amendment of s. 60 of 17 & 18 Vict., c. 103.

PRIVATE IMPROVEMENT EXPENSES.

229. (*Abs*). *Power to make Private Improvement Rates.*—Whenever an urban authority have incurred expenses which by this Act are or by such authority may be declared to be private improvement expenses, such authority may, if they think fit, make and levy on the occupier of the premises in respect of which the expenses have been incurred, in addition to all other rates, a rate or rates to be called private improvement rates, of such amount as will be sufficient to discharge such expenses, together with interest thereon at a rate not exceeding £5 per centum per annum, in such period not exceeding thirty years as the urban authority may in each case determine.
230. Proportion of Private Improvement Rate may be deducted fromR ent.
231. Redemption of Private Improvement Rates.

EXPENSES OF RURAL AUTHORITY.

232. (*Verb*). *Expenses of Rural Sanitary Authority.*—The expenses incurred by a rural sanitary authority in the execution of this Act shall be divided into general expenses and special expenses.

General expenses, other than those chargeable upon owners and occupiers under this Act, shall be the expenses of the establishment and officers of the sanitary authority, and all other expenses not determined by this Act or the order of the L. G. B. to be special expenses.

Special expenses shall be the expenses of the construction, maintenance, and cleansing of sewers in any contributory place within the district, the providing a supply of water to any such place, the providing, repairing, and cleansing public wells, the lighting where duly authorised, the charges or expenses arising out of or incidental to the possession of property transferred to the rural sanitary authority in trust for any district or contributory place, and all other expenses incurred or payable by the sanitary authority in or in respect of any contributory place within the district, and determined by the order of the L. G. B. to be special expenses.

When the rural sanitary authority makes any sewers or provides any water supply or executes any other work nder this Act for the common benefit of any two or more contributory places within its district, it may apportion the expense of constructing any such work and of maintaining the same, in such proportions as it thinks just, between such contributory places ; and any expense so apportioned to any such contributory place shall be deemed to be special expenses legally incurred in respect of such contributory place.

Ten or more ratepayers, or any number of persons lia bl to be rated to one-fifth part of the whole rate, of any contributory place, if aggrieved by anysuch apportionment, may send or deliver a memorial to the L. G. B. stating their grounds of complaint, and the said Board may, after due inquiry, make such order in the matter as to it may seem equitable, and the order so made shall be binding and conclusive upon all parties concerned.

General expenses shall be payable out of a common fund to be raised out of the poor rate of the electoral divisions or parts thereof in the district according to the rateable value of each electoral division or part thereof.

Special expenses shall be a separate charge on some contributory place or places.

The following areas situated in a rural sanitary district shall be contributory places for the purposes of this Act; that is to say,

(1) The dispensary district :
(2) The electoral division :
(3) The townland :
(4) Such portions of any townland or a townlnds as may be determined by the L. G. B :

Provided that the L. G. B. shall have power to determine on what area of charge being a contributory place, or consisting of contributory places, any special expenses shall be chargeable, whether incurred after the passing of this Act or still due in respect of works executed before the passing of this Act.

233. Mode of Raising Contributions in Rural Sanitary District.

EXPENSES OF BURIAL BOARD.

234. (*Abs.*) *Expenses of Burial Boards.*—The expenses incurred by the rural sanitary authority of any district as the burial board of such district in the execution of Part III. of this Act shall be charged on and paid out of the poor rates of the union, or of any electoral division, or of any townland or town lands situate therein, as the L. G. B. shall in each case determine.

EXPENSES OF JOINT BOARD.

235. (*Verb.*) *Expenses incurred by Joint Board.*—Any expenses incurred by a joint board in pursuance of this Act, unless otherwise determined by the provisional order, shall be defrayed out of a common fund to be contributed by the component districts or contributory places in proportion to the rateable value of the property in each district or contributory place, such value to be ascertained according to the valuation list in force for the time being.
236. Payment of Contributions to Joint Board.

BORROWING POWERS.

237. (*Verb.*) *Power to Borrow on Credit of Rates.*—Any sanitary authority may, with the sanction of the L. G. B., for the purpose of defraying any costs, charges, and expenses incurred or to be incurred by them in the execution of the Sanitary Acts or of this Act, or for the purpose of discharging any loans contracted under the Sanitary Acts or this Act, borrow or re-borrow, and take up at interest, any sums of money necessary for defraying any such costs, charges, and expenses, or for discharging any such loans as aforesaid.

An urban authority may borrow or re-borrow any such sums on the credit of any fund or all or any rates or rate out of which they are authorised to defray expenses incurred by them in the execution of this Act, and for the purpose of securing the repayment of any sums so borrowed, with interest thereon, they may mortgage to the persons by or on behalf of whom such sums are advanced any such fund or rates or rate.

A rural authority may borrow or re-borrow any such sums, if applied or intended to be applied to general expenses of such authority, on the credit of the common fund out of which such expenses are payable, and if applied or intended to be applied to special expenses of such authority, on the credit of any rate or rates out of which such expenses are payable, and for the purpose of securing the repayment of any sums so borrowed, with interest thereon, they may mortgage to the persons by or on behalf of whom such sums are advanced any such fund, rate or rates.

238. *Regulations as to Exercise of Borrowing Powers.*—The exercise of the powers of borrowing conferred by this Act shall be subject to the following regulations, namely,

(1) Money shall not be borrowed except for permanent works (including under this expression any works of which the cost ought, in the opinion of the L. G. B., to be spread over a term of years).

(2) The sum borrowed shall not at any time exceed, with the balances of all the outstanding loans contracted by the sanitary authority under the Sanitary Acts and this Act, in the whole twice the net annual value of the premises assessable within the district in respect of which such money may be borrowed.

(3) Where the sum proposed to be borrowed with such balances (if any) would exceed the assessable value for one year of such premises, the L. G. B. shall not give their sanction to such loan until one of their inspectors has held a local inquiry and reported to the said Board.

(4) The money may be borrowed for such time, not exceeding sixty years, as the sanitary authority, with the sanction of the L. G. B., determine in each case; and, subject as aforesaid, the sanitary authority shall either pay off the moneys so borrowed by equal annual instalments of principal or of principal and interest, or they shall in every year set apart as a sinking fund, and accumulate in the way of compound interest by investing the same in the purchase of Exchequer bills or other Government securities, such sum as will, with accumulations in the way of compound interest, be sufficient, after payment of all expenses, to pay off the moneys so borrowed within the period sanctioned.

5) A sanitary authority may at any time apply the whole or any part of a sinking fund set apart under this Act in or towards the discharge of the moneys for the repayment of which the fund has been established: Provided that they pay into the fund in each year and accumulate until the whole of the moneys borrowed are discharged, a sum equivalent to the interest which would have been produced by the sinking fund or the part of the sinking fund so applied.

(6) Where money is borrowed for the purpose of discharging a previous loan, the time for repayment of the money so borrowed shall not extend beyond the unexpired portion of the period for which the original loan was sanctioned, unless with the sanction of the L. G. B., and shall in no case be extended beyond the period of sixty years from the date of the original loan.

239. Power to borrow on credit of Sewage Land and Plant.

240. Form of Mortgage.

241. Register of Mortgages.

242. Transfer of Mortgages.

243. Receiver may be appointed in certain cases.

244. Rent charge may be granted in respect of Advances made for Private improvements.

245. Rent Charges may be registered.

246. Power of Commissioners of Public Works to lend to Sanitary Authority on recommedation of Local Government Board.

247. Borrowing Powers of Joint Boards and certain other Authorities.

AUDIT OF ACCOUNTS.

248. Audit of Accounts.

PART VI.—LEGAL PROCEEDINGS.

PROSECUTION OF OFFENCES AND RECOVERY OF PENALTIES, ETC.

249. Summary Proceedings for Offences, Penalties, &c.

250. General Provisions as to Summary Proceedings.

251. Restriction on Recovery of Penalties.

252. Application of Penalties.

253. (*Abst.*) *Proceedings in certain cases against Nuisances.*—Where any nuisance under this Act appears to be wholly or partially caused by the acts or defaults of two or more persons, it shall be lawful for the sanitary authority or other complainant to institute proceedings against any one of such persons, or to include all or any two or more of such persons in one proceeding; and any one or more of such persons may be ordered to abate such nuisance, so far as the same appears to the court having cognisance of the case to be caused by his or their acts or defaults, or may be prohibited from continuing any acts or defaults which, in the opinion of such court, contribute to such nuisance, or may be fined or otherwise punished, notwithstanding that the acts or defaults of any one of such persons would not separately have caused a nuisance; and the costs may be distributed as to such court may appear fair and reasonable.

254. Summary Proceedings for Recovery of Rates.

255. Recovery of Expenses by Sanitary Authority from Owners.

256. Justice may act though Member of Sanitary Authority, or liable to Contribute.

257. (*Verb.*) *Appearance of Sanitary Authorities in Legal Proceedings.*—Any sanitary authority may appear before any court, or in any legal proceeding by their clerk, or by any officer or member authorised generally or in respect of any special proceeding by resolution of such authority, and their clerk, or any officer or member so authorised, shall be at liberty to institute and carry on any proceeding which the sanitary authority is authorised to institute and carry on under this Act.

258. (*Verb.*) *Sanitary Officers to attend and assist at Prosecution by Sanitary Authority.*—Every officer of a sanitary authority shall attend and assist in any prosecution instituted by such authority on receipt of an order from such authority so to attend: Provided always, that if a medical officer of the sanitary authority shall so attend and assist, he shall be entitled to remuneration from the sanitary authority at such rate as the L. G. B. shall approve, unless it shall have been agreed that the duty of affording such attendance and assistance shall be included in his salary, or that his whole time shall be occupied in the discharge of the duties of his office; and such payment shall be deemed to be expenses incurred by the sanitary authority under this Act, and may be recovered as part of the costs of the prosecution.

259. Name of Sanitary Authority need not be Proved.

260. Demands may be Recovered in Civil Bill Court.

261. Proceedings not to be Quashed for want of Form.

262. False Evidence Punishable as Perjury.

263. Notice of Action against Sanitary Authority, &c.

264. (*Verb.*) *Protection of Sanitary Authority and their Officers from personal liability.*—No matter or thing done, and no contract entered into by any sanitary authority or joint board, and no matter or thing done by any member of any such authority or by any officer of such authority or other person whom-soever acting under the direction of such authority, shall, if the matter or thing were done or the contract were entered into bonâ fide for the purpose of executing this Act, subject them or any of them personally to any action, liability, claim, or demand whatsoever; and any expense incurred by any such authority, member, officer, or other person acting as last aforesaid shall be borne and repaid out of the fund or rate applicable by such authority to the general purposes of this Act.

Provided that nothing in this section shall exempt any member of any such authority from liability to be surcharged with the amount of any payment which may be disallowed by the auditor in the accounts of such authority, and which such member authorised or joined in authorising.

NOTICES.

265. Orders of the Local Government Board, how to be published.

266. (*Verb.*) *Notices, &c., may be printed or written.*—Notices, orders, and other such documents under this Act may be in writing or print, or partly in writing and partly in print; and if the same require authentication by the sanitary authority the signature thereof by the clerk to the sanitary authority, or their inspector of nuisances, shall be sufficient authentication.

*(To be continued.)*

## TO READERS.

THE Editor will feel especially obliged by receiving copies of newspapers which contain any Poor-law or other intelligence of medical interest, in order that he may, if fit, republish i for the benefit of the readers of the *Medical Press*. Although twenty-one of the leading Irish newspapers are received at the Irish office, many things may escape notice which are deserving of attention. Newspapers should be marked, and addressed to Dr. JACOB, at the Dublin offices of this paper.

### FURTHER RESEARCHES ON THE PHYSIOLOGY OF SUGAR IN RELATION TO THE BLOOD. (a)

By F. W. PAVY, M.D., F.R.S., F.R.C.P.,
Physician to Guy's Hospital.

The first of these communications was devoted to the consideration of the quantitative determination of sugar for physiological purposes. Some important physiological conclusions had been drawn by Claude Bernard from the results obtained through a modified method introduced by him of employing Fehling's solution. I pointed out the manner in which I considered the process in question to be open to fallacy, and showed that the results yielded by it differed to a marked extent from those yielded by a gravimetric method, which I described, of using the copper test.

I have since continued my investigations, and have now results to bring forward obtained by another process, which I described in a communication read at the Royal Society, January 16, 1879, and published in the "Proceedings," vol. xxviii, p. 290. This process does not differ in principle of action from Bernard's, and if there were no fallacy in either case involved, the results yielded by the two should agree. In both the reduction of the oxide of copper is made to occur without the precipitation of the reduced oxide, so that the change to be watched in the action of the test is a progressive decolouration, unobscured by the presence of any deposit. In Bernard's process this result is brought about by the action of potash in a concentrated form upon the organic matter incidentally present in the product prepared for examination, and the agency in force is, according to the view I have expressed, the development of ammonia. In my own process, for particulars regarding which I must refer to the published communication in the "Proceedings," ammonia is added to the test, and no fixed alkali employed beyond that present in Fehling's solution.

By means of this new process an opportunity is afforded of ascertaining on which side the fault lies in the disagreement between the results obtained by Bernard's and the gravimetric method.

The accompanying table contains the results given by the application of the three processes to six specimens of blood.

The figures in the first two columns are derived from the analyses respectively conducted with the use of potash (Bernard's plan) and ammonia, and with the adoption of Bernard's proposition that the liquid obtained from equal weights of blood and sulphate of soda measures, in cub. centims., four-fifths of the total weight in grammes of the sulphate of soda and blood taken.

The figures in the next two columns represent the results given by the same two processes of analysis applied to the product obtained after the plan adopted for the gravimetric process. The blood is treated with sulphate of soda, filtered, the coagulum thoroughly washed to extract all the sugar, and the filtrate and washings brought to a known volume.

The last column furnishes the mean of two gravimetric analyses carried out upon two portions of the blood distinct from that employed for the analyses in columns three and four.

On looking at the results the first point to which attention may be directed is that evidence is supplied showing that reliance cannot be placed upon the formula adopted by Bernard for calculating the volume of liquid derivable from the weight of blood taken for analysis. The figures in columns three and four were drawn from direct observation, and if the formula supplied correct information, the results in columns one and three and two and four should respectively coincide. It is noticeable, however, that whilst in some instances they approach closely to-

(a) Read before the Royal Society, April 24th, 1879.

wards agreement, in others there is a pretty wide divergence.

*Results given by Bernard's, the Ammoniated Cupric, and the Gravimetric Processes for the quantitative determination of Sugar in Blood.*

| Source. | Sugar per 1,000 parts. | | | | |
|---|---|---|---|---|---|
| | With Bernard's formula for estimating volume of liquid derived from the blood. | | Preparation of blood product by the process employed for the gravimetric method. | | Gravimetric process. Mean of two analyses. |
| | Bernard's potash process. | Ammoniated cupric process. | Bernard's potash process. | Ammoniated cupric process. | |
| I. Sheep..... | 0·930 | 0·560 | 0·842 | 0·571 | 0·589 |
| II. Bullock.... | 1·212 | 0·901 | 0·980 | 0·650 | 0·735 |
| III. Bullock.... | 1·563 | 1·130 | 1·240 | 0·896 | 0·921 |
| IV. Sheep..... | 0·888 | 0·579 | 0·905 | 0·567 | 0·553 |
| V. Bullock.... | 0·816 | 0·534 | 0·839 | 0·559 | 0·511 |
| VI. Sheep..... | 0·879 | 0·635 | 0·945 | 0·650 | 0·631 |

In the second place it is seen that the results obtained by the method of analysis involving the employment of the potash stand considerably higher than those yielded by the ammoniated form of the test. It may be assumed that in the action of the potash on the incidental organic matter present to give rise to the required condition for maintaining the suboxide in the dissolved state, a reducing substance becomes developed, or else that the amount of oxide of copper appropriated to the oxidation of the sugar becomes altered in the presence of the large amount of potash which it is necessary to employ.

Lastly, it may be observed that a close conformity exists between the figures in columns four and five. The results obtained by the gravimetric method are thus confirmed by the volumetric results obtained by means of the ammoniated form of the cupric test. Seeing that separately prepared specimens of the respective samples of blood were submitted to the two kinds of analysis, the conformity is certainly striking, and gives strong weight to the validity of the results yielded by the gravimetric method.

One of the points referred to in my second communication (*a*) is the spontaneous disappearance of sugar from the blood after withdrawal from the body. It is a part of Bernard's doctrine that the natural seat of destruction of sugar within the system is in the systemic capillaries, and if it can be shown that an active disappearance of sugar occurs in the blood after removal from the vessels, support is given to his proposition. I cited the observation which has been adduced by Bernard to illustrate that a marked aptitude exists for the disappearance of sugar under the circumstances named. According to this observation, a reduction from 1·070 to 0·880 parts per 1,000 occurred during the first half hour, and at the end of twenty-four hours the analytical result obtained is represented as standing thus—0·000. I stated that my own experience furnished evidence of a widely different nature, and introduced the figures yielded by five observations in proof of this assertion.

The gravimetric process is only suited for the examination of blood before decomposition has set in, as the result would be vitiated by the presence of ammonia as a product of decomposition, the effect being an interference with the deposition of the cuprous oxide. With the ammoniated cupric test, however, any state is suitable; and since my communication of June 21st, 1877, was published, I have applied this process, as well as to Bernard's potash process, to blood which has been kept for lengthened periods, instead of limiting the examination, as I had previously done, to the first twenty-four hours. The results obtained were quite unlooked for, and quite irreconcileable with the representation in Bernard's observation, which has been referred to, that at the end of twenty-four hours the blood ceased to give any indication of the presence of sugar.

I have before me a large amount of recorded experience, but need only select a few illustrative examples, for the information supplied is of the same nature throughout. In no case, although the blood had acquired a highly offensive character from putrefaction, has it failed to exercise a decided amount of reducing power over the copper test. It will be seen in the succeeding observations that there is a period during the first few days when the reducing power undergoes a pretty sudden fall, and that it afterwards remains nearly stationary. If the reducing action is to be attributed to sugar, and sugar only, it would have to be said that sugar can exist in a mass of putrefied blood without undergoing destruction. It seems to me, and this view is supported by evidence to be presently adduced derivable from the addition of sugar to decomposing blood, that there is another reducing substance present besides sugar which is not affected in a similar manner by contiguous decomposition. The period of sudden fall, it appears, may be taken as corresponding with the disappearance of sugar, and this, it will be noticed, presents a variation within certain limits. In the observations at the top of the list the period is more prolonged than in those lower down. It is possible that this may have arisen from the atmosphere of the laboratory having become influenced by the presence of decomposing samples of blood.

The earlier observations were conducted with the application of Bernard's process only, as it was not until June, 1878, that I began to apply the ammoniated cupric liquid. In the employment of this liquid the same product prepared from the blood was used as for Bernard's mode of testing. It is noticeable that the results yielded by the two processes differ from each other in the manner that has been already commented upon.

In a further series of experiments, blood with added sugar was subjected to the influence of a current of different gases. I was desirous of ascertaining if oxygen promoted the disappearance of sugar, and counterpart observations were made with carbonic acid and hydrogen. The results obtained afford no evidence of any chemical action being exerted. Whatever slight effect occurred, I think, may be assumed to have arisen from increased molecular action excited by the transit of the gas.

The following conclusions may be expressed as constituting the issue of the results recorded in this communication :—

That the results bearing on the physiology of sugar in relation to the blood derived from the application of the gravimetric process, and given in my former communication to the Royal Society (vol. xxvi., p. 346), are confirmed by those yielded by the ammoniated cupric test, described by me in the "Proceedings," vol. xxviii., p. 260.

That the disappearance of sugar from the blood after withdrawal from the system takes place in the gradual manner that might be expected from the effect of ordinary decomposition, and presents nothing to support any conclusion regarding the destruction of sugar in the blood as a physiological phenomenon.

That there appears to exist a reducing substance besides sugar in the blood which is of a sufficiently stable character to resist the effects of advanced putrefaction. Expressed as sugar, it amounts to from ·200 to ·300 per 1,000. These figures, therefore, would appear to require to be deducted from those which have been given as representing the amount of sugar present in the blood.

That the passage of a current of oxygen through the blood does not exert any appreciable effect in the direction of oxidation of the sugar.

# ADENOID TUMOURS OF THE NASO-PHARYNX; THEIR INFLUENCE ON HEARING, RESPIRATION, AND PHONATION; AND THEIR TREATMENT.

By Dr. B. LÖWENBERG, Paris,

Translated by H. Macnaughton Jones, M.D., &c., Professor, Queen's University, Ireland.

(*Continued from page* 323.)

When these troubles occur during a growing period of life, they may have permanent consequences, and imprint on the ultimate form of the thorax the alterations which we have described.

A case which we have now under observation verifies us in the explanation we offer. It is that of a little girl, æt. 7, whose respiration, usually jerking, is interrupted by these intervals of stuffing, during which she forgets, and closes her mouth. Here also there is a general flattening of the thorax, and further, the particular alterations described above. Here it is extremely interesting to recollect that Dupuytren (*a*) has found a considerable deformity of the thorax in persons affected with greatly hypertrophied tonsils. M. Lambron has investigated the same subject; he attributes the deformity, of which he has given an excellent description, to hypertrophy of the tonsils, as Dupuytren had already done. He thinks that the alterations in the development of the thorax are due to active and repeated contractions of the diaphragm, of which the movable points of attachment will be finally drawn downwards (See the article of M. Desnos (*b*):—Amygdales, Inflammation, Chronique, Hypertrophie).

It appears to us that the opinion of Dupuytren, and those who agree in his view, requires verification from new researches. We are inclined to consider that the cases in question must have been complicated with an affection then unknown—adenoid of the pharynx—and that to this should have been attributed the more serious consequences of the disease on the bony portion of the chest.

It is true that the existence simultaneously of two extremely hypertrophied tonsils would involve peculiarly the condition in one who was affected with adenoid tumours, by adding to the occlusion of the naso-pharynx, a formidable constriction of the buccal respiratory passage, on the side of the isthmus of the throat.

It is needless to add that neither Dupuytren nor Robert can be accused of having lightly treated an affection which was not recognised till long after the death of these two great surgeons.

We need not say that, in order to have indisputable results, we have carefully excluded in the study of this subject cases of hypertrophy of the tonsils co-existing with adenoid tumours. Moreover, we shall be compelled to return to this question in treating of differential diagnosis.

### Influence on Pronunciation (*Nasonnement*).

It is not alone for normal respiration that a pervious condition of the nasal passages is requisite. There is another function of unparalleled importance from a social aspect, for the regular discharge of which it is absolutely necessary that the nasal fossa should be permeable. We allude to language and pronunciation. While thus in cases of occlusion of these canals, respiration can still be fairly performed by the mouth, there are, on the contrary, certain letters for the pronunciation of which the nasal passages should be absolutely free. These are those which have been called resonant, inasmuch as in their articulation the air should escape through the nasal fossa, and there excite sonorous vibrations. The result of this is that patients, when the affection is sufficiently advanced to obliterate the naso-pharyngeal passage, find it impossible to pronounce these resonants, *m* and *n*. If the patient wishes to form them he replaces them by others by means of a substitution, the mechanism of which we shall endeavour to explain. Instead of *m* he says *b*, and *n* becomes *d*, *e.g.*, *mamma* is pronounted *baba*, *nose* is changed into *dose*. Besides this the nasal sounds are changed. This no one has as yet noticed in French pronunciation.

If to these substitutions, we add a peculiar timbre, of a muffled, dull character difficult to describe, which arises from the absence of that resonance of the vocal sounds in the nose and in the naso-pharynx, which is so important for a good articulation, we get the mode of speech which constitutes the extreme degree of *nasonnement*.

It appears to us of some interest to carry our investigations still further, and to endeavour to account for the origin of this method of speech. We shall do so with the more care, as, although the study of the defects of pronunciation marking the advanced stages of the affection in question, is very curious, we have nowhere found an explanation founded on the mechanism of phonation, and the new physical conditions, created by the disease. Moreover, certain defects of pronunciation are of unparalleled importance, socially. They imprint on the individuality of the subject something characteristically unpleasant, which has at all times strongly impressed the auditor. This importance of the voice in speaking did not escape Pliny. *Vox in homine magnam vultus habet partem*, said this Roman naturalist (In man the voice greatly influences the individual physiognomy). (*a*)

And of all the defects of pronunciation, *nasonnement* is perhaps—after lisping—the one which is most prejudicial to the social advantages of the individual, by giving to him an aspect both stupid and dull.

Let us attempt to analyse the physiological conditions of phonation, and to determine why there is a substitution of certain letters for certain others in those cases in which this exists, and the manner in which the change is effected.

We will first take the consonant *m*. In pronouncing it the air is expired by the nose, while the buccal cavity is closed in front by the application of the lips against one another, and open posteriorly, the isthmus of the throat remaining open. The organs being in this position, the air contained in the mouth and in the nasal fossa is thrown into sonorous vibrations when we pronounce the consonant *m*. But the buccal cavity would assume the same shape in pronouncing *b* (the labial letter similar to *m*), with this difference, that here the soft palate is raised to intercept the access to the nose, and that the current of air must then escape by separating the lips. We may then call *b* an *explosive* letter. The celebrated authority on acoustics, Chladni, designated the consonants of this order, "*lettres de fermeture.*" (*b*)

If it happens that a pathological obstacle, adenoid tumours, for instance, close the passage for air from the pharynx to the nasal fossa, the air can no longer escape through these, and will pass forcibly through the only available avenue by separating the lips. It is thus that the explosive labial letter *b* replaces the resonant labial *m* in the pathological condition that we have just been discussing. (*c*

It is the same in the substitution of *d* for *n*, except that these two are lingual letters, that is to say, that here the closure, instead of being formed by the lips, is effected by the tongue, the point of which is applied to the upper incisors and the adjacent portion of the alveolar arch; in contrast with the labial consonants, the obstruction is, so to speak, carried a step further back. Except for this, the mechanism of the pathological substitution is the same as in the preceding case. The anterior lingual closure of the

(*c*) Compare the excellent article of M. Blake, of Boston, "Intra-tympanic Pressure during Phonation," in "Transactions" of the American Otological Society, Vol. II., Part I., 1875.

buccal cavity is necessary in the pronunciation of *n*, which requires that the air can escape through the nose ; so is it also in pronouncing the letter *d* ; conditionally, that a current of air effects the separation. If, then, the nasal passage is intercepted, as in the condition we are discussing, and we desire to pronounce *n*, the air forces open the linguo-palatine union, and thus substitutes the consonant *d* for *n*, the explosive lingual for the resonant lingual letter which corresponds to it. (*a*)

It is similar in the case of the *n*, which enters into the formation of *gn*.

There now remains for our examination a group of phonetic sounds, which we find equally modified in *nasonnement*, but which has not been studied, so far as we know, from this special point of view. These are the nasal vowels, as they are pronounced in France. (*b*)

Here the narrowing is effected by the elevation of the base of the tongue on the one hand, and on the other the depression of the soft palate. The special aperture which produces the characteristic sound, is still further back than in the case of lingual letters. The nasal vowels are formed while the column of air dividing between the buccal and nasal channels escapes partly through the aperture restricted by the soft palate and the back of the tongue, which approach one another, and partly at the same time through the nasal fossa, there giving rise to the characteristic resonance of French pronunciation. The vowels, *a e o* and *u*, pronounced in this position of the vocal organs, become nasal, and are then *an*, *ein*, *on*, and *un*.

When the nasal passage is obstructed, two things are possible, according to our observations : 1st. That the simple corresponding vowel replaces the nasal vowel ; for instance, *penchant* resembles *pacha ;* or 2nd. That a *g* is added to the vowel. *Penchant* becomes *pague-chague*. In this latter case the obstruction is *suddenly* dispersed, and the entire volume of air escapes by the mouth. Here also the letters, for which it is necessary that the vibrating column of air can penetrate either entirely or in part into the nasal fossa, are replaced by *explosive ones* when, as in the example before us, access to these cavities is interfered with at their posterior orifice.

We shall take this opportunity of referring to a subject which requires some explanations. We often confuse the nasal sounds of the French language (and which for this reason we shall call *sons nasans français*), with the sounds similarly called *nasal*, but of a different sonority, which are contained in the other Latin languages (Spanish, Italian, Portuguese), English and German. M. Segond (*c*) first noticed this important distinction. We shall call these latter, *sons nasans non français*. They are also employed in certain portions of Central France, where they replace the pure French nasal sounds. We have noticed in other parts that the vowel followed by *nn* is substituted for the vowel with the peculiar nasal timbre ; for instance, *monde* becomes *monn-de*. (*d*)

The difference between these two classes of nasal sounds consists, as we think, in this : that in the above described narrowing the back of the tongue and the soft palate approach much more nearly to one another for the foreign nasal sounds than for the French pronunciation of these sounds. (See also on this subject the work of M. Brücke, published in the "Transactions" of the Academy of Sciences of Vienna, 1849).

The French nasal sounds, which Brücke designates as $^{1}$ and $^{2}$ (examples : German in Klingel, Enge, Wange ; English, in tinker, angel, &c.), are all resonant ; but as we have just explained, the closure of the buccal cavity is more complete, and the nasal aperture still more indispensable, than in the case of French nasal sounds. When the nose is closed posteriorly it is impossible to pronounce them, and the air, forcing through the palato-lingual obstruction, forms *gh* ; for instance, *klingel* becomes *klighghel*. The group of substitutions proceeding from posterior nasal obstruction constitute *nasonnement*, which must be distinguished from *nasillement* (*naeseln* of the Germans, *twang* of the English). *Nasonnement* is found temporarily in persons who have caught cold, and is excited by intense swelling of the nasal mucous membrane.

It is surprising that the French language alone possesses different expressions to distinguish these two totally opposite defects of pronunciation, and that other modern languages, those at least with which we are acquainted, confuse them. Besides, even in French this distinction is not widely known. The words *nasonner* and *nasonnement* are not found in most of the classical dictionaries (Académie Française, Littré, Larousse, &c.), but we have met with them in Lachâtre, and in Boiste.

Even in medical language these terms are used to express defects of pronunciation quite different from one another ; thus they are applied to the articulation of persons with the nose obstructed, and also to that of persons affected with fissure of the palate. The physical conditions being entirely different, we have not been at all surprised to find that the substitution of the *phonèmes* are opposite in the two cases. We shall, moreover, take another opportunity to return to this interesting point ; here, indeed, we only treat of the defects of pronunciation characterised by the substitutions described above.

*Nasonnement* differs from *nasillement* in that this latter is produced by an exaggerated nasal resonance, which accompanies all the sounds, and not, as in a normal case, the resonants only. On touching the nose in these cases, we perceive a continuous vibration, and it is possible to produce the nasal sound artificially by narrowing or pinching the cartilaginous portion of the nose near to the bony part. We can thus say that in articulating normally, we speak through the nose for certain letters (m, n, and nasal vowels) ; that in nasal speech we speak *too much* through the nose—nasal resonance generalised and increased—and that in *nasonnant* we speak *without the assistance of the nose*—nasal resonance is absent. Dodart (*a*), Gerdy (*b*), and M. Segond (*c*), were already aware of these distinctions. (See the excellent treatise of this latter author on the modifications of the timbre of the human voice. (*d*)

We must not leave the study of this symptom without mentioning that the nasal passage must be, so to speak, completely *abolished*, in order to produce *nasonnement*. While a simple impediment at the posterior entrance of the nasal fossa is quite sufficient to prevent respiration by the nose, which requires a rapid and voluminous current of air, phonation can be accomplished with a

(*a*) See the work of M. Rosapelly, in the "Travaux du Laberatoire de M. Marey." 1876.

(*b*) *M* and *n* are also called semi-vocal, or nasal (Rumpelt), or *rhinophones* (Czermak).

(*c*) *Archives Générales*, 1848, p. 346, and following.

(*d*) We have been surprised to find that the French nasal sounds are not peculiar to French pronunciation, as is generally believed ; (for instance, M. Brücke, loc. cit. 39). We have met with them in certain dialects of the South of Germany, amongst others in that of Frankfort-on-the-Maine, and in certain patois in Austria.

It is not, therefore, surprising that the inhabitants of the countries we have alluded to learn instantly to pronounce the nasal sounds of the French language, while the North German succeeds with more difficulty in substituting them for the nasal [illegible]s pronounced in his mother-tongue.

(*c*) Loc. cit.

(*d*) The defects of pronunciation described in this chapter will certainly recall to the readers who are familiar with English literature, one of the most remarkable of the characters in Dickens' novels. In "Oliver Twist," a young fellow named Barney is represented as speaking thus. Moreover, the *nom de plume* adopted for some time by this great humourist, *Boz*, (corrupted from *Moz. Moses*), borrowed from the familiar name of one of his brothers, would appear to imply that the latter was afflicted with the characteristic *nasonnement*, probably proceeding from adenoid tumours, for we believe that this defect of pronunciation is much more often caused by them than by *chronic coryza*, which it is generally attributed.

much diminished circulation of air. Thus we are at present treating a boy of eight years of age, the son of a much esteemed colleague in Paris, in whom it is easy to prove the presence of very large adenoid tumours, with almost all their train of symptoms, such as deafness, buccal respiration, snoring at night, &c., but in whom the pronunciation has remained normal, the naso-pharyngeal passage not being completely obstructed, but only contracted.

### Influence on the Larynx and Singing Voice.

We here touch on a very obscure point. Paralytic aphonia has frequently been observed, which resists electrical treatment, the usual panacea in similar cases, and which is only cured when a hypertrophied pharyngeal tonsil, or other adenoid tumour, is finally destroyed. Once this complication is removed, the aphonia disappears spontaneously, or under the influence of the induction current, which till then had been powerless. (See the observations of M. Bresgen (*a*), and of M. Gerhardt (*b*). We must only conclude that this is due to a reflex action caused by the pharyngeal affection on the innervation of the laryngeal muscles. M. Gerhardt even goes so far as to admit that every irritation of the pharynx may induce aphonia by reflex action.

Sometimes, instead of suppressing the voice, the presence of the adenoid tumours only diminishes its compass. If they are of considerable size, they may interfere with the articulation of the high notes, which the patient can no longer emit until the morbid growths have been removed. M. Meyer, of Copenhagen, has seen a case in which, immediately after the operation, a tone and a half was added to the voice. He wished to prove that the presence of a material obstacle had prevented the voice from attaining its normally highest pitch, and for this purpose he attempted to imitate the pathological condition by artificial occlusion of the posterior nares. Having obliterated them in a tenor with plugs of lint, he observed that these latter exercised the same influence on the voice of the singer as the morbid growths have produced in some patients.

Apart from this mode of action, adenoid tumours frequently prevent the voice being raised, by interfering with the elevation of the soft palate; indeed, it is well known that in proportion as we approach the treble notes, the soft palate is raised. However, it must not be forgotten that there is no necessity that an actual obstacle of this size should exist, for this hindrance to occur; are we are not aware that a simple granular pharyngitis may suffice to interfere with the articulation of the high notes? (See, with reference to this subject the work of M. Lasègue). (*c*) The question is not then so simple as it would at first appear, and it is necessary to combine in each case of this nature the inspection of the pharynx, and even laryngoscopic examination, with the rhinoscope, to ascertain that there is no other affection either of the pharynx or of the larynx.

### Influence of Adenoid Tumours on the Middle Ear.

Pharyngeal adenoid tumours are always accompanied by inflammation of the naso-pharynx, and we think, that correctly speaking, they only constitute a special form of this inflammation. Besides, there is in the majority of these cases, buccal pharyngitis, very often chronic rhinitis, and sometimes also, hypertrophy of the tonsils. But the most serious complication is that of *otitis media*, which accompanies almost three-fourths of these cases.

As to the exact nature of the affection from which the organ of hearing suffers, in cases attacked by adenoid tumours, we have usually met with *catarrhal inflammation* of the Eustachian tube, and tympanic cavity, generally tending to become chronic. The *suppurative variety, with perforation of the membrana tympani*, comes much more rarely under our observation. We will just refer to the account of a case which, in connection with the first related in this treatise, will show the curious manner in which these two forms may follow one another in the same individual. The history of the patient which we are about to relate, seems to us to deserve publicity on account of the singularly intermittent progress of the aural affection, especially as we had opportunities of studying it for so long a time, from the commencement of 1865, up to the present time, 1878.

Case IV.—M. X., musical, æt. 41 (in 1865); neither the patient nor his parents had shown any striking constitutional taint. A great smoker of cigarettes, he was, for a long time, a sufferer from chronic pharyngitis, to which was added, by slow degrees, mischief in both ears: deafness varying in intensity, and very distressing tinnitus, sometimes spontaneous, or sometimes excited by certain notes of the orchestra.

During the last fortnight, there was an increase of the tinnitus, and there is also pain in the interior of the right ear, the patient's voice re-echoing unpleasantly there, the orchestra producing only a confused noise. At last a purulent discharge appeared, accompanied by relief from pain, but producing no change in the acoustic phenomena.

The patient first consulted us on the 13th January, 1865, when on examination of the ears, a perforation of the right membrana tympani was discovered, about the size of a small pea, situated towards the middle of the handle of the malleus.

A watch (which a normal ear under the same conditions for sonorous impressions, would hear as far off as 1m. 25 c.) could only be heard at the distance of 2 cm.; the patient could easily perceive the tick of this watch, when applied to the cranial bones, and in an equal degree when applied to the temples. Marked granulations of the throat were present.

With the aid of the rhinoscope we saw small adenoid tumours of the naso-pharynx, especially in the neighbourhood of the Eustachian tubes, principally situated at the right side. Only one of these was more markedly developed, to about the size of a haricot bean, and situated immediately above the superior extremity of the nasal partition.

*Treatment.*—Daily catheterisation of the Eustachian tubes, with insufflation of air, and the injection of some drops of solution of sulphate of zinc (*au centième*). Instillation of the same solution in the right auditory meatus, the head being inclined horizontally on the left shoulder, in order to keep the liquid in contact with the membrana tympani; also treatment of the pharyngitis.

These therapeutical applications rapidly obtained the cessation of the discharge, and cicatrisation of the perforation, the hearing has continued at 38 centimetres by the watch.

When this intercurrent suppurative otitis was cured, the patient resumed his old habits, and would not consent to any radical treatment, directed especially towards the morbid growths, and the persistent catarrhal otitis, which however, is indispensible treatment in such cases! He was content to preserve the hearing power in a fair condition, by the use of Politzer's method, and active *cauterisation* confined, however, to the buccal pharynx, applied by a colleague.

The ultimate course of the affection was marked by very curious alternations: since the first attack, the discharge relapses every two or three years in the right ear, and a perforation simultaneously occurs always in exactly the same position on the membrana tympani. After the cicatrisation an extremely thin pellicle replaces the tissue of the membrane, so resisting in the normal condition.

A cure is generally effected after a few visits, and lasts for two or three years; after this time, the phenomena we have described reappear afresh. The last episode of this kind occurred only some months past; the same treatment was rapidly followed by the same successful result.

The left ear of the patient is affected with simple chronic

(*a*) *Centralblatt f. Chirurgie*, 9th June, 1877.
(*b*) Ibid. (Quoted by M. Bresgen).
(*c*) é des Angines," 332.

catarrh of the cavity and Eustachian tube ; *here, also*, it is impossible absolutely to obtain a permanent success. As long as the patient is subjected to treatment appropriate to this condition the hearing power is fair ; but if this is discontinued the symptoms are soon aggravated by the persistence of the adenoid tumours at the entrance of the tubes—the primary cause of the aural affection.

Since then we have had opportunities of observing three cases very similar to that which we have just described, save for the age of the patients, as they were three children—a boy of eight years, another of eleven years, and a little girl of eight years. They had all suffered from many relapses of the intercurrent otitis media, followed by perforation of the membrana tympani, which it has always been easy to heal temporarily. We operated on the morbid growths in the eldest of these two boys, and since that time the recovery has been permanent; the other, not having been submitted to an operation, on account of the refusal of his parents, is still subject to the same alternations, although alleviated by constant treatment as complete as the persistence of the tumours permits us to give. Just at present the little girl is being cauterised, for the purpose of destroying the excrescences.

*(To be continued.)*

# Clinical Records.

## MERCER'S HOSPITAL, DUBLIN.

### Under the care of Mr. E. STAMER O'GRADY.

Amongst the patients in this service whose cases came to a conclusion during the months of February and March were the following :—

*Amputation in Upper Fourth of Thigh.*—A very underfed and sickly lad, æt. 10, was admitted for disease of various bones. The middle phalanx of the little finger of the right hand protruded, black and necrosed from an unhealthy ulcer ; there was disease of the tibia on the same side, the probe finding bare bone through several sinuses immediately above the ankle. The shaft of the left femur was likewise extensively necrosed. So far as the lad's history could be learned, he had been in another hospital five months previously with "fever," and whilst there he caught scarlatina, from which he made but a feeble convalescence, the three localities named subsequently becoming painful, swollen, and the seat of purulent depots. After several weeks of careful treatment, the phalanx separated, and the little wound healed kindly. The boy's health, too, mended somewhat for a time, but afterwards the left limb grew steadily worse, the femur being denuded of periosteum for more than the lower three-quarters of its length, with an increasingly free discharge, from which, and the constant pain, the lad was steadily running down, when the limb was amputated by long anterior and short posterior flaps, the knife traversing tissues fatty and degenerated. On removal of the Esmarch bandage, eleven vessels were tied, the periosteum peeled up and exposed another portion of diseased femur; this was sawn off, making the amputation sub-trochanteric. The surface of the wound was well babbed with a solution of chloride of zinc (40 grs. ad ℥j.) ; three hours subsequently it was brought partly together with carbolised cat-gut sutures, due provision being made for "drainage." The operation was well borne ; soon the appetite became good, and constitutional improvement patent, and the stump healed in less than a month. This case also illustrates the difficulty occasionally encountered in controlling the action of caustic potash. At the time of the amputation advantage was taken of the lad being under the influence of the anæsthetic, to lightly touch with potassa fusa the diseased tibia of the right leg through a couple of the sinuses, after which compresses soaked in vinegar were applied. No local pain was afterwards complained of, but the same night a large piece of skin over the front of the lower part of the leg was seen to be black. In due time the slough separated, exposing the tendons and a large portion of diseased tibia. This wound, too, healed in by granulation steadily and rapidly to a few, and subsequently to a single, sinus. From these, several small portions of bone came away and the leg grew more firm and shapely, the little fellow was eventually allowed up. When he was able to use his crutches with safety he was sent, four and a-half months after the amputation, to a convalescent institution, where improvement has continued to be progressive. A good right leg seems likely to be recovered.

*Amputation of Leg (Three Cases).*

A. On an English woman, a cook, æt. 60, for an ulcer so extensive as almost to surround the limb, and which extended from immediately above the ankle so nearly to the knee as barely to leave room for a circular amputation at the "seat of election ;" where the knife traversed the integument, it was dense, hard, infiltrated, and a quantity of enlarged tortuous and knotty veins coursed up the inner side of the knee and thigh. Marked improvement in the general condition followed the operation, the soft parts speedily took on healthy action, the stump being soundly healed in less than five weeks.

B. On a woman, æt. 30, for disease of tibia supervening on Syme's amputation above the ankle for extensive disease of the tarsus, the patient's condition at the time rendering the first operation imperative, though she was in the sixth month of utero-gestation. The pregnancy ran an uninterrupted course, terminating normally three months and a week after it. The convalescence proceeded as usual. At first the Syme stump seemed to be getting on favourably, but after a time morbid action again developed, and the condition of parts continued to grow worse subsequent to her confinement. Four and a-half months after it, Esmarch's bandage was applied, and the stump laid freely open in the hope that perhaps the mischief might be such as could be dealt locally with ; it proved, however, to be too extensive, and the limb was accordingly amputated by the circular operation at the "seat of election." The bone at point of section was fragile, oily, and unhealthy-looking ; five vessels were ligated. For some days the patient was considerably depressed, debility and night sweats causing much anxiety. The rally was remarkable, the health began to improve, and the stump to heal apace, the wound being soundly closed in less than a month.

C. On a man, æt. 56, for bad compound comminuted fracture of leg with great destruction of soft parts. Just a year previously the same limb had met with a severe injury (described by the patient as being very similar to the present one), from which a good recovery was obtained. On this occasion, however, matters went steadily from bad to worse—profuse fœtid suppuration, loss of appetite, diarrhœa, and night sweats had much reduced the patient, when, eight days after the accident, the limb was amputated by the circular method a hand's breadth below the knee. The stump was brought together four hours after the operation, but in the evening, reactionary hæmorrhage necessitated the outer angle being opened. For some days patient continued in a weakly state with night delirium ; he gradually, however, began to amend, when the stump repaired rapidly, being quite healed within four months. (*a*)

*Gunshot Wound of Hand.*—A man, æt. 55, accidentally fired a fully charged gun whilst his left hand was over the muzzle. The metacarpal bones on the ulnar side were smashed, and the little and ring fingers blown off. When the patient came to the hospital two days after the accident, the wound was in a blackened sloughy state ; the splintered butts of the proximal phalanges projecting through it. On the eighth day after the accident,

(*a*) In each of the foregoing cases the fresh wound was dabbed with the solution of chloride of zinc.

profuse arterial hæmorrhage suddenly occurred, fortunately, when the patient was in the ward, and at a moment when skilled aid was present to immediately command the flow. Though local conditions had previously made it undesirable to interfere surgically, the jagged bones were now disarticulated at the metacarpo-phalangeal joints, when, after removal of splinters, the hæmorrhage ceased spontaneously; and, subsequently, the progress of the hand to repair, though slow, was ultimately most satisfactory; the patient being dismissed from the hospital after a stay of thirty-nine days with a hand which promised to be a thoroughly useful member, and which was but comparatively little deformed.

*Ingrowing "Toe Nails."*—A female, æt. 30, a draper's assistant, had the two great toes affected; both margins of the left, and the external margin of the right, being extensively implicated. After some necessary preliminary constitutional treatment, the diseased surfaces and subjacent tissues were sliced freely off, the rawed surfaces forming inclined planes, receding well from the nails. Local pressure, by little cylindroid pads, was kept up during the healing, which was rapid and satisfactory; the patient leaving the hospital quite cured a little more than a month subsequent to the operation.

*Phantom Tumour.*—The patient, an unmarried woman, æt. 40, had in and above the left iliac fossa a well-marked and clearly defined tumour, somewhat larger than a full-sized cocoa-nut. This could be moved about freely, and partly lifted by the hand, feeling solid and firm, though tympanitic on percussion. Conditions remained uninfluenced by purgatives or enemata, but on patient being profoundly anæsthetised, the swelling entirely disappeared, but returned to its former state as she recovered consciousness. The woman was in no way hysterical. Severe and long standing pain was complained of in the side above the "phantom." The patient was a virgin; the vagina bifid above; the uterus merely rudementary. The history given was that the catamenia had been regular from twelve to fourteen years of age, then ceased till twenty-one, when the flow occurred once, and never returned since.

*Vesico-Vaginal Fistula.*—Patient was a remarkably large fat heavy woman, æt. 32, the subject also of ulcerated legs. She had been confined of her first child ten months previously. The vagina was closed immediately above the vulvæ by a dense cicatricial septum, which completely occluded the passage except a small opening at its upper part, which scarcely permitted the entry of the tip of the little finger. The perforation was close to the vesical extremity of the urethra; this canal being here much contracted, and requiring considerable dilatation to let a full-sized cathether pass. The instrument when in the bladder could be felt just within and above the fistula. The position of the opening made it a matter of difficulty to pare its edges; this accomplished, the little wound was united by a couple of silver-wire sutures. The patient continued dry, the urine coming off by the catheter, which was changed as occasion required, till the tenth day, when leakage began. On removal of the sutures on the twelfth day, the fistula was found to be less than half of its former size.

Among the following cases illustrative of the surgery of the face, in the third and fourth, opportunities were afforded of testing the great rapidity with which clean-cut wounds about the mouth may unite.

*Secondary Operation for Disease connected with the Upper Jaw—Rapid return.*—A lad, then æt. 14, two years previously had part of the right upper jaw removed in connection with the extirpation of a naso-pharyngeal polypus, which had also grown into the antrum, and perforated the alveolar margin. Good recovery followed, the lad grew strong and healthy, and as time passed on it was hoped the cure would prove radical. However, after two years' respite, the trouble began to appear again, and when the patient, now grown into a strong and well-developed young man, came back to the hospital, then only a fortnight after he first noticed the return of the trouble, the mass had already acquired considerable dimensions. There was protrusion of the eye forwards and upwards, œdema and eversion of the lower lid. A finger inserted into the deficiency remaining from the former operation in the upper jaw, felt high up a large soft polypoid mass. For the present operation the superficial incisions were made as nearly as possible identical in position with those practised on the former occasion (the resulting cicatrices therefrom being now scarcely discernible), coursing from external to the outer canthus of the eye along the lower border of the orbit, and down inner side of the nose, round the alæ, and through the middle of the upper lip. The cheek having been raised, the radical points of attachment of the upper jaw were cut through with powerful forceps, and the bone with the malar removed, except only a very small portion containing the central incisor, which was left; the bone being here cut obliquely for this purpose. A large fungating polypoid mass came clean away with the bone, every vestige of the growth seemed to be entirely removed. The floor of the orbit was seen to have been in great part absorbed. The actual cautery having been applied to some bleeding points, lint plugs with attached strings and previously squeezed out of carbolised oil were placed in the cavity, and the long wound united with hare-lip pins and sutures. Repair seemed unaffected by the circumstance of the operation wound on this occasion being over the old ground of the former operation; nearly the entire healed by first intention, the eye receded, and for a time the progress of the case seemed in every way to be most hopeful. Circumstances happened to delay the patient in hospital after the period which had been arranged for his return home, and on the twenty-fifth day after the operation a suspicious appearance was noticed at the bottom of the cavity. To this locality iodoform was kept applied for some days seemingly with much benefit. This however proved to be but very transitory, and it soon became but too evident that the disease was again growing. It rapidly sprouted down into the mouth, and when the patient left the hospital, only thirty-eight days after the operation, the trouble was increasing at such a rate that from visit to visit its advances were recognisable. There was, however, absolute freedom from pain, a result obtained it, seemed likely, by the removal of all bone pressure.

*Severe Wound of Face.*—A man, æt. 42, was struck in the face by a car running at a rapid pace, the point of the shaft catching the right angle of the mouth, tearing the cheek open almost to the ear, and inflicting much injury on the adjacent parts. The huge wound was brought together by interrupted sutures. At first there was a considerable degree of inflammatory action accompanied by much swelling; this subsided after a few days, and the case did remarkably nicely, the patient leaving the hospital, almost unmarked, fifteen days after the accident.

*Extensive Cancer of Lower Lip and Angle of Mouth.*—The patient was a man, æt. 55, the disease, of very rapid growth, affected the entire lower lip to within a quarter of an inch of the left angle of the mouth; the right being involved. A modified H operation enabled the disease to be cut clean away; the lower figure of the H was dissected up to aid in forming a new lip. The integument and mucous membrane of the cheek were whipped together to form part of a new mouth. A narrow strip of mucous membrane, which it was happily able to preserve below the transverse limb of the H, similarly whipped to the edge of the integument flap, furnished a promising border for the new lip. It was necessary to secure two large spouting vessels with carbolised catgut ligature. Four hare-lip pins, with some points of interrupted suture, kept the parts in good condition. *Ten hours after the operation*, in consequence of smart hæmorrhage, which cold and pressure failed to staunch, the right extremity of the wound had to be opened. After withdrawing the two hair-lip pins here placed, it was surprising to find the amount of firm adhesion which had already obtained. A

considerable degree of force was necessary to separate the parts. The bleeding vessels having been ligated, the wound was put up as before. Subsequent repair was languid at first, but did not seem to be more so in the part of the wound which had been interfered with than elsewhere. When the patient left the hospital in the fourth week all was soundly healed. There was very little deformity; the new lip had come well up; it was moderately movable, and fairly fulfilled its functions. No glandular enlargement.

*Hare-lip (Four Cases).*

A. *Complicated Double Hare-lip and other Malformations.*—In addition to double hare-lip and cleft palate, attended with great protrusion of bone, this infant, a male, had six fingers on the left hand, six toes on the right foot, and seven on the left. His mother was an uncommonly comely, well-made woman, and there was said not to be any other malformed members in the family. A little wedged-shaped bit of bone was removed sub-mucously from the septum, immediately behind the protruded intermaxillary mass, which was thus enabled to be pushed back readily. A week later (the infant being now six weeks old), the little wound having thoroughly healed, the lip was operated on. The apposed surfaces of the intermaxillary and of the maxillary bones were first rawed and united by inter-osseous sutures. During this process, two milk teeth were unavoidably extruded. The soft parts having been pared, were united by two hair-lip pins, with one suture of carbolised catgut at the red border; the result being a lip singularly free from lateral or other deformity. Scarcely any blood was lost during the operation. Nothing occurred to excite alarm till twenty-two hours afterwards, when the infant suddenly became pale and immediately died. There was no purging nor convulsion, no warning; up to a very brief period before his death, the little creature seemed to be quite as well as he had been all along. On local examination of the region of the wound this was seen to be well and firmly united, a considerable tug being required to separate the parts, and nothing could promise more admirably than the appearance of the lip.

B. *Double Hair-lip*—A male infant, three months old, with cleft palate; the alveolar arch, however, being only notched on either side of the intermaxillary bones. The fissures in the lip were deep, extending up into the nostrils on either side. The soft parts were dealt with as in the preceding case. The pins were removed at the end of four days, and suitable straps of plaster running round the head were subsequently applied. The result of this case was eminently satisfactory.

C. *Complicated Double Hare-lip.*—The patient, a handsome and intelligent lad, æt. 12, had also cleft palate. During his infancy the hare-lip had been twice operated on, and a partial union effected on the right side, but none on the left, where, through the wide gap, the inter-maxillary mass protruded obliquely. It contained the four incisors—the lateral projecting into the fissure on either side. It was contemplated to operate first on the palate in which the cleft was wide, but the lad's parents would only permit the lip to be done. In dealing with this, the septum was cut through sub-mucously by a slender bone forceps behind the prominent bone, which this procedure enabled to be, as it were, folded back to the left; it filled up nicely the gap in the alveolar arch. The lateral incisors were extended and the freshened surfaces of the maxillary and inter-maxillary bones united by an inter-osseous suture of strong carbolised catgut. The sides of the cleft were then suitably pared, and the left cheek having been freed from the subjacent structures, brought together with three hare-lip pins, and one suture on the red border of the lip, collodion and adhesive straps were also used. The union obtained from the prior operations was preserved intact, and as little interfered with as possible, as it seemed preferable to leave this part to be dealt with independently afterwards if necessary. One needle was withdrawn after three, the others after four, days, when good union was found to have been effected, the adhesive plaster-straps surrounding the head being continued as a safeguard. Four days later a small gap was found to have formed since the preceding visit on the red border; this there was good reason to believe was caused by some indiscretion on the lad's own part. An entomology-pin was inserted with figure-of-8 suture of soft silk, and on its removal some days after, a catgut suture was inserted farther back; good union was thus obtained, though the boy had a bad cough. The weather at the time was extremely cold and severe. The returned central bone projection had taken a vicious position, the incisor teeth looking backwards down the throat, as it were, and diverging greatly from each other. To remedy this, Mr. Sherlock kindly made a modification of Hainsby's truss with a connecting arch in front, from which wires were attached to the teeth, and these, together with the parent bone, were brought forward into position, when a plate with a cross-bar so arranged as to pass behind the bone and keep it and the teeth steadily fixed, was fitted in by the same gentleman. The appearance of the lip itself was not improved by the bringing forward of the bone mass, which made the lip shallower in the middle and look as it were puckered up, specially on the left side. This state, however, it was expected, would be easily dealt with when the bone became solidified. Pending this, however, the illness of the lad's mother necessitated his return home with the lip still partially unfinished.

D. *Complicated Double Hare-lip.*—In this case, also, the boy, æt. 5, was much older than the subjects of this operation usually are. Here, too, though a good result was ultimately obtained, prolonged and careful after-treatment had to be sedulously attended to. The deformity was very great, the consolidated inter-maxillary bones projected nearly at the tip of the nose, and contained four partially erupted teeth. There was no cleft palate beyond the hiatus in the alveolar arch. The parts were dealt with as in the preceding case. Three needles were required, the upper one transfixing behind the alæ of the nose. There were also two carbolised catgut sutures—one on either side between the central and lateral portion, in addition to that on the red border; collodion and adhesive plaster completed the dressing. Forty-eight hours after the operation, the face was greatly swelled, but otherwise the child was doing very well. The middle needle was removed after three days, the others after four, when pus appearing oozing out above the plaster straps, they were also taken off, and the two sutures cut out. It was now seen that the upper portion of the wound, where it branched up into the nostril on either side, was well and firmly united, adhesion had occurred, too, at the lower part, where it also looked healthy, but in the middle the parts fell asunder, and the edges and bottom here were seen to be unhealthy and sloughy. Tonic treatment was given, and the parts carefully supported by straps of adhesive plaster. Three days later—a week after the operation—the small sloughs had come away, and the parts looked clean and healthy, but there was a hole in the middle of the lip which would admit the tip of the finger. The deeper structures were now healthy-looking, and the bone lay nicely in position. As there seemed to be a tendency for the union to give way, the edges behind were approximated and supported by a small pin and figure-of-8 suture of soft silk. The sides of the central opening in the lip were considerably approximated by pads of lint placed beneath the adhesive straps which surrounded the head, and were so arranged as, by pressure on the lint pads, to carry and support the cheeks forward. The daily dressing of the case was most carefully attended to; when the supporting pin and suture were removed the union of the red border was found to be satisfactory and firm. The same manœuvre was repeated higher up, so as to bring the sides of the central opening in the lip into apposition, pieces of cork run down on the needle on either side, effectually warded off all pressure of the superposed silk on the soft parts. Only partial success was, however, obtained here, and the edges of the reduced opening cicatrised; subsequently, liq. potassæ was applied, so as to remove the newly-formed

skin. Soon after this reparative action took a new start, the cavity rapidly filled up with healthy granulations and cicatrised, a satisfactory and comely lip being eventually obtained. The growing teeth in the central portion of the alveolar arch are viciously directed, and will require the dentist's skill.

# Transactions of Societies.

## ROYAL MEDICAL AND CHIRURGICAL SOCIETY.

On the 22nd April the meeting of this Society was occupied with the adjourned debate on the Report of the Committe appointed to Inquire into the Relation of Croup and Diphtheria. Only a few Fellows spoke, owing to the length of the speeches made by those who had the opportunity of expressing their opinion on the subject. The debate was therefore again adjourned.

Dr. G. Johnson said that the question was one in which he had long taken more than ordinary interest. For many years he had been a firm believer in the theory that the usual anatomical result of inflammatory croup is formation of membrane. But his belief in this theory was much shaken by having under his care two cases of unquestionable croup, in which, after death, no false membrane was found in any part of the air passages. Moreover, a study of that instructive collection of memoirs on diphtheria translated by Dr. Semple, for the New Sydenham Society, seemed to throw a new light upon membranous croup. He there learnt that French pathologists describe croup as a disease attended with exudations of false membrane, and hat it is a form of diphtheria, and that they d istinguishe d between this form and "false croup" or "stridulous laryngitis." Referring to the works of Home, Cheyne, and even to that of West, he thought those authors had confounded two distinct diseases—the one simple laryngitis, the other diphtheria. Since then others had taken up the same view. Four years ago the publication of a lecture by Sir W. Jenner in the *Lancet*, and simultaneously of a paper of his own, led to much discussion, and it was remarkable how great differences of opinion existed. With regard to the Report, he thought it was, perhaps, more valuable for its questions than for its decisions, and in the main he agreed with Mr. Parker in his criticism upon the Report, save that where he thought the committee should have expressed a positive opinion. This, which would be easy for any one observer, would be less so for a committee of many members, each of whom might have individual opinions on the subject. He was surprised to hear Mr. Holmes state that the committee had decided that the two affections were not identical in a positive way by their statement that "croup may be membranous or not membranous, due to diphtheria or not so." The important question was—Is membranous croup a form of diphtheria? The anatomical results of simple catarrhal inflammation of the air-passages are known to everyone; it is a disease met with every day, and in every degree of severity. A membranous exudation has never been found as the result of this—*i.e.*, as produced by cold. The diphtheritic poison has a tendency to attack abraded cutaneous or mucous surfaces, as a leech-bite, or a blistered surface. Trousseau, dealing with the subject of "cutaneous" diphtheria, mentions a case where an abrasion of the foot was inoculated from a case of diphtheria. Patients suffering from scarlet fever, or typhoid, not unfrequently have the complication of diphtheria, and it is important to bear in mind that in such cases we have instances of two distinct specific diseases attacking the same subject at the same time. With respect to two illustrations of this statement, he remarked that, supposing the first infant had been exposed to the east wind in Hyde Park and got catarrhal laryngitis, the probability would have been very great that he would have been infected by the diphtheritic poison on the abraded surface, and have died of membranous laryngitis—the true cause of which (the insanitary state of the house) being unsuspected. The committee quote similar instances—some given by Dr. Fagge; and the case related in which membrane formed on the air-passages after inhalation of eau de Cologne could hardly be said to be due to the mere contact of this fluid. The remarkable fact in the history of this patient was that the restorative was given her because she was "fainting from pain at stool." She could not have been in good health, and very likely was then suffering from diphtheria. He would say, then, that as when scarlet fever is complicated with diphtheria there are two distinct diseases, so when diphtheria succeeds injury two distinct agencies are at work. The committee had dwelt upon the differences presented by the purely laryngeal cases and those in which exudation was limited to the fauces. In the purely laryngeal the disease appeared to be less infectious, less frequently accompanied by albuminuria, with less glandular swelling and less general depression. These differences might be expected from what we know of the diphtheritic poison. The risk of infection would be in direct proportion to the amount of exudation, and especially to its existence in the fauces, where it was less firmly attached than in the larynx, and, moreover, could readily be coughed out. The albuminuria, like the glandular swelling, probably resulted from the absorption by the lymphatics from the part infected, and was in direct proportion to the extent of surface involved. He held that the amount of exudation was a measure of the severity of the disease, and in proportion to this was the constitutional disturbance great. He also well remembered how the first two cases of diphtheria he saw occurred in two sisters, one of whom had a patch of exudation on the tonsil, and the other had none on the fauces, but died from membranous croup. Dr. Dickinson quotes a similar case (p. 123 of Report), where a child with membranous croup and follicular tonsillitis, with diphtheria, infected the nurse in attendance on her after tracheotomy. In examining cases of catarrhal inflammation he had often been struck by the fact that where there was no visible inflammation of the soft palate and fauces the lower part of pharynx, epiglottis, and larynx were much inflamed, so that if such were exposed to the diphtheritic poison these regions would be more likely to get affected. He differed from the statement on page 32, that "in the larger number of cases of membranous affection of the larynx the cause is obscure;" and he quoted instances where at first the cause was not obvious, but subsequently became so. He had no doubt that, as the committee state, diphtheria is less specific than typhoid fever; he thought it often arose *de novo* from bad drainage, &c.; and he related an instance where some cases followed the opening up of a cesspool, the house in which they occurred being situated so that the wind blew the emanations from the cesspool towards it. It was important that the committee found no specific difference, chemical or microscopical, between the membrane found in the pharyngeal and that in the laryngeal cases. Their conclusion on page 32 was (just after the statement that the cause is obscure in the larger number of cases of membranous laryngitis) that, "among those in which it (*i.e.*, the cause) is apparent, common irritation seldom presents itself as the source of the disease, and accidental injury is but very infrequently productive of it. But few cases of undoubted origin from exposure to cold are on record. On the other hand, in a very large number of cases infective or zymotic influence is to be traced." He would go further than this, and would say that in every case there is an infective or zymotic influence at work.

Mr. Hutchinson directed the attention of the Society to a subject which he thought bore largely on the question of the nature of diphtheria, and that was the subject of diphtheritic or pellicular ophthalmia. This was an affection met with in very various degrees of severity, sometimes as a mere film, at other times as a thick pellicle which it was easy to peel off in one layer. In England it was believed to be but rarely contagious. In these cases there was no evidence of their being exposed to special diphtheritic poison. Another class of cases, rarely seen in England, were those in which diphtheritic or pellicular inflammation attacks wounds. He had seen this pellicular condition of wounds in hospital practice, chiefly during an epidemic of hospital gangrene some years ago at the London Hospital; and several cases since. These facts had led him to assent to the much-assailed doctrine of Virchow, that "diphtheria should be placed in the same category as hospital gangrene." Passing to the membranous or fibrinous angina of Bretton-neau, he would like to ask the committee whether cases of contagious sore-throat, occurring frequently in an epidemic manner, and marked by pellicular patches on the pharynx, but never fatal, were to count as diphtheria or not? It was

almost impossible to draw a line of distinction between these cases and those of recognised diphtheria. He could make no distinction between these mild forms of contagious sore-throat and those with which we are familiar under the name of "hospital sore-throat," and he would ask whether they should not all be considered as minimised forms of diphtheria. The question for discussion was partly one of fact and partly one of definition. The committee have adopted a suggestion made by other writers, that it would be desirable to disuse the word "croup." Sir John Cormack prominently states this in heading one of his lectures "Croup—a symptom; diphtheria—a disease." In his own view it would be equally wise to disuse "diphtheria" too, for it had come to be employed in far too limited a sense. If there was any one statement in the Report to which he would take exception, it would be the perpetual recurrence of the terms "diphtheritic poison" and "zymotic influence." His own impression was that there was no disease in which membranous inflammation occurred that could be styled "zymotic." All might be explained on the view of a simple inflammation. The only grounds upon which diphtheria was assumed to be a specific fever were these—its contagiousness, the occurrence of albuminuria, the supervention of paralysis, and the peculiar membranous inflammation characterising it. He submitted that many diseases were contagious which were not specific forms, for he drew a strong line between contagious inflammation and a specific fever, a disease in which a special seed may be assumed to grow in the blood. The fact of contagion goes for nothing; it occurred in erysipelas and other inflammatory affections arising *de novo;* and he held that any disease capable of arising *de novo* was not a specific fever. The production of membrane on the inflamed surface was a peculiar symptom, but after all it was not one on which the idea that diphtheria was a specific fever could be based. Albuminuria occurs frequently after erysipelas, often after burns (within six or eight hours of the injury), so there was nothing unusual in that. As to the sequence of paralysis, he would submit that we do not know enough of diphtheritic paralysis, regarding which some interesting facts had come under his observation, confirming the opinion that the paralysis bears no relation to the severity of the throat affection. Child after child had come to him with paralysis of accommodation, and in many of them no history or diphtheria could be obtained, often only of a sore-throat almost disregarded or forgotten. Not long ago a child with this form of paralysis was brought to him from Finchley, and he said that it must have had diphtheria; and, inquiring, found that it had had a sore throat at the same time as its sister and a man in the same house had. Mr. Hutchinson concluded by saying that his chief object in rising was to submit as a definite proposition the queries:—Is there any *bonâ fide* and sound reason for speaking of diphtheria as a specific fever? Is it not much more probable that the diphtheritic false membrane may arise from ordinary causes of inflammation, and that it becomes itself contagious? Diphtheria had no true period of incubation like other fevers, and he believed the recognition of this view would clear away a great deal of obscurity attending the subject. The committee had acted judiciously in giving no positive opinion. It was impossible that they could arrive at one so long as they understood the term diphtheria as implying a specific febrile disease. It was a specialised local inflammation producing various constitutional effects, and not a disease depending on zymosis. When this dogma had been got rid of the facts would be viewed in a clearer light; so long as it was retained they would be confused and obscure.

Dr. SQUIRE did not expect to hear the fact of diphtheria being a specific disease called in question. The practical point was, whether isolation should be resorted to in cases of croup? Only, he would reply, when undoubted evidence of diphtheria could be obtained; that it might be, indeed, only revealed by subsequent paralysis of the ciliary muscle affecting the sight. The mere occurrence of false membrane was indecisive, for he believed that this might be present on the tonsils apart from diphtheria; and might be absent in undoubted cases of that disease. The report had not sufficiently dwelt on the epidemic character of diphtheria, and its analogy with scarlet fever. He commented on the fact of the higher rate of mortality from diphtheria in continental towns, as compared with London, a difference attributable to sanitation, and urged that differences in season should have weight in deciding between croup and diphtheria; the former prevailing in the cold winds of spring, the latter being more common in autumn and winter. He did not insist upon croup as an entity, but claimed for both croup and diphtheria a place among zymotic diseases.

Dr. SEMPLE recalled the attention of the Fellows to the fact that the report now circulated owed its existence to a paper read by himself at a meeting of that Society held in November, 1875. On that occasion he expressed an opinion, and supported it by facts and arguments, that membranous croup and laryngo-tracheal diphtheria were one and the same disease. The conclusions he drew were not opposed; but the subject appeared to the Fellows to be so important that a committee was voted for, and subsequently appointed, with a view to consider the question as to the identity or non-identity of the two above-named affections; and the result, after three years' deliberation, was now before the profession. He thought he was justified in referring to the circumstances under which he formed the opinions he now maintained. In the year 1858 he was appointed by the Committee of the New Sydenham Society to edit and translate a series of memoirs on diphtheria by Brettonneau, Trousseau, Bouchut, Guersant, Empis, and Daviot, and he became, of course, acquainted with the French views entertained on the subject. It so happened that, at the very time he was so engaged, a very severe and memorable epidemic of diphtheria broke out in this country; and he had an opportunity of witnessing the course and termination of the disease, at Bagshot, in Surrey. He performed the post-mortem examinations himself, and brought the specimens so obtained to the very table before which he was now standing—Dr. (now Sir Thomas) Watson presiding on the occasion as President of the Pathological Society. He was struck by the exact resemblance presented by the cases, both in their clinical features and the post-mortem appearances, to those recorded so accurately by Brettonneau and his then pupils, Velpeau and Trousseau, as having occurred in and about the town of Tours, in France. After the great English epidemic at the period referred to, there was a lull in the virulence and extension of the disease in England, and he for some time saw very little of; but a few years afterwards—namely, in the year 1865—as chance would have it, a case occurred in the practice of a dispensary to which he was attached as physician, presenting in its course and termination and post-mortem appearances the very same features as those he had observed before at Bagshot, although the case was a sporadic one and no infection or extension of the disease could be traced. This case he had also himself examined after death, and had presented the specimen so obtained to the Pathological Society. But on reflecting on this case, and comparing it with the descriptions found in the existing text-books, he became convinced that much error and confusion existed on the subject of so-called croup, and at the meeting of the Society in question he expressed his opinion that "diphtheria of the trachea was essentially the same as croup, the latter disease being, in fact, a variety of the former." He also then stated that the word "croup" in the systematic books really comprised, or rather confounded together, three separate diseases, namely, tracheal or laryngo-tracheal diphtheria, infantile laryngitis, and laryngismus-stridulus. All these different diseases are confounded together in the text-books, as any one may see by consulting those works, and he particularly referred to the Cyclopædia of the great medical lexicographer, the late Dr. Copland, who, in the article "Croup," distinctly confounds all these three maladies together. The opinions offered by himself (Dr. Semple) in 1865 were undoubtedly opposed, but they had since been adopted and expressed by Dr. George Johnson, Sir Thomas Watson, Sir John Rose Cormack, Sir William Jenner, Dr. Bristowe, and Dr. Morell Mackenzie. In making this statement he did not intend in the slightest degree to assert or to insinuate that any of those distinguished men had derived their views from anything he had done, spoken, or written; but he begged to state, with the same emphasis and distinctness, that he had not borrowed his opinions from them, but had pursued his investigation, whether clinically or historically, in an independent manner, having for his sole object the discovery of the truth. He had made all his post-mortem examinations himself, and he had recorded no case which had ended fatally without having done so. He had been represented as stating that croup and diphtheria were the same disease, but he had never been guilty of any such absurdity, for he was of course well aware that diphtheria, besides appearing in the throat, might attack the eyes, the

nose, the ears, the anus, the glans penis, the vagina, and the skin; while croup, however vaguely the word was used, was applied only to some malady of the throat. What he maintained in 1865 he asserted still more strongly now—namely, that laryngo-tracheal diphtheria was the same disease as membranous croup. The disease commonly and popularly called "croup" was infantile laryngitis, of which he had seen multitudes of cases, especially among the children of the poor; but although in all his cases of death from this disease he had made post-mortem examinations, he had never found any false membrane, although there might be frothy mucus or pus. With regard to the queries sent out by the Committee, he would say that in nineteen out of twenty cases where a negative answer had been sent to the question whether it was believed that croup and diphtheria were identical, the answers were based on mere assertions, and were unsupported by facts. So imperfect was the knowledge thus obtained that the committee sought for information from various children's hospitals, the result being the valuable tables furnished by Drs. Dickinson, Fagge, and Gee. The conclusion rationally drawn from this inquiry was, that in all but a very small percentage of cases of membranous laryngitis was due to the diphtheritic poison; in a very few cold or traumatism was thought to be an excitant of it. For his own part he felt that the conclusions at which he had previously arrived had been strengthened by that report. It might be asked—*cui bono?* He would reply, it was of much gain, for hitherto the literature of croup and diphtheria had been a mass of confusion; but the recognition of the diphtheritic nature of croup would alter this, and tend to simplify our nosography. Dr. Semple then alluded to the simple and generally harmless character of non-membranous laryngitis contrasted with the fatal tendency of the membranous form, in which tracheotomy alone afforded a chance of recovery, the object of the operation being, in that case, not only to admit air into the lungs, but to clear out the membrane. A distinguished surgeon had told him that his cases of tracheotomy for "croup" were successful, those for diphtheria unsuccessful; the fact being, that in the former he probably had to deal with simple laryngitis. He held then that the question was not simply one of terminology; it involved a great question of nosology, and, in the second place, was of great importance as indicating the correct lines of treatment to be pursued.

Dr. LOWNDS said that in India he had seen many cases called croup which became almost urgent enough for tracheotomy; but which yielded to antimonial emetics. But in the sixteen years of his service in that country he had met with only two cases of diphtheria. He could not agree with Mr. Hutchinson that there was no premonitory fever in diphtheria. In many cases shivering was the first symptom of its existence. He had no doubt of the occurrence of sporadic cases of diphtheria.

Sir WM. GULL said that it was interesting to notice how varied the discussion had been. The question before the meeting was not so much the nature of diphtheria as the relation between that disease and membranous laryngitis. He did not think the pathology of the larynx could be settled with our present knowledge, although the profession was greatly indebted to Dr. Semple, Sir W. Jenner, and Dr. Johnson for showing how widespread was the influence of diphtheria in causing membranous inflammation of the larynx. But he could not agree that this embraced the whole question, and he joined with Dr. Wilks in his statement that the same pathological products may have various causes. The committee had attributed a large number of cases to zymotic influence. Twenty years ago, in a report he drew up at the request of Mr. Simon for the Privy Council, he (Sir Wm. Gull) had drawn the distinction between cases which were diphtheritic and those which were due to diphtheria. He believed with Mr. Hutchinson that in many cases the change is at first a local affection, propagating itself by contagion from part to part, like erysipelas. From this point of view the sporadic occurrence of the disease was explained. He believed that there was every degree of affection. Still he thought that in the child's larynx there is a special proneness to membranous inflammation. The epithelial lining of the infantile larynx was more of the pavement character than that of the adult and was devoid of cilia, and this was one difference which might account for the greater liability to membranous inflammation. It was quite true that membranous inflammation limited to the larynx was less contagious than the pharyngeal form. As to the question of diagnosis between idiopathic and specific membranous inflammation of the larynx, he would say that in a young child under two years of age it was most likely to be idiopathic, and to require treatment of a simpler kind than an older child, especially if in the latter case the fauces were affected. It had for many years past been the practice to say that all cases of plastic (diphtheritic) inflammation should be treated with iron. He, however, now ventured to declare publicly, what he had long stated in private, that in many such cases mercurials given at the same time, &c., to support the nervous system, were preferable to iron. From an experience of several cases—three in particular—he was sure that the old discarded plan of giving calomel to alter the character of the inflammation was the correct one. It may be that the cases which do well on this plan are idiopathic; it may be that they are diphtheritic; although, for his part, he thought Mr. Hutchinson nearer the truth in grouping them together as varieties of one form of local contagious inflammation than in separating them. Whatever the view on this point, it is clear that in practice we must be prepared to pursue the old method of altering the character of the inflammation. He would not venture on the mercurial treatment if the glands were much enlarged, and the constitutional depression great, but he believed this stage might sometimes be anticipated. He spoke strongly on the matter, for three-fifths of his family were victims to diphtheria, and he could not think the question so completely decided as those who held the diphtheritic origin of all membranous laryngitis would have us believe. The question was not categorically settled yet, and he hoped it would still remain open.

'SALUS POPULI SUPREMA LEX.'

WEDNESDAY, MAY 7, 1879.

## CROUP AND DIPHTHERIA.—II.

OUR first article on this subject was confined to a consideration of the Report of the Committee of the Royal Medical and Chirurgical Society. Although this report was a most able one, and reflected great credit upon

those who undertook the arduous task of compiling it, neither the evidence it contained, nor the decision of the Committee, could be said to be so satisfactory as to settle the question either one way or the other. One or two of he Fellows of the Society appear to have been of the same opinion; and, therefore, it remains to be seen whether the Society will throw more light upon the matter, or whether the opinions of the many eminent men who have expressed, or have still to express, their views on the subject, are so divided as to show that the identity or not these of diseases is still an open question.

From our report it will be seen that many of the facts adduced by Dr. G. Johnson, who opened the discussion which took place at the meeting of the Society on the 22nd ult., had little or nothing to do with the question at issue. They showed that diphtheria was remarkably contagious, that it often broke out through insanitary conditions which were entirely unsuspected or overlooked at the time of its occurrence, and that many cases which appeared to originate from local irritation, and which were set down as membranous croup, might have been caused by inoculation with the diphtheritic poison. Such facts were interesting in illustration of some of the well-known characteristics of epidemic diphtheria, but they did not bear upon the point at issue. So far from proving that diphtheria and croup were different forms of one disease, they went rather the other way. The fact of a membrane appearing on a wound that had been caused by an operation for congenital phymosis, and of two servants contracting diphtheria at the same time and in the same house, was surely an argument for, rather than against, the duality of these diseases, inasmuch as such phenomena have never been observed in the case of sporadic inflammatory croup. Much more to the point was the ingenious way in which Dr. Johnson controverted the distinction that has been made between croup and diphtheria on the ground of certain symptoms alleged to be present in the one and not in the latter. It has always been contended by one party that croup is not infectious, and that it is seldom or never attended by the albuminuria, the glandular swellings, and the great prostration so characteristic of diphtheria. But, says Dr. Johnson, that the purely laryngeal cases (so-called croup) should exhibit these phenomena to a much less extent, "might be expected from what we know of the diphtheritic poison." The risk of infection would be in direct amount to the exudation, and especially to its existence in the fauces, where it was less firmly attached than in the larynx, and could, moreover, be readily coughed up. "The albuminuria and the glandular swellings, which probably resulted from absorption by the lymphatics, was also in direct proportion to the extent of surface involved. The amount of the exudation was a measure of the severity of the disease and of the constitutional disturbance." The argument is certainly a very plausible one, the consideration of which we must reserve for a future occasion. Throughout his speech Dr. Johnson laid great stress upon the origin of diphtheria in bad drainage, or from the presence of "an infective and zymotic influence at work;" and it must be admitted that if it could be shown that most cases of so-called croup originated the same manner, a serious blow would be inflicted upon the dualistic theory of croup and diphtheria. This, however, has not yet been done. The report of the Committee was in this respect rather ambiguous, for in one place it stated that "in the larger number of cases of membranous laryngitis the cause is obscure," and in another, that "in a very large number of cases infective or zymotic influence is at work."

The most valuable part of Mr. Hutchinson's long speech was where he threw out the suggestion that the diphtheritic false membrane may arise from ordinary causes of inflammation, and that it becomes itself contagious. "It was a specialised local inflammation producing various constitutional effects, and not a disease depending upon zymosis." The only grounds on which diphtheria was assumed to be a specific fever, were its contagiousness, the albuminuria, the peculiar membranous exudation, and the supervention of paralysis. But he submitted that many diseases were contagious which were not specific forms or diseases in which a special seed may be assumed to grow in the blood. There was nothing, too, unusual in the albuminurias, for that may occur after erysipelas, burns, &c. He found, however, more difficulty in dealing with the after paralysis, for he only remarked that we do not know much about the pathology of this symptom, and that it does not bear any relation to the severity of the throat affection. We must confess that, were it proved and generally admitted that diphtheria was nothing more than a specialised local inflammation, most of the arguments that have been adduced in favour of croup and diphtheria being distinct diseases would fall to the ground. But at present this opinion is one for which Mr. Hutchinson is not likely to find many advocates, not even amongst those who firmly believe in the identity of the two diseases. Few there are who would think of placing diphtheria among the local inflammations any more than they would consent to place it with Virchow "in the same category as hospital gangrene." The evidence in favour of diphtheria being a general, and not a mere local, affection, will be acknowledged by most practitioners to be very conclusive.

Dr. Semple was quite justified in referring to the circumstances under which the committee had been called upon to investigate the question; for he was one of the first in this country to draw attention to the probable identity of croup and diphtheria, and had perhaps devoted more time to the study of the comparative pathology of these diseases than any other Fellow of the Society. His speech was forcible, eloquent, and to the point, and showed that his opinions were based upon a large experience and careful post-mortem examinations. Nevertheless, we doubt whether the actual facts he adduced in support of his views were such as would carry conviction home to the minds of those who were still hesitating as to which view of the subject they would take. His chief argument appeared to be that he had seen many examples of simple inflammation of the larynx and trachea—ordinary infantile laryngitis—to which the term "croup" is often applied, and some of which had proved fatal, "but in none had he found membranous exudation after death." Dr. J. Johnson had also stated that his belief in the old theory had been much shaken

by having had under his care two fatal cases of "unquestionable croup," in which no membrane was found in any part of the air-passages. To this argument, however, it might be replied that, granting there really was such an affection as laryngo-tracheitis or true croup apart from diphtheria, it could not be expected that every case would terminate in the formation of a false membrane for the same reason than it could not be expected that every case of pneumonia will terminate in hepatisation of the lung, or every case of pleurisy in effusion.

In the cautious remarks of Sir William Gull there were several points worthy of attention. But if any advocate of either side of the question should look to those remarks for some confirmation of his own opinions on the subject, he would be certainly disappointed. Sir W. Gull did not seem inclined to pin his faith to either of the extreme and opposite views that are held with respect to the nature of croup and diphtheria. He even thought that in the present state of our knowledge we were scarcely warranted in giving a decided opinion on the true pathology of these diseases, which, he said, should still remain an open question. On the whole, however, he appeared to acknowledge that some distinction should be made between them. He considered the child's larynx was especially prone to membranous inflammation; that with regard to the diagnosis between idiopathic and specific membranous inflammation of the larynx he would say that in a young child under two years it was most likely idiopathic, and such as to require simple treatment. At all events "he did not think the question so completely decided as those who held the diphtheritic origin of all cases of membranous laryngitis would have us believe." It is evident, therefore, that Sir W. Gull cannot be counted among those eminent physicians who maintain the identity of these affections. His opinion that the larynx and trachea of children are on anatomical grounds especially prone to idiopathic or even membranous inflammation is possibly true, and would, were it a well-established fact, almost amount to a demonstration that croup and diphtheria are distinct and different diseases.

## DRUG SMOKING.

In the *Practitioner*, for April, Dr. Reginald R. Thompson has an interesting and suggestive paper on the "Therapeutical Value of Drug-Smoking." The subject is one that should interest every medical man engaged in the practice of his profession. For, just as the hypodermic injection of medicines has been found to be a valuable therapeutical innovation, so the day may come when the lungs will be found a common and useful medium by which drugs may be made to enter the system.

It is somewhat remarkable that although there are five or six methods by which medicines may be introduced into the circulation, it is only recently that any other channel than those of the stomach and rectum has been generally selected. Even the practice of administering drugs per rectum has fallen into unmerited neglect, notwithstanding the distinguished therapeutist, Graves, used to show in his "Clinical Lectures" what advantages may be obtained by giving remedies in this way. As for administering medicines externally, through the medium of the skin, it has scarcely been thought of in modern times; yet, whoever is acquainted with the writings of the ancients must have been struck with the frequency with which they ordered certain drugs to be applied to the skin, in order to secure their constitutional effects upon the system. Virtually, therefore, there remain at the present time but two channels by which medicines are made to enter the system, namely, the stomach and the subcutaneous cellular tissue; and therefore it becomes a question whether the extensive and vascular surface offered by the bronchi and vesicles of the lungs might not be put into requisition for the administration of many drugs that are now nearly always given by the stomach. The less the tissue intervening between the channel of introduction and the blood-vessels, the more rapid will be the absorption, the more intense the effect, and consequently the smaller will be the requisite dose. Considering then, observes Dr. Thompson, the special arrangement of the blood-vessels in the lungs as so disposed that the interchange of gases should take place freely, with as little let and hindrance as possible, it might be fairly conjectured that absorption through the air passages would more closely approximate to the immediate introduction into the blood-vessel in rate of absorption and intensity of effect than any of the other modes of administration.

There are several ways in which medicines may be administered into the lungs—by inhalation with steam, as atomised fluids, by insufflation, or by fumigation with powders, prepared so as to burn freely in the air, or, lastly, by smoking. The simplest and surest method is, in the opinion of Dr. Thompson, the use of paper soaked in a weak solution of nitre to make it burn continuously, and dipped afterwards in the tinctures or solutions of the drugs to be tested, the paper being rolled into cigarettes of uniform size. In order, however, to disguise the odour of burnt paper, a little tincture of tobacco is used, as in the following formula which represents the basis for each cigarette:—Swedish filtering paper, size 4 in. by 2½ in.; potassæ nitratis, ¼ gr.; tinct. tabaci, ℥x.; olei anisi., ℥ ⅛ (tincture of tobacco made with 2½ ozs. of the leaf to a pint of spirit). A solution of any drug can then be prepared, and the paper having been floated through the solution, in a flat dish, when dry can be cut into a certain size, and the dose thus accurately measured. Opium was the first drug experimented with, and one-eighth of a grain of the drug the dose at first tried; but it was soon found that the effects produced by smoking this quantity were too intense, and it was at last discovered that one-sixty-fourth of a grain of the extract of opium was sufficient for an initial dose. Cigarettes with this quantity of opium were smoked by Dr. Thompson and three other healthy men, and in a few minutes a decided effect of dizziness was produced. The cigarettes were smoked in the ordinary way, the smoke being partly rejected, but if the full effect of the dose be desired, the smoker should be instructed to expand the lungs with full inspiration and retain the smoke in the lungs. In the case of one healthy man the dose was increased to one-thirty-second of a grain of the extract, but this, together with the same dose of stramonium caused too much and too prolonged dizziness. Dr. Thompson cites several cases in

which the smoking of these cigarettes appeared to have been followed by the most satisfactory results. In one case so small a dose as the two-hundreth of a grain of opium procured many hours of sleep, a result which far surpasses that obtained from the subcutaneous injection, a mode of administration "which has hitherto been looked upon as likely to give the most concentrated results."

Such are the chief facts and recommendations contained in Dr. Thompson's paper, the highly suggestive character of which cannot, in our opinion, be overrated. We say this advisedly, for unless we are too sanguine, several great advantages may, in some cases, result from smoking medicated cigarettes. "Drug Smoking" may secure the speedy and successful action of a medicine in cases in which its ordinary mode of administration has proved a failure. In asthma we may look forward to very good results from the smoking of certain drugs; for hitherto chloroform, stramonium, and the datura tatula have been almost the only drugs the inhalation of which has been generally employed in this disease. Even the fact of it furnishing a means of giving drugs in a convenient and agreeable form is a strong recommendation for drug-smoking. How many patients there are who would prefer smoking a cigarette to drinking a nauseous mixture or swallowing a bulky pill! Besides, as Dr. Thompson says, the few vapours that are on the list of the British Pharmacopœia are of modern date, and there is a total omission of any means for the pulmonary introduction of drugs by smoking. We, therefore, hope that Dr. Thompson and other observers will continue their investigations into this method of administering drugs, for it aims at making some of our standard medicines both more powerful, more efficacious, and more palatable, than they are at present.

# Notes on Current Topics.

## Deaths from Glanders.

WITHIN very recent times there have been recorded several deaths from glanders. As lately as last week two victims succumbed to this fearful disease. The St. John's Hospital for Skin Diseases not very long ago had a case, and others have been reported (*Medical Press*, April 23rd) all ending fatally. It may be a question how far Mr. Paget, the magistrate at the Hammersmith Police Court, is justified in asserting that "glanders are far more dangerous than a bite from a rabid dog," though the statement, when properly modified, contains more truth than is commonly found in magisterial dicta. It remains, however, that an unfortunate termination is invariable in every case where the human organism is infected by the virus of "farcy," and there is good reason, therefore, to urge the adoption of severe measures against those whose culpable negligence conduces to the spread of a disease so inimical to life. In the first instance the two persons who died after contagion undoubtedly were exposed to decided risk from the proximity to their dwelling-place of horses suffering from glanders. An imposition of the extreme penalty that could be legally inflicted—£20 in each case—is no sufficient security to the public for its future safety, and some amendment of the existing law seems called for. It is not too much to demand a regular inspection of horses that are kept herded together in numbers, and the adoption of preventive measures to guard against chance infection spreading, as it rapidly will unless vigorously opposed. It will not add to the comfort of the thousands of business men who make daily use of hansom cabs to know that cases are related in which passengers in those vehicles have been infected with glanders by matter thrown off from the horses behind which they were seated; and the sooner the possibility of such an occurrence is reduced to a minimum, so soon only will there be any satisfactory result attendant on the sacrifice of the lives lately lost.

## Food and Drugs Bill.

THE Select Committee of the House of Commons appointed to consider the clauses of this Bill, have agreed to their report. It is suggested that the standards for gin and "other spirits" be 35 and 25 under proof respectively; and that "open places of resort" be added to the list of those where articles exposed for sale may be purchased with a view to analysis by the public officer; adulteration of such articles will involve punishment to the vendor, and so will arise one more cause of grievance to the retailer. It is a good thing to force the people into healthful feeding by legislative restriction on the adulterative propensity of the trader; but it is scarcely wise to leave the decision of who is to blame so entirely in the hands of the less responsible agents in the prosecution. "Open places of resort," is so superlatively meaningless and vague, that we may fairly anticipate the most complicated discussions to arise in the future on the import of this section of the new Act. The enforcement of a fixed standard of dilution, however, for spirits is so much of good for a single bill to embody, that we should not grumble if all the rest of it be bad, as much of it undoubtedly is.

## A Caution to Prescribers and Dispensers.

THE following we take from a German paper:—The chemist should be very careful in dispensing mixtures of an explosive nature. Thus a physician prescribed a mixture of nitric acid (nitro-hydroc. acid?) and tinct. of cardamoms. The dispenser made it up, and gave it to the messenger, who was just on the point of putting the bottle into his pocket when, to his astonishment, it burst, at the same time spoiling his clothes. The dispenser made the mixture up again, and cautioned the messenger against shaking the bottle. It was therefore carefully taken to the patient's house, but on opening the bottle some of its contents flew into his eyes, injuring his sight, and disfiguring his face. Only by careful medical treatment extending over several days did he recover from the effects of the accident. The dispenser should have first mixed the acids, and, after adding the tincture, should not have given up the bottle until all reaction was at an end. Wood says in his work on "Therapeutics and Pharmacology: "The patient should not, in opening the bottle, hold his mouth over its mouth, as the sudden escape of gas may injure his eyes. A physician does not do his duty who does not warn his patient against the occurrence of such an accident."

## Adulteration in Dublin.

THE Seventeenth Annual Report on Food, &c., by Dr. Cameron, medical officer of health and analyst for the City of Dublin for the year 1878, appeared last week.

During the year 1,690 analyses were made, in 44 cases the food, &c., was found to have been adulterated. The milk was adulterated with from 8 to 50 per cent. of water, and in two instances, with rice flour. The general quality of the milk supplied to Dublin has been much improved, and very gross cases of adulteration are now rare. The coffee was adulterated with burnt biscuit, burnt sugar and chicory. The mustard was adulterated with from 40 to 50 per cent. of wheat-flour, cayenne pepper, and coloured with turmeric. The arrowroot consisted of potato-starch. The brandy was largely adulterated with corn-spirit. The butter was adulterated with foreign fats. A sample of wine was a spurious article. A specimen of citrate of iron and quinine contained only two-thirds the proper quantity of quinine. The adulteration of many articles of food once common in Dublin has, within the last few years, almost ceased to be practised; milk is the only article commonly adulterated. The quantities of unsound food condemned during the year—303 carcasses of beef; 7 of mutton; 16 of pork; corned beef and pork, 4,815 lbs.; bacon, 6,944 lbs.; fish, 24,752 lbs.; butter, 22 lbs.; eggs, 560; fruit, 178 lbs.; vegetables, 1,120 lbs. Total, 326 carcases, and 243, 084 lbs.

## The Vaccination (Ireland) Amendment Bill.

THE committee stage on this Bill has been reached, and a number of amendments to it have been put on the notice paper. There is the inevitable anti-vaccination opposition, and a motion of Mr. James to release anti-vaccinators from a repetition of prosecution and fine when they continue to infringe the Act.

The chief amendments are those by Mr. C. H. Meldon, to be moved by him at the instance of the Irish Medical Association. Amongst these is the amendment necessary to raise the vaccination fee from 1s. 6d., as proposed by the Bill, to 2s. 6d., as now paid in England. Mr. Mitchel-Henry, M.P., has also tabled amendments for the purpose of extending to Ireland the system of awards for successful vacccination which now exists in England.

We trust to see these amendments supported by the Irish members with warmth and unanimity. It is simple "Justice for Ireland" that a dispensary doctor should receive the same remuneration for the same work as his English *confrère*, and we can hardly anticipate what reason the Chief Secretary may have to give why the Irish vaccinator should be offered less.

## Exemption of Hospitals from Taxation.

AT the Dublin Police Court, last week, in the case of the summons issued by the Collector-General against the Orthopædic Hospital, Usher's Island, the magistrate said that the Collector-General could not have acted otherwise than in issuing the summons, and he did not think that he could go behind the rate books, and as all the formalities had been complied with, he should make an order against the defendants for the payment of the £25 17s. 6d. It was a very nice question whether the hospital would be considered a charity within the meaning of the Act, as it received even small sums in payment from the patients. A case bearing on this was Mayo College *v.* Commissioners of Valuation, 1 v, I. L R., 436. It was stated in court that several other hospitals in the city are in the habit of taking paid patients, and in one there was a ward for such patients. Mr. Mooney said that in this latter case this one ward would probably be rated.

Presumptuous as it may be to differ with a police magistrate, we, having had occasion to acquaint ourselves with the law on this subject, are strongly of opinion that the decision of the learned judge in this case is not borne out by the terms of the Act. Competent authorities have advised that, so long as it can be shown that no monetary profit is derived from the hospital, it comes within the exemption clause of the Act, even although every patient in it paid something towards maintenance. The magistrate's decision, if justified by the law, subjects to taxation every hospital in Dublin and most hospitals elsewhere.

## Poisoning by Wild Hemlock.

LAST week the coroner held an inquest at Dungannon, touching the death of Mary O'Rorke, daughter of a shoemaker. It appeared in evidence that the deceased, aged 8 years, a sister a year older, and a little brother 6 years of age, were at play not far from their own door. Each of them eat a portion of water hemlock. The little boy came into the house and told his father that his head ached, and to put him to bed. The father carried him up stairs and laid him on the bed. About ten minutes after, the deceased came home and sat on the door-step; she seemed to stagger as she sat down; he spoke to her, but she did not answer; he carried her up and laid her on the bed beside the little boy, and returned to his work. The mother an hour or so after, on going up with some tea, found the girl dead. Dr. Browne examined the body, and found portions of the leaves of water hemlock (or fool's parsley as it is commonly called) between the teeth of deceased; one of the children pointed out to him where they had pulled it. He found it to be hemlock; had no doubt that deceased was poisoned from eating it. It is a most deadly plant, and very quick in its action; causing head-ache, paralysis of spine, nerves and heart, torpor and death. He gave the other two children an emetic; they are now quite recovered. This was the third case in his district within two years, of poisoning from children eating hemlock.

## Spiritualistic Quackery.

A SICKENING exhibition of the most unblushing quackery is being weekly made in certain so-called spiritualistic newspapers. These contain, many of them, numerous advertisements from persons who arrogate power of the most absurd description to themselves; one, more believing in the credulity of his victims, or more despicably daring in his pretensions, announces "healing by the laying on of hands," and "magnetised fabric for the alleviation or cure of disease, 5s. per packet; renewal 5s." Another advertises "Developing and Healing. Medical advice to ladies and children. *Terms modified to suit circumstances.*"

Anything more atrociously disgusting than this array of rascally cheating, it would be difficult to conceive; and in view of the grave harm that may be daily inflicted on the innocent but superstitious victims of their base deceit, it becomes a pressing duty to devise some effectual means of opposing a system vicious in intent, and degrading in fulfilment. It is a disgrace that the state of our law is such as to permit these vampires to pursue their course unimpeded; but this being so, it is the more a duty that the profession should in some way expose the serious nature of the practices that are carried on by these human leeches.

We purpose devoting some attention to the subject in a series of articles and exposures.

## Doctors' Co-Operation and Advertising.

A CONTEMPORARY calls attention to the fact that the Directors of the Clergy Co-operative Association entertain so poor an opinion of the feeling of honour existing in our profession as is implied in the following notice taken from their last prospectus :—

"A directory of medical practitioners, printed on tinted paper, will form part of the appendix to the price list. The charge for insertion in this list is to be for shareholders and life members 5s. per quarter, for all others 10s."

We take such a proposition as amounting almost to an impertinence, and we wish the customers of the co-operative association every joy of the medical advisers whose names they will find in such a list.

## Prevalence of Suicide in Different Countries.

THE *Echo* draws attention to an interesting body of figures just collected by an eminent French statist on this subject. It appears that the Danes through a series of years exhibited the largest average of self slaughter; while their neighbours of Norway, breathing a kindred climate, are only seventh on the list. The second place is held, as has generally been the case, by France, in which the totals of such deaths fall short of 5,000 annually—one-half due to hanging, one-fourth to drowning; but among women in a majority of instances, through inhaling the fumes of charcoal. Returning to the order of nationalities, the Swiss, curiously enough, rank next to the French, and, after them, the people of Baden, the Prussians, and the Austrians in succession. These last are followed by the Belgians, after whom come the English. The crime is a rare one in Spain, and not a common one in Italy; but the country in which it is most rare is Ireland.

## Overcrowding of Lodging Houses in Ireland.

AT the Fermoy Petty Sessions last week, a man was charged with making a disturbance in the streets. It was stated, in defence, that the man was unable to get lodgings owing to the overcrowded state of the lodging-houses. The coroner said he had held an inquest on the body of a woman who died suddenly on the night in question in one of those houses, and there were half a score adults of different sexes in the house where she died, and the head-constable said that he had known cases where there were twelve and thirteen persons of both sexes huddled together at night in some rooms. The defendant was fined.

## Poisoning in the Limerick Workhouse.

AN inquest was held last week at the Limerick Workhouse, touching the death of Patrick Neiland in the hospital of that institution. It appeared from the evidence that a liniment was prescribed for him by Dr. O'Connor, as was also a cough mixture, both of which were placed on a shelf over his head, and that, in the night, having occasion to use the latter mixture, he took down the former in mistake, and took a draught of it, from the effects of which he died next morning. The jury returned a verdict of "accidental poisoning."

## The Irish Drug Contract System—A Specimen.

WE quote the following from the local paper :—

"BALLINA UNION.—In reading over the tenders for medicine and medical appliances, some wonder, and not a little amusement, was excited by the difference in the prices of drugs, *one tender asking* 1*s. for what another asked only* 2*d.*"

## The Profession at the Levee.

H.R.H. the Prince of Wales, by command of the Queen held a Levée on Saturday last at St. James's Palace, when the following members of the profession had the honour of presentation :—Fleet-Surgeon W. J. Baird, M.D., by the first Lord of the Admiralty. Surgeon-Major H. Griffith, Madras Establishment, by the Secretary of State for India. Dr. Clement Godson, by Sir George Burrows, Bart. Professor G. M. Humphry, M.D., Cambridge University, by the Rev. W. G. Humphry. Surgeon T. H. Hill, 36th Middlesex Rifles, by Lieut. Col. Gordon Ives. Surgeon-Major J. Law, M.D., Madras Medical Service, by the Secretary of State for India. Surgeon-Major J. L. Miller, M.D., by the Secretary of State for the Colonies. Dr. Strong, by Lieut. Col. Creaton. Assistant Surgeon Leth, by Lieut.-Col. Hope. The following also attended the Levée :—Dr. Acland, President of the Medical Council. Dr. Vincent Ambler, Dr. Hinckes Bird, Dr. T. B. Christie, Dr. W. T. Domville, Dr. Mathews Duncan, Dr. W. Playfair, Dr. Lockhart Robertson, and Mr. Wm. Adams.

THE death-rate from the seven principal zymotic diseases averaged 2·8 per 1,000 last week in the large towns, and ranged from 0·7 in Wolverhampton, to 4·1 and 4·2 in Sunderland and Oldham. The fatality of whooping-cough showed the largest proportional excess in Birmingham; and the deaths from scarlet fever in Oldham and Sunderland. There were 17 deaths in London, and 2 in Plymouth from diphtheria. Eighty-eight deaths were referred to whooping-cough in London, and 491 to diseases of the respiratory organs. Small-pox caused 10 more deaths in London, 9 in Dublin, but not one in any of the other large towns.

IN the principal foreign cities the rates of mortality according to the most recent weekly returns, were—Calcutta 33, Bombay 35; Paris 31; Geneva 31; Brussels 32; Amsterdam 25; Rotterdam 27; The Hague 28; Copenhagen 32; Stockholm 24; St. Petersburgh 47; Berlin 30, Hamburg 25, Dresden 27, Breslau 31, Munich 31 Vienna 34, Buda-Pesth 42; Rome 27,

Naples 38, Turin 23; Venice 26; Alexandria 44; New York 26, Brooklyn 20, Philadelphia 17, and Baltimore 20 per 1,000 of the populations.

THE rates of mortality per 1,000 last week in the principal cities and large towns of the United Kingdom were —Bradford 17, Portsmouth 19, Brighton 19, Wolverhampton 21, Hull 21. Edinburgh 21, Leeds 22, Nottingham 22, Liverpool 24, Bristol 24, Glasgow 24, Sunderland 25, Sheffield 25, Oldham 25, London 26, Salford 26, Newcastle-upon-Tyne 27, Birmingham 28, Norwich 38, Manchester 29, Plymouth 29, Leicester 29, and the highest death-rate 35 in Dublin.

THE Children's Hospital, hitherto of Buckingham Street, Dublin, has been removed to 15 Upper Temple Street, in that city.

# Scotland.

(FROM OUR NORTHERN CORRESPONDENT.)

THE HEALTH OF GLASGOW.—According to the report of Dr. Russell, during the fortnight ending 19th April, there were 529 deaths registered, as compared with 553 in the fortnight preceding, representing a death-rate of 24 in place of 25 per 1,000 living. The death-rate in the first week of the fortnight was 23, in the second, 25 (24·7). The number of deaths of persons aged below 1 year was 97 in place of 115, and of persons aged 60 years and upwards, 82 in place of 85, as compared with the fortnight preceding. The number of deaths from pulmonary diseases was 197 in place of 214, representing a death-rate of 9 per 1,000 living in place of 9½, and constituting 37 in place of 39 per cent. of the total deaths. The number of deaths from fever was 7 in place of 3, viz., 3 from typhus, and 4 from enteric fever. The number of deaths from infectious diseases of children was 32, in place of 46, viz., 19 from whooping-cough, 9 from scarlet fever, and 4 from measles. The number of cases of fever registered was 35, in place of 25, viz., 25 of enteric fever, 5 of typhus, and 5 undefined. In addition to these cases of fever, 139 cases of measles, 79 of whooping-cough, 32 of scarlet fever, and 20 of diphtheria, were the occasion of sanitary assistance and supervision at home. There are at present in the hospitals, Belvidere, 38 cases of scarlet fever, 36 of enteric fever, 24 of typhus, 13 of measles, and 11 of whooping-cough, in all 122 cases, as compared with 120 the preceding fortnight.

A STATUE IN WESTMINSTER ABBEY TO THE LATE SIR JAMES Y. SIMPSON.—Dean Stanley, it would appear, has granted his consent to the placing of a bust of the late Sir James Y. Simpson in Westminster Abbey. The inscription for the pedestal has been composed by the Dean. It runs as follows:—"In Memory of Sir J. Y. Simpson, owing to whose genius and benevolence the world owes the blessings derived from the use of chloroform for the relief of the suffering. *Laus Deo.*" The worthy Dean thus unconsciously lends himself to the perpetration of an oft controverted historical error.

EDINBURGH UNIVERSITY SUMMER SESSION.—The Summer Session of the University commenced on the 1st inst., when a number of the classes were opened by the professors. Professor Sir Wyville Thomson delivered his opening address in the large hall of the Museum of Science and Art in presence of a large assemblage of students. The Summer Session of the Medical School was also opened on the same day.

ROYAL MATERNITY HOSPITAL, EDINBURGH.—The New Royal Maternity and Simpson Memorial Hospital, Lauriston, was formally opened, on Friday last, by Dr. Peddie, President of the Royal College of Physicians. After prayer by the Rev. Dr. Lees, the Secretary (Mr. J. Turnbull Smith, C.A.) gave an account of the Institution; and Dr. Peddie expressed his gratification that the Maternity Hospital was now raised into its proper rank amongst the humane and benevolent institutions of Edinburgh. Mr. David Dickenson, Master of the Merchant Company, Dr. Andrew Wood, Mr. R. A. McKie, and Professor Simpson also addressed the meeting. Dr. Wood said it was time they fortified their medical schools from attack from the South by establishing such a valuable Obstetrical School as the Royal Maternity Hospital would now prove.

THE REGISTRAR-GENERAL'S WEEKLY RETURN.—The weekly return of births, deaths, and marriages, says: The death-rate in the eight principal towns during the week ending with Saturday, April 26th, 1879, was 23·7 per 1,000 of estimated population. The rate is 0·7 under that for the seventeenth week of last year, and 1·2 under that for the previous week of the present year. The lowest mortality was recorded in Perth, viz., 17·6, and the highest in Paisley, 40·3. The death-rate from the seven most familiar zymotic diseases was 2·9 per 1,000, being a little under that for the previous week.

"CAPPING" OF MEDICAL GRADUATES AT ABERDEEN.—The ceremony of "capping" the medical graduates at Aberdeen University, at the close of the winter session of 1878-79, took place in the Hall of the Marischal College, on the 26th ult., in presence of a large assemblage composed chiefly of ladies. While the number of undergraduates present was not larger than on similar previous occasions, it was thought by some that the amount of noise they produced exceeded their efforts at the last two or three "cappings." Specially to be condemned were the interruptions during prayer, a common occurrence on such occasions, and one strangely at variance with the high and pronounced order of Scotch ecclesiasticism. Some portions of the prayer were applauded as part of a speech specially addressed to the students. As usual, most of the demonstrations made were utterly purposeless, except in the direction of annoying such as wished to hear the proceedings conducted in an orderly and decorous manner. So much was the cock-crowing, chorus-singing, and stick-rapping deemed in excess of a rational amount of exuberance, that Principal Pirrie intimated it would be the duty of the Senators to go through the ceremony in private if they were so disturbed in its performance. The Principal who presided was accompanied to the platform by Professors Pirrie, Geddes, Struthers, Trail, Forbes, Stephenson, Smith-Shand, Christie, &c. The honour list was read by Professor Trail, in the absence of the Secretary of the Medical Faculty, Professor Brazier.

ANIMAL INTELLIGENCE.—A prolonged and animated discussion on this subject has been carried on in the *Scotsman* for several days past. This discussion shows within what limited range the logical faculty moves when restrained and prevented by the theological drag. Professor Blackie posed as the champion of man, as possessing a different kind of intelligence from the lower animals. His ratiocination was certainly not distinguished by the accuracy and ability which usually characterise our genial friend's utterances.

A poor clergyman had the temerity to appear at a loop-hole in the same line, and with characteristic malignity and ingratitude to throw mud at the kindred of Balaam's Ass, but was directly pelted by "Cockatoo." Man, says the parson, points with his hand or forefinger; the lower animals never do, *therefore* the intelligence of man and the lower animals is of a different kind! "Cockatoo" acknowledges that he does not point with the forefinger, for his neck is flexible, his eyes keen, and the poking with the forefinger so conspicuous in man when he wishes to point, *seems* to him ludicrous from its clumsiness. Cockatoos do not call the being preached and prayed at once a week by the name of "worship." Men must be either more patient or more hypocritical animals than cockatoos. . . . . Man erects monuments. If cockatoos were guilty of this weakness, they would assuredly avoid proving their mental inferiority by claiming credit for it. Is the monument at the intersection of George Street and Hanover Street a proof of man's wisdom? Other points of difference in favour of the bird are pointed out, and the letter is altogether a good example of the *reductio ad absurdum*, the only form of argument with which one can hope to make the slightest impression on the Scotch clerical brain.

# Literature.

## BRYANT'S PRACTICE OF SURGERY. (*a*)

THE fact that this work has already reached a third edition is the best evidence that could be given of the value of its contents; a value which, perhaps, will be best appreciated after the period of examination is over, and when the student is brought into contact with the difficulties of practice, for it is upon the excellence of much of the clinical teaching to be found in its pages that the success which this book has met with in great measure depends. It cannot be denied that the author is, at times, too liberal in his views altogether to satisfy the requirements of examiners, but it is just this quality which makes the book of greater service when the time has come for the student to think for himself. The present edition is, in many respects, an improvement upon its predecessors; many of the obscurities in style noticed in the first edition have now disappeared; the number of the illustrations has been increased, and some have gained much from an improved manner of printing. The more recent additions to our knowledge have been incorporated, thus there is a section on Osteitis Deformans, with several engravings; and Dr. Howard's method of performing artificial respiration is fully described. The treatment of aneurism by Esmarch's bandage is mentioned, though not with approval, and Mr. Dix's method of controlling arteries is clearly explained. We have a description of Thomas's splints for the hip and knee, and the management of fractures of the shaft of the femur is very fully discussed, preference being given to the double long splint. Much space is allotted to the diagnosis and treatment of Intestinal Obstruction, the author being a strenuous advocate of early abdominal section in suitable cases. It should be added, however, that the diagram of the abdominal contents on page 609 is, in several respects, misleading. Not only are the dividing lines not such as are usually employed, but the relations of some of the viscera, particularly of the kidneys, are very imperfectly represented. The chapter on Diseases of the Kidneys following Surgical Affections of the Urinary Passages can hardly be considered satisfactory.

The word inflammation is defined on page 13 as being synonymous with "too much action in the wound;" it should surely be explained that this is the clinical, as distinguished from the anatomical, use of the term, and in the chapter on Pyæmia, the author remarks that the disease probably occurs as frequently in private as in hospital cases; this, we fancy, would depend a good deal upon the hospital in question.

His views with regard to the modes of syphilitic infection remain unchanged. He favours the belief that syphilis may follow the absorption of the products of a secondary secretion, without the intervention of a breach of surface; while as to the question of recognising an infection before the occurrence of a secondary rash, we cannot help thinking that in a book of this kind, intended to serve as a text-book for students, he too absolutely excludes the prognostic value of an indurated sore, with indolent glandular enlargement, appearing some time after the date of infection.

Why should a tumour of the dental structures be called an odontome? Such a word suggests an instrument rather than a new growth.

The minor defects we have noticed, however, detract but little from the great value of Mr. Bryant's work, embodying as it does the matured opinions of an observant and skilful surgeon.

(*a*) "The Practice of Surgery." By Thomas Bryant, F.R.C.S., Surgeon to, and Lecturer on Surgery at, Guy's Hospital. London: Churchills. 1879.

# Literary Notes and Gossip.

FROM a careful summary in the new *Medical Register*, we learn that 1,009 were registered in 1876, 940 in 1877, and 996 in 1878; the total number now standing in the *Register* is 22,600. Furthermore, as to the characteristic part of the volume, the list of names, addresses, and qualifications, we see that the first place is appropriately given to the NAME, which has hitherto been printed, quite out of place in the second column; and we learn that, since 1876, many thousands of corrections of accumulated errors have been made in this part, not a few of them being erasures of names of men who have been many years dead. The cumbrous process of correction prescribed by Section 14 of the Medical Act (1858), places the editor of this work, Mr. Miller (who is also Registrar), under grave disadvantages, so far as accuracy is concerned, unless practitioners bear carefully in mind that it is their own interest to send immediate notice—as enjoined by the Act—of all changes in their addresses, otherwise they may, to their astonishment, find that, in consequence of such neglect, their names have been perforce removed from the *Register*. As a matter of statistics we may add, in conclusion, that the first edition of the *Register*, published in 1859, contained 335 pages, and was sold for 7s. 6d.; the edition for 1876 contained 598 pages; and the edition for 1879 contains 676 pages, with 64 pages of prefatory matter, and is sold for 6s.

* * *

A NEW journal has been recently started, entitled the *American Journal of Otology*: a Quarterly Journal of Aural Surgery and Physiological Acoustics, under the joint editorship of Dr. Clarence Blake, of New York; Prof. A. M. Mayer, of Hoboken; Dr. A. H. Buck and Dr. Samuel Sexton, of New York; Dr. C. H. Burnett, of Philadelphia; Dr. J. Orne Green, of Boston, and Dr. H. N. Spencer, of St. Louis. The object of this Journal is to afford a medium for the publication of original articles on subjects pertaining to Aural Surgery and Acoustics—two fields of investigation intimately related to each other, and at present commanding an increasing interest, and also to furnish reviews of contributions upon these subjects appearing in other publications. The publishers are Messrs. Wood and Co., of New York.

* * *

DR. COWLING, Professor of Surgical Pathology in the University of Louisville, has issued his address in pamphlet form on the "Life and Character of Dr. Yandell," President of the Kentucky State Medical Society, recently deceased, which contains many interesting sketches of this "born genius." Probably few have done more to enrich the literature of the United States than Professor Yandell; his education and style were in the highest degree classical, far above the average of American doctors; and at his death he was the oldest medical journalist in the States, with the single exception of Dr. Hayes, of the *American Journal of Medical Sciences*, who survived him but a few days. His first essay as a journalist was in 1832; in 1857, he founded the *Western Journal of Medicine*, and in addtiion was the principal editor till the time

of his death of the *American Practitioner*. His biographer remarks that age had not taught him to practise the precautions he preached in the care of his own health; hence he became a victim of the disease which he had recorded as so fatal to the old.

* * *

THE Paris correspondent of a contemporary announces the appearance in French of Mrs. Besant's notorious pamphlet on the means of preventing conception. But pachydermatous as the French are commonly supposed to be in regard to literature of "Frenchy" character, the Besant production has so shocked them that a petition for the suppression of the pamphlet has been presented to the director of the press, the work being considered unscientific as well as filthy. The correspondent, moreover, says that the introduction of the book into France at this time is a misfortune, because of a steady decrease in the population, which has so alarmed the nation that popular works are published on all sides to teach better management of infants, and check the excessive infant mortality which now prevails in France.

* * *

As a counterblast to the notorious Bradlaugh-Besant book before referred to, Dr. Routh a few weeks since published the paper read by him before the British Medical Association in August last, together with the discussion which followed. The title of this pamphlet was the "Moral and Physical Evils likely to follow if Practices intended to act as Checks to Population be not strongly Discouraged and Condemned;" and such is the interest created in the subject, that the first edition of a thousand copies has sold already, and the pamphlet is, for the present, out of print. We are glad to chronicle the success of this manly and straightforward *exposé* of those evils, moral and physical, which have, and must necessarily follow, from the indiscriminate circulation of works of the Bradlaugh-Besant type, the extent of which, only the medical profession have the opportunity of judging.

* * *

THE Annual Press Fund Dinner is announced for May 10th, at Willis's Rooms, St. James's. Lord Rosebery will preside, and as Lord Derby, the Right Honourable W. H. Smith, Lord Houghton, and other notables have promised their presence, a great success is anticipated. The objects of this Association commend it to all who have the welfare of literature at heart. Funds are raised solely for the relief in want or distress of the whole class of literary contributors to the Press of the United Kingdom,—editors, sub-editors, leader writers, reviewers, &c., as well as to afford assistance to their widows, families, parents, or other near relatives in the hour of need.

* * *

FROM Part III. of that valuable compilation the *Index Medicus*, we find, on careful analysis, that during the month of March, there were published the following new works and new editions:—"Anatomy and Physiology," six; "Anatomy and Histology," four; "Physiology," seven; "Anthropology," seven; "Pathology," two; "Practice of Medicine," three; "General Diseases," eleven; "Nervous System (including Annual Asylum Reports)," twenty-two; "Circulatory System," twelve; "Urinary," three; "Skin," six; "Syphilis," four; "Climatology," five; "Hospital Reports," eleven; "Therapeutics," five; "Materia Medica," six; "Hydropathy," three; "General Surgery," nineteen; "Gynæcology," eleven; "Diseases of Children," four; "Ophthalmology," three; "Medical Education," six; "Hygiene (including Annual Reports)," twenty-seven; "Military and Naval Medicine," six; "Medical Jurisprudence," five.

* * *

IN the May number of *House and Home*, a journal devoted to sanitary matters, for popular circulation, the first number of which we noticed a few weeks since, there is an excellent portrait and biographical sketch of Sir Henry Thompson, F.R.C.S.; though, why the subject of the sketch should occupy a couple of pages in a journal devoted to Sanitary Reform we fail to see. That Sir Henry is a great surgeon, a skilful operator, and an accomplished artist, every member of the profession is fully satisfied. That he should be introduced to the world afresh as a sanitarian will perhaps astonish no one more than Sir Henry himself. True, he is bold in his advocacy of cremation; but of the practicability of this scheme the world has not yet made up its mind, and he once took the chair at a meeting in favour of "moderate drinking;" but we hope every member of the profession would do this without the expectation of a portrait and biography in *House and Home*.

AT the Annual Meeting of the Royal Literary Society on Wednesday, Prince Leopold, the president, delivered an address on "The Modern Greeks, considered as a Nationality," in which he pointed out that the *patois*, popularly called "modern Greek," and supposed by many people to be a real language, is, after all, only a dialect of the ordinary commercial language of the Eastern Mediterranean, which has gradually superseded the Italian, for so many centuries, owing to the domination of Venice and of the other Italian Republics, the chief medium of inter-communication. Since the establishment of the Greek Kingdom this jargon has been cultivated so as to become what it scarcely ever was before—a written language; the process whereby this result has been obtained being wholly artificial, words and expressions having been borrowed from classical authors and substituted for the Turkish, Italian, and other foreign words heretofore in use. The fact simply is, that the ancient Greek or Hellenic population, never really very numerous within the old Greek area, became more and more adulterated as time went on, till it was so completely expunged that it may be safely stated that there is far less possible trace of it than of the Celtic race in Saxon England. The language is evidently that of an intrusive people, who originally spoke another tongue, which they translated into Greek words, retaining at the same time their own odioms, grammar, and construction.

## THE CHANGES IN THE IRISH LOCAL GOVERNMENT BOARD.

IN our issue for March 5 we foreshadowed the retirement of Sir Alfred Power from the Presidency of the Irish Local Government Board, and the probable appointment to that office of Mr. Henry Robinson, Under Secretary to the Lord Lieutentant. Our anticipation has come to pass, and the past week has witnessed a change of office which is of extreme interest and importance to the profession. Sir Alfred Power's dictatorship is a thing of the past; that of Mr. Robinson—let us hope—will never exist. The late king of the Irish Local Government was undoubtedly a remarkable man. Strong-willed and self-willed, born to command, yet lacking the discretion to make him a good governor. He uled his department with an unbending despotism, but with unequivocal talent. He had many admirers within the circle of those who served under him, yet but few friends, and though the Local Government Board grew and throve under his *regimé*, it acquired the character of a national institution which regarded neither the law which it administered, nor the persons with whom it dealt.

Sir Alfred Power's successor is admittedly a man of ability, and his long service as an inspector inspires us with hope that he will make an excellent president. We give him the credit for a sufficiently sound judgment to see that the system of administration of the Local Government Board is of a bygone date; that the law must be constitutionally and fairly administered, and that autocracy is out of place in the present day. He has a most weighty duty in hand, and we are confident he is capable of performing it efficiently; and it is not inapposite now to repeat what we said two months since:—

The throne of the Local Government Board is, with respect be it said, of more direct interest to the people of Ireland than that of the Lord Chancellor, or even of an Archbishop. The efficiency of the sanitation and poor-law administration of every parish and every village in the country is, every day in the week, directly influenced by the Local Government Board, and while on the one hand an industrious, intelligent, and capable leader of the department would out-value a prince in its relation to Ireland, so on the other hand an indecisive, dull, or impracticable President of the Local Government would be a living calamity to the country.

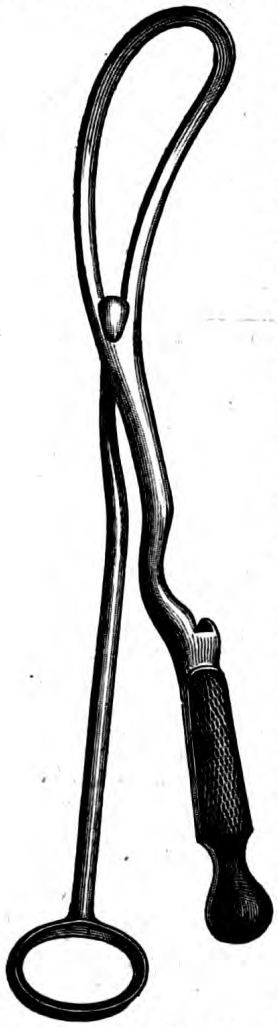
## THE CARMICHAEL PRIZES

WERE awarded on Monday last before the President, Vice-President, and Councillors of the Royal College of Surgeons in Ireland. There were—as we have already said—thirteen competitors, and the prizes were carried off by Mr. W. Rivington, of London, and Dr. Laffan, of Cashel

# Novelties.

## NEW TRACTORS FOR MIDWIFERY FORCEPS.

ANYONE who has had a fair amount of experience in forceps cases must have often felt the want of additional tractile power, especially where the head was more tightly wedged than usual in the pelvis, or when, from misproportion, it required more than the ordinary amount of exertion with the strength at the operators command to effect delivery. I had often considered if some means could not be devised which in a difficult case would give the required power without the necessity of calling an assistant (even if one were always at hand). I was, therefore, much pleased by reading in a number of the *British Medical Journal*, for June 29th, 1878, a description of tractors invented by Mr. Morgan of Lichfield, to be hooked into the fenestra of any long forceps *after introduction* (in imitation of a more portable and cheaper form of the principle of M. Tarnier's instrument), and which he says "applies the power in a new direction, viz., in the middle of the curve of the forceps instead of the long axis of the handles," which latter he connects together by an india-rubber ring, and while the tractors are being used are always at hand when required, and moving in the direction in which traction ought to be made form a safe guide in what direction to pull.



Having purchased a pair of Mr. Morgan's tractors (made by Maw, Son, and Thompson, London), I endeavoured (more than once) to apply them according to his directions, but besides the great difficulty of reaching the lower edge of the fenestra *after the forceps were locked*, I found that the usual amount of moulding and elongation of the head had taken place, which forced the scalp into those openings, and made it impossible for me, without injury to the child's head, to apply them.

I have since had a modified pair of tractors made for me by John Whyte, Dublin, which I hope I shall be excused for saying, are, I think, an improvement, as they can be introduced *with the blades and before the forceps are locked;* and not being hooks, but having a shield-shaped extremity, can be buttoned into the fenestra of each blade before introduction, and not being liable to slip, cannot possibly injure the scalp of the child or soft parts of the mother.

When additional traction is required as in cases of convulsions, hæmorrhage, &c., where time is very important, I slip the rings of my tractors into an ordinary swivel, attached by metal band to a strap which I have previously buckled round my waist, and thus sitting quietly behind my patient can make any amount of traction *consistent with safety*, by simply leaning backwards, with the greatest ease to myself and without fatigue or perspiring profusely as I often did before and many do still.

The woodcut represents the lower blade of forceps with tractor attached ready for introduction. The amount of force can be modified at will, is always applied in the right direction, and when the operator has no help at hand may save him much fatigue, and sometimes from resorting to the much dreaded operation of craniotomy.

# NOTICES TO CORRESPONDENTS.

THE COUNCIL OF THE POOR-LAW MEDICAL OFFICERS' ASSOCIATION ask us to announce that the Annual Meeting has been adjourned from May to June, the day and hour of which will be duly made known to the members.

DR. J.—With pleasure when we have full particulars.

DR. TILT.—We shall be glad to receive the communication referred to for early insertion.

DR. J. L.—The circumstances of the case are not before our readers, and therefore the newspaper report and your letter would be unintelligible.

THE CONTAGIOUS DISEASES ACTS.—In Mr Thomson's paper, "On some Results of the Contagious Diseases Acts," which appeared in our last number, the tabulated return should have been printed immediately before the foot-note on page 342. The phrase "Girls, children, and women," on the next page, should have been "Girl-children and women."

THE Dublin Medical Society will meet on Wednesday next, at 8 o'clock, when the following communications are set down for reading: Dr. J. W. Moore, to exhibit a Specimen of Pyæmic Embolism."—Surgeon-Major Jackson, C.B., "Notes on a Case of Fever in Cyprus."—Dr. C. A. Cameron, on "An Outbreak of Fever caused by Infected Milk."

EPIDEMIOLOGICAL SOCIETY.—On Wednesday, May 7, at 8½ p.m., Mr. Robert Lawson, Inspector-General of Hospitals, "On the Course and Distribution of Cholera in India in 1876."

CLINICAL SOCIETY OF LONDON.—On Friday, May 9, at 8½ p.m., Mr. Bryant, "A Case in which a Biliary Calculus was removed by Operation from the Gall Bladder, and a Cure resulted."—Dr. Allen Sturge, "A Case of Spondylitis Deformans." Mr. Hulke, "Case of Sutural Junction of the Ulnar Nerve fifteen weeks after its complete Severance by a Roofing-plate—Early Restoration of Function."—Mr. A. T. Norton, "Papilloma of the Bladder; Excision; Death."—Mr. Morrant Baker will exhibit a Case of Amussat's Operation for Artificial Anus.

## VACANCIES.

Canterbury Hospital.—Assistant House Surgeon. Salary, £50, with board, &c. Applications to the Secretary before May 23.

City of Dublin Hospital.—A Compounder to the Hospital. Election, May 25.

Coombe Lying-in Hospital, Dublin.—Assistant Master. Particulars may be obtained on application to the Master.

Droitwich Union, Cheshire.—Medical Officer for the Claines District. Salary, £93 15s., with extra fees. Applications to the Clerk by May 13.

Kells Union, Kilskeer Dispensary.—Medical Officer. Salary, £135, wi fees. Election, May 13.

Longford Union, Drumlish Dispensary.—Medical Officer. Salary, £120 with fees.

Meath Hospital and Co. Dublin Infirmary.—Surgeon; vice Mr. White, deceased.

Ongar Union, Essex.—Medical Officer for No. 2 District. Salary, £55, with fees extra. Applications to the Clerk of the Board before May 13.

Oxford.—Medical Officer of Health for the County. Salary, £616. Candidates must send testimonials, &c., to R. B. B. Hawkins, Solicitor, Woodstock, Oxon., on or before May 14.

Royal College of Surgeons, Ireland.—Curator of the Museum. Salary, £250. Election, June 5.

# Marriages

MURTAGH—FORSTALL.—On April 30, at the Church of St. Francis, Merchant's Quay, Dublin, Edward Joseph Murtagh, M.D., Drogheda, to Margaret, youngest daughter of the late John Forstall, Esq., Edinburgh, and niece of John Fegan, Esq., 74 Pembroke Road, Dublin.

SCOTT—MANLEY.—On April 30, at St. Peter's, Fareham, J. W. Scott, M.R.C.S., to Alice, younger daughter of John Manley, M.D., Medical Superintendent Hants County Asylum.

# Deaths.

CLARK.—On April 29, at Wellingborough, Thomas Clark, F.R.C.S., aged 83.

DIXON.—On May 1, at 6 Alfred Place, London, W.C., G. P. N. Dixon, M.D., of Northwich, Cheshire, aged 21.

FLINT.—On May 1, at Canterbury, of typhoid fever, Horace Flint, M.B., M.R.C.S., aged 26.

HART.—On May 3, at Erith, Kent, P. Neville Hart, M.B., M.R.C.S., aged 28.

MASSY.—On April 27, at Southampton, Hugh Deane Massy, L.R.C.S.I., Surgeon-Major, Army Medical Department (on half-pay).

MILLER.—On April 22, at Eldon Square, Newcastle-upon-Tyne, James Miller, M.R.C.S.E., aged 64.

MORRIS.—On April 21, at St. Owen Street, Hereford, Edward Morris, Ext. L.R.C.P.L., aged 83.

POTTLE.—On April 11, at Bath Street, City Road, London, John Rowland Pottle, M.R.C.S.E, aged 67.

REDFERN.—On April 22, at Grove House, Ventnor, Isle of Wight, Charles Redfern, Surgeon (formerly of Manchester), aged 62.

# IRISH POOR-LAW INTELLIGENCE.

## ATHY UNION.

### LIABILITY OF PUBLIC INSTITUTIONS TO SUPPORT THEIR OWN POOR.

THE relieving officer reported that there was at present in the fever hospital a child who had been admited from the Stradbally Orphanage suffering from fever. As the doctor had some doubts about the case, he was anxious to have the opinion of the guardians on the subject.

Mr. W. Dunne said he had been speaking to the Reverend Mother at Stradbally on this subject, and he had her authority to state that she was most anxious the question should be raised in all its bearings, and as they had the Local Government Board Inspector present, a very favourable opportunity arose for having a full discussion on the subject. The doctor, it appeared, had some doubts as to whether he would be justified in giving an order for her admission. There was no doubt it was a very serious question for the ratepayers whether any or all of these 200 children were eligible for relief in the workhouse hospital. He (Mr. Dunne) could not state it on his own authority, but he had been informed on what he considered good authority, that it was customary in Dublin to send children and adults from charitable institutions to the workhouse hospitals.

Dr. M'Cabe said it appeared to be decided that an inmate of a charitable institution was a destitute person. At the same time it was not absolutely necessary that a person obtaining medical relief in a workhouse hospital should be a pauper.

Mr. Lyons—They may be admitted as pay patients.

Dr. M'Cabe—They may or they may not, according to circumstances.

Chairman—Apply this test. Does the institution pay taxes?

Mr. M'Laughlin—I do not think the orphanage does, but I believe the convent is rated.

Dr. M'Cabe—The most practical way to look at it is this: there is no one legally responsible for these children's maintenance. If the nuns choose they could turn them all out, and then assuredly you would be obliged to maintain them. As this is a test case, and a most serious one, I would recommend the guardians to place the whole circumstances before the Local Government Board for their advice.

The Relieving Officer said he would wish to have the directions of the board in case he should be called on to give a ticket in the case of another applicant.

Dr. M'Cabe said the guardians could not tie the relieving-officer's hands by any resolution; he is bound by the Act of Parliament to use his own discretion.

It was unanimously agreed that the whole matter be submitted for the opinion of the Local Government Board.

## WATERFORD GUARDIANS.

### THE SALARIES AND THE PROPOSED REDUCTION.

THE Chairman said the Board could consider the recommendation of the committee to reduce the salaries of their officers, but at the same time they should remember that they could not reduce any of the salaries by their resolution. They could not reduce any officer's salary without giving due notice to the officer, who might accept the change or resign. But in any case they should have the consent of the Local Government Board to any change of salary, either of reduction or of increase. All that was wanted was, what should be passed would be only a recommendation to reduce the salaries to be submitted to the Local Government Board.

Mr. Newell said he begged to propose that a reduction of ten per cent. be made in the salaries of several officers whose salaries were paid by the rates and not by the Government. The doctors in the house were to be reduced by ten per cent. off the £50 they get from the rates.

Captain Power characterised the reduction as a puerile attempt at economy. It amounted to £254, or one farthing in the pound, so that an average farmer would save 10d. a year, and a householder in the city 5d. a year; and that was done for what? What could be the result but to lessen the energy of their officers, and weaken their efficiency.

Mr. Jacob opposed the resolution. It was not fair to put their hands into the pockets of their officers to relieve the depression of business and the pressure on the rates. There certainly was pressure on the rates, but in his long life he remembered as great depression and pressure on the ratepayers, and the bad times were got over. They should remember that the times were just as bad in other places, and such a proposition was not mooted. The resolution, if it should be carried, would be unjust to several classes, to the doctors, and to the nuns, who did the most work for food and clothing alone. If the resolution was carried the food would be taken out of their mouths, and that was a proceeding he would strongly oppose.

Mr. Clampett supported the motion. There was fearful depression in the country, and so great was it that labourers in the union who used to get 1s. 4d. a day and their food, now were glad to get 8d. a day.

Mr. Meade—I spoke to several of my constituents on the subject of the doctors' salaries and those of other officers, and they said that instead of the salaries being too high that they were too low.

The Mayor said that no doctor could be expected to live and work on less than £120 a year.

Mr. Veale having briefly replied on the question, the resolution was put and lost, the voting being:—For—12. Against—17. Did not vote—3.

# IRISH MEDICAL ASSOCIATION.

*(Continued from "Supplement" of March 5.)*

That most urgent necessity exists at present for amendment of the Irish vaccination laws cannot be questioned in view of the results (so far as ascertained) of the epidemic of small-pox now prevalent in many parts of Ireland—notably in Dublin, Athy, Galway, and Kilbeggan—and I am directed to assure you that in the opinion of the Council—which is also unmistakably that of the governing bodies of the several medical corporations, and other bodies in Ireland competent to form an opinion on the subject—that if the Irish vaccination laws were amended as fully as suggested by the Bills drafted by this Association, no such formidable epidemic of small-pox could possibly again occur in Ireland; nay, more, that the enaction of either of them as law would as completely as possible, by perfect and universal vaccination, protect the population against small-pox in future.

I have the honour to be, Sir,
Your obedient Servant,
JOHN WILLIAM MOORE, M.D.,
Hon. Secretary to the Council.

40, Fitzwilliam Square, Dublin.

To the letter of the Committee of Council, dated 30th November, 1878, no reply, beyond acknowledgment of its receipt, has as yet been received; but the Committee of Council believe that attention is being bestowed upon the subject by the authorities, with a view to new legislation regarding vaccination.

### REPAYMENT TO DISPENSARY MEDICAL OFFICERS OF POSTAGE EXPENSES ON OFFICIAL DOCUMENTS.

Mr. E. J. Browne, an auditor of the Local Government Board, having recently informed the guardians of Boyle Union that as a sum had been paid to one of the dispensary medical officers of that Union for postage expenses, and that as the salary of the medical officer is intended as full remuneration for all his duties—a portion of which is to furnish returns—he is therefore not entitled to receive any payment for postage or other expenses incurred by him in the discharge of his duties, and that in future any payment made of this nature it would be his (the auditor's) duty to disallow, and to surcharge to the party or parties making or authorising the payments—the Clerk of the Union added that the auditor had instructed him to deduct from the salary of any medical officer the amount paid as postage on letters which had not been prepaid. The Committee of Council brought this matter under the notice of the Local Government Board, and in reply were informed that Mr. Browne had since intimated to the Boyle guardians the opinion expressed to him by the Local Government Board, that it would be only reasonable, if a dispensary medical officer has occasion to correspond with any Union officeron business connected with the public service of the Union, that he should be repaid any expenditure thereby incurred by him.

### DUTIES AND REMUNERATION OF MEDICAL OFFICERS OF HEALTH.

The following letter was addressed by the Committee of Council to the Local Government Board:—

Irish Medical Association, Royal College of Surgeons,
October 2, 1878.

To the Secretary Local Government Board.

SIR,—I am directed by the Council of the Irish Medical Association to express a hope that, in defining the duties of the medical officers of health under the "Public Health (Ireland) Act, 1878," the Local Government Board will—without in the least degree depriving the public of any of the benefits conferred by that Act—take especial care that those officers may not be subjected to annoyance from ill-disposed persons.

The Council have directed me to suggest that complaints as to the alleged existence of nuisances should be made, in the first instance, to either the clerk to the sanitary authority, or to the inspector of nuisances. It can hardly be necessary that such complaints should be made directly to the medical officers of health, unless in cases of alleged default or inattention on the part of the other sanitary officers. The Council consider that it is not necessary or desirable, or even consistent with the standing of a medical practitioner, that he should be placed in the position of an inspector of nuisances at the instance of any ill-disposed person, whose sole motive might possibly be to annoy. At the same time they consider it very desirable that the medical officers of health should report the existence of nuisances which come under their immediate observation. The duties of the medical sanitary officers, as laid down by the Local Government Board under the "Public Health (Ireland) Act, 1874," empowered any person to require the medical sanitary officer of the district to make unnecessarily frequent inspections of, and reports as to, the condition of, any ashpit, &c., which was alleged to be a nuisance.

The Council are of opinion that, as far as may be consistent with the terms of the Public Health Act, the duties of the medical officers of health should be confined to those which properly come within the province of a medical practitioner to perform; and, with regard to the detection and abatement of nuisances, that it should be the duty of the inspectors of nuisances in all uncontested cases to have the nuisances abated—in contested cases the certificate of the medical officer of health would, of course, be necessary.

I am further directed to add that the Council believe that unless the medical officers of health are remunerated much more liberally than hitherto for their services, they will not act with that cheerfulness and acquiescence which are so much to be desired in carrying out the important provisions of the Public Health Act, to which a thorough effect can hardly be given otherwise. In a word, there is good reason to fear that unless these officers are fairly requited for the duties compulsorily imposed on them, the result will be a failure.

I am, Sir, your obedient Servant,
JOHN WILLIAM MOORE, M.D.,
Hon. Sec. to Council.

40 Fitzwilliam Square West, Dublin.

The Committee of Council have long been in expectation that the Local Government Board would assign to the medical officers of health their duties under the new Public Health Act, and also that the sanitary authorities would ere this have been informed that the salaries awarded to those officers were admitted by Government not to be sufficient: however, as neither of these instructions have been issued, the medical officers of health remain uninformed as to their duties, and as to what remuneration they are to receive—a state of matters which certainly does not conduce to the effective working of the new Act.

The Committee of Council would direct the attention of the medical officers to sections 158 and 258 of the Public Health Act, which direct payment of fees for special services.

In accordance with the powers vested in the Local Government Board under section 258, the Board has fixed the rate of remuneration to be given to medical officers of health for attendance and evidence in sanitary prosecutions at not less than one guinea a day, nor more than two guineas a day.

### REGISTRATION OF BIRTHS AND DEATHS BILL.

The Bill drawn up by this Association, and introduced into the House of Lords by the Right Hon. the Earl of Donoughmore, has again been brought under the notice of the Government in a letter to the Chief Secretary, asking whether it was intended to be taken up this session as a

Government measure? and if not, whether its reintroduction as a *private* Bill would meet with the support of the Government, the Bill having already been favourably reported upon by the several departments. The receipt of the letter was formally acknowledged, but for some unaccountable reason no definite reply to the questions put has as yet been received. The Committee of Council felt it necessary to take this course in consequence of the absence from this country of the Earl of Donoughmore.

*(To be continued.)*

## PUBLIC HEALTH (IRELAND) ACT, 1878.

*(Continued.)*

267. (*Verb.*) *Service of Notices.*—Notices, orders, and any other documents required or authorised to be served under this Act may be served by delivering the same to or at the residence of the person to whom they are respectively addressed, or where addressed to the owner or occupier of premises, by delivering the same or a true copy thereof to some person on the premises, or if there is no person on the premises who can be so served, by fixing the same on some conspicuous part of the premises; they may also be served by post by prepaid letter, and if served by post shall be deemed to have been served at the time when the letter containing the same would be delivered in the ordinary course of post, and in proving such service it shall be sufficient to prove that the notice, order, or other document was properly addressed and put into the post.

Any notice by this Act required to be given to the owner or occupier of any premises may be addressed by the description of the "owner" or "occupier" of the premises (naming them) in respect of which the notices is given, without further name or description.

APPEAL.

268. (*Abs.*) *Appeal.*—Where any person deems himself aggrieved by the decision of the sanitary authority in any case in which the sanitary authority are empowered to recover in a summary manner any expenses incurred by them, or to declare such expenses to be private improvement expenses, he may, within twenty-one days after notice of such decision, address a memorial to the L. G. B. stating the grounds of his complaint, and shall deliver a copy thereof to the sanitary authority.

269. Appeal to Quarter Sessions.

PART VII.—MISCELLANEOUS PROVISIONS.

270. Payments to Members of Sanitary Authority as counsel illegal.

271. Entry on Lands for purposes of Act.

272. (*Abs.*) *Penalty on obstructing Execution of Act.*—Any person who wilfully obstructs any member of the sanitary authority, or any person duly employed in the execution of this Act, shall be liable for every such offence to a penalty not exceeding five pounds.

Where the occupier of any premises prevents the owner thereof from obeying or carrying into effect any provisions of this Act, any justice to whom application is made in this behalf shall, by order in writing, require such occupier to permit the execution of any works required to be executed, provided that the same appear to such justice to be necessary for the purpose of obeying or carrying into effect the provisions of this Act; and if within twenty-four hours after the making of the order such occupier fails to comply therewith, he shall be liable to a penalty not exceeding five pounds for every day during the continuance of such non-compliance.

If the occupier of any premises, when requested by or on behalf of the sanitary authority to state the name of the owner of the premises occupied by him, refuses or wilfully omits to disclose or wilfully mis-states the same, he shall (unless he shows cause to the satisfaction of the Court for his refusal) be liable to a penalty not exceeding five pounds.

273. Penalty on Damaging Works, &c., of Sanitary Authority.

274. Compensation in case of Damage by Sanitary Authority.

275. (*Verb.*) *Compensation to Officers in Certain Cases.*—If any officer of any body by this Act constituted the sanitary authority of any district is, by or in pursuance of this Act or of any provisional order made under the authority of this Act, removed from his office or deprived of the whole or part of the emoluments of his office, and is not employed in an office of equal value, and with equal privileges, by such sanitary authority, the L. G. B. may by order award to such officer such compensation as the said Board may think just; and such compensation may be by way of annuity or otherwise, and shall be paid by the authority of the sanitary district in which such officer held his office out of the rates applicable to sanitary purposes within that district.

276. As to Consent of L. G. B. required in Certain Cases.

277. Settlement of Differences arising out of Transfer of Powers or Property to Sanitary Authority.

278. As to Construction of Incorporated Acts.

279. Construction of Schedules.

PART VIII.—SAVING CLAUSES AND REPEAL OF ACTS.

SAVING CLAUSES.

280. (*Verb.*) *Provision as to the Sanitary Authorities Existing at the Passing of this Act and their Officers, &c.*—All urban sanitary authorities and rural sanitary authorities existing at the time of the passing of this Act shall be deemed to be urban authorities and rural authorities under this Act; and all joint boards and committees of rural sanitary authorities existing at the time of the passing of this Act shall be deemed to be joint boards and committees of rural sanitary authorities under this Act; and the members of all the above-mentioned bodies shall hold office for such time as they would respectively have held office if this Act had not been passed; and the officers and servants of all the above-mentioned bodies shall continue to hold their several offices and employments on the same terms and subject to the same conditions, as to duties, remuneration, and otherwise, as they would have held them if this Act had not been passed; and all bye-laws duly made under any of the Sanitary Acts by this Act repealed and not inconsistent with any of the provisions of this Act shall be deemed to be bye-laws under this Act; and all the provisions of this Act shall apply to all such bodies existing at the time of the passing of this Act, and to their several officers and servants, in substitution for the provisions of the Sanitary Acts by this Act repealed, but so as not to affect any right acquired or liability incurred under the Sanitary Acts, or any of them, before the passing of this Act, and existing at the time of the passing of this Act.

281. Saving for Works and Property of certain Authorities and for Navigation and Water Rights, &c.

282. Reference to Arbitration in case of Works not within Preceding Section.

283. Effect of Arbitration.

284. Provision as to Transfer of Powers, &c.

285. Provision as to Alteration of Sewers.

286. Saving for Water Rights generally.

287. Arbitration as to Alteration of Sewers injuriously affecting Supply of Water, &c.

288. Saving for Mines, &c.

289. Saving for Corporate Bodies and Government Departments.

290. Saving for Payment in certain cases to Sanitary Authority.

291. Saving for Acts of Authorities under any Local Act.

292. Saving for Proceedings under Local Acts.

293. Powers of Act to be Cumulative.

REPEAL OF ACTS.

294. (*Verb.*) *Repeal of Acts in Schedule A.*—The Acts specified in the first and second columns of Schedule A. to this Act are hereby repealed to the extent in the third column of that schedule mentioned:

Provided that this repeal shall not affect—

(*a*) Anything duly done or suffered under any enactment hereby repealed; or

(*b*) Any right or liability acquired, accrued, or incurred under any enactment hereby repealed, or any regulation or order duly made in pursuance of any such enactment; or

(*c*) Any security given under any enactment hereby repealed; or

(*d*) Any penalty, forfeiture, or punishment incurred in respect of any offence committed against any enactment hereby repealed; or

(*e*) Any investigation, legal proceeding, or remedy in respect of any such right, liability, security, penalty,

forfeiture, or punishment as aforesaid; and any such investigation, legal proceeding, and remedy may be carried on as if this Act had not been passed.

## SCHEDULES.

SCHEDULE A.—*Enactments which have been already Repealed are in a few instances included in in this Repeal, in order to avoid the necessity of Reference to previous Statutes.*

| Session and Chapter. | Title or Short Title. | Extent of Repeal. |
|---|---|---|
| 14 & 15 Vict., c. 28 | The Common Lodging Houses Act, 1851. | The whole Act, as to Ireland. |
| 16 & 17 Vict., c. 41 | The Common Lodging Houses Act, 1853. | The whole Act, as to Ireland. |
| 23 & 24 Vict., c. 26 | The Common Lodging Houses Act (Ireland), 1860 | The whole Act. |
| 17 & 18 Vict., c. 103 | The Towns Improvement (Ireland) Act, 1854. | Sections 33, 34, 35, 42, 45, 46, 48, 49, 52, 53, 54. |
| 18 & 19 Vict., c. 116 | The Diseases Prevention Act, 1855. | The whole Act, as to Ireland. |
| 18 & 19 Vict., c. 121 | The Nuisances Removal Act for England, 1855 | The whole Act, as to Ireland. |
| 23 & 24 Vict., c. 77 | An Act to amend the Acts for the Removal of Nuisances and the Prevention of Diseases | The whole Act, as to Ireland. |
| 19 & 20 Vict., c. 98 | The Burial Grounds (Ireland) Act, 1856. | The whole Act. |
| 23 & 24 Vict., c. 76 | An Act to amend the Burial Grounds (Ireland) Act, 1856. | The whole Act. |
| 26 & 27 Vict., c. 117 | The Nuisance Removal Act for England (Amendment) Act, 1863. | The whole Act, as to Ireland. |
| 28 & 29 Vict., c. 95 | The Sewage Utilisation Act, 1865 | The whole Act, as to Ireland. |
| 29 & 30 Vict., c. 41 | The Nuisances Removal (No. 1) Act, 1866 | The whole Act, as to Ireland. |
| 29 & 30 Vict., c. 90 | The Sanitary Act, 1866 | The whole Act, as to Ireland. |
| 30 & 31 Vict., c. 113 | The Sewage Utilisation Act, 1867 | The whole Act, as to Ireland. |
| 31 & 32 Vict., c. 115 | The Sanitary Act, 1868 | The whole Act, as to Ireland. |
| 32 & 33 Vict., c. 100 | The Sanitary Loans Act, 1869. | The whole Act, as to Ireland. |
| 34 & 35 Vict., c. 109 | The Local Government (Ireland) Act, 1871 | The whole Act, except sections 11 to 18, both inclusive, 20, 21, 24 to 27, both inclusive, 29 & 30, and the shedule. |
| 35 & 36 Vict., c. 69 | The Local Government Board (Ireland) Act, 1872 | Sections 8 & 9. |
| 36 & 37 Vict., c. 78 | The Sanitary Act, 1866 (Ireland), Amendment Act, 1873 | The whole Act. |
| 37 & 38 Vict., c. 93 | The Public Health (Ireland) Act, 1874 | The whole Act. |

SCHEDULE B.

FORM I. Form of Mortgage of Rates.
FORM II. Form ofTransfer of Mortgage.
FORM III.—Form of Rentcharge.

SCHEDULE C.—FORMS.

FORM A.—*Form of Notice requiring Abatement of Nuisance.*—To [personcausing the nuisance, or owner or occupier of the premises wheron the nuisance exists, as the case may be]. Take notice that under the provisions of the Public Health (Ireland) Act, 1878, the [describe the sanitary authority], being satisfied of the existence of a nuisance at [describe premises or place where the nuisance exists], arising from [describe the cause of nuisance, for instance, want of a privy or drain; or for further instance, a ditch or drain so foul as to be a nuisance or injurious to health; or for further instance, swine kept so as to be a nuisance or injurious to health], do hereby require you within ..... from the service of this notice to abate the same, and for that purpose to [state any things required to be done or works to be executed]. If you make default in complying with the requisitions of this notice, or if the said nuisance, though abated, is likely to recur, a summons will be issued requiring your attendance to answer a complaint which will be made to a court of summary jurisdiction for enforcing the abatement of the nuisance, and prohibiting a recurrence thereof, and for recovering the costs and penalties that may be incurred thereby.—This ... day of ... 18... Signature of officer of sanitary authority.

FORM B.—*Form of Summons.*—To the owner or occupier of [describe premises], situated at [insert such a description as may be sufficient to identify the premises], or to A. B. of ..... You are required to appear before [describe the court of summary jurisdiction], at the petty sessions [or court] holden at ..... on the ..... day of ..... next, at the hour of ..... in the ..... in the ..... noon, to answer the complaint this day made to me by ..... that in or on the premises above mentioned [or in or on certain premises situated at No. ..... in the ..... street in the parish of ..... or such other description or reference as may be sufficient to identify the premises], in the district, under the Public Health Act (Ireland) 1878, of [describe the sanitary authority], the following nuisance exists [describing it, as the case may be], and that the said nuisance is caused by the act or default of the occupier [or owner] of the said premises, or by you A. B. [or in case the nuisance be discontinued, but likely to be repeated, say, there existed recently, to wit, on or about the .....day of ..... on the premises, the following nuisance [describe the nuisance], and that the said nuisance was caused [&c.] and although the same has since the said last-mentioned day been abated or discontinued, there is reasonable ground to consider that the same or the like nuisance is likely to recur on the said premises].—Dated this ..... day of ..... 18...—(Signed) Justice.

FORM C.—Form of Order for Abatement or Prohibition of Nuisance.

FORM D.—Form of Order for Abatement of Nuisance by Sanitary Authority.

FORM E.—Form of Order to permit Execution of Works by Owner.

FORM F.—*Order of Justice for Admission of Officer of Sanitary Authority.*—Whereas [describe the sanitary authority] have by their officer [naming him] made application to me, A. B., one of Her Majesty's justices of the peace having jurisdiction in and for [describe the place], and the said officer has made oath to me that demand has been made pursuant to the provisions of the Public Health Act (Ireland), 1878, for admission to [describe situation of premises so as to identify them], for the purpose of [describe the purpose, as the case may be], and that such demand has been refused. Now, therefore, I the said A. B. do hereby require you [name the person having custody of the premises] to admit the said [name the sanitary authority], [or the officer of the said sanitary authority], to the said premises, for the purpose aforesaid.

## TO READERS.

THE Editor will feel especially obliged by receiving copies of newspapers which contain any Poor-law or other intelligence of medical interest, in order that he may, if fit, republish it for the benefit of the readers of the *Medical Press*. Although twenty-one of the leading Irish newspapers are received at the Irish office, many things may escape notice which are deserving of attention. Newspapers should be marked, and addressed to Dr. JACOB, at the Dublin offices of this paper.

### ON THE NATURE AND TREATMENT OF THE CHIEF SYMPTOMS OF CHOREA. (a)

By W. H. DAY, M.D.,

Physician to the Samaritan Hospital for Women and Children.

MR. PRESIDENT AND GENTLEMEN,—Few diseases possess a wider interest than chorea; few have given rise to more fanciful theories, and few have yielded to more varied modes of treatment.

Chorea may be accepted as one of the most singular of the numerous disorders which affect the nervous system. It is substantially allied in some respects to other neurosal conditions; but it is so variable and capricious in its manifestations, that it may be clinically recognised as possessing peculiar and independent phenomena, which distinguish it from all other affections.

Chorea is a functional derangement of the motor nerves, causing irregular movements of the muscles, and influencing voluntary action. It is a common disorder in nervous and sensitive children from the greater excitability of the nerve-cells in youth. It is not accompanied with fever. With it there is no defect of consciousness or volition, as is the case with epilepsy.

The symptoms of chorea are too well-known to need any recapitulation—the restlessness and inability to sit still, the twitching of the muscles, or the tremulous agitation of the limbs, the grotesque forms and contortions which the mouth assumes, the difficulty in eating and swallowing, the thick and hesitating speech, the ludicrous and fantastic method of locomotion, the careless semi-drunken sway, and the fatuitous expression of the features, are all characteristic. I should like, however, to advert very briefly to a few of the most significant symptoms, and of these I will first say a word or two about the *pulse*.

Irregularity and intermission of the pulse are often present, as in neurosal affections of the heart in children, whether this has arisen from long standing debility, anæmia, rickets, or fright and terror. As a rule the pulse is not accelerated except from debility and nervous agitation. In some cases it is slow, and does not exceed sixty beats a minute in a child thirteen years of age. To this point I shall refer later on.

A child suffering from chorea is liable to great variation in the progress of the malady, being sometimes better and sometimes worse, so that without taking this into consideration, we may fancy the patient has recovered, when the complaint is only temporarily subdued.

When the attacks are threatening there may be mental irritability and spitefulness. In one case that came under my notice, a child whose intellect was below the average, was unable to restrain herself from kicking and biting those about her whenever she was thwarted in her plans; and even without any provocation she would sometimes break out into uncontrollable fury. In chronic cases parents can often judge when an attack is threatening, or when the case is becoming worse, from the altered manner and disposition of the child. Timidity, caprice, and wilfulness are noticeable when the intellectual faculties are disordered, and it is, in such cases as these, that we may witness fits of passion pass into temporary unconsciousness.

I have known the symptoms much aggravated by another patient in the same ward practising these extraordinary movements and mimicries, or suffering from a painful disease which has annoyed and irritated the choreic child. This is the only explanation I could offer of a girl's temperature in chorea suddenly going up two successive evenings to 102°, when a little child with catarrhal pneumonia in the same ward became difficult to pacify. When this child was removed into another ward the temperature of the choreic patient fell to normal, and there was no further rise. I have frequently thought whether this nerve-element which exercises such an in-

(a) Read before the Harveian Society, May 1, 1879.

fluence over the circulation may not explain many obscure cases of sudden elevation of temperature in children, more particularly about the period of approaching menstruation—cases which perplex us as to the actual cause of the pyrexia, for in the present day zymotic influences (not readily traceable) are believed to originate so many disorders in which fever is present, that it often occasions unnecessary alarm. A little girl thirteen years of age, of nervous temperament, and whose only illness consisted in chronic debility, had for three days a temperature of 102° and 103° without gastric disturbance, or or any lesion that could be detected. The only explanation that appeared at all probable, was that under excitement or fatigue, this fleeting elevation of temperature took place. The administration of quinine was followed by a return of a normal temperature in a day or two, and yet whilst the fever lasted it was impossible to predict the true nature of the disorder.

Sir Thomson Watson mentions in his lectures that "chorea is liable to be propagated by a species of contagion, or rather involuntary imitation," and most of us have noticed how a restless and fidgetty child will propagate this species of infection to its playmates, when their companionship is inseparable.

In one case under my care the choreic movements were preceded by headache of three months' duration. The patient was a girl ten years of age, who had become very anxious in her studies, and her nervous system was lowered in consequence. Her temperature in the evening was constantly elevated. This symptom of headache, according to my experience, is exceedingly rare, except the patient is exhausted, and then it may be present as the accompaniment of debility. Sir T. Watson has drawn attention to the fact that he has frequently met with instances of pain in the head in chorea, "and in some of them, with pain on that side of the head, which was opposite to the agitated limbs." (*a*)

That there is a close relationship between the two conditions so essentially involving the nervous system, is just what we should imagine. A little boy who was subject to paroxysmal headache, had a sister eight years of age who was afflicted with severe chorea, and there was a strong hereditary tendency to nervous disease in the family.

Cardiac murmurs are sometimes present in this affection, and in the early stages of the disorder they are often overlooked. I am confident that they pass unnoticed repeatedly among out-patients, when neither pain, nor discomfort, nor breathlessness are complained of; and there is no direct symptom to draw attention to the heart. In some cases we may discover exaggerated action and impulse of the heart, or a bellows murmur at the left apex, with other accompaniments of mitral regurgitation. When the heart is so affected it is often traceable to rheumatism. In other cases the heart is healthy, but the neurotic disorder has implicated the cardiac plexus, and produced irregularity and deficiency in power; or there are to be discovered merely the evidences of palpitation, with prolongation of the first sound both at apex and base,—a soft systolic murmur in fact, which though significant of organic change, may happen in some examples of anæmia and general debility. These are cases sometimes erroneously classed among heart diseases in connection with chorea, whereas I believe that the relationship in many instances, goes no further than the blood impoverishment and the disturbance of the cardiac ganglia which are common to chorea, and some other neurosal states.

Sometimes palpitation is very severe and violent, and there may be a systolic mitral murmur of dynamic origin which passes away with the seizure as the general health is restored.

The urine is often found to be of high specific gravity, acid, turbid, and containing an excess of urea, and sometimes phosphates. In twelve cases which were under my care, the highest specific gravity reached 1032; there was a copious deposit of whitish lithates in three, phosphates in four, and in the remaining five (which were mild cases) the urine was normal. In one case which came under my care last year, the urine contained copious phosphates for five days in succession, and the specific gravity was never below 1030. During this time the child was taking from eighteen grains to one drachm of sulphate of zinc in the twenty-four hours. When she took eighty grains in the day, the urine became suddenly loaded with lithates, and the day following when the zinc was reduced, it was normal. I rather inferred from these and some other cases, that large doses of sulphate of zinc had a tendency to cause these deposits in the urine of choreic patients, but I have recently thought that such a change is not invariable, and I am, therefore, inclined to attribute the urinary changes to the disease, rather than to the remedy. I have known a child when taking eight grains of the zinc daily pass turbid urine, containing pink lithates, of a specific gravity of 1032; and the same child when taking sixty-four grains daily to pass clear urine with a specific gravity of 1020. We may conclude then that the urinary secretion is subject to great changes in chorea.

Now among the many causes of this singular affection, are a naturally delicate nervous organisation. Irritability of the nervous system is among the most frequent causes, and hence this is assigned as one reason of its frequency in the female sex. Over and over again we see young children in consequence of school work, or debility, or some other cause not well-defined, become irritable, sleepless and fretful, followed by irregular twitching movements of the muscles and limbs, that if allowed to go on without treatment, the choreic state is gradually developed.

In 12 consecutive cases admitted under my care into the Samaritan Hospital, as in-patients, 10 were females; the eldest, a girl, was 14 years of age, and the youngest, was a boy of 7. Vogel says that, "among 11 chorea patients which I noted in my diary, I find only 1 boy affected." (*a*) "But though the fact," says Dr. West, "of the greater liability of the one sex to chorea is undoubted, so that of 775 children suffering from it, who were admitted as in- or out-patients of the Children's Hospital, 499, or 64 per cent., were girls; still, not only were all of these children under the age of 10, but 66 out of 102 of the number were under the age of 5." (*b*) This table does not agree with my experience so far as the age is concerned. Taking the last 25 cases among the out-patients of the Samaritan Hospital, 21 were females; the two eldest were 20 and 21 years of age respectively, and one was only 3; eight were 11 years of age, six were 7, three were 12, two were 8, one was 14, one 10, and one 9.

Dr. Braxton Hicks says:—"Of 422 cases occurring up to 12 years of age, 122 were males, and 300 females. Between the ages of 4 and 5, the proportion of males to females was as 4 to 16, and between 10 and 12 as 23 to 81. Again, when chorea occurred after puberty, it was among women that it was principally seen; yet as chorea was not confined exclusively to females, we must seek the cause in a factor common to both, but especially intense or prominent in the female." (*c*)

Dr. Radcliffe observes that "up to nine years of age the two sexes appear to be equally liable; after this age females become much more liable than males, in the proportion of 5 to 2." (*d*)

Among the causes are fright, anger and injury. Several cases have come under my notice in which the disease has been traceable to terror and alarm, and these were of a most severe description. One of the worst cases I ever

saw happened to a girl 10 years of age from seeing a dead person. In another girl 8 years of age, three separate and severe seizures were attributable on the first occasion to the death of a sister, on the second occasion to seeing a lady killed in the street, and on the third occasion to the sudden death of her grandfather.

In a family with which I was once acquainted, one daughter had severe chorea, the other died of convulsions, a son perished from phthisis, the mother died of paralysis, and the father committed suicide.

We know that chorea may arise during convalescence from acute rheumatism, and from embolism in connection with rheumatic endocarditis; but the concurrence of chorea with rheumatic fever is not quite so frequent as is supposed, though it cannot be denied that the rheumatic constitution is frequently associated with it. In the 12 cases I have alluded to, there was no history of rheumatic fever in any of them, and in a large number of cases, I have failed to discover anything more than a casual relationship.

*(To be continued.)*

## REMARKS ON SOME INJURIES OF THE BRAIN. (a)

By MICHAEL HILLARY, L.R.C.S.I.

*Proposition:* That injuries to the skull and wounds of the brain depend for their severity on the following facts.

1. On the class of projectile.
2. The velocity with which the projectile is moving when the impaction takes place.
3. Whether the molecular structure of the brain is simply cut or bruised.
4. That the molecular structure of the brain, consisting of its nerve-cells, &c., when struck by any projectile moving at high velocity which simply cuts it, and cleanly removes portions of it, resolves itself into a simple incised wound, and heals with the same facility.
5. A projectile (like a bag of sand) striking the skull breaks up and pulpifies the molecular structure of the brain.
6. A projectile (like a spent bullet) may strike the skull, and although not breaking it, may, if the impact of the blow is carried forward to a vital point, produce death instantaneously by molecular destruction of the tissues in its track.
7. That a blow on the head causing concussion, is simply a shaking of the connections of the nerve-cells with one another.
8. That the amount of injury sustained by the brain from a blow on the skull will depend very much on whether at the time the brain is near to the skull or not, during its pulsating action, or whether fluid is interposed.

I find the amount of injury, and calculate my prognosis of a case from a similar result produced on the most common of objects—a pane of glass. A rifle ball will pass clean through, making a round hole if moving *at high* velocity, and if moving *slowly will smash it* to pieces; so I compare the injury to the molecular structure of the brain. The following cases will illustrate what I have stated.

In the year 1863 I was, while in Canada, called to see a man, æt. about 25, and of fine physique, at one of the saw mills in the neighbourhood, who had been badly injured. An hour previously, while passing under a circular saw revolving at high speed, he raised his head too soon, and the teeth caught the side of his skull just at the temporal fossa, about the coronal suture, and above the zygomatic arch, tearing through the bone, and tearing out quite a large piece of the anterior lobe of the brain. It then tore back the top of the scalp in a flap, opened the skull through the saggital suture, as well as the superior longitudinal sinus. When I saw the man he presented a shocking appearance, but was perfectly rational and sensible. Hæmorrhage had almost stopped. On inquiring, and finding that he had been struck by the saw *on its upward turn*, I judged from that fact and the man's appearance, that there was no danger of compression, and if the inflammation could be kept within bounds he had a chance of recovery.

I shaved away the portion of extruding brain with a scalpel, replaced the scalp, applied ice in bladders to the head, and left.

Next day saw him, and found him no worse than a person after an ordinary severe wound. I decided to remove him from the shanty where he was to his father's house, three miles off, which was accomplished with a hand litter. He was placed in a fine airy room, and nothing further was done, but to keep ice to the head, and give light nourishment. When suppuration commenced, warm water dressings were substituted for the cold ones. Recovery went on with a steady pace, and a month afterwards I was called away to the war in the United States, and left him in charge of my brother, with whom he made a perfect recovery. I saw the same man about four years ago, and he said he felt as well as ever, but could not drink as much whisky as was his wont; there was a depression in which the tops of the fingers would fit in the temporal fossa, and also on the top of the skull, but not so deep there. I ascribe his recovery to the fact of the wound being made with the *large wedge-shaped* teeth of the saw (everything it cut *was removed outside*) and to the *velocity of its movement localising the injury.*

The next case is directly the reverse of the preceding. In the year 1864, when serving with the army of the "James," in Virginia, I was passing along our trenches when there was a lull in hostilities on both sides, and one could safely show himself. As I was walking by a couple of soldiers sitting on the side of the ditch inside the trench, and whose heads were bent *below the level of the parapet*, one of them fell over dead, and the other picked up a bullet that fell upon the ground after hitting his comrade. I heard *no shot*, so it must have been a long way off. The men were *under cover for a direct shot*, and the trajectory of the ball must have described a *considerable curve* to hit the man that was killed. I examined the man's head, but there was no wound, only a mark where the ball struck him just behind the mastoid process, over the occipital and below the superior curved line. I was rather astonished at so apparently trivial an injury producing such a fatal result, and did not think of it again, until at one of our numerous engagements, a soldier came to me in the field hospital, suffering great pain in his foot—he had removed his shoe and hobbled along on his heel. He showed me the shoe, and said he was struck on the sole of it with a ball from a case (or canister, old name) shot as he was retreating, *the shot not going* through, but making a complete half impression, the size of the old musket ball. On looking at the sole of the foot I found it indented in exactly a similar way; the pain was very severe, more than if there was a perfect wound. I had to send him away to the rear as we were in action, and of course lost sight of him, as he did not belong to my battery; but I have not the slightest doubt the whole *dent of the bullet sloughed out*, as I had always seen as a similar result from spent balls striking other fleshy parts of the body. The case was valuable to me as a solution of the cause of death in my last narrated case. It appeared to me that although neither the skin nor skull was broken, the pulpy brain mass in the track of the ball's impact was molecularly destroyed, and that track extended to the medulla oblongata, and divided it as completely physiologically as a knife would, in pithing an animal.

From observations of other gun-shot wounds of the head I found cases with depression when the injuries were received *at close quarters*, and when the *balls skimmed* over the skull at their *highest speed*, do fairly well on elevation,

(a) This paper was taken as read at the last meeting of the Surgical Society of Ireland, there being no time to bring it forward in the ordinary way.

but depression, resulting *from a long shot*, were almost *all fatal*. The reason I ascribe for their favourable result in *close quarter* cases is, that the destruction is *local* and *complete*, the molecular particles of the brain have not time, I may say, to take *extended disintegration;* in a *long or spent shot they* have, and the injury is diffused, perhaps *to a vital point*. I think, further, if the antiseptic precautions that are undertaken in ovariotomy operations were extended to these cases, the result would be equally brilliant.

The class of injuries from sand bags and other blunt projectiles, can be easily understood as to their fatality, from their method of destroying and pulpifying brain tissue. I may refer to Coles' statement, where he says, in his "Field Practice in India," that the English cavalry soldier in his encounter with the Sikh or Afghan cavalry, often received a clean incised wound, *cutting right into the brain*, from their keen blades, but was able to live long enough to return a deadly blow, killing his antagonist instantly, with his *blunt sabre*. I think it very likely if the English soldier could have been placed under favourable circumstances immediately, he would recover, and that the probabilities were, that hæmorrhage killed him, and not the amount of brain injury.

What I have stated is to show that in those peculiarly puzzling head injuries we may gain considerable assistance in our prognosis and treatment, by having an approximate knowledge of the velocity of the body producing the injury to the brain, and the direction and class of projectile that has inflicted it.

# Clinical Records.

## MEATH HOSPITAL, AND COUNTY DUBLIN INFIRMARY.

*Brief Notes of Cases of Operation.*

UNDER THE CARE OF

Mr. LAMBERT H. ORMSBY, F.R.C.S.

(For the following notes we are indebted to MR. MACNAMARA WILLIAMSON, Resident Pupil).

OPERATION I.—*Removal of Sequestra—the Result of Specific Necrosis of Tibia.*—John B., a stout young man, æt. 20, was admitted for necrosis of tibia on April 21st, 1879.

*History.*—Had contracted syphilis about two years previously. Six months ago was suffering from specific periostitis of tibia. Operation performed on April 23rd. Esmarch's bandage applied. An incision about three inches long was made over the anterior portion of the diseased tibia. The gouge was then very freely used, and, with the aid of bone forceps, several small sequestra were removed. The patient was fully etherised. Since the operation the patient has been entirely free from nocturnal pain, which was constant before.

Mr. Ormsby alluded to this point in his clinique on the case; mentioning that exacerbations of nocturnal pain in syphilitic disease of bone, was a marked characteristic of the affection.

OPERATION II.—*Removal of Sequestrum from Tibia—the Result of Necrosis caused by Injury.*—Mark M., æt. 50, a countryman, admitted on April 19th, 1879.

*History.*—In appearance this man looked healthy and robust. Two years ago he received a severe blow on the front of his shin, and the front of the leg was more or less tender ever since. Six months ago he received a fresh blow on the same place, and he got a sharp attack of periostitis, which he neglected. When examined with a probe the sequestrum was quite moveable and loose in the bottom of the ulcerated surface. Operation performed on April 23rd by a single incision over the sequestrum. Gouge and bone forceps used, and the sequestrum was removed without much difficulty. The soft parts, as is mostly the case, were very vascular.

Mr. Ormsby remarked that in this case we had necrosis coming on from a traumatic cause, and neglected periostitis. It was also interesting to remark that the patient did not at all complain of increase of pain at night, which was most marked in the preceding case. The patient since the operation has been progressing favourably.

OPERATION III.—*The Effect of the Needles of Leclanché's Battery on Vascular Tumours.*—A. L., a baby, about 9 months, was suffering from a small congenital nævus on the nose. The needles attached to a Leclanché battery were introduced into the centre of the nævus. Hardness was the most immediate effect, and gradually the entire spot seemed to disappear by suppuration. In this nævus it only required two applications of the needles to produce the desired effect.

Mr. Ormsby mentioned a 10-celled Leclanché's Battery was quite powerful enough to cure the majority of capillary and other nævi. Some required one application, some more, according to the size. He also drew attention to a very simple matter, which is very important to be aware of; when withdrawing the needles from such vascular tumours, one of these points frequently bleed very freely, and require sometimes continued pressure, styptics, &c., to stop it, it is also found that the bleeding in the majority of cases comes from the puncture made by the needle in connection with the carbon plate of the battery, and seldom from the puncture of the needle in connection with the zinc plate. The current in the needles can be easily changed by simply reversing the attachments at the battery; in this way, both needle points are completely seared by the galvanic action, and no bleeding takes place.

OPERATION IV.—*Excision of Hypertrophied Tonsils by Means of Luer's Guillotine.*—J. M., a strong healthy girl, æt. 19, was admitted into the Meath Hospital suffering from enlarged tonsils, which gave her a great deal of trouble when swallowing, particularly when she had a cold. Medical treatment and local caustic applications had frequently been adopted with very little effect. Operation performed with Luer's guillotine. Both tonsils were completely removed; the hæmorrhage resulting was very slight, and the girl left the hospital ten days after the operation perfectly well. Mr. Ormsby drew the attention of the class to this case, mentioning the ease by which the tonsils could be removed by the form of guillotine he used. In case, however, that the surgeon had not the guillotine at hand, a hernia knife and a hook were useful means for removing portions of the tonsil.

# Transactions of Societies.

## CLINICAL SOCIETY OF LONDON.

FRIDAY, MAY 9TH.

Dr. GREENHOW, President, in the Chair.

Mr. BRYANT

ON A CASE IN WHICH A BILIARY CALCULUS WAS REMOVED BY OPERATION FROM THE GALL BLADDER, AND A CURE RESULTED.

It occurred in a single woman, æt. 53, who was admitted into Guy's Hospital under Mr. Bryant's care in July, 1878, with two discharging sinuses of three years' standing, following an abscess, which had been previously forming for two. At first the sinus was laid open, and pus alone escaped; but subsequently, as bile flowed in quantities from the wound, an exploratory operation was performed, and at a depth of two inches a biliary calculus, one inch long, turned out of the gall bladder. Everything went on well after the operation, and although bile continued to escape from the wound for about two weeks, the parts quite healed in about four months, and the

patient left the hospital cured. The author brought the case before the Society as an encouragement to surgeons to apply their art in later or allied cases, for he was well prepared to support the suggestion of Dr. Thudichum, made twenty years ago, "that gall stones might be removed from the gall bladder through the abdominal walls;" and he pointed out that under certain circumstances the operation was justifiable, when the sinuses by their presence were setting up inflammatory and suppurative changes about the gall bladder, without any obstruction to the bile ducts, as well as in that more serious class of cases in which the cystic or common bile duct was obstructed, and dropsy of the gall bladder, with jaundice, complicated the case, as shown by the cases of Dr. M. Sims and Mr. G. Brown.

Mr. HULKE said there was no shadow of doubt as to the propriety of the treatment in Mr. Bryant's case. He simply rose to say that the whole question had been exhaustively treated in an early number of the *Memoires de Chirurgie* of about the year 1706. In a case there discussed, the stone was withdrawn by the forceps, and the author drew an analogy between it and the operation of lithotomy.

Dr. ALLEN STURGE

ON A CASE OF SPONDYLITIS DEFORMANS.

The patient, a man, æt. 26, was an artificial flower maker, who had been under his care at the Royal Free Hospital. The mother suffered very much from rheumatism. One brother had severe chronic rheumatism, and another was said to be very subject to gout. The patient's health had been good before the present illness; there was no distinct history of syphilis. Prior to his illness he had been a strong, upright man, and a rapid runner. The present condition began eight years ago, with pain in the back, which had never since quite left him. Gradually the back became stiff, both in the cervical and dorsal regions. When he came under care the spinal column was remarkably fixed throughout. The lumbar and dorsal regions together formed a curve of large radius, with the convexity backwards (spinal lordosis); and the spine, as a whole, was on a plane, posterior to that of the sacrum, producing a projection forwards of the abdomen, the legs being carried back in a corresponding degree to catch the centre of gravity of the body. There was no special tenderness of the spine at any part. In bending forwards, the spine, as a whole, remained quite stiff, and flexion appeared to be almost entirely confined to the lower two or three lumbar vertebræ. The cervical part of his spinal column was very stiff. Power of flexion of the head forwards and backwards was very limited, and lateral movement of the head towards the shoulders was almost abolished. Power of rotation, though imperfect, was less impaired than the other movement. The thorax was very rigid; breathing was almost wholly abdominal. On drawing a deep breath there was a slight movement of expansion, but scarcely any of elevation. Dr. Sturge remarked that this condition was one of very rare occurrence, and would appear to be rheumatoid in its nature. The post-mortem changes were described a good many years ago by Professor R. W. Smith, of Dublin, and more recently by Dr. von Shaden, of Altona. They were like those met with in rheumatoid arthritis of other parts of the body, viz., absorption of the articular cartilages, nodular growths on the articular surfaces of the bones, and anchylosis of adjacent vertebræ, to which must be added absorption of the intervertebral cartilage. It might coincide with rheumatoid affections elsewhere, but in many cases it was confined to the spine, or to the spine and costo-sternal articulation. Todd had seen a case in a man aged 25, and Eulenberg had met with it in a girl of 12 years old. As a rule, however, bony anchylosis of the vertebræ occurred in old people; but it was doubtful whether the disease in young persons could be looked upon as identical with that which occurred in old people.

Mr. BRYANT remarked that Dr. Fagge had brought before the Pathological Society about two years ago a case of the kind, in which the joints between the vertebræ, and those between the ribs and the vertebræ were anchylosed, so that the patient, having bronchitis, and not being able to cough or breathe, died asphyxiated. Dr. Fagge had not in that case discovered the anchylosis during life, and there was not in that case the deformity found in Dr. Sturge's case.

Mr. BARTER inquired whether in these cases there was fusion between the bones of the spine, or whether there was simply a locking of the bones, due to bony outgrowths. Fusion in such cases was rare. Was there complete bony union, so that on section one could not find the line of division between the vertebræ?

Mr. HEATH did not think fusion between the vertebræ was so very uncommon, as a result of rheumatic arthritis; but such cases did not lead to the deformity present in Dr. Sturge's case. He thought a photograph exhibiting that patient's deformity should be added to the case, as such deformity was rarely met with, except as a result of ordinary angular curvature.

Dr. STURGE, in reply, was sorry that he had overlooked Dr. Fagge's case in examining the Pathological Society's *Transactions*. He would endeavour to obtain a photograph of his patient, though the man was now in prison.

Mr. HULKE

ON A CASE OF SUTURAL JUNCTION OF THE ULNAR NERVE FIFTEEN WEEKS AFTER ITS COMPLETE SEVERANCE BY A ROOFING-SLATE: EARLY RESTORATION OF FUNCTION.

He said the procedure was a rare one, but where practised had already given most satisfactory results, and held out the promise of restoration to many an otherwise crippled limb. His case was interesting from the long interval that elapsed after the injury before the operation was performed, and for the speedy restoration of commencing nerve function, which was only three or four weeks after the operation. The patient, a blacksmith, æt. 53, was struck by a slate from a roof in a hurricane across the inner side and front of the elbow. The wound thereby produced healed slowly, and was painful from the first, the pain assuming a neuralgic character. The forearm and arm wasted; the man's health suffered; and he was quite unable to do any work. Fifteen weeks afterwards all parts supplied by the ulnar nerve in the hand were numbed and cold, and the scar in front of the elbow was exquisitely tender. The patient was then chloroformed, and an Esmarch's bandage put on. The ulnar nerve was exposed at the elbow, and found to be completely divided, and the two ends widely separated. The upper end was bulbously swollen, and dragged out of its course by the shrinking scar; the lower end was shrivelled. In both ends were minute particles of slate embedded. Both ends were removed by clean transverse sections, and were then found to be three-quarters of an inch apart. In order to bring them together the upper end was stretched, and drawn down, and joined as closely as possible to the lower one by four silk sutures passed through the sheath. Absolute contact was not attainable. The operation was done, and the wound afterwards dressed antiseptically. The neuralgia ceased at once, and did not recur, and in less than six weeks the patient returned home. The sensitiveness which had begun to return about a month after the operation rapidly increased, so that upon leaving the hospital the man went at once to his work.

Mr. MARSH said that on Wednesday last an operation had been performed by Mr. Savory at St. Bartholomew's Hospital, which was very similar to that of Mr. Hulke. Mr. Savory had found the upper end of the nerve bulbous and the lower end wasted, and the ends separated, and had used catgut sutures to join them. He did not think, however, that Mr. Savory had adopted the ingenious expedient of Mr. Hulke, of stretching the upper end, in order to approximate the ends. Mr. Wheelhouse, at Leeds, had had a similar case in which the sciatic nerve had been severed. Surgery was advancing rapidly, for only ten years ago, he (Mr. Marsh) had seen the case of a child with paralysis of the limb from division of the sciatic nerve, and that child had been left without operation, as it was not known that relief was possible.

Dr. GLOVER inquired what was the distance between the ends of the nerve after the operation?

Dr. ALTHAUS said there were on record several cases of recent division of nerves in which, after operation, innervation had recurred; but he did not think there was another case reported in which, fifteen weeks after injury, such an operation had resulted in recovery of nervous power. If the ends of a divided nerve were brought within a quarter of an inch of one another, true nerve fibres formed between them, and a return of innervation occurred; if the ends

were left separated more than a quarter of an inch a union of simply fibrous tissue resulted. If a quarter of an inch of a nerve trunk were removed, innervation returned within eight or ten days.

Mr. HEATH said that after division of a nerve there was often a kind of reflex nerve action in the parts supplied by it, so that they seemed to have their nervous functions carried on by adjoining nerves—as with the ulnar and median. Some years ago he had divided the ulnar nerve in opening a sinus near the elbow; he had immediately put in a silk stitch through each half of the nerve, and had thus united them. He had heard no more of the stitch; and the patient who, when well, left the hospital, had previously recovered much nerve power. He was not a bit the worse for the stitch in his nerve, and had not since been heard of.

Mr. G. BROWN said that Mr. Wheelhouse's case was remarkable because the operation was done so long after the injury—two years, he thought—and the separation between the two divided ends was two inches. The man had originally come to the Leeds Infirmary to have amputation of the leg performed, as the limb was perfectly useless from its paralysed condition.

Mr. MORRIS, in answer to an inquiry, was informed that the silk through the nerve in Mr. Heath's case caused no nervous symptoms, such as neuralgia.

Mr. BRYANT asked what portion of the nerve had been divided. There were several cases of the kind on record, where, the injury having been done for months and even years, the operation had been very successful.

Mr. WALSHAM inquired whether the trophic, as well as the sensory branches of the nerve, were restored.

Mr. HULKE, in reply to Dr. Glover, said that the ends of the nerve after the operation were not absolutely touching, but were as nearly as possible together without actual contact. To Dr. Althaus he said that other cases with a longer interval than his own between the injury and the operation, had been recorded. He had himself in excising pieces of nerve for frontal tic been sometimes quite annoyed at the rapidity and thoroughness with which nerves, from which an eighth of an inch of the trunk had been excised, united, so that their sensitiveness, and with it the tic returned. Then he had cut out half an inch, and the sensitiveness had not returned after six months. But in another case, where nearly half an inch was excised, sensitiveness did return. To Mr. Heath Mr. Hulke replied that the ulnar side of the ring finger before the operation was numbed, and after the operation had re-acquired sensitiveness, so that it did not appear that any adjoining nerves had in his case taken on themselves the functions of branches of the ulnar nerve-twigs in the fingers. Altogether, Mr. Hulke thought that he himself had removed three-fourths of an inch of the nerve at the time of the operation. As to the trophic condition of the skin, he could say nothing about it. The patient has long since left the hospital, and was now at work.

### Mr. A. T. NORTON

#### ON A CASE OF PAPILLOMA OF THE BLADDER—EXCISION—DEATH.

M. C., æt. 34, was admitted into St. Mary's Hospital suffering from the effects of long-continued hæmorrhage from the bladder. The urine contained in addition large quantities of mucus and phosphates. She frequently passed pieces of phosphate of lime the size of a No. 3 shot. There was continual desire to pass water, and after doing so she said the bladder always seemed full. Pure blood escaped after the water, and the pain was excessive. Mr. Norton, on examination, found no calculus, but the bladder was thick in the region of the trigona. A tumour of the bladder was diagnosed. The patient was put under the influence of chloroform, and the bladder examined by inserting the finger through the urethra. In the floor of the bladder was a tumour one inch square, not much raised above the mucous membrane, but occupying the trigona, and about half-an-inch from the sphincter. The tumour was coated with phosphatic calculus. It was evident that the tumour must be removed, and the patient submitted to the risks attendant upon a severe operation, or she must be left to endure the tortures brought about by the contraction of the bladder upon the growth after micturition, and with the certainty of an early death from hæmorrhage, or from blood poisoning. It was impossible to remove the growth through the urethra, and it was decided to cut the mass away by opening the vagina. It was considered that the growth could not be cleared without cutting through the urethra, and the operation was performed as follows:—The spring scissors were inserted, one blade into the bladder nearly up to the tumour, and the other into the vagina, and closed; the front wall of the vagina was then incised centrally to within half-an-inch of the uterus and the vaginal wall, which was found to be not incorporated in the growth, was dissected from the bladder; the growth was then seized with the vulsellum forceps and drawn forwards, and was then excised by the scissors and removed. Bleeding was arrested by actual cautery, and the lateral flaps of the vagina approximated by sutures; to prevent further hæmorrhage a catheter was inserted, and the bladder compressed by plugging the vagina; no hæmorrhage of importance took place. The temperature remained below normal, and the pulse rose to 120. Severe vomiting was persistent until the tenth day after the operation, notwithstanding subcutaneous injection of morphia and five-grain doses of quinine administered frequently by the stomach. After the tenth day she was considered out of danger, was making good progress, took food well, and was cheerful. On the twelfth day after operation, when apparently in health, she vomited, and shortly afterwards fell asleep, in which sleep she died from syncope. *Post-mortem.*—Heart healthy, left side empty; slight clot black, half discoloured; greater part of blood in vessels fluid; wound green and sloughing upon surface, but healthy immediately beneath. Phosphatic deposit upon wound and also in orifices of ureters. Mucous membrane of bladder congested, but of normal consistence. Pelvic fascia and peritoneum uninjured. No thrombosis of vesical or pelvic or iliac veins, and no pelvic cellulitis nor peritonitis. From post-mortem it appears that she died from syncope, and at a time when she was recovering from the complications of the operation. By examination of the wound it was evident that so far as the peritoneum was concerned, a tumour nearly twice the length and twice the breadth could have been removed, but the ureters would be included in such an operation. Whether or not including the ureters in such an operation would add to the severity of the operation cannot be proved, but it is probable that the urine would escape without injury to the parts around. A microscopical examination showed the tumour to be a papilloma. Since writing the above case Mr. Norton had operated upon a second case of tumour of bladder, now in the hospital, but which had completely recovered from the effects of the operation.

Mr. HEATH, in answer to an inquiry, learned that the piece of tumour removed was about an inch across, and was a papilloma. He asked whether it involved the mucous layer of the bladder only, or if it implicated the muscular coat as well?

Mr. KNOWSLEY THORNTON had recently had under his care a case of the kind in an old lady. Having dilated the urethra, he passed his finger into the bladder, and found the growth was small and soft, and situated just above the left ureter. With his nail he had scraped away sufficient to put under the microscope, and it proved to be a round-celled sarcoma. He thought it might be removed by one of three operations, viz.: *per vaginam*, by the supra-pubic method, or through the peritoneum; and that the first method would be much less dangerous than either of the other two. Though, if one could be quite sure that the urine would not be putrid, there would not be much risk in operating through the peritoneum. Usually, however, the urine was decomposed, and even in the specimen of tumour which he had removed with the nail there were bacteria in numbers.

Mr. MORRIS asked what was the quantity of blood lost by Mr. Norton's patient, and whether he had removed the whole thickness of the wall of the bladder. A patient in the Middlesex Hospital, æt. 56, and who had often had hæmorrhage from the bladder, was chloroformed, and had the urethra dilated. A long growth was then seized, and taken away by the écraseur, and all the immediate symptoms were relieved, though she died eventually of hydronephrosis. The tumour had acted as a plug to the ureters, and prevented the free passage of urine from the kidneys to the bladder.

Mr. HULKE inquired what was the object of splitting up the urethra as well as the bladder, and after the urethra,

bladder and anterior wall of the vagina had been split up, how was the tumour dealt with? The vomiting had continued much longer than the vomiting from chloroform would have lasted. After the removal of the diseased part the actual cautery was applied, and the parts were then drawn together by suture, was it not probable that the ureters were thus dragged, and the passage of urine interfered with until the sutures were removed? And was not that traction upon the ureters probably the cause of the sickness?

Dr. GLOVER asked if there was any disease in the neighbourhood of the bladder. He related the case of a patient passing blood *per urethram*, with probably cancerous disease of the bladder, there sudden hæmorrhage ensued, and the patient died. There was no disease of the neighbouring parts, and the growth was not encrusted with urinary salts.

Mr. MORRANT BAKER wished to know the character of the growth in Mr. Norton's second—the successful—case.

Mr. BRYANT asked why Mr. Norton had not had recourse to dilatation of the urethra for the operation itself as well as for the diagnosis. Fifteen years ago he (Mr. Bryant) had removed a growth from the bladder of a female patient with the *écraseur*, and the patient was still quite well eight years afterwards. In two other cases he could isolate the growth, and could, he believed, have removed it through the urethra. Such an operation was much less severe than the serious one performed by Mr. Norton.

Mr. MARSH inquired to what degree it was right to dilate the urethra. Beyond a certain point incontinence of urine followed large dilatation. No stone, for instance, larger than an acorn should be so removed. The Society seemed to think that cutting through the vesico-vaginal septum was a serious operation, but he had done it twice or three times in adults, and once in a child, for stone, without any serious results.

Mr. BRYANT thought that with rapid dilatation there were no bad after-effects, but that after slow dilatation incontinence resulted.

Mr. NORTON, in reply, said that he first cut down into the vagina and dissected off the vagina from the bladder. He had then seized the bladder, and with spring scissors had removed the growth. The operation was necessary because of the incessant torture into which the patient was thrown by the constant micturition and hæmorrhage. He had not considered it a very serious thing to cut through the urethra if requisite, as he had before made one from cellular tissue, and could always rely on making the cut surfaces subsequently unite. In reply to Dr. Glover he said if the disease were killing the patient one must do the operation, and consider the disease itself before the constitution of the patient. He said that if he had attacked the disease from the urethra he would have failed, for such an operation was impracticable. As regarded the composition of the tumour from his second patient, it was being prepared for examination under the microscope.

## THE RELATIONSHIP BETWEEN CROUP AND DIPHTHERIA.

AT the monthly meeting of the Metropolitan Counties Branch of the Medical Association, Northern District, held at the Holloway Hall, on April 24th, Dr. TIMMS in the chair, a discussion was introduced by Dr. MORELL MACKENZIE, on this important subject.

He said that the general character of croup and diphtheria is the same, and that the differences in the phenomena are only such as may fairly be attributed to difference of site. He first discussed the question of constitutional disease in general, and pointed out the extreme difficulty in many cases of determining whether a disease was local or constitutional. He then briefly referred to the subject of type of disease, maintaining that the theories as to types were very unreliable as a basis of distinction. Passing on to more specific matters, he referred to post diphtheritic paralysis, albuminuria, and infection. As regards albuminuria, Dr. Mackenzie remarked that it was sometimes present in croup as well as in diphtheria, and it was so often a temporary condition in many diseases that it could not be made a ground of distinction between any two affections. Paralysis, he remarked, sometimes occurred in croup as well as in diphtheria, but that true croup was so commonly fatal that there was seldom an opportunity for observing sequelæ. With regard to the non-contagiousness of croup, he referred to cases reported by Rhüle and Bohn, in which contagion followed cases which were regarded as undoubted examples of croup.

Dr. HENTY remarked that he had seen and treated many cases of croup, in early practice, on the medical advice laid down by the authorities of the day—bleeding by leeches, tartarised antimony, and emetics of ipecacuanha, and most of them did well; but he remembered in 1852 a severe visitation occurred in an agricultural district of East Kent, when great mortality took place in children from one to three years of age, when different treatment was necessary. The children were suddenly attacked, and as suddenly died from asphyxia, and he thought the east wind which prevailed was the exciting cause, but possibly some zymotic influence prevailed. He did not examine for diphtheritic membrane, which might have existed, believing that the false membrane was the product of inflammation, as in the cases called in the present day infantile acute laryngitis. He had seen many cases of laryngismus stridulus which only resembled them in the sudden spasmodic attacks, and which mostly recovered. As an old practitioner, he was glad to learn modern views as to the identity of the disease, which probably were correct, if the anatomical characters of the exudation were the same, as no doubt they were.

Dr. COUPLAND drew attention to the perfect anatomical similarity between cases of membranous laryngitis, with or without concomitant faucial exudation, which in many cases was present in very small degree, and in others quite absent. It was impossible to exclude the diphtheritic poison in any given case. He asked for an explanation of the rarity with which, in the diphtheria of adults, the membranous inflammation extends from the pharynx to the larynx, as compared with the comparative frequency of such extension in children.

Mr. PARKER said he agreed with those who advocated the etiological identity of all forms of membranous laryngitis. He thought the question was something more than a mere professional difference of opinion, for it would be impossible to treat one's cases well unless correct views as to causation were previously formulated and laid down. Thus so long as croup was thought to result from cold, while diphtheria was acknowledged to be due to some specific poison, different plans of treatment would be adopted; while precautions which it was desirable to take in all cases, might and frequently would be omitted, to the detriment of one's patients, no less than of professional reputation. He could not see anything improbable in the identity of these cases, for the links of communication were obvious and plentiful. He compared contagion to a grain of seed. Seeds were known to differ in their vitality; and, furthermore, soil was known to vary in its power of growing seed. These differences in seed and soil—patients' constitution and the nature of the contagion—could account for all the apparent differences between individual cases, differences which had originally led to the idea of there being two separate diseases.

Dr. DOWSE did not agree with those who considered croup and diphtheria the same disease. After an experience of several epidemics during the past twenty years, he came to the conclusion that diphtheria was not allied to acute inflammatory affections of the throat. On the other hand, he felt sure that at no distant date it would be found that diphtheria was of zymotic origin, and that the poison or germs which gave rise to diphtheria were allied to, if not identical with, those which engendered scarlatina. He contended that so long as we were content to base our opinions upon the anatomical characteristics, and upon the site and course of the exudative material in the throat, so long should we fail to comprehend the nature of the disease which we knew as diphtheria; and he held that the poison of diphtheria, whatever it may be, did not of necessity attack the throat, inasmuch that no false membranes were produced in a great number of cases, but the sequelæ of disturbance in the automatic and volitional activity of the nervous centres was in every case a marked feature. The cyanosis, rapid action of the heart, and respiration, upon the slightest exertion, long before asphyxia could result from closure of the glottis by exudation, showed clearly what a specific effect the poison had upon the pneumogastric nerve and cerebro-spinal centres. The whole train of symptoms were so essentially distinct from those of any catarrhal inflammation of the throat, that he wondered how

it was possible for men who had had experience to confound them together.

Dr. Godwin Timms observed that on the opponents of a received opinion lay the burthen of showing the reason of their dissent. Forty years ago diphtheria was unknown to the London practitioner. About five years later he began to meet with a new—to him—kind of sore throat (with different appearances, symptoms, and required treatment), which, in the severer forms, resulted in occlusion of the trachea by exudation. This exudation, which he considered only an accident of the disease, he is now called upon to receive as a pathogenetic sign of diseases, among which croup is to be numbered. It is difficult to comply with this, when he calls to mind, 1. The sudden onset of croup in healthy children, of from two to four years of age, in inclement seasons. 2. The short course and rapid termination. 3. The absence of contagiousness from the severest cases. 4. The recoveries free from sequelæ. 5. The treatment. And on the other hand, 1. The blood poisoning in diphtheria. 2. The vital depression. 3. The fœtid exudations. 4. The active contagiousness. 5. The lingering course, remarkable sequelæ, and opposite treatment. For these considerations, in opposition to the majority of speakers, he expressed his conviction that the diseases, croup and diphtheria, were distinct diseases.

Dr. Semple being called upon by the chairman, offered a few observations on the relations existing between diphtheria and croup, and expressed his regret that the word croup was used in such an indefinite manner that it was difficult to understand what it really meant. The word in itself had hardly any meaning at all, and was only a common colloquial expression still used in Scotland to denote any harsh or stridulous breathing; but it was applied in medicine to three diseases which are certainly quite different from one another, namely, laryngo-tracheal diphtheria, infantile laryngitis, and laryngismus stridulus. The word "croup" was used by Dr. Home towards the end of the last century to denote a disease attended with a false membrane in the windpipe, and the word was adopted by Dr. Cullen and Dr. Cheyne in the same sense, and it was also adopted by many French writers at the commencement of the present century, who, however, confounded under the same name the three different diseases just mentioned. In this state of confusion into which the word had fallen, Bretonneau adopted it to denote the disease he witnessed at and around the town of Tours, in France, but he cleared away a great part of the then existing anomalies by applying the word "diphtheria" to the croup of Home, and eliminating infantile laryngitis and laryngismus stridulus altogether from the category. Those who doubt whether the tracheal diphtheria of Bretonneau is the same as the croup of Home, must suppose that the former author did not understand what he wrote, for he distinctly expresses himself to that effect in every part of his memoirs. Those who agree that croup and diphtheria are quite different diseases, are perfectly right if they mean that infantile laryngitis is different from tracheal diphtheria, but he (Dr. Semple) could not admit that there were two distinct *membranous* diseases of the larynx and trachea.

# Department of Lunacy.

## MR. DILLWYN'S LUNACY BILL.

The Lunacy Amendment Bill of Mr. Dillwyn, now before the House of Commons, is of itself peculiar. It contains in all seventeen sections, and with the exception of one of these, it is worthless as an addition to our present lunacy law. The result of a long Parliamentary sitting of the Lunacy Committee has given rise to this Bill, but which does not, however, reflect much credit on the framers of its various clauses. It commences by a section in which the justices are empowered to purchase private asylums; but this is not compulsory, and the proprietors of the private asylums can suit their own convenience in this matter. If a private asylum is purchased, it becomes immediately converted into a public one, and is to be governed as such according as the existing lunacy law directs. Private asylums are to be under the jurisdiction of the justices and not of the Commissioners in Lunacy. Before a patient can be received into a private asylum he must be certified by two medical men, and an order for his admission must be signed by a justice of the peace, who, however, is not obliged to personally examine the alleged lunatic. In a case of sudden and violent attack of insanity, a person can be received into an asylum upon one certificate called an "emergency certificate," without any order being obtained previous to his reception. In such a case, however, a second medical certificate and a justice's order must be given within forty-eight hours from the time of the admission. There is one clause which refers to the admission of voluntary patients into asylums which is likely to do good service; a provision is here made by which lunacy certificates need not be signed except when absolutely necessary. One of the chief objections at the present day to placing patients in asylums is a general antipathy to lunacy certificates and the fear of being "branded" as a person of unsound mind to the detriment of future generations should the patient recover his reason sufficiently well to be liberated from restraint and supervision. By this clause it appears to us that it will not be illegal for the proprietor to receive into his establishment patients who may be stated to be on the borderland of insanity. Notice of this must be given to the Commissioners within three days from the reception. There is one extraordinary section enabling any one to apply for permission to send two medical men to examine a person confined in a private asylum. If the Commissioners think proper to grant this request, the medical men visit the patient on two separate occasions, seven days intervening between the visits, and if they consider the case to be a proper one for discharge, he is set at liberty. The person who signed the order has notice of this, but no provision is made for him to take any steps to protest against such interference. This clause is most unsatisfactory in many respects, and is likely to be followed by endless complications. Attendants can be licensed to take the legal care of lunatics in private houses. This is most objectionable; it reminds us of the treatment of lunatics in the olden time, when attendants were entrusted with the responsibility of taking care of the insane, and when they knew that they were free from supervision they would lock the hapless lunatic in his room and repair to the nearest pot-house. Human nature is the same now as it was in those days to which we refer.

The proposed Act may be summed up as inadequate and useless for the purpose for which it was intended, and as there is no possible chance of such an Act passing, it is to be regretted that the work done by the Lunacy Committee has been in vain.

## A CASE OF ORGANIC DEMENTIA OF TWO YEARS' STANDING GREATLY BENEFITED BY HYOSCYAMINE.

By BEVAN LEWIS, L.R.C.P. Lond.,
West Riding Asylum, Wakefield.

L. Q., æt. 40, married, and a schoolmistress by occupation, was admitted on the 24th of January last. Two

years ago patient had a "stroke," in which she was unconscious for half a day, and upon recovery found that she had lost the use of the left side of the body; that there was facial paralysis, and speech troubles. She had suffered frequently since this period from severe supra-orbital neuralgia. She had never perfectly regained the use of her limbs, and her speech had been affected up to the present time. About a fortnight prior to admission she became rambling, incoherent, and alternately depressed and excited. She developed delusions of a suspicious nature with regard to members of her family, and declared they wished to poison her. Hallucinations of sight and hearing were also present, and she constantly addressed imaginary persons, who she stated watched her through openings in the walls of her room. There was no family history of neuroses. She had been a steady, temperate, industrious woman. Upon admission patient was very restless, excited, and suspicious. She comprehended all that was said, but failed in her replies to maintain the drift of conversation, becoming rambling and vacant. There was considerable dementia, evidenced by loss of memory for recent events, and by her replies to questions. She talked continuously and very incoherently to herself in excited tones. There was slight emotional disturbance displayed when talking of her home. She acknowledged having had a stroke, and pointed to the left side of the face as having been paralysed. There was great amnæsic aphasia; thus, when shown a hat she failed to call it by its name. She was next shown a key, and immediately called it a "hat key." There was much tremor present from combined debility and excitement. The pupils were equal but sluggish in reaction. Expression fatuous. Tongue protruded straight and steadily. Respiratory and circulatory systems appeared normal.

January 30th—She is somewhat feeble, tottering in her gait. Her mental condition is one of advanced dementia, and she exhibits in her habits, expression, and behaviour, a great similarity to a general paralytic. Her aphasic condition, when most marked, is, however, evidently amnæsic, and there is as yet no decided ataxia. On the other hand, her expression is one of fatuous rapture. Her articulation is somewhat impaired, although but slightly. Her habits are degraded; locomotion very unsteady. The pupils are equal.

February 9th.—Very restless, and decidedly more troublesome during the past few days. She refuses her food on the ground of its being poisoned.

12th.—Yesterday she had 1-6th of a grain of hyoscyamine, with the result of diminishing her restlessness. She still entertains delusions of suspicion against nurses and medical attendants, and refuses food.

26th.—Has had 1-6th of a grain of hyoscyamine daily up to the 18th inst., and now is much improved. She speaks cheerfully and distinctly, and states that the past few weeks have been quite a blank to her.

March 16th.—She now presents no mental anomaly. She is cheerful, chatty, and industrious; perfectly rational, and gives no evidence of motor disturbance. According to her own account, the sequence of symptoms of her paralytic seizure was as follows:—Left hemiplegia and facial paralysis, with prior loss of consciousness, and no convulsion. Then gradual recovery, speech troubles, great confusion of memory, which remained up to her admission here. The arm regained power last.

26th.—Discharged recovered.

## MEDICAL STAFF OF THE AFGHANISTAN EXPEDITION.

MOOLTAN FIELD FORCE.

*Principal Medical Officer.*—Deputy Surg.-General A. Smith, M.D.

*Surgeons-Major.*—J. B. C. Reade; J. Warren; J. D'Alters; J. Robinson; W. Venour; F. A. Turton; J. J. McCarthy, M.D.; E. C. Mackay; E. Footner, M.D.; A. R. Hall, M.D.; H. S. Muir, M.D.; G. Atkinson, M.D.

*Surgeons.*—J. H. Moore; J. M. Beamish, M.D.; J. J. Greene, M.B.; B. W. Wellings; J. C. Dorman, M.B.; J. Boulger; P. H. Johnson, M.D.; G. M. Russell, M.D.

PESHAWUR FIELD FORCE.

*Principal Medical Officer.*—J. Gibbons, Esq.

*Surgeons-Major.*—J. A. Hanbury, sen.; F. W. Moore; W. Cattell; A. M. Tippetts; H. J. Rose; N. Ffolliott; M. Lewer; M. G. Jones; W. B. Ramsbottom, M.D.; G. S. Davie, M.D.; J. Martin; G. C. Gibbons, M.D.; T. Wood; W. Creagh; O. Owen; B. P. Fergusson; W. Ffolliott; T. Moriarty, M.D.; W. S. M. Price; W. F. Rutledge; J. E. Fishbourne; G. J. H. Evatt, M.D.; J. H. Wright; A. H. Ruttigar; H. Cornish.

*Surgeons.*—J. F. Tupple; G. Shaw; O. F. Molloy; G. T. Langridge; W. L. Gubbins, M.B.; P. J. M'Quaid, M.D.; C. P. Turner; P. G. Severs; M. R. Regan, M.D.

QUETTA FIELD FORCE.

*Principal Medical Officer.*—J. Hendley.

*Surgeons-Major.*—W. S. Whylock, M.D.; W. G. N. Manley, V.C.; E. Hopkins.

*Surgeons.*—N. Knox; A. E. Hayes.

KOORUM AND KOON FIELD FORCES.

*Surgeons-Major.*—C. Martin; T. H. Hoysted; J. H. Jeffcoat; E. L. Low, M.B.; W. Nash, M.D.; R. F. Buchanan; G. J. Gibson, M.D.

*Surgeons.*—N. G. Thomsett; P. J. M'Quaid, sen.; H. J. Robbins, M.D.; J. T. Carey, M.D.; H. Colter.

## THE WEATHER AND ITS EFFECTS UPON THE HEALTH.

THE severity of the long winter through which we have just passed, the present inclemency of the weather,

the great prevalence of north-easterly winds, and the long absence of continuous sunshine, are circumstances which give more than usual interest to the Registrar-General's quarterly return.

The winter of 1878-79 will, says the Registrar-General, long be remembered as one of unusual length and severity, although the frosts that prevailed were not of the same intensity as many that have occurred during the past twenty years. The cold during the long severe frost in January and February, 1855, was much more intense than any recorded last winter. The mean temperature of the three winter months of 1878-79, was, however, lower than in 1854-5, and if the month of November were also taken into account, the deficiency of temperature during the past winter would appear still more strongly marked. The mean temperature of the quarter was 37°·1, and was 2°·8 below the average for the corresponding period in 38 years. The number of hours of bright sunshine, measured during the quarter at Greenwich Observatory, was 137·5, and the month of January was so unusually sunless that only 14·8 hours of sunshine were recorded. Moreover, the quantity of rain which fell was as remarkable as the lowness of the temperature. The measured rainfall in the quarter was 7·0 inches, being 2·0 inches above the average amount in the corresponding quarter in 64 years. Since 1815 there has been but one instance of so heavy a fall of rain as that which occurred in February, when the rainfall amounted to 3·8 inches.

Notwithstanding, however, the severity of the weather during the first quarter of the year, the death-rate was not so high as might have been expected. It was certainly above the average, but it was lower than the rate prevailing in the winter of 1870, and much lower than in the winter of 1875. During the last quarter the registered number of deaths was equal to an annual rate of 25·2 per 1,000 of the estimated population. This death-rate exceeded the average rate in the 10 preceding corresponding quarters by 1·1 per 1,000, while the excess upon the average rate in the first quarter of the 40 years 1838-77, was only 0·4 per 1,000. In those 40 years the rate of mortality, mainly governed by temperature, ranged from 21·6 in 1846, to 29·1 in 1855. We are also informed that the cold of the past winter was less fatal than the cold of the first quarters of 1870 and 1875; that the cold was more fatal among our female than among our male population; that the excess of mortality due to cold is invariably greater among rural than among urban populations, and that nearly the whole of the excess in the English death-rate last quarter occurred among elderly persons over 60 years of age. The excess of mortality from cold in the country is ascribed to the far higher proportion of elderly persons in rural populations. With regard to the mortality among elderly persons, the death-rate last quarter among persons over 60 years of age was equal to 103·8 per 1,000, showing a marked excess upon those that prevailed in the three corresponding quarters, and exceeding by no less than 17·9 per 1,000 the average rate in the first quarters of the nine years 1870-8. But the death-rate of infants under one year of age, being equal to 151 per 1,000 births, against 138 and 149 in the two preceding corresponding quarters. Taking twenty of the largest English towns, including London, the lowest rates were 20·3 and 21·3 in Portsmouth and Brighton. The highest rates in Salford (31·5), Liverpool (32·9), and Manchester. The death-rate was also unusually low in Hastings (17·5), and Middlesbrough (18·2).

It must not, however, be supposed that the effects of extreme and varying ranges of temperature are shown merely by the mortality for the quarter during which such ranges of temperature were prevalent. Many of those who for instance fall victims to the severity of the weather in January or February, do not actually die till April or May. They would thus swell the mortality of the quarter following that on which they contracted the fatal disease—a quarter which might be remarkable for its mildness and its relatively low death-rate. We, therefore, think it probable that if the mortality of the month of April or May following a severe winter were, over a series of years, compared with the mortality of the same months following a mild winter, we should find that the death-rate in the first case greatly exceeded that which obtained in the other.

Nor are the effects of remarkably cold, hot, wet, or unseasonable weather, upon the health to be exactly guaged by the mortality to which it may give rise. Unfortunately there are always a number of people who are so constituted as to be morbidly sensitive to extreme cold or heat, to sudden changes of temperature, to very wet weather, or to the prevalence of particular winds. The idiosyncrasy of the human body in this respect is almost as remarkable as that of the stomach with regard to food. We know one patient who revels in a north-easterly wind, and thus finds pleasure in that which is to most Englishmen particularly offensive. We know another who is never so well as when the weather is very wet and sultry. One man does not mind how cold, and another how hot, the weather is, while to most people plenty of bright sunshine is most congenial. There are some who will find most satisfaction in a leaden sky. Dr. Johnson was, therefore, wrong in ridiculing Bozzy for his frequently complaining of the effect of the wet weather upon his health and spirits. The feelings which give rise to such complaints are by no means so imaginary or conventional as the great lexicographer supposed them to be, although doubtless they become much exaggerated through want of exercise of body or occupation of mind. Lastly, there are various functional derangements of the system, or local affections which may be traced to the effect of very high or very low ranges of temperature upon the human frame. These may be of a temporary and comparatively harmless character, or they may make a permanent impression upon the system that is not strongly manifested until long after the occurrence of the circumstances to which they owed their origin. Here, however, we must draw our remarks to a conclusion, only observing that Nature has fortunately so constituted man that he is able to live with impunity in all climates and in all seasons, however severe or changeable they may be. Those who are very old or very young, who lead inactive lives, or whose minds are not fully occupied, are the chief sufferers from the inclemency of the weather.

## THE MEDICAL BENEVOLENT COLLEGE ELECTIONS.

THE mode of election to the benefits of the Medical Benevolent College has frequently of late engaged the attention of the governors. It has been often urged that the system at present in vogue is more likely to defeat than promote the objects of the charity. It must be quite apparent to every one that the expenses attendant upon the canvassing system, especially of so large a body as that of the Medical Benevolent College, is an intolerable evil; for whilst it entails a large expense upon the friends of candidates, it certainly holds out a better chance of success to the more wealthy than it does to the more needy and deserving. Not an election occurs but this truism is painfully exemplified. At the last election an only child, whose friends were manifestly wealthier and more influential than those of other candidates, was elected on a first application, and at the head of the poll, to the exclusion of another left at the head of the unsuccessful candidates whose third and last application it was, and who was the son of a poor widow with four children totally unprovided for. With a view of preventing the constant occurrence of abuses of this kind, and it is hoped of securing the advantages of the College for all alike, a large and influential committee of governors has been formed, who, during the past month issued its views, together with the experiences of those who had already undergone the hardships and expense of a personal canvass. It is proposed by the committee in question, as a remedy for the disappointment involved under the canvassing system, "that the claims of the several candidates be investigated by a committee appointed by the council prior to each election. That a classified list, indicating the more urgent and deserving cases be prepared, and sent with each polling-paper, containing, as heretofore, the names of all the candidates." Already very nearly 3,000 governors and subscribers have answered in favour of this proposal, which we venture to think will be the means of securing the election of the most deserving of the candidates, whilst it will virtually abolish the worry and annoyances of the canvassing system. In a charity like the Medical Benevolent College, it should be quite unnecessary to parade the misfortunes of the family of a deceased brother before the public. In our other charities the greatest regard is given to this point, and, therefore, both the "British Medical Benevolent Fund" and the "Society for the Relief of Widows and Orphans of Medical Men" administer their funds in a quiet and unostentatious manner. The proposed change should recommend itself to those who have at all thought of the subject, and who are ready to acknowledge that our charities exist for the *beneficiares*, and not for those who support them. It is an exceedingly narrow-minded view to take of charity, to demand the exercise of a petty piece of patronage in return for every guinea subscribed. We cannot believe that this is the view entertained by the majority of our medical brethren. It is, therefore, a matter of considerable importance to the welfare of the Medical Benevolent College, and still more to those who are called upon to endure the burdens imposed by the present system, that the great body of the subscribers should not only express an opinion upon the question, but should also attend at the annual meeting on the 29th inst. and support the actions of the committee of governors. At the present moment it is desired that the whole of the governors and subscribers should express an opinion upon the proposed change in the mode of election, and we urge upon those who have not yet signed either form No. 1 or No. 2 of the circular already supplied to them to do so without delay, and return the same to Mr. Jabez Hogg, the Honorary Secretary of the Committee.

# Notes on Current Topics.

### The New Medical Students' Register for 1879,

which contains a list of all medical students duly registered during the year 1878, has just been issued from the Medical Council office.

As in the "Medical Register," to which we have already called attention, so likewise in this Register, there are, we are glad to see, many improvements on former editions. In the body of the work the names and dates are now arranged and punctuated as in the Medical Register, and full information is appended as to the place and date of commencement of medical study, as certified by a master, or a teacher, or an official in a medical school or hospital. Besides these improvements, there is now prefixed to the work a careful introduction, compiled by its Editor, the Registrar, wherein is set forth in full a list of the examining bodies whose examinations fulfil the conditions of the Medical Council as regards preliminary education; a list of the places of medical study in England, Scotland, and Ireland: both lists being furnished with recognised abbreviations, for the sake of securing perspicuity and uniformity in the contractions used; a synopsis of the various recommendations and regulations of the Medical Council in regard to all matters connected with the preliminary education, the registration, and the final examination, of medical students; and a summary of the number of medical students registered during each year, in each of the three divisions of the United Kingdom, from the commencement of students' registration in 1865 down to the present time.

All these features of the Register are new, and greatly add to the value of a work which ought not to have run through a dozen editions, as it has done, in its former slipshod fashion.

The summary of the numbers registered is curious, as showing how gradually the yearly total has increased up to the present numbers. In 1865 there were registered in England 313, in Scotland 61, and in Ireland 208; but in the past year the English students amounted to 881, the Scotch to 500, and the Irish to 353; while the whole number of students registered, from 1865 to 1878, has been in England 8,319, in Scotland 4,719, and in Ireland 4,034—making a total of 17,072.

Under the old *régime* at the Medical Council office, the Register appeared many months after date, and was almost useless for reference. We are glad to see that under the

more business-like management of Mr. Miller, the present Registrar, systematic work has taken the place of that happy-go-lucky style which, for so many years, was characteristic of the office.

## A Russian System of Sewage.

THE *Vratschebniya Vedomasti* gives the following curious account of a method of sewage which is practiced in some towns and villages on the Balkan. The inhabitants dig a canal, which is supplied with water from some stream, and direct its course towards their town. This canal is generally closed by a dam, or the water is used for irrigation purposes, but from time to time, when it is thought necessary, the dam is opened and the water overflows the streets ; the inhabitants then throw into the rushing torrent all the filth and dirt which has accumulated in their courtyards and houses, and even in their cesspools. It is remarkable that, in those places where this method of sewage is practised, the people look very strong and well, and malaria, as well as epidemics, are unknown.

## Cremation.

THE Philadelphia *Medical Reporter* refers to the opposition to cremation in England in very emphatic terms. It says—

That the *bourgeois*, the Philistines, should have set themselves against the method, would not have surprised us. The wilful ignorance and senseless prejudice of that class, in every country, is great; but that the leading medical journals should oppose it is a sad sign of how small the English mind is, even in its better examples. The *Lancet* condemns the experiment in unmeasured terms ; it hopes that "nothing so imbecile as an adoption of the heathen practice of burning the dead will be tolerated in England." It goes on to say : "Time changes many things, but we question whether it has yet so completely obliterated the sense of decency as to enable the people of this country to tolerate the notion of burning their dead," and it actually calls upon the government to put a stop to the undertaking.

After this outburst of folly from a once leading and prominent medical journal, need we be surprised that the English public are rapidly putting a veto on vivisection, on taking casts of criminals' heads, on physiological experiments, and are preparing to do so on the use of unclaimed bodies for anatomical purposes ? We need not be surprised at it, nor shall we have half so much cause to regret it as we thought we had ; for if such stuff as above quoted is acceptable to English medical men, they are scientific men no longer.

## Bogus Diplomas.

THE Philadelphia correspondent of the Boston *Med. Journ.* writes :—There are in this city several institutions which have been doing a good business by granting medical and other degrees *in absentia*. This diploma-selling has become notorious, and has had the effect of casting discredit abroad upon Philadelphia colleges in general, to the great injury particularly of the University of Pennsylvania, whose name has been closely copied in the titles, "The University of Philadelphia," and "The American University." Legislative committees have repeatedly investigated the charges, and indeed a resolution was finally passed revoking their charters, but the supreme court of the State decided that the legislature had no right to rescind these charters, as this can only be done through the courts. Within the last week *quo warranto* proceedings have been instituted, therefore, in our courts, and there is now a determination to accomplish something decisive that shall at last uproot this evil. The present mayor of Philadelphia has done much to abate this nuisance by publishing circulars describing the character of these institutions, which are sent out in response to inquiries that are being constantly received from England and the Continent particularly.

## The Case of Mr. Millerchip.

AT a numerously attended meeting of the Council of the Poor-law Medical Officers' Association, held last week in London, Dr. Joseph Rogers, the President, in the chair, the following resolution was passed—"That this Association learns with regret, that notwithstanding the undoubted and unanswered grounds for reversing the sentence passed on Mr. Millerchip, the Home Secretary has not seen fit to revise the harsh sentence passed on him by Lord Justice Coleridge ; and in such a case in which the solicitor and counsel concerned present new facts in mitigation, and in which the jury had very strongly recommended the accused to mercy, so severe and uncorrected a sentence, cannot but be construed as a refusal of that mercy which ought always to accompany justice. That this is not the first instance in which Lord Justice Coleridge has shown marks of undue severity and prejudice in dealing with charges against members of the medical profession, and that this Council considers that in such cases where the main element of representation to the Home Secretary was that the judge had shown unnecessary harshness, and had not given effect to the recommendation of the jury, it is undesirable that reference to him should be made, and that his opinion should a second time control the sentence against which appeal is made."

## Roman Doctors and their Fees.

SOME time ago there was an animated discussion about physicians' fees. What will the lucky English physician or even general practitioner say to the miserable remuneration of the Italian doctors ? Dr. Ulysses Malusardi, a surgeon and physician employed in the Hospital Della Consolazione, was lately summoned to give evidence before a Roman court in a criminal case, and was detained during the trial from 9.30 a.m. to 3.15 p.m. For this attendance of nearly six hours the doctor was paid the sum of 3 lire, about half-a-crown in English money—a most inadequate remuneration for a professional man. Foreigners, however, pay much higher fees to Roman doctors, often as much as ten or twelve francs a visit. According to recent statistics, says the *Globe*, Rome contains 682 persons exercising the various branches of the healing art, namely, 183 physicians and surgeons, 142 physicians, 66 surgeons, 74 apothecaries, 23 veterinary doctors, 145 midwives, 20 dentists, and 29 phlebotomists. The presence of so many professional bleeders is rather a significant fact, and shows that the lancet is not, as it is with us, repudiated by the Italian physicians. In fact, venesection must be largely practised, for there are many more phlebotomists than dentists.

## Habitual Drunkard's Bill.

THIS Bill, of which we were amongst the first to approve, has just been read a second time in the House of Lords. It has now every chance of becoming law, inasmuch as it is now shorn of most of those provisions which, in its original form, appeared so objectionable as to preclude its having any chance of receiving the sanction of the legislature. If, however, the compulsory clauses of the original bill did not afford sufficient safeguards against any abuse to which they might have been subject, the present bill is, perhaps, as Lord Selborne remarked, "rather too cautious"—so cautious, so permissive, and so experimental, that its very mildness may defeat the object for which it was framed. Certain retreats for the reception of habitual drunkards will be licensed after due inquiry into their fitness for treating dipsomania, and they will be placed under vigilant supervision. The sufferer may be taken there if he, of his own free will, apply for admission, his application to be in writing, and his signature thereto to be attested by two magistrates. He may state the period during which he desires to be detained, and, provided that period does not exceed twelve calendar months, he must remain in the asylum until it is ended, unless, of course, he be discharged cured.

Such being the character of the Bill, there was much truth in Lord Aberdare's remark that drunkenness, enormous as it was, principally affected the lower classes, and yet the present bill would not touch them. A few respectable dipsomaniacs may be persuaded, or even wish, to enter one of these retreats. But it is difficult to conceive how the drunken navvy is to be coaxed, or where the funds are to be found to support him, in one of the proposed retreats. One of the daily papers says that if the Bill do no good, it cannot possibly do any harm—a remark that is not calculated to awaken very sanguine expectations with regard to the satisfactory working of the Bill.

## The Proposed Coroners' Bill.

IN the 30th clause of the proposed Bill "to consolidate and amend the law relating to coroners," it is intended to continue the practice of requiring medical officers of public charities to give evidence at inquests without fee. Against this clause a memorial has been presented to the members of Parliament for the borough of Liverpool, signed by all the hospital physicians, surgeons, and general practitioners of that town, in which they very properly represent the practice as unjust, both to medical officers and to the charities. They urge that as the important services required of them are for the public benefit, such services ought to be adequately acknowledged from the public purse; while the time occupied in giving evidence at inquests is time that could be otherwise devoted to the charities. We do not quite see the force of this last complaint, for how could the payment of a fee to a medical officer compensate the patients for the temporary loss of his services? Defective, however, as the wording of this memorial may be, it cannot be doubted that medical officers of public institutions are perfectly justified in demanding some pecuniary acknowledgment of the trouble and loss of time which attendance at coroners' courts necessarily entails; nor would it be politic of the Government to withhold all remuneration for the important services rendered by medical officers under the circumstances. Compulsory and gratuitous service of any kind is never so satisfactory and reliable as that which is adequately remunerated; and, therefore, Parliament, by continuing the objectionable practice, would be not only doing an act of injustice to the medical officer, but would be acting contrary to the interests of the public, and in opposition to the object for which inquests are held.

## Development of the Anglo-Saxon Race.

IN the number of the *Revue Positiviste*, which has just appeared, says the Paris correspondent of the *Daily Telegraph*, M. Littré has given a rapid glance at the probable development of the races which now divide the world between them. The first thing that attracts attention is the enormous expansion of the English race and language, and whatever may be the future reserved to Canada, India, and Australia in their relations with the metropolis, the English element will remain a living one in all these countries, as it is in the United States.

At first sight this announcement may seem to have little connection with medical politics, but a little reflection will show that the greater the extension of the English-speaking population of the globe the greater scope there will be for the practice of our profession, the greater will be our opportunities of spreading one, and, perhaps, not the least of the blessings of civilisation, and the greater the incentive to advance the knowledge of that service which has for its object the prevention, as well as the cure, of disease.

## The Approaching Election of Council of the Irish College of Surgeons.

THE first Monday in June—fixed by Charter for this election—approaches, and with it brings rumours as to the coming Council. Dr. Mapother, the existing Vice-President, of course ascends the Presidential Chair, which will be vacated by Mr. Smyly; Dr. McClintock seeks the Vice-Presidency; and in the event of Dr. Chaplin, of Kildare, who had announced his intention to compete for that honour, deciding to postpone his candidature, Dr. McClintock will, no doubt, be unopposed. For seats upon the Council, all the existing members will, so far as we know, offer themselves for re-election, and Mr. Smyly, the out-going President, will, no doubt, resume his seat as a Councillor. By the election of Dr. H. G. Croly to the Examinership in Surgery, a Councillor's seat is unoccupied, and for admission to the executive body of the College the following Fellows have already offered themselves: Dr. Wheeler, an ex-Examiner and former Councillor; Mr. Baker; and Mr. Swanzy, Ophthalmic Professor in the College. No doubt there will be many other competitors.

THE Council of the Royal College of Physicians recommend Charles Darwin, Esq., F.R.S., as Baly Medalist for 1879.

## The Examinerships in the Irish College of Surgeons.

THE first Tuesday in May is the day for the election of Examiners, and on Tuesday last the election took place. The whole of the members of the three Courts of Examiners in Surgery, Midwifery, and in General Education offered themselves for re-election. The result was, that in the Surgical Court Dr. Wheeler was replaced by Mr. H. G. Croly, who had formerly occupied the same position, and who had just resigned his office of Councillor to enable him to seek the Examinership. The Courts for the ensuing year, are—

*Examiners to examine Candidates for Letters Testimonial and Fellowship*—B. Wills Richardson, Edward A. Stoker, Edward O'Grady, William H. O'Leary, M.P., Henry Gray Croly, William Thomson, Robert S. Swan, and William Frazer.

*Midwifery*—Henry Croly, John R. Kirkpatrick, and William J. Smyly.

*General Education*—Frank J. Davys, Michael J. Malone, and Robert Morton.

## Extraordinary Gluttony.

IT is not often we hear of extraordinary instances of gluttony; and such cases are only deserving of notice in so far as they show the quantity of food that can be taken at one time into the human stomach. In some of the daily papers an account is given of a gastronomical feat recently performed by two Hayti negroes, who were passing through Paris. They betted 1,000 frs. that they would eat without stopping six hours, and won easily, sitting down to table at noon, and not rising before half-past six. In the long interval they succeeded in consuming eight soles *au gratin*, twelve lamb cutlets, a joint of roast veal weighing eight pounds, three kilogrammes of asparagus, and an omelette of twelve eggs, besides a Dutch cheese, twelve pounds of bread, and fifteen bottles of wine. This story reminds us of similar cases of gluttony narrated by Dr. Carpenter in his "Human Physiology." One Esquimaux, says Captain Parry in his "Arctic Voyages," devoured in 24 hours, no less than 35 lbs. of various kinds of food. The half-breed *voyaguers* of Canada, and the wandering Cossacks in Siberia, habitually consume a quantity of animal food which would be soon fatal to anyone unused to it. The former are spoken of as very discontented, when put on a short allowance of 8 lbs. of meat a day; their usual consumption being from 12 to 20 lbs. We also recollect reading in one of the numbers of the old *Saturday Magazine*, an account of a Hindoo who could eat the whole of an uncooked sheep at a time. There must have been some trickery about this latter feat; but the other cases are well authenticated, and show the extraordinary capacity of the stomach in certain individuals, and in certain conditions of the system.

## Resignation of Dr. Acland.

AFTER a service of thirty-one years Dr. Acland has resigned his post of physician to the Radcliffe Infirmary, which is held in conjunction with the Lichfield Professorship of Clinical Medicine. As there is at present no medical school at Oxford the latter office was a sinecure.

A MEETING of the Executive Committee of the General Medical Council is summoned on Friday, the 23rd inst.

## Danger of Injecting the Uterus with Perchloride of Iron.

AT a recent meeting of the Obstetrical Society of London, Dr. Cory showed the uterus of a woman who had died from the effects of this operation. A solution of perchloride of iron (1 part to 10 or 12 of water) was injected, by means of a Higginson's syringe through the ordinary vaginal tube. The woman became suddenly collapsed, and died almost before the tube could be removed. The fluid appeared to have entered the peritoneal cavity through the left Fallopian tube. In reference to this case Dr. Barnes said that the patient appeared to have died from shock. That the mere contact of iron solution with the peritoneum was not necessarily fatal or dangerous was certain. He also referred to a mode of applying this styptic by means of swabbing, or by using a tube perforated at the end, and containing sponges saturated with the solution which oozed out under the pressure of a piston.

## Waterproof Paper—A New Surgical Dressing.

IN a communication to the Philadelphia *Medical Reporter* Dr. Keen, of St. Mary's Hospital, in that city, after a series of experiments on oiled silk and other membranes supposed to be impervious to water, speaks strongly in favour of a waterproof paper prepared by Seabury and Johnson, of New York, with some preparation of india rubber. It resists damp and any moderate heat, and is not more than a twentieth the cost of oiled silk.

## Surgeon-Major Reynolds.

IN some of our recent issues we referred at length to the distinguished and heroic services of the above gentleman on the occasion of the conflict between a handful of our army pitted against three thousand Zulus, on the memorable night of the 22nd of January, at Rorke's Drift. Not alone do medical men, but all who have read or heard of the trying incidents at that eventful battle, when the heroic services of Dr. Reynolds were witnessed, feel proud of him as an Irishman and a brave soldier. We are now happy in announcing that the King and Queen's College of Physicians in Ireland, on the proposition of Sir D. Corrigan—who referred to Dr. Reynolds's services in the South African war and at Rorke's Drift—unanimously conferred on him the Fellowship *honoris causa* of their College. We cannot but admire the promptness with which the College has presented to a most deserving recipient its most cherished prize, and which is never bestowed unless under notable circumstances. We anticipate that other honours await Dr. Reynolds, and that he will receive the Victoria Cross at the termination of the war.

IT is generally understood that Dr. John Harley will be elected to the post of Physician at St. Thomas's Hospital, vice Dr. Murchison, deceased. Dr. Harley is at present Senior Assistant Physician and Lecturer on General Anatomy and Physiology to the Hospital.

## Society for Relief of Widows and Orphans of Medical Men.

THE Annual General Meeting of this Society was held on Wednesday April 30th, in the rooms of the Royal Medico-Chirurgical Society, kindly lent for the occasion. The chair was taken by the President, Sir George Burrows, Bart., and there was a large attendance. The Secretary read a summary of the proceedings of the Society for the year 1878, from which it appeared that a sum of £3,199 had been received available for the payment of grants and expenses, and a sum of £3,084 had been expended. The total grants to the widows and orphans had had been £2,896 and the expenses of the year £188. A legacy of £500 and a composition fee of 11 guineas had been invested. Thirteen new members had been elected; seven had died, and five resigned. The total number of members at the end of the year was 386. Two widows and two orphans had ceased to receive grants, and two orphans had been taken on; there were fifty-eight widows and eleven orphans receiving ordinary grants, and three orphans on the Copeland fund on the books of the Society, December 31st.

Dr. Stiff, Mr. Sheehy, Dr. Brodie, Dr. Hare, Mr. Holden, and Mr. Heath were elected in place of the six senior directors, who retired by rotation.

Dr. Andrew Clark, having presented £100 to the Society, was, on the recommendation of the Court of Directors elected an Honorary Member. A vote of thanks to the editors of the medical journals for their kind advocacy of the interests of the Society was proposed and carried.

The meeting was made special to consider certain alterations in the bye-laws of the Society proposed by Mr. Charles Hawkins, V.P. The alterations proposed and approved of chiefly related to the general meetings of the Society, and to the publishing by the Court of Directors of an annual report. A cordial vote of thanks to the President for his kindness in presiding at the meeting, and for the great interest shown by him in everything connected with the well-being of the Society, was carried unanimously.

---

THE rates of mortality in the principal foreign cities according to the most recent weekly returns, were—Calcutta 37, Bombay 37; Madras 34; Paris 30; Geneva 29; Brussels 38; Amsterdam 27; Rotterdam 26; The Hague 32; Copenhagen 32; Stockholm 32; St. Petersburgh 53; Berlin 77, Hamburg 28, Munich 42, Vienna 36, Buda-Pesth 45; Rome 23, Naples 33, Turin 29, Venice 24; Alexandria 32; and New York 29 per 1,000 of the populations. Small-pox caused 42 deaths in St. Petersburgh and 24 in Paris.

---

THE death-rate last week in the large towns from the seven principal zymotic diseases averaged 3·0 per 1,000. Whooping-cough showed the largest proportional fatality in Brighton and Sheffield; and scarlet fever in Salford, Newcastle-upon-Tyne, and Nottingham. The deaths from measles were most numerous in Newcastle-upon-Tyne, Salford, and Norwich. There were 72 deaths from whooping-cough in London. Small-pox caused 10 more deaths in London, 6 in Dublin, but not one in any of the other large towns.

---

CLEOPATRA'S NEEDLE is now being covered with an enamel solution, to protect it from the destructive effects of the London climate and its smoke. This solution, made by the Indestructible Paint Company, is proved to have excellent preservative powers for stone, brick, wood, iron, &c., and has already been used on the Houses of Parliament, St. Paul's Cathedral, and other public buildings. Mr. Erasmus Wilson's noble present to the nation has during the past few days been the subject of litigation in our law courts on the question of salvage.

---

THE rates of mortality per 1,000 last week in the principal cities and large towns of the United Kingdom were—Bristol 17, Portsmouth 18, Leeds 19, Edinburgh 20, Sunderland 20, Nottingham 21, Glasgow 21, Oldham 22, Brighton 22, Sheffield 22, Hull 23, Bradford 23, Wolverhampton 24, London 24, Liverpool 24, Salford 24, Norwich 24, Leicester 25, Birmingham 25, Plymouth 27, Newcastle-upon-Tyne 28, Manchester 28, and the highest rate in Dublin 31.

---

WE hear that Surgeon-Major W. T. Harding, of the Army Medical Department, in charge of the Station Hospital at Beggar's Bush Barracks, is about to retire on half-pay. He joined the service on the 13th May, 1853, became Surgeon on the 28th of January, 1862, and Surgeon-Major on the 23rd of December, 1872.

---

A TELEGRAM from the Governor of Astrachan announces that several cases of spotted typhus have appeared in Astrachan, and that the necessary precautions have been taken to prevent the disease spreading.

---

# Scotland.

(FROM OUR NORTHERN CORRESPONDENT.)

THE SMITHSTON ASYLUM, GREENOCK.—Dr. Sibbald, one of her Majesty's Commissioners in Lunacy, has in company with the chief parochial officials connected with Greenock, inspected the new Asylum at Smithston, and granted the license for the removal of the lunatics from the old institution in Captain Street to the new premises.

ABERDEEN UNIVERSITY.—The summer session of the Faculty of Medicine, opened on the 5th inst, with the usual introductory addresses from the various professors, the chief event of the day being the assumption of office by Dr. J. Crossar Ewart, the recently-appointed Professor of Natural History, in room of the late Professor James Nicol. The young professor was accorded a most cordial welcome. He was introduced by the Rev. Principal Pirrie, who said that he had the best authority for saying that Dr. Ewart was among the first—probably the very first—of students of biological science. Dr. Ewart, at the close of the introductory address, which may be said to have been purely a class lecture, made suitable allusion to his predecessor, who, he said, had done much to make Scotland a classic field for students of natural science.

THE ROYAL SOCIETY OF EDINBURGH.—The eleventh ordinary meeting of the Royal Society of Edinburgh was held on the 5th inst., Dr. John H. Balfour, and afterwards Sir Wyville Thompson, presiding. Professor Thomas R. Braser read a paper on the "Pituri Narcotica of Australia," proceeding on experiments which he had himself made on a specimen of pituri extract which had been recently given him by Dr. Bancroft. He had been successful in obtaining from this extract a principle which was alkaloidal, having characters similar to those of conia and of nicotia, the principle of tobacco. Thus it produced almost exactly the same physiological action as did nicotia, the only difference which he had discovered being that it caused irritation and contraction of the pupil, followed by dilatation, whereas nicotia produced only irritation and contraction without any subsequent dilatation. The resemblance between the chemical characters of the two substances, he found, to be equally striking. The two principles, therefore, bore a very close relation to, if, indeed, they were not identical with each other. The botanical description of the plant, to the completeness of which, however, a specimen of the fruit was wanting, showed that the pituri plant was that known as *Duboisia Hopwoodii*, and its botanical, taken along with its physiological and chemical characters, made it certain that the pituri plant was properly classed along with the allied belladonna and similar plents in the natural order of the *Solanaceæ*. Sir Robert Christison pointed out that one great importance of the communication lay in the fact that it afforded a proof of the concordance of physiological action with botanical character. Dr. R. H. Traquair explained to the Society the points of a long paper which he exhibited on the structure and the affinities of the platysouridæ, a family of extinct and fossil fishes, which is common to the carboniferous and permian formation. Dr. Traquair's argument was, that the members of the group of Platysouridæ are peculiarly specialised forms of the Paleoniscidæ, and constitute a separate family, having their nearest relations in the last-named group. Sir Wyville Thomson stated that, in his opinion, Dr. Traquair had made out an excellent case for his family and its relations. A note of the probability that marriage entered into by a man above the age of forty would be prolific, was read by Mr. T. B. Sprague, M.A. The purpose of the paper was stated to be to provide reliable data on which actuarial calculations as to the value of successions might be entered into in the cases of men who should marry after the age of forty. The result of Mr. Sprague's investigations was to show that the percentage of unfruitful marriages after that age steadily increased in proportion with the age of the husband.

DR. CLOUSTON ON MENTAL DISEASES—UNIVERSITY OF EDINBURGH.—On the afternoon of May 5th, Dr. Clouston, of the Royal Edinburgh Asylum, began a course of lectures on "Mental Diseases" in the Practice of Physic Class-Room in the Edinburgh University. There was a good attendance of students. Dr. Clouston was accompanied to the platform by Principal Sir Alexander Grant, Professors Maclagan, Rutherford, Grainger, Stewart, Dr. Arthur Mitchell, and Dr. Sibbald. On the same day Dr. Dickson, the newly appointed Professor of Botany, gave his inaugural lecture in the Clinical Class-Room of the University at 4 o'clock in the afternoon.

REASON *versus* THEOLOGY IN SCOTLAND.—The fierce gladiatorial displays at present exhibited in Scotland between the promptings of reason, and the carping narrowness and [illegible] of theological superstition possess interest to the psychological student. The disciples of the "Prince of Peace," when questions arise involving difference of opinion as to the interpretation or value of a dogma seemed to be afflicted with their brethren of humanity with equal frailties, and to be distracted with equal passions, to say the least of it. To what extent asylums have been peopled, the fairest mundane prospects blighted, and domestic felicity embittered by the Calvanistic acerbity of Scotch religion, and its offspring in other countries, is well known to the psychological expert. A bad stomach, a torpid liver, and a genuine Scotch sermon on predestination, duly seasoned with the brimstone condiment for which this country is so famous, all conspire to form the most favourable starting point for mental alienation. A certain section of the Scotch church—the United Presbyterians—evidently at length ashamed of the doctrines of the murderer of Servetus, and of what is politely called here "the eternal damnation of infants," and of "the heathen," the latter comprehending *all* sects outside the pale of the Christion religion, has resolved upon relaxing its standards, or otherwise of checking somewhat the black-balling which leads to Hades—a locality with which the Greeks were familiar, as lying beyond the Cimmerian Bosphorus, but which the Church, for purposes of trade, has transferred to a future state of existence. It now allows, it would appear, so far as it is possible to follow theological ratiocination, that some other than "elect infants," and that *some* of the heathen may be saved. It is difficult in the case of infants, outside the pale of the "elect" ones, to determine how or where the line is to be drawn; while it must be clear enough, so far as the heathen are concerned, that the Zulus and Afghans are entitled to "damnation," and that the Church may safely exclude them by the Heavenly cordon! Contemptible though the reports of meetings of synods, &c., be, the evolution of reason is not without interest to the physician, and it is fervently to be hoped, as one must expect, that it will coincide with healthier brain function, and consequently a greater peace of mind to mankind.

REGISTRAR-GENERAL'S RETURN.—The weekly return of births, deaths, and marriages in the eight principal towns in Scotland for the week ending Saturday, May 3, says:—The death-rate in the eight principal towns during the week ending with Saturday, the 3rd May, 1879, was 22·3 per 1,000 of estimated population. This rate is 3·4 under that for the corresponding week of last year, and 0·9 under that for the previous week of the present year. The number of deaths from whooping-cough has decreased, while that from measles continues the same. The lowest mortality was recorded in Greenock, viz., 18·2, and the highest in Paisley, viz., 43·6. The death-rate from the seven most familiar zymotic diseases was 2·9 per 1,000, exactly the same as for the previous week. The number of deaths from acute diseases of the chest is 19 less than that for the previous week.

CHAIR OF BOTANY IN THE UNIVERSITY OF GLASGOW.—It is stated that Mr. Bayley Balfour has been appointed by the Crown to the Chair of Botany at Glasgow, vacant by the appointment of Professor Dickson to the Chair of Botany in the University of Edinburgh.

THE SWINEY LECTURES.—Professor H. Alleyne Nicholson, St. Andrew's, delivered the first of a course of twelve lectures, under the bequest of the late Dr. George Swiney, in the School of Arts, Chambers Street, Edinburgh, on the 7th inst. The subject of the lecture was the "Geological History of the Vertebrate Animals." There was a large attendance of students.

# Literature.

## MATERIA MEDICA AND PHARMACY FOR THE USE OF MEDICAL AND PHARMACEUTICAL STUDENTS PREPARING FOR EXAMINATION. (a)

It is seldom that the posthumous work of a medical man is published, seldomer still when that work is one intended for students, and treating of a subject so fully written on as materia medica and pharmacy; and there can be no greater evidence of the high esteem in which Dr. Griffiths was held than the appearance of this volume after his death, and its having been edited so carefully by Dr. Duffey.

The author intended to advocate the dissociation of therapeutics from the chemical and other details constituting materia medica, which we believe with him should be completely separated. Materia medica has its proper place in the early part of a student's education; therapeutics should be taught concurrently with medical and surgical practice, and if possible at the bed-side. This volume must therefore, not be judged with other works on materia medica; it is essentially designed for pharmaceutical students, whether they intend to limit their ambition to a diploma from the Pharmaceutical Society or wish to obtain further professional standing

The brief accounts of chemical processes and the descriptions of drugs and pharmaceutic preparations are lucid, and with the aid of a collection of specimens of materia medica, such as that sold by Messrs. Southall, Brothers, and Barclay, of Birmingham, which the author recommends, ought with diligent study to enable a student of average talent to pass a creditable examination. He will soon learn that it is needful to turn to two or three places before he can read all about any given substance; thus calomel appears on p. 57, where its name, pharmacopœial preparations, their strength, doses, and a brief abstract of its action and use are ranged in the columns of a tabulated form. In p. 61 it is described and its chemical characterists detailed, whilst he will have to refer to page 59 for its mode of preparation and an explanation of the reaction which occurs. This is a capital plan for a lecturer or private teacher who requires to group his facts in presenting them to a pupil, but it is questionable whether it is as good for the ignorant student, and certainly it is far less pleasant, than having all the facts presented in a consecutive manner.

One objection to these tables strikes us: take the first of the organic substances, p. 97, order Ranunculaceæ where aconiti and its preparations are described. Under the head of dose, the tincture appears with a dose of five to fifteen minims. Aconitia and unguentum aconiti have short lines drawn. A professor of materia medica well knows this must mean that they are not intended for internal use, but a mere tyro, a student commencing life, might fairly fancy it meant that aconitia was given in a similar dose to the tincture. We would suggest either printing all preparations intended for local employment in red ink or in different type, or in some way carefully differentiating all drugs and preparations intended for internal use from those only applied topically.

To illustrate further what we mean, at p. 145, elder-flower water is said to be "used as a cosmetic and vehicle for lotions;" yet its dose is alleged to be one to two ounces. The matter here is of no practical importance; with aconita it is different altogether.

The typography, entire appearance, and execution of the work is in its favour—it is a creditable specimen of Irish printing. The duties devolving on the editor and deceased author have been discharged with care and cautious supervision, which is evident in every page. The loss of Dr. H. Griffiths to the Irish school was one deeply felt. He promised to occupy a prominent position as a teacher, he had devoted himself with exceptional zeal and ability to become an authority in pharmacy; it is needless to say to what extent he had secured the good wishes and high esteem of his professional brethren. Our ranks have too often to deplore the removal at an early age and unexpectedly of men who are a public loss; few could be worse spared than Dr. Griffiths, and the posthumous appearance of his work deepens our regret that he is no longer toiling in our midst.

We can recommend this book to the student of pharmacy as a good handbook of materia medica.

(a) "Materia Medica and Pharmacy for the use of Medical and Pharmaceutical Students preparing for Examination." By W. Handsel Griffiths, Ph.D., &c. Edited and in part written by George F. Duffey, M.D., Physician to Mercer's Hospital. Dublin: Fannin and Co.; London: Baillière, Tindall and Co.

## CROUP AND DIPHTHERIA.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—Now that the much vexed question of the identity or non-identity of croup and diphtheria is being seriously discussed at the Royal Medical and Chirurgical Society, it is to be hoped that the distinguished body of men engaged in the controversy will not desist from their labours till something definite and conclusive be arrived at. As in multitude of council there is safety, so in earnest debate, however conflicting the views of the speakers may be, truth is sure to be eliminated from error. It is interesting so far to note the general drift of professional opinion on the questions involved. The majority of the fellows incline to the belief that both diseases, though simulating each other in some general or special characters, are yet to be classified under separate and distinct nosological heads. Some of them, however, while holding these tenets, yet obscure their faith (unconsciously, I trust), by ambiguous language, and indulge in such vague generalities as to leave it in doubt to which party they really belong. Should these gentlemen not suffer themselves to be led astray by specious theories, and should only transport themselves in spirit to the bedsides of their patients, they would not fail, I am certain, to recognise broad clinical distinctions between both diseases. There they would see that there is as great a difference between simple inflammatory catarrhal croup, whether accompanied or not by membranous exudation, and diphtheria, as there is between the edible mushroom and the toadstool. The one is benign, at least in the sense of belonging to the ordinary phlegmasiac, and being combatted successfully by the means usually employed against that class, the other is malignant. The one is local, non-contagious; the other constitutional and communicable. The one runs a course, "short, sharp, and decisive," generally terminating in recovery or death in two or three days; the other not unfrequently lasting as many weeks. In the one, convalescence is rapid, and free from troublesome sequelæ; in the other recovery is a work of slow growth, and not seldom embarrassed by grave after effects. The membranes formed in both diseases present well-defined histological characters, showing a further pathological difference between them. In the one (croup) the membrane is brittle, inodorous, easily detached from the adjacent structures, and consists principally of albumen; in the other, it is elastic, fœtid, firmly adherent to the subjacent tissues, and is mainly composed of fibrine—"fibrillated fibrine," as Dr. Alonzo Clarke, of New York, has well described it. The therapeutic indications, as I have shown on another occasion, are not the less marked and distinct than the morbid phenomena of both affections.

Of all the forms, laryngismus stridulus (false croup, spasmodic croup, &c.), is perhaps the most formidable in appearance, yet, in reality, the most harmless, yielding as it readily does, to nauseating or emetic doses of ipecacuanha wine, &c. The symptoms of asphyxia which are its most prominent feature, recur at intervals, or in paroxysms, while those of the inflammatory and diphtheritic forms are continuous and persistent, and are the unerring harbingers of speedy death, save in the very few and exceptional cases where tracheotomy has been performed with success.

Hoping that these remarks will not be inopportune at the present moment, and claiming your kind indulgence,

I am, &c.,

Bernard Kelly, M.D.

Rotherhithe, S.E., May 10th, 1879.

## INDIA-RUBBER TRACHEOTOMY TUBES.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—I have heard from two distinct sources during the past week that elastic tracheotomy tubes are being manufactured without a canvas lining between the layers of rubber, and with so weak a connection between the tube and its collar, that these can be pulled asunder on making the slightest traction. A tube thus constructed was placed in my hands by a friend on Friday last.

If the question were one merely of good or bad construction, however, I should not, of course, have troubled you with any communication on the subject, but, as the use of these ill-made tubes would be always dangerous, and might be followed, if one broke while in use, by serious consequences, it seems my duty to ask you kindly to insert this note of warning.

The advisability of testing the strength and elasticity of the tubes may not occur to a surgeon using them for the first time.

I am Sir,

Your obedient servant,

W. MORRANT BAKER.

## MANIA AND NECROSIS.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—The following is a case of chronic mania which came under my care on board one of the express steamers from Bombay :—

Whilst at sea, a bad gathering took place on one of the fingers, which led to necrosis of the bone, with mortification of the soft parts. Having previously administered chloroform, I amputated the finger successfully, and to this and the care she received on board ship, I attribute her safe arrival in Liverpool. I consider the case interesting, and worthy of record, inasmuch as she had been given over by the medical men both at Madras and in Bombay.

Appended is a history of the case :—

On the 5th March I received Mrs. S. under my care. She was brought on board suffering from chronic mania. Her general health was bad. She had boils and pimples all over her body. Her hand, too, was quite inflamed. There was necrosis of the ungual phalanx of the middle finger, with mortification of the soft parts, gradually extending up the finger, and the hand was tender and greatly swollen. Several large openings on the dorsal surface of the hand were discharging caseous matter. I may mention there was great difficulty in keeping on poultices and dressings on the hand, as the patient used to remove them as often as they were applied. She took nourishment and medicines badly. She had lost flesh, and was feverish, pulse varying from 100 to 120, and at times used to fall into a state of stupor. Treatment consisted of sedatives, absorbents, and tonics, with nourishment. Stimulants were not much used. Antiseptic poultices and stupes were applied to the hand.

On 11th March, I had a consultation with Surgeon-Major Mackertich (one of the passengers), who very kindly gave me his assistance. We decided that the removal of the finger was the only chance of saving life. Consequently (having no instruments on board except a small pocket case), previously administering chloroform, I proceeded to remove the finger, by the only method at my disposal—viz., disarticulating the metacarpo-phalangeal joint. The operation turned out a great success. By great care and nourishment, the bad symptoms subsided. She became more rational ; eat her food, and slept better at night, &c.; and on the 14th March, for the first time, recognised her husband, and her female nurse. The hand also continued to improve, and heal rapidly. I should remark the after-treatment of the wound was on the antiseptic principle.

On 23rd March she walked out on deck, and seemed wonderfully improved in every respect, not only mentally, but also as regards her gait, hand, and health generally.

She left my care on the 4th April, better in health, wound gradually healing up, mind somewhat improved.

I am, Sir,

Yours obediently,

WALTER CROKER POOLE,
B.A.M.B. Dub. Univ., L.R.C.S.I., L.M., &c.

## THE DISPENSARIES (IRELAND) BILL.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—Boards of Guardians, with their usual enlightened ideas, are trying to strangle the beneficent Bill, or its intentions, of Mr. Bruen. In reply to the circular letter of the Local Government Board inquiring what is required in the union, most of them are sending in negative replies. I believe a wrong impression has arisen from the wording of that letter. It states the rates are to be liable for the outlay, but does not state that a percentage is to be deducted as a rent from the salary of the medical officer. Many boards have jumped to the conclusion that the ratepayers are to be at the sole expense, and one board has passed a resolution to petition its county member to oppose the Bill. Another, where a committee of management approved of it on account of a wretched residence, and where the clerk stated he could not, if left to himself, conscientiously say its provisions were not required, was directed by a member of the board to give this *false* reply, stating at the same time, "It was the board's, and not his (the clerk's) answer, that they should be very careful to open anything which might lead to an extravagant outlay, like the pumps, and the pumps were bad enough."

Such are the opinions of sanitary authorities. They state residences are not required where there are none, and where a medical man was obliged to live in a couple of little rooms in a small public house. In another place that there is a very good residence, where even a Local Government Board inspector, who saw it, acknowledged its unsuitability ; and when they had to give in to the imperfections of some of the dispensaries, said they were likely to be repaired. They are always blind to the other side of the matter ; they seem to forget that it would be good management to have their officers residing in a good residence, and medicines kept in a proper place. Their officer ought to be in the best possible health ; not only to be able always efficiently to discharge his duties, but to be able to resist infectious diseases, which he so frequently comes in contact with. They forget that by obliging him to reside in an unsanitary state he is more liable to become ill, and become a burden on the rates for a *locum tenens* ; and while a medical man's opinion is consulted by the highest in the land as to the sanitation of a dwelling, he is left to have no voice as to his own ; but Mr. Bruen's beneficent and wisely-framed Bill does not leave it altogether to guardians to decide, and if passed into law, it is to be hoped their inspectors will see that this Act of Parliament is not attempted to be trampled on or almost annihilated, as the Sanitary Act was also tried to be made a dead letter.

Yours, &c.,

SANITAS.

## ON THE UNITY OF POISON IN SCARLATINA, PUERPERAL FEVER, TYPHOID, DIPHTHERIA, ERYSIPELAS, &c., AND CONCERNING THE ORIGIN OF TYPHOID FEVER AND SCARLATINA.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—In turning over my cases I find two, which, bearing on this subject, I would place on record.

Mrs. B. stated to me that the only manner in which she could account for her having contracted the fever, was that one hot day while walking in the Belgrave Road on her return home from shopping, the dustmen were emptying the dust-bin, and as she passed they were just turning the basket over into the cart. She got a whiff of foul air from some decomposing offal—she thought it was a dead rat or cat—and "the horrid smell never left her nose, nor its taste her mouth, till her convalescence from the fever."

The next patient was a lady, who, finding a most unpleasant smell about the front of her house which could not be accounted for, searched everywhere till she came to the dust-bin, on opening the door of which the foul emanations from a decomposed rabbit met her, and were so offensive that she vomited, immediately sickened, and was for a long time laid low with typhoid, from which she made a tardy convalescence.

A little time since I attended some patients in a house wherein an elder member was suffering with typhoid, the younger members being all down with scarlatina, which had shown itself first. From carefully examining into the history

of this outbreak, I gathered that the drains had previously emitted most offensive effluvia. I could find no clue to any other source of origin for these two affections, and the people themselves were persuaded that their illness was due to the one cause—the foul drainage emanations.

Such examples as these, coupled with the cases I have already published, and also those given to the profession by Dr. John Harley, go far to prove that scarlet and typhoid fevers originate from the same contagium—may be, in fact, the same poison developed differently in different persons of different constitutions and circumstances, by which differences, as well as by the largeness of the dose of poison absorbed, typhoid is determined in one case, scarlet fever in another.

Many such cases could be brought forward, both from the case-books of other medical men and from my own, but these I consider to be sufficient.

I remain, yours, &c.,

G. DE GORREQUER GRIFFITH.

9 Lupus Street, Belgravia, London, 25th April, 1879.

## PRISON SURGEONCIES IN IRELAND.

IT will be in the minds of our readers from our frequent references to the subject, that the portion of prison surgeons in Ireland has become very unsatisfactory since the gaol system passed into the hands of the Prisons' Board which was constituted by the recent Act. Under the 27th section of that Act it seemed to the surgeons that all their rights, privileges, and immunities were protected and preserved, and they, therefore, permitted the Act to pass without active remonstrance. No sooner was the Bill law than the Prisons' Board set to work to increase very seriously the surgeon's duties, and as a first step dismissed all the apothecaries and ordered the surgeon to do the work of dispensing. It would have been in the power of the board to modify the duties of its officers, but not to impose new functions; but they not only added to and increased the work of the surgeons but they did so without making any promise as to the amount of increased pay.

Most of the provincial prison surgeons were, *ipso facto*, the surgeons of the County infirmaries, and they protested warmly against these proceedings. Thereupon the opinion of Mr. Purcell, Q.C. was taken by the Irish Medical Asssociation, and was distinctly that the surgeons of prisons were not bound to do the additional work, and could not be dismissed for refusing it.

This decision applied to regularly appointed gaol surgeons, and it is as yet unchallenged, but the County infirmary surgeons held their prison offices by law as an appendage of their infirmary surgeoncy, and the Prisons' Board at once availed itself of that fact to repudiate the rights of these gentlemen and to declare that it did not regard them as prison officers at all or as being in the least protected by the Act. "If," said the Board, "these gentlemen chose to continue to do their duty after the passing of the Act that was their own affair. We did not acknowledge them, and we shall deal as we please with them." Within the past week the question has culminated in consequence of a circular letter addressed by the Board to these surgeons, which informs them that they have ceased to be prison officers and may if they please present themselves for re-election on such terms as the Board sees fit to dictate. Thus challenged, the County Infirmary Surgeons, we are glad to learn, have put themselves firmly on the defensive, and they have already taken steps which, we think and hope, will put the Prisons Board in a dilemma. They have enlisted the sympathy of an influential member of Parliament to bring the case before the House of Commons, have sought the advice of the most eminent Counsel as to their *locus standi* under the 27th clause, and have addressed to the Lord Lieut. an emphatic remonstrance.

We do not profess to interpret the law, though our belief is that the letter of the statute protects the infirmary surgeons, but we feel equal to expressing an opinion respecting the proceedings of the Irish Prisons Board.

Legal or not, it is an outrage on fair dealing, an insult to surgeons of the highest rank, and a discreditable ebullition of despotism and sharp practice, for any board thus to attempt to avail themselves of a legal quibble to oust from their offices, the servants of their department whom they have hoodwinked by the deceptive phraseology of their law.

The transaction is but on a piece with the autocracy which has been adopted in some of the public departments in Ireland. It involves the administration of the Prisons Department in discredit, and we warn the official who is responsible for it, that the attempt to cover injustice by legality will not succeed, and that, if it should, it will cover the administration of the department with disrepute.

# Medico-Parliamentary.

### ARMY MEDICAL DEPARTMENT IN SOUTH AFRICA.

Colonel STANLEY.—In answer to the question of Dr. Ward, I have to say that I think it is premature to consider what honours should be given in regard to the present campaign; and this applies to the Medical Department as well as to the combatant branch of the service. With respect to the defence of Rorke's Drift, an exception was made in the case of Surgeon Reynolds, who has been promoted to the position of Surgeon Major, a promotion like that of Lieutenants Chard and Bromhead, which was special.

### THE CONTAGIOUS DISEASES ACTS.

IN reply to Sir Harcourt Johnstone, Colonel LOYD-LINDSAY said that the Government proposed to at once appoint a select committee to inquire into the operation of the Contagious Diseases Acts. The committee would consist of fifteen members, ten to be nominated in the usual way, and five to be added by the committee of selection, the object being to secure an entirely impartial tribunal.

### PROFESSOR GALLOWAY AND THE COLLEGE OF SCIENCE.

Dr. PLAYFAIR has given notice that he will ask, on Thursday next, whether it was true that Professor Galloway had been dismissed his post as Professor of Chemistry in the College of Science, Dublin, after 23 years' service; and whether the Vice-President of the Council objected to lay the papers on the table explaining the grounds for such dismissal.

# Obituary.

## SURGEON-MAJOR PATRICK J. CLARKE.

WE regret to notice the death of the above-named Army Medical Officer, which took place on last Thursday, at Dinapore, E.I. Having been apprenticed to Mr. W. Colles, he became a Licentiate, and afterwards Fellow of the Royal College of Surgeons in Ireland, and was much respected in Dublin, where he had acted as Recruiting Surgeon from 1872 to 1876. Hart's Army List records that he "served with the Royal Engineers at the destruction of the docks and forts in Sebastopool (Crimean and Turkish Medals). Served at the siege at Lucknow, and in the subsequent operations in Oude (Medal)." In August, 1876, he was refused promotion by the present Director-General of the Army Medical Department on grounds which appear to have been vexatious and unwarrantable. The case has been brought under notice of the House of Commons, by Mr. Weldon, who will revert to the matter on a future occasion.

# Medical News.

**Royal College of Physicians of London.**—The following Members were admitted Fellows of the College on May 9th :—

Bagshawe, Frederick, M.D. Camb., St. Leonards.
Edis, Arthur Wellesley, M.D. Lond., 22 Wimpole St.
Greenfield, W. Smith, M.D. Lond., 15 Palace Road,
Gowers, W. Richard, M.D. Lond., 50 Queen Anne St., W.
Irvine, James Pearson, M.D. Lond., 3 Mansfield St., W.
Mackenzie, Stephen, M.D. Aberd., 26 Finsbury Sq., E.C.
Squire, William, M.D. St. Andrews, 6 Orchard St., W.
Stevens, Henry, M.D. Lond., Sutton, Surrey.
Taylor, Frederic, M.D. Lond., 15 St. Thomas St., S.E.
Williams, John, M.D. Lond., 28 Harley St., W.

**Royal Colleges of Physicians and Surgeons, Edinburgh :**—The following gentlemen passed their final examination, and were admitted L.R.C.P. Edin., and M.R.C.S. Edin :—G. Holt, Hull, C. Williamson, Leith, T. R. Horton, Melbourne, T. O. Wiley, Dublin, S. Gilbert, Wincanton, J. Barr, Manchester, H. Wylie, Kincardine-on-Forth, J. T. Hague, Lancashire, T. R. Allinson, Hulme, Manchester, N. Williamson, New York, H. J. Rice, Mountmellick, J. P. Elliot, Bellingham, J. A. Aris, Holland, J. S. Hooker, Bedford, O. S. Wraith, Lancashire, A. J. Brodie, London, A. M. Gibson, Perth, Canada, C. A. Stewart, Hobart Town, E. I. Read, Stoke, Devonport, O. Williams, Anglesey, P. C. Boyd, Hobart Town, J. F. Arlidge, London, W. J. Notley, Shipdham, E. L. Smith, Tipperary, H. J. Clements, Dingle, P. Mulvany, co. Meath, G. S. Ward, Radstone, Brackley, J. G. Hardy, Durham, G. W. Ellis, Shropshire, T. F. MacNeece, co. Tyrone, J. S. Wray, co. Tyrone, A. W. Oakes, New South Wales, F. H. Daly, Dublin, B. W. Horsford, Cork, A. G. Mackenzie, Strathspey, J. V. Monty, Mauritius, C. J. Harris, Cork, R. Wilson, Buckie, H. S. Lyons, Australia.

**Royal College of Surgeons, Edinburgh.**—Mr. John Griffiths, Wales, passed his first professional examination, and the following gentlemen passed their final examination at the April sittings, and were admitted Licentiates of the College :—H. M. Brachin, Pennyslvania, H. R. Powell, South Sea Islands, E. W. F. Stiven, Mooradabad, Bengal, T. E. Underhill, Staffordshire, H. F. M. Pope, West Malling, Kent, A. W. Scatliff, London, E. Williams, Mold.

**College of Physicians in Ireland.**—At the April examinations the following obtained the licenses in Medicine and Midwifery :—

MEDICINE.—James Robert Barton, Henry Lewis Battersby, Robert Howard, William A. Mahony, Harry Molony, John William Mullen, Andrew Dillon Peyton, Charles Rorke, Henry Arthur Wall, Robert Warnock.

MIDWIFERY.—Henry Lewis Battersby, Robert Howard, William A. Mahony, John W. Mullen, Charles Rorke.

**South London School of Pharmacy.**—The prizes for the 2nd B. course were presented on Saturday, the 3rd inst, by the Secretary, Mr. W. Baxter, to the following successful competitors :—Senior Chemistry : medal, Mr. Newbigin ; certificate, Mr. Lemmon. Junior Chemistry : medal, Mr. Scammell ; certificate, Mr. Stevens. Botany : medal, Mr. Betts ; certificate, Mr. Dutton. Materia Medica : medal, Mr. Cook ; certificate, Mr. Stedman. Pharmacy and Practical Dispensing : medal, Mr. Stevens ; certificate, Mr. Cook.

## NOTICES TO CORRESPONDENTS.

### NEW TRACTORS FOR MIDWIFERY FORCEPS.

In our last issue, page 378, Dr. Alexander Duke, Assistant Physician to the Rotundo Hospital, Dublin, figured and described a new tractor which had been designed by him and used with signal success in hospital practice. By a printer's error Dr. Duke's name was omitted, for which we beg to offer our apologies.

DR. DE GORREQUER GRIFFITH.—We cannot insert letters that have appeared in other journals.

DR. J. B. B.—Many thanks for the information.

MR. H. A. R.—An obvious mistake which the parties concerned would doubtless be glad to rectify.

DR. TILT'S paper on "The Right Understanding of the Change of Life" shall appear, if possible, in our next.

DR. BYRD, Quincy, U.S.A.—We have directed our publisher to send you the missing Nos. Your communication on "Dilatation of the Rectum in Hæmorrhoids" shall appear shortly.

MR. E. CONNOR.—We regret to be unable to assist our correspondent as it is our rule never to give medical advice editorially.

INQUIRER.—A letter addressed to Dr. Farquharson, Brook Street, London, W., will ensure the receipt of a schedule.

### SIR HENRY THOMPSON AND NEWSPAPER CRITICS.

IN our last number, under the head of "Literary Notes and Gossip," we mentioned that a portrait and biographical sketch of Sir Henry Thompson appeared in the May number of a magazine called *House and Home*, which would "probably astonish no one more than Sir Henry himself." That our conjecture was correct, we learn from a letter addressed to us by that gentleman who says that he is continually solicited by journals and magazines of all classes for biographical notes, which he firmly refuses. All notices in whatever shape, therefore, appear not only without his permission, but against his wish, and cause him much annoyance.

A CAPITAL IDEA.—A medical man in very large practice, and much respected for his personal worth as well as his professional skill, lately received an anonymous letter, containing £100, and a slip of paper on which was written, "St. Mark, chap. vi., verse 31st." The text referred to is this : "And He said unto them, Come ye yourselves apart into a desert place, and rest awhile ; for there were many coming and going, and they had no leisure so much as to eat." A more happy instance of Christian consideration could not be conceived. It is not uncommon for ministers to receive from their people the means of taking a holiday, at least in free churches, where the State is not supposed to support the clergy. In America, for example, a pastor's trip to Europe is frequently franked by the generous and considerate members of churches ; but for other classes of overworked professional men this thoughtful kindness is so rarely shown that the case of the doctor is worthy of special notice. Many a man is worn out prematurely for lack of the means to "Rest awhile."—*Leisure Hour* for May.

HARVEIAN SOCIETY OF LONDON.—On Thursday, May 15, at 8½ p.m., Dr. Alfred Meadows, "On Ovarian Menorrhagia." Mr. Edmund Owen, "Cases of Cleft Palate treated by Operation." Mr. Knowsley Thornton, "The Antiseptic Method in relation to Drainage of the Peritoneum in Abdominal Surgery."

### VACANCIES.

Birmingham General Dispensary.—Resident Surgeon at the Aston Branch. Salary, £170. Applications to the Secretary before May 21.
Liverpool Dispensaries.—Assistant House Surgeon. Salary, £108. Applications to the Secretary, 34 Moorfields, Liverpool, before May 26.
Manchester Township.—Resident Assistant Medical Officer to the Workhouse. Salary, £140. Applications to the Clerk before May 22.
Naas Union, Clane and Timahoe Dispensary.—Medical Officer. Salary, £125, with fees.
Oldcastle Union, Ballyjamesduff Dispensary.—Medical Officer. Salary, £120, with fees, and £15 as Sanitary Officer. Election, May 23.
Portsmouth Lunatic Asylum.—Medical Superintendent and Assistant Medical Officer. Salary of the former to commence at £450 ; of the latter at £120, with board. Applications to the Town Clerk before May 26.
Rathdown Union, Powerscourt Dispensary.—Medical Officer. Salary, £110, with fees.
Royal College of Surgeon, Ireland.—Curator of the Museum. Salary, £250. Election, June 5.
Royal Free Hospital, London.—Junior Resident Medical Officer. Board and residence provided, no salary. (See Advt.)
Tullamore Union, Clara Dispensary.—Medical Officer. Salary, £100, with fees, and £20 as Sanitary Officer. Election, May 30.
Waterford Union, Ulid Dispensary.—Medical Officer. Salary, £120, with fees, and £20 as Sanitary Offieer. Election, May 22.
Wolverhampton General Hospital.—House Physician, also a House Surgeon. Salary, £100, with board, in each case. Applications to the Chairman of the Medical Committee before June 2.
University of London.—Examinership in Medicine. Salary, £120. Applications to the Registrar. Election, June 18.

# Births.

MARTIN.—On April 27, at Ballybay, co. Monaghan, the wife of B. R. Martin, of a daughter, prematurely, stillborn.
THOMSON.—On April 29th, at 34 Harcourt Street, Dublin, the wife of William Thomson, A.B., F.R.C.S.I., of a son.
MARSHALL.—On May 2, at Bradford, Yorkshire the wife of T. Harrison Marshall, M.R.C.S. Eng., &c., of triplets, two sons and a daughter, who survived their birth a few hours.
DAVYS.—On May 5, at Swords, co. Dublin, the wife of F. J. Davys, F.R.C.S., of a daughter.
MACALISTER.—On May 3, at 15 Palmerston Road, Rathmines, the wife of Alexander Macalister, M.D., T.C.D., of a son.
O'NEILL.—On May 5, at Athy, co. Kildare, the wife of P. L. O'Neill, L.R.C.S.E., of a son.
BOILEAU.—On May 5, at Overdale, near Southampton, the wife of Surgeon-Major J. J. Boileau, M.D., F.R.C.S., of a daughter.

# Deaths.

BRIGGS.—On April 30, at Shaw Heath, Stockport, William Briggs, M.R.C.S.E., aged 60.
BROWN.—On April 27, at Rochester, Frederick James Brown, M.D., aged 55.
CHAMBERS.—On May 3, at Brighton, Charles Hall Chambers, M.R.C.S.E., Staff-Surgeon, R.N., retired.
CUMMING.—On May 9, at 18 Ainslie Place, Edinburgh, James Cumming, M.D., F.R.C.P.
GAYTON.—On April 30, at Church Street, Spitalfields, William Gayton, Surgeon (in practice before August, 1815), aged 82.
GRIFFITHS.—On May 1, at Torquay, Francis Thomas Griffiths, M.D., late of Sheffield.
JAMES.—On April 30, at Park Row, Bristol, Joshua James, M.R.C.S.E., aged about 38.
LAMING.—On May 3, at Arundel, Richard Laming, M.R.C.S.E., aged 79.
LANE.—On April 28, at Grosmont, James Lane, M.R.C.S.E., aged 87.

### ON THE NATURE AND TREATMENT OF THE CHIEF SYMPTOMS OF CHOREA. (a)

By W. H. DAY, M.D.,

Physician to the Samaritan Hospital for Women and Children.

(*Concluded from page* 381.)

Of 66 cases of chorea observed by Dr. West 16 were accompanied or preceded by rheumatic symptoms, and in 11 of these was a systolic bruit, persisting after convalescence in 10. In one of the 16 cases rheumatic symptoms and heart disease followed in the course of the chorea; in all the other cases the rheumatism preceded it. In 9 cases, although there was no rheumatism present, nor any history of rheumatism, the heart was the seat of valvular affection when the patients came under observation.

A case of chorea is related by Dr. Althaus (Clinical Society, Jan. 11, 1878), where it came on from masturbation at fifteen years of age, and after lasting for six years it became complicated with epilepsy. Arsenic, bromide of potassium, and various nerve tonics and sedatives failed. Hydrate of chloral checked the restlessness and general convulsion till the patient got into the habit of taking immoderate doses, and at last died in 1874. In obscure cases of chorea, the possibility of masturbation in both sexes should not be overlooked.

As to the pathology of the disease there are two theories extant; one where the disease is attributable to embolism, and the other where it is set down to hyperæmia. Both have found able advocates. Dr. Dickinson is opposed to the embolic theory, and it appears to me inconsistent with the history and clinical features of the disorder. Of seven fatal cases in which Dr. Dickinson made *post-mortem* examinations, he found no plug of fibrine in any of the arteries. Of twenty-two fatal cases which he examined, the frequency of mitral endocarditis was noticeable. (a) He believes the disease to consist in hyperæmia of the nervous centres, particularly the corpora striata and thalami optici, and that congestion in the cervical, dorsal, and lumbar portions of the spinal cord is frequently to be detected. Dr. Broadbent has seen "one fatal case of rheumatic chorea with delirium, in which there was plugging of minute vessels of the brain with decolorised clots." (b) Dr. Hughlings Jackson has met with emboli in the small arteries, and others have seen them in the corpora striata. (c) The slow manner in which the disease so frequently creeps on and returns from time to time at uncertain intervals, the occasional sudden disappearance of the disorder, and the seizures being often general instead of one-sided, are not consistent with the theory of embolism. Dr. Handfield Jones observes "that there seems no more reason for requiring a demonstrable lesion in chorea than in many cases of insanity or delirium tremens, between which and chorea a considerable analogy certainly exists." (d)

Now with regard to *treatment*, rest in bed is the first and most important step to observe in the treatment of chorea. In many cases drugs exert only a secondary influence, rest, warmth, and proper food being all that are required; but the class is by no means small in which iron, quinine, arsenic, phosphorus, and strychnia fail as remedial agents. I have given sixteen drachms of the succus conii in twenty-four hours, to a girl ten years of age, without producing dimness of vision or dilatation of the pupil; indeed, the patient was no more affected than if she had taken water only.

*Chloral hydrate* has been recommended in large doses in violent chorea. (e) The principle of treatment was to

give thirty grains, and to repeat the dose, or half of it, if the patient did not obtain ten hours' sound sleep in the twenty-four. On waking, a second dose was given in proportion to the ascertained effect, but always less than the first. On waking again another dose less than the second, and so on till the amount of sleep had been obtained, when the chloral was discontinued till the next night. Of two patients so treated, aged eighteen and twenty, one was completely cured in one day, and the other on the fourth day. In a case of acute chorea in a girl of nine, I found that five grains given every night produced tranquil sleep, and it was unnecessary to continue the drug beyond a week. In another case, a girl thirteen years of age, suffering from most severe chorea, began to take ten grains every four hours on admission, as she was much exhausted, and the mother stated she had not slept for a week. In the first twenty-four hours after commencing the drug she did not obtain more than two hours' sleep; then it was given every two hours. After following this treatment for another twenty-four hours, my report says, the effect of the chloral has been to induce sleep for ten minutes at a time, but the least noise woke her. The effect has also been to raise a small weak pulse from 60 to 72 and 76 per minute, and the respirations to 20. Towards the close of the day her sleep became so sound that the eyelids could be moved upwards and downwards for some seconds before reflex action was excited; then she would screw up the eyelids, and relapse into sound and heavy sleep for an hour. The remedy was gradually discontinued as natural sleep returned, and the cure was completed by large doses of sulphate of zinc.

There can be no question whatever that hydrate of chloral is a valuable remedy in some cases of chorea, particularly in those where vascular excitement is present and the pulse is good. Dr. Althaus considers that the theory of chorea is explained by active hyperæmia of the corpora striata and the parts surrounding the fissure of Sylvius, and that the beneficial action of hydrate of chloral is to be attributed to the anæmia which it produces in these structures. Its danger as a depressant is nothing compared to the repose and rest which it ensures to the nervous system, lessening as it does in suitable doses the extreme agitation of the limbs, and the violence of the choreic movements. Sleep so obtained gives the necessary time for repair to the over-excited parts, and will be found to succeed when morphia yields no result.

Dr. Drummond, of Newcastle-on-Tyne, cured an obstinate case of chorea, in a girl seven years of age, by the subcutaneous injection of curara. He commenced with an aqueous solution of gr. 1-40 for two days, increasing the dose on the third day to gr. 1-20, and the next day to gr. 1-10, on the fifth day to gr. 1-8, and on the sixth day gr. 1-5, by which time the patient had recovered complete power over the voluntary muscles. Two days later gr. 1-4 was administered, and there was no return (*Brit. Med. Journal*, June 15, 1878, p. 857.) In a chronic case of chorea which was admitted into the Samaritan Hospital, under my care, in October, 1878, I determined to try the effect of curara. The patient was a girl eleven years of age, and had been under my care on three previous occasions with the same disease. There was incessant agitation of the arms and legs, and it was necessary to keep her in bed. The heart's action was rather excited and thumping, and there was a soft systolic bruit over the apex. After taking hypophosphite of soda and iron, as well as cod-liver oil, she was not manifestly better, and any excitement or conversation would make her very fidgety and increase the muscular movements.

On the 15th of October I injected into the right forearm gr. 1-60 of curara with the following effect:—

16th.—Ten a.m., no effect; 11 a.m., gr. 1-40 injected; 2.30 p.m., no change, pulse 72, gr. 1-30 injected; 6.45, since the injection she has been much quieter and is lying perfectly still, with complete command over the the limbs; pulse 80, inclined to sleep.

17th.—She passed an excellent night, and slept better than she had done for some time past, but agitation w returning in the arms, and I now injected gr. 1-20 at 10.45; at 6.45, as there was no further improvment, I injected gr. 1-10.

20th.—No injection used to-day, but after 2 p.m. the limbs became more agitated, and the facial muscles were more active.

21st.—The mouth, hands, and legs were in greater motion. The effect of the curara has been to keep her quiet for twenty-four hours, and then it has passed off.

I must admit that this drug fully answered my expectations, and I should be disposed to employ it again when the agitation is great, because it controlled the movements, and caused neither headache, sickness, nor any unpleasant symptoms. One difficulty is the alarm which the injection causes.

Lastly, I should like to say a few words about sulphate of zinc, and what I have noticed concerning its action. Small doses are sometimes utterly useless, when large doses succeed; and if it is determined to try the remedy at all, it should not be set aside till the latter have had a fair trial. I have given this drug in doses of from one to five grains three times a day, and continued it for a week without producing any effects, and the remedy has so repeatedly disappointed me that for some time I ceased to employ it. This most likely arose from giving it in too small a dose. Sir T. Watson gave it successfully in ten-grain doses three times a day, in a severe case which had resisted other remedies. There can be no doubt that zinc sometimes succeeds where iron and other remedies fail. In prescribing it, the dose should not exceed a grain three times a day to begin with, and should be gradually increased till there is nausea, or an amelioration of the symptoms. In a chronic case which was temporarily relieved by the hypodermic injection of curara, I began with two-grain doses twice a day, increasing the dose daily, till on the ninth day the patient was taking 18 grains. For the first time this controlled the muscular agitation, improved her voice and appearance, and caused no sickness. On the tenth day, she took twenty grains three times a day, and on the twelfth day forty grains twice a day, without causing the least unpleasant symptom. The heart on admission was rather unsteady, with a soft apex bruit, which I attributed to debility, it was now quiet and regular, and the murmur had entirely disappeared. In another similar case no benefit resulted from large doses of sulphate of zinc, and the patient only became slightly sick when taking ninety-six grains daily in three doses.

I must urge, in conclusion, that the more we look at chorea from the neurosal side, the more we realise its origin in anæmia, debility, and all sources of exhaustion, the more successfully shall we be able to control and to cure it. I believe that a blind credulity in its rheumatic origin, of which we still hear so much, is a serious mistake to entertain, because it induces us to overlook a cause of far greater frequency, and leads to a line of treatment which I have satisfied myself on several occasions, has further tended to impoverish the blood and aggravate the irritability of the nervous system.

## SOME OBSERVATIONS ON THE PECULIARITIES OF THE CAPILLARY CIRCULATION OF THE NEGRO. (*a*)

By MICHAEL HILLARY, L.R.C.S.I.

DURING the late civil war in the United States, in which I was engaged as a military surgeon, the greater facility with which wounds healed in the negro troops in comparison with the whites, was a common remark amongst us. Now, I have never heard any reasonable explanation given for this very well known fact, except the extraor-

(*a*) This paper was taken as read at the last meeting of the Surgical Society of Ireland, there being no time to bring it forward in the ordinary way.

dinarily wise one, "That the negroes were so near akin to the brute." The matter remained in abeyance in my mind, until about three years ago, when I went from Canada, in the winter-time, to assume a government appointment in Jamaica. I was on temporary duty in the Public Hospital at the city of Kingston, in that island, and was very much struck with the larger number of ligatures used in the same class of amputation in the latter country as compared with that in the one I had just left. We had been using torsion and hot sponges to repress hæmorrhage there, and I suggested their use to our chief medical officer, Dr. Steventon, but he said his experience had told him there was nothing for it in the negro but to tie every spouting vessel visible, and even then there was great oozing and welling up of blood. The explanation I got was, that it was the heat, but I tried some simple operations myself in the comparatively cool climate of the Coffee Mountains, and I found the same trouble in stopping the hæmorrhage as they did on the seaboard. Still the matter was inexplicable to me until I was reading the reason given for the loss of temperature caused by the imbibition of alcohol, that it was due to the rapid action of the heart sending the blood through the extremities at such an increased rate as to cause its cooling. This gave me the key to the fact, that had been staring me and others in the face so long, and that is that the circulation, although not diverging from the general distribution met with in the white races is, in the negro, and probably other dark races, more branching and capillary, and less trunkal than with us; this would give the negro the great advantage of having his blood cooled and supplying the free perspiration with which he is endowed, as well as saving his heart the necessity of increased action. To accomplish it, of course the blood will be more slow in his capillaries; this will explain also the cause of the greater vascularity of his wounds and the facility with which they heal. We have only to refer to wounds on our own face or heads to confirm this, being more vascular and we also perspire more freely there than in other parts of the body.

Now this vascularity of the negro, along with his black skin, will account for his immunity from sunstroke, and will also tend to enlighten our knowledge of the pathology of elephantiasis, and its frequency amongst tropical natives. I might also, in conclusion say, that from observations of operations in extreme climates I am inclined to believe that the circulation will be found modified as we go from the Tropics to the Poles, and that the circulation in the Esquimaux is just the reverse of the Negro, we, in the temperate zone holding a middle point, and further, that the pulmonary organs act in an inverse ratio, being more active in the Arctic regions and least so in the Tropics.

## ADENOID TUMOURS OF THE NASO-PHARYNX; THEIR INFLUENCE ON HEARING, RESPIRATION, AND PHONATION; AND THEIR TREATMENT.

By Dr. B. LÖWENBERG, Paris,
Translated by H. Macnaughton Jones, M.D., &c., Professor, Queen's University, Ireland.

(*Continued from page* 364.)

### The Manner in which Adenoid Tumours Influence the Ear.

In what manner do adenoid tumours of the naso-pharynx act on the ear, in the numerous cases in which they cause aural affections? It would appear that their influence may be exerted in two different ways; first, by keeping up an irritation in the pharynx, which easily extends to the middle ear; secondly, by mechanically obstructing the entrance to the Eustachian tubes. With regard to the first mode of action, any inflammation whether acute or chronic, which commences in the pharynx, often extends to the mucous membrane of the Eustachian tubes, and even, at length, to that of the tympanic cavity. The same may be said of the inflammation which always accompanies adenoid tumours in this region; its deleterious action may affect the ear, in the earlier stages of the affection, as well as in a more advanced one.

In the cases where the morbid growths have attained their maximum development, their influence may be also exerted, according to their second mode of action, that is to say, by interfering with the orifice of the Eustachian tubes, in such a manner as to prevent the renewing of the air contained in the cavity of the tympanum and the mastoid cells. Arising from that there would be a diminution in the volume of air, by the process which we have described under the name of *quasi-respiratory* change. (*a*) For the theory, hitherto universally admitted, we have substituted a new one, based on physics and physiology, which has also been confirmed by the results of two new methods of treatment arising from this hypothesis.

We must refer the reader to our treatise for a sketch of the consequences of this destruction, and the manner in which to remedy them.

Besides that, the obstruction of the tube by very large morbid growths may prevent the discharge of the fluid effusions secreted in the middle ear, in cases of inflammation; the retention of these secretions will lead to perforation of the membrana tympani, or even to disorders of a still more serious nature. See Case I, where an abscess was formed in the interior of the mastoid process.

### Prognosis of Aural Affections which arise from Adenoid Tumours.

The *prognosis* of aural affections, arising from adenoid excrescences of the pharynx is *in general, very favourable;* this is an important point; they offer, we consider, more probability of a successful result than the analogous aural affections which proceed from other causes. This result is evidently due to the fact, that in these cases we can successfully attack the root of the mischief itself, which it is often impossible to do in other groups of aural affections.

The first essential of success is always to remove, as soon as possible, the cytogenic tumours, which cause, or at least which maintain, the aural troubles. If we operate sufficiently early, we shall usually obtain a complete and permanent recovery; but this successful result will be more problematical if we delay too long to interfere *manu armata.* Even if we operate at the earliest opportunity, it is undoubtedly necessary, at the same time, to attend to the aural affection, guided by the principles which are entailed from the nature of each case, and the degree of development of to which it has attained.

### Views of Authors on the Deleterious Effects of Respiration by the Mouth on the Middle Ear.

We must not leave this subject without referring to the ideas brought forward by many authors, as to the injurious action exercised on the health, and particularly on the condition of the ears, by buccal respiration, one of the most important results of the adenoid affection.

We will first allude to the well-known work of Mr. G. Catlin (*a*); this author, artist and traveller, lived for a long time amongst the Red Indians of North America, and has described them in an extremely curious book. He has laid special stress on the fatal habit of breathing by the mouth, which he calls *malo inferno*, or "the most destructive of habits." Amongst two millions of Indians

(*a*) See our memoir: "De l'Echange des gaz dans la caisse d tympan; considérations physiologiques et applications thérapeutiques." By Dr. Lœwenburg. Published in *Progrès Médical*, February 14th, 1877.

(*a*) Catlin: "History of the North American Indians."

whom Catlin examined, he did not find one individual who breathed by the mouth, nor a single deaf one, with the exception of three or four deaf mutes.

Not one, among 150 chiefs, with whom he conversed, could remember, during the last ten years, a single comrade deaf, or even with defective hearing. Catlin attributes this to a practice of the Indian mothers, who close their children's mouths each time that they breathe through them. (See also Niemeyer, *loc. cit.*, p. 29.)

The conclusions of Mr. Catlin, who does not belong to the medical profession, must not be accepted without reserve, though we admit, even for a moment, the important part which this author attributes to buccal respiration, in the production of affections of the ear causing deafness; it is not the less true that there exists, particularly in childhood, many other causes of aural affections. Nevertheless, we refer to the conclusions of this author, because he deserves the credit of having first directed general attention towards this important subject.

Dr. Cassells lays especial stress on the prejudicial effect of buccal respiration on the integrity of the ear, and thus on the accuracy of the hearing power. When we perform the experiment associated with the name of the regretted aurist, Toynbee, and which consists of swallowing with the nose closed, the air contained in the naso-pharynx is rarified; the effect of this extends to the membrana tympani, through the Eustachian tubes, since the pressure of the external atmosphere now predominating over the intra-tympani pressure drives the membrane outwards. (*a*)

The consequent diminution of the hearing power continues until equilibrium is re-established by swallowing with the nose, because then the interior of the cavity is in communication with the surrounding atmosphere, through the tubes and the nasal fossa, and, therefore, the equilibrium is easily obtained. But when the nose is permanently closed it is no longer possible to re-establish the equilibrium; each act of deglutition can only augment the disorder, which finally becomes completely established.

This influence of deglutition on persons having the nose constantly closed, on which M. Lucæ, of Berlin, (*b*) has laid great stress, is theoretically plausible; nevertheless, we are of opinion that the conditions necessary to cause this could only exist in cases where there was an absolutely hermetic closure of all the nasal passages; but according to our observations, the cases in which the passage of even the finest current of air by the nose is absolutely impossible are extremely rare, and are only those of nasal or naso-pharyngeal polypus, unusually developed. In most cases, even the most advanced, of pharyngeal adenoid tumours, the nose is so much obstructed as not to leave a sufficient channel for the volume of air necessary to respiration, but the obstruction is not complete; and since only a very small channel of communication is required to re-establish at once the equilibrium of pressure between these two cavities filled with air, any passage, however small, will be sufficient to avoid the unpleasant results mentioned above.

It seems to us that this process has been confused with that of the exchange of gas by diffusion, for which, indeed, a much longer time is necessary than for the re-establishment of the equilibrium of pressure.

*En résumé*, we think, for our part, that the suction produced by the repetition of the act of swallowing, can only be prejudicial to the ear in those cases which are extremely rare, of hermetical occlusion of the two nasal fossa.

### Diagnosis of Adenoid Tumours of the Pharynx.

We have already said that the symptoms we have described must not be considered as conclusive, although they render the presence of adenoid tumours very probable; the definite and certain diagnosis must be based only on *direct proof* of these pathological productions. This certainly can be gained in two ways: by the rhinoscopic examination and by digital exploration. We shall commence by discussing the first of these two methods.

1. *Rhinoscopic Examination.*—The rhinoscope constitutes, so to speak, the counterpart of the laryngoscope; both these special instruments consist of a small mirror, which is introduced into the back of the throat to illuminate certain concealed parts, and to show the reflection of these parts in the same mirror; but in the use of the rhinoscope the polished surface of the mirror, instead of being turned downwards, as is necessary for the larynx, is directed upwards, and it thus projects the rays of a lamp, or of the sun, towards the naso-pharynx and the posterior orifices of the nasal fossa, the reflection of which is being studied. A detailed account of this method will be found in special treatises, as also in our Memoir, published in 1865, (*a*) which contains some of our own views; for instance, those as to the course of the rays of of light, &c., &c. We shall here only borrow some observations which we believe may assist in diffusing a knowledge of this excellent method of examination.

Though some authors consider it *extremely* difficult, and in certain cases even impossible, we are enabled to affirm, on the contrary, that it often succeeds at the first trial, that it is really very difficult to execute in other cases, but that we have never found it decidedly impossible in any of the numerous cases in which we have tried it. It is true that an unusual amount of patience is in some cases required on the part of both doctor and patient, but the result will amply compensate for the trouble which has been taken and the time employed.

The principal difficulties will arise from two organs—the tongue and the soft palate. Many patients do not know how to flatten the tongue so as to prevent it from diminishing a space, already so limited, a troublesome peculiarity which we find more frequent in women than in men.

If we attempt in these cases to depress the organ with a tongue-depressor it will frequently forcibly resist, and the muscular contractions will engage the pharynx, and sometimes even other parts of the digestive tract. Under these circumstances we show the patient before a mirror in what position he should place his tongue, and we make him practice depressing it until he succeeds sufficiently for the examination.

The second difficulty is still more serious: in order for it to be possible to project the rays of light from below upwards, from the buccal pharynx to the posterior nares,

(*a*) We will avail ourselves of this opportunity to acknowledge publicly the prior claims of an author who has not received the justice which he deserved. The first who advanced correct views on the phenomena which take place in the naso-pharynx during deglutition, was M. Maissiat, whose degree thesis (of the year 1838) contains an excellent description of this physiological act. He supports his opinion by argument, but also by ingenious experiments, for which he first used a mano-metric glass-tube, hermetically adjusted to one nostril, while the other was closed. He thus proved suction inwards during the repetition of the act of deglutition, which was seen by the inward movement of a drop of coloured liquid, closing the opening of the mano-metric tube. Although a *résumé* of this account is found in the physiology of Longet, the classical manual most widely circulated for many years, the conclusive experiments of M. Maissiat have, so to speak, remained unnoticed, so much so, that in 1853 Toynbee ("On the Muscles which Open the Eustachian Tube" in "Proceedings" of the Royal Society, 1853) supposed that there was, on the contrary, at the moment in question, increase of pressure and a reflux current of air directed back towards the middle ear. It required the assistance of our friend M. Politzer, to re-establish the facts that M. Maissiat had laid down; he also proved them by the aid of a mano-metric tube, which he this time inserted into the external meatus, following the example of M. Fick. He thus ascertained the concavity of the membrana tympani from the influence of the rarefying of the air in the middle ear which takes place during the repetition of the act of deglutition, when the nose and mouth are closed. This diminution of the pressure is only a result of what takes place at the same time in the naso-pharynx, and which may act under these special conditions on the gaseous contents of the cavity, through the canal of the Eustachian tube, which is considerably dilated at that moment.

(*b*) *Archives d'Otologie*, 1869, p. 188, and following,

(*a*) *Loc. cit.*, pp. 105, 106.

the soft palate must be lowered, or else it will intercept the communication between these two cavities ; but in many persons, the least contact of the exploring mirror with the base of the tongue, and still more with the soft palate, excites active movements of contraction, during which it becomes absolutely necessary to cease the examination, lest we may even bring on vomiting.

Other persons, by merely opening the mouth, raise the soft palate so as to interfere completely with the rhinoscopic examination. It is, in order to avoid this last inconvenience, that Czermak advised making the patient pronounce a nasal vowel, the emission of which would prevent the elevation of the soft palate. We prefer, to this frequently ineffectual expedient, another, to which we shall devote a few remarks.

We cannot direct the patient to lower the soft palate, for he does not possess isolated and conscious control over this organ. We, therefore, make him perform a complex movement, with which he is familiar, and which enables us to avail ourselves of the action of the pharyngeal valve. We simply tell him to breathe, or blow the nose, an action which is only possible when the communication between the buccal pharynx and the naso-pharynx is open—in a word, when the soft palate is depressed. Under these circumstances, the tongue being arched, and the soft palate relaxed, by both, the pharynx is, in a manner, shut off from the mouth. But when the operator, while the patient is attempting to execute the desired movement, forcibly depresses the tongue, there remains only the relaxation of the soft palate, which can be thus obtained in a great number of cases. It is evident that then it is *impossible to breathe only by the nose;* but this is of no consequence, the object is attained, the examination can be made. (*a*)

It is often very useful, before proceeding with the rhinoscopic examination, to employ the naso-pharyngeal douche (see below) to remove the secreted masses which encumber, in great numbers of cases, the pharynx and nasal fossa.

Once the rhinoscopic image is obtained, the diagnosis is made immediately ; nothing is more striking than these strange protuberances, which disfigure the ordinary aspect of the naso-pharynx. Thus we were greatly surprised at the first cases in which we saw them, all the more so as at that time, the study of adenoid tumours of this region was, so to speak, in its infancy, having had its origin in the observations of Czermak, Türck, and M. Semeleder.

Besides these positive results, the rhinoscope sometimes gives us negative ones, which are by no means valueless ; we have, for example, lately observed two young people, in whom the symptoms, on the part of the nose and the throat, gave reason to suspect the presence of adenoid tumours, up to the time when the pharyngeal mirror, which was extremely easily applied in both cases, showed that there was no trace of them.

In certain cases of marked glandular quinsy at the back of the throat, where we might expect to find this condition extending above the level of the floor of the nasal cavity, the rhinoscope has shown us that the upper pharynx was exempt in a normal condition, and that the symptoms observed must be attributed to other causes.

Wendt, of Leipsig, ascertained in a case of this nature that there was even atrophy of the pharyngeal tonsil. (*a*)

*Digital Examination.*—Certain authors have lately introduced digital exploration, as if it were a newly discovered method of examination of the naso-pharynx ; this assertion is incredible, since the most superficial study of surgical literature will show that this method has often been employed in other cases to study naso-pharyngeal polypus (see the principal works on surgery ; M. Gosselin, "Clin. Chirurgical," p. 99, &c.)

The method of palpation is as follows :—The index finger, bent, with the dorsal surface downwards, is introduced into the mouth, and hooked round the soft palate. Having reached the naso-pharyngeal cavity, the soft point of the finger explores successively the posterior openings of the nasal fossa, the lateral and superior surfaces of the pharynx, the entrances to the Eustachian tubes, and the postero-superior surface of the soft palate. Here we must practice the "*cito tuto et jucunde*," of the ancients, especially rapidity and gentleness, in order to insure the absence of pain and nausea. Much delicacy and lightness of touch are necessary, especially when we are examining a soft palate, which is easily irritated and much enlarged. This latter difficulty, although, according to our observations, less frequent than some authors believe, in addition to the reflex movements caused by the contact of the finger with these sensitive parts, often interferes with digital examination.

Some authors have believed that it would facilitate this method of examination if the patients breathed by the mouth ; but in obeying this injunction they could not fail to instinctively raise the soft palate in order to prevent the air from passing by the nose, and they thus add a further serious obstacle to the introduction of the finger. We prefer, in accordance with what we have explained in treating of the rhinoscope, to direct the patient to breathe by the nose, at the same time keeping the mouth open, while we then carry it round the soft palate. In attempting to accomplish this the patient is obliged to depress the organ, and this enables us to pass the finger at the proper moment.

We must add some further details of importance. The nail of the exploring finger should be cut closely, and carefully filed, to remove all the edge, which would cause great pain to the patient. Notwithstanding this precaution, traces of blood are almost always seen on the soft part of the finger ; they are due to the great vascularity of these morbid growths, and are even considered as characteristic in the diagnosis of these tumours. We have, however, proved the absence of this sign in indisputable cases of this affection.

It has been proposed to direct the patient to bend the head forward in order that the soft palate, in accordance with the laws of gravity, may fall further forwards. This method, intended to facilitate rhinoscopic examination, has been tried by us for digital exploration also, but we soon perceived that in neither of these cases did it attain the object proposed, and for this reason—that the head, when bent forwards, is brought nearer to the anterior surface of the vertebral column, and

(*a*) We purposely make use of this power of depressing the soft palate in order to facilitate certain operations performed on the middle ear and naso-pharynx.

When the soft palate is raised, during catheterisation of the Eustachian tube, it strikes against the beak of the sound, at the moment when the instrument is being rotated, before it is engaged in the gutteral orifice of the canal. This contact often provokes reflex contractions of the constricting muscles of the pharynx, and thus renders the operation very painful, and sometimes even impossible. We then direct the patient to blow or breathe by the nose, when the difficulty is obviated because thus the soft palate is depressed. Similarly, when in a case of impermeability of one side of the nose, we are obliged to introduce the catheter by the opposite nares—for instance, to pass it by the left nasal fossa, in order to catheterise the right tube—the contact of the instrument often excites reflex contractions, analagous to those which we have been describing. It is then impossible to turn the beak of the sound, in order to disengage it, and draw it away, when the operation is finished. It has been recommended to use force under the circumstances, but we have always found it useless.

In every case we have succeeded in disengaging the instrument with ease, by simply telling the patient to breathe by the nose ; this lowers the soft palate, and relaxes the contracted pharynx as if by magic.

Let us add that it is generally necessary to avoid, as much as possible, contact with the posterior and superior surface of the soft palate, except it is absolutely necessary for operative manipulations.

When a bent sponge or caustic holder is introduced by the mouth, in order to touch a portion of the naso-pharynx—for instance, the entrance to the tubes—the elevation of the soft palate forms an insurmountable obstacle ; here also, we generally obtain a free passage by making the patient attempt nasal respiration.

(*a*) Wendt : "Krankheiten der Nasenrachenhœple," in Ziemssen, "Handbuch der Speciellen Pathologie und Therapie," p. 253, 1874.

that thus the dimensions of the naso-pharynx are considerably diminished from before backwards in the antero-posterior diameter. We believe it to be better to direct the patient to incline the thorax forwards and the head backwards; by this means we get the widest space between the soft palate and the back of the throat; at the same time we secure the greatest distance from the surfaces of the cervical vertebræ, thus gaining as much space as the anatomical relations of these latter with the cranium will allow.

*Comparison of these two methods with one another.*—*Digital examination* enables us to judge of the condition of the posterior superior walls and the lateral regions of the pharynx—a result which it is more difficult to obtain by the rhinoscope, for optical reasons easy to understand. Besides this, the finger gives us the parts in their relative position, as they really are, while, when reflected in the pharyngeal mirror, they necessarily appear fore-shortened, grouped in relation to one another otherwise than as they are in reality. Palpation also shows us whether the morbid growths are soft or hard—an important distinction when considering the method of treatment to be adopted. This method of examination is the more valuable since it almost always succeeds at the first trial, and, consequently, gives immediate results, which sometimes would not be obtained for a long time with the rhinoscope.

Whilst digital examination enables us to ascertain the presence or absence of the tumours, their site, their dimensions, their shape, and often their insertion, the *rhinoscopic* mirror, on the contrary, shows, the condition of the mucous membrane, its colour, and the nature of its secretion; with its asssistance we can also examine deeply into the nasal fossa. Moreover we learn from it with greater certainty than by palpation, the existence of small tumours.

*Conclusion.*—These two methods complete and corroborate each other. We should then, so far as it is possible, combine them in the examination of the patient; the time employed and patience exercised will be more than recompensed by the accuracy of the diagnosis, and the possibility thus acquired of radically curing the affection.

We have still to devote a few lines to another method of diagnosis—the inspection of the superior pharynx by the nasal fossa. According to M. Zaufal and M. Michel, who have advocated it of late years, independently of one another, it enables us to recognise the presence of adenoid tumours. M. Zaufal (*a*) inserts full-sized specula, eleven centimetres in length, into the nasal fossa, until the extremity reaches the pharyngeal cavity almost as high as the entrance to the Eustachian tubes. There are instruments of different calibres, for larger or smaller nasal passages. This method, in certain cases, enables us to examine the entrance of the tube and a greater or less extent of the mucous membrane of the naso-pharynx.

We may add that it is sometimes possible to suspect—almost to diagnose—the existence of adenoid tumours *during catheterisation of the Eustachian tube*, when the beak of the sound meets with a large and resisting obstacle in regions which should normally be free (compare our observations, *loc. cit.*, p. 117—119), but it must not be forgotten that certainty is never acquired except by pharyngoscopic examination, or by palpation.

## PERICHONDRITIS OCCURRING IN CONNECTION WITH THE RIBS.

By H. P. POTTER, M.D.,
Surgical Registrar to St. Thomas's Hospital.

An affection which I believe to be a form of perichondritis may implicate the cartilages of the ribs. Several cases, some seven or eight, which have lately come under observation bear the following characteristics: The disease occurs usually in females about twenty years of age; the swelling which is hard affects one side only, more generally the left, and not extending beyond the cartilages; associated with pain and tenderness, the former being rarely localised, but diffused both forwards and backwards, following the course of the intercostal nerves. In the early stage there is some œdematous swelling of the integuments, which upon pressure are always exceedingly sensitive. It is the subacute form with which patients usually present themselves, the amount of pain, however, having no relation to the duration of the disease; absence of history of any injury or other assignable cause, uncomplicated with hysteria, and not yielding readily to treatment. Mr. MacKellar has kindly shown me some examples of this morbid condition which he has lately noticed, and the symptoms of which closely coincide with my observances. The patients have been treated with the iodide of potassium, quinine, &c., occasionally with very indifferent results. It would be interesting to know whether any of your readers have met with an affection similar to that which I have briefly described, and the results as to relief afforded. It has occurred to me that in those in whom drugs and local anti-inflammatory treatment are of no avail, recourse might be had to deep incision of the swelling.

( ) Zaufal, in various papers inserted in the *Archives d'Otologie*, and in the *Prager Medicin Wochenschrift*.

# Clinical Records.

## HOPITAL DU MIDI, PARIS.

### *Amblyopia, symptomatic of Cerebral Syphilisation.*

By M. CHARLES MAURIAC,
Physician to the Hospital.

Visual disturbance, with alteration of the optic nerves, sometimes arises, either in the course of syphilitic encephalopathia, or after its apparent cure. The study of these visual lesions has been the object of some remarkable works, amongst which must be mentioned in the first place, those of Hughlings Jackson. At the present day, owing to the interest excited by researches into cerebral localisation, their clinical importance seems to be increased, for no one can deny the narrow correlation which exists between optic neuritis and morbid intracranial productions.

But though there are many obscure points to elucidate, yet we should not any longer content ourselves with a vague diagnosis or prognosis. We must interpret the phenomena from their pathogenic point of view, trace them to their immediate cause, and determine in a precise manner, by the aid of pathological physiology, all the morbid circumstances which explain their existence.

Amongst diseases of the brain, those which depend on syphilis are, with cerebral tuberculosis, the most varied and fitted for this kind of investigation. In some previous papers I have endeavoured to solve some of these problems, I again return to the subject with a new case of syphilis of the brain, followed by amblyopic disturbance.

I.—The patient, æt. 21, contracted at Evreux, about the middle of the month of August, 1872, a syphilitic chancre, which had an incubation of about a month. The chancre and the first consecutive complications were slight, and there was no particular indication to excite suspicions of ulterior determination to the brain.

At the beginning of 1873 he had some mucous and superficial erythemato-papulous syphilides. He was taking each day two pilules of the sublimate, of one centigramme each: but not content with this dose, he took five or six in the 24 hours, for many months. In March, he had already consumed 500. He took very little care of himself, and indulged in frequent excesses with women.

In April, he felt himself very fatigued. About this period he suffered from vomiting and dreadful pain in the head. His physician believed it was ordinary me-

ningitis, and applied to his head, leeches, ice, and Milan flies.

Amongst other symptoms he had insomnia, with loss of memory and vertigo, without paralysis or convulsions.

This state lasted for three weeks, when one day, as he was walking along the Boulevard Mont-Parnasse, he was suddenly struck, without losing consciousness or falling, with complete aphasia, with paresis of the face, of the arm, and leg, on right side. The passers-by took him for a drunken man : he was led to his house, and 24 hours afterwards was brought to the Hopital Necker.

From the moment he was attacked, up to some hours whilst in the hospital, he did not lose consciousness for a single instant—he saw, heard, observed everything which passed around him, without being able to utter a single word. But after 24 to 36 hours, complete coma ensued, interrupted from time to time by delirium, which necessitated the of the strait-waistcoat. Leeches were applied, and the syrup of Gibert was given him. The state of unconsciousness, the alternation of coma and excitation, with aphasia and right hemiplegia persisted for three weeks. Then a sensible amelioration took place, and went on without interruption. The power of movement returned in the upper extremity, then in the right lower extremity. The aphasia persisted for a long time after the disappearance of the hemiplegia ; it only disappeared, little by little, as memory returned. He was obliged to learn afresh to read and write.

*Treatment.*—The syrup of Gibert and iodide of potassium was continued.

Speech became clear in the month of July, 1874—the second year of syphilisation, the sixteenth month of head symptoms. He had not recovered his full intellectual integrity—he was obliged to become a cab driver.

II.—Two years afterwards, about the middle of the year 1876 (the fourth year of syphilisation) his sight became weak, the pupils dilated and became stationary. I then received him under my care. At the bottom of the pharynx and on the left side of the isthmus, deep tertiary ulcerations were seen. His physiognomy presented a strange appearance, on account of the dilatation of the pupils. His intelligence was far from being brilliant. There was no embarrassment of speech, memory pretty good, no nervous trouble, nothing on the side of the heart or large vessels ; general health satisfactory.

Returning to the previous history ; the aphasia and right hemiplegia had been very precocious, as they had supervened in the seventh or eighth month of syphilisation, after being preceded by three weeks of pseudo-meningitic prodromata.

Thanks to the specific treatment, his cerebral state was sufficiently satisfactory, for the most urgent symptoms had disappeared. This case may be cited as a typical example of one of the most known forms of symmetrical encephalopathia. I have proved in my memoir on "Precocious Syphilitic Affections of the Nerve Centres," that the synthoma, aphasia and right hemiplegia, predominate amongst the other manifestations of cerebral syphilis. This case may be added to those already published.

Before proceeding to the ocular derangement, which is the principal object of this paper, I desire to point out that the patient had taken sublimate to excess, for some months preceding the attack.

Had the long continued ingestion of this salt, in large doses, any influence in the production of head symptoms ? Without rendering it completely responsible for the encephalopathia, may we not suspect it was not a stranger to it ? I put these questions, because in the statistics of Dr. Julliez, on the "Etiology of Tertiary Syphilis," we see that patients treated by mercury were more frequently attacked by cerebral complications, than those who did not absorb this medicine. We must not for that incriminate, or still less condemn a remedy which has rendered such precious services. But, perhaps it would be well to use it with great care. We may affirm that, if it has not been instrumental in producing the encephalopathia, yet it was not efficacious to prevent it.

III.—This patient had become, little by little, amaurotic. Although the disturbance of speech and motion had not returned, though there was no fresh attack of encephalopathia, yet there could be no doubt that syphilis was the direct cause of this new complication.

But in what did the alteration of the eyes consist ?

One of our most learned ophthalmists, M. Maurice Perrin (Professor, Val-de-Grace), examined the patient with the ophthalmoscope. His notes I subjoin—

*State of Vision of M. L——.*

*Visual acuity.*—Right eye, 1-30 ; left eye, 1-10.

*Field of Vision.*—Right eye : central scotoma, the effect of which renders peripheric vision clearer than central vision. Diminution of frontal and jugal angles. Left eye : visual field normal ; no central scotoma.

*Optometric State.*—The two eyes are hypermetropic, the right to a greater degree than the left.

*State of Sense of Colour.*—Both eyes dyschromatopic.

*Ophthalmoscopic Examination—*

*Right Eye.*—The optic papilla is in process of atrophy. It presents in the centre a vast physiological excavation, with considerable enlargement of the central artery. The arteries are diminished in size, the veins, on the contrary, are large, of a deeper colour and sinuous. No appreciable alteration of the muscular region.

*Left Eye.*—Same ophthalmoscopic appearance.

(*To be continued.*)

# Special.

## SKETCH OF A MORE POPULAR AND ECONOMIC ORGANISATION OF THE ARMY MEDICAL DEPARTMENT,

AND THE MORE IN ACCORD WITH THE WISHES OF THE ARMY THAN THAT PROPOSED BY THE WAR OFFICE COMMITTEE, WHILE AT THE SAME TIME EMBODYING THE BEST OF THEIR RECOMMENDATIONS, AND THOSE GENERALLY APPROVED OF BY THE MEDICAL PROFESSION.

*Mode of Government.*—Army Medical Board to be abolished, and a single responsible chief substituted under the sole control of his Royal Highness the Commander-in-Chief at the Horse Guards.

*Title.*—More military, as "Royal Medical Staff Corps," shown in the Army List among the corps, not the Departments of the War Office.

*Organisation.*—As in the German army, the most highly organised and administered for the purposes of war—*i. e.*, modified regimental. Each battalion of infantry, corps of cavalry, and brigade of artillery, being in charge of a medical officer available for duty in, or charge of, stationary hospitals. For these special duties 190 of the reduced establishment proposed by the Committee would be required—viz. :

| | |
|---|---|
| Battalions of infantry ... ... | 138 |
| Regiments of cavalry ... ... | 28 |
| Brigades of artillery ... ... ... | 24 |

Leaving 600 officers, or more than three-fourths, for brigade depôts, general staff duties, casualties, reliefs, &c.

NOTE.—Each battalion in the German army is in medical charge of an officer, styled a "staff and regimental surgeon," who treats his sick in sedentary or "garrison" hospitals. The *personnel* and equipment of these hospitals are localised. The name of the medical officer appears in the

regimental cadre and gazettes. He accompanies his corps into action, and is mounted.

*Advantages claimed—*

(*a*) Would not interfere with reduction to establishment proposed by War Office Committee, as a means of covering the cost of improvements in rates of pay and retirement.

(*b*) Regiments would be organised during peace in their medical *personnel* as they are to be by regulation on the outbreak of war, with the additional advantage that the medical officers would have a general knowledge of officers and men, a desideratum advocated by Sir John Pringle, Fergusson, Jackson, Hennen, Guthrie, Sir James McGrigor, Currie, Gordon, Mouat, and other experienced surgeons of the British army.

(*c*) Would keep intact, and tend to propagate the soldierly spirit in the medical staff, and that gentlemanly tone and feeling which has been characteristic of its regimental service in time past.

(*d*) Would accord with the desire of regimental officers and men without impairing the independence of action and consequent greater usefulness of the department.

(*e*) For all practical purposes would settle mess questions—soldier servants, and grooms—as battalion medical officers would be honorary members of regimental messes, have soldier servants, and as mounted officers, be entitled to a groom from the ranks.

(*f*) Would not interfere, or infringe upon, the system and regulations for the localisation of *personnel* and equipment in stationary hospitals, or the command of the medical staff corps, admitted on all sides as a necessity to insure the best adaptation of means to ends. (*Vide* recent series of resolutions passed by eminent Continental military surgeons at Paris Congress.)

(*g*) Would tend to make the service more popular in the schools, especially if appointments to battalions were brought prominently before the public in the Gazettes as formerly, and medical officers of the Indian Staff Corps, without losing their individuality, appear in the Indian Gazettes when appointed to change of corps, and are shown in their cadres. (*Vide* Harte.)

(*h*) As being a more common sense arrangement during peace than the present, which for medical purposes divides a corps into three units—one medical officer being in charge of officers, women and children, another of the men, and a third, of the sanitary arrangements—duties best performed by a single officer, and ample to fully occupy his time.

(*i*) Under proper arrangement would not, to any extent, interfere with the roster.

(*j*) Would be more suitable to scattered Indian stations, and less expensive for its government, who are now obliged to employ highly-paid officers in insignificant charges. (*Vide* Indian Army List.)

*Hospitals.*—On the stationary system in regard to equipment, nursing, *personnel*, &c., as at present, the more military term "garrison" being substituted for "station," to be under sole command of medical staff corps, subordinate to general staff only.

*Hospital Corps.*—Designation to be same as medical officers, viz., Royal Medical Staff Corps. Officers of orderlies to act as quartermasters, as at present.

*Uniform.*—Scarlet for all ranks, as a branch of the general staff of the army. Helmet, as being more suitable and convenient, replacing the cocked hat. One set of belts, as in Engineers. The horse appointments trimmed with gold lace, with distinguishing badges in gold, as in other departments.

*Relative Rank.*—As proposed by committee, and according to date of commission.

*Pay.*—As proposed by committee for administrative officers and medical officers under twenty years' service; leave out brigade surgeons, and style all surgeon-majors of twenty years and a higher relative rank, senior surgeons-major with following rates of pay :—

| | s. | d. |
|---|---|---|
| 20 years ... ... ... ... | 25 | 0 |
| 25 ,, ... ... ... ... | 27 | 6 |
| 30 ,, ... ... ... ... | 30 | 0 |

*Retired Pay and Gratuities.*—Up to eighteen years' service, as suggested by committee :—

| | s. | d. |
|---|---|---|
| On completing 20 years ... ... ... | 20 | 0 |
| ,, ,, 25 ,, ... ... ... | 25 | 0 |
| ,, ,, 30 ,, ... ... ... | 27 | 6 |

contingent upon services during a declared national emergency.

*Promotion.*—Twelve years surgeon-major, twenty years senior surgeon-major. Administrative ranks by seniority modified by non-selection. Copies of all confidential reports, which are of an adverse nature, to be supplied at once to the officer concerned, as is the practice in the combatant ranks of the army. All officers to have the right of appeal to His Royal Highness the Commander-in-Chief, whose decision is to be final.

*Forage.*—All battalion medical officers to be mounted. Staff medical officers, ranking as field officers, to draw forage for horses actually kept. (*Note.*—The actual cost of forage in the United Kingdom is probably not more than 1s. 6d. per diem, and as medical officers who only really required horses would keep them, the cost of this concession would be small, and some men at least would know how to ride.)

*Servants.*—Soldier servants for battalion medical officers. The usual allowance to staff officers.

*Exchanges.*—As in other branches of the army.

*Fuel and Light.*—Staff or regimental, according to duty.

*Quarters.*—Battalion surgeons, regimental. Other medical officers departmental, or usual allowance.

*Roster.*—To be hung up in the office of the Army Medical Department for the inspection of all officers. (*Note.*—The objections made to this hitherto have been childish.)

*Honours and Good Service Pensions.*—In the same proportion as granted to other scientific corps of the army.

*Leave.*—As recommended by the committtee.

*Militia Surgeoncies.*—To be filled by retired military surgeons. (*Note.*—A militia medical reserve in addition to the general reserve of officers, would be an advantage to the State, as the former would perform active duties during a portion of every year. Sooner or later the militia must become the great reserve of the army, and it should be complete in its medical *personnel*.)

*Mode of Entry.*—By competition, as in other branches of the public service. (*Note.*—When the medical service was honourably treated and fairly administered, it never wanted the best from among the schools.)

*Training of Candidates*—As proposed by committee—it is generally acknowledged that it would be an advantage to have it longer than at present.

*Appointments to Battalions* to be given to the best conducted and most distinguished younger officers as vacancies occurred after their probationary course of study in the Army Medical School. On arrival in India, the corps would revert to the charge of a surgeon-major under whom would continue to serve its staff surgeon. Hospital equipment to be localised in India as at home.

*Field Service*, according to present regulations, which are compatible with the foregoing recommendations.

*Civil Practitioners* to be employed at the smaller stations, a preference being given to retired military surgeons.

*Time of Home Service* never to be less than three years. Officers who have suffered much from tropical disease to be employed by preference in the healthier stations above.

*Rules as to Indian Services* to be officially promulgated in medical regulations.

*General Conclusions.*—A moderate increase of pay to the senior executive ranks according to length of service, a distinct designation to officers ranking as lieutenant-colonels, and more favourable rates of retirement, would be far more popular in the medical department than the creation of a new and nondescript rank whose duties it would be difficult to define. Successful medical officers have not wished for "seconds," nor do they require them. The attaching of the younger officers to regiments for a time would be a great advantage to them in a social and disciplinary point of view, and tend to make the service more popular in the schools, while they would, when doing duty in stationary or garrison hospital, be brought in contact with their seniors in rank and experience, and so gain a better knowledge of the habits and customs of the soldiers in combination, ultimately advantageous to the Government, popular in the army, and likely to be favourably received by the medical profession, without whose cordial support no scheme of organisation can succeed.

Two medical students in London have, during the past few days, committed suicide through nervous excitement consequent upon excessive study in preparing for examinations. One of the deceased was a son of the well known Birmingham surgeon, Mr. Oliver Pemberton, and was a St. Bartholomew's student; the other was Mr. Attwood, a St. Thomas's student, Much sympathy has been drawn forth for the friends of the deceased, by these melancholy occurrences.

'SALUS POPULI SUPREMA LEX.'

WEDNESDAY, MAY 21, 1879.

## THE REGISTRATION OF MEDICAL STUDENTS.

WE referred last week to the issue of the "Students' Register," for 1879, in an improved form and at an unusually early date, and we return to the subject to-day for the purpose of referring to a matter of much importance to medical education, and forcibly illustrative of the abuses which the Medical Reform Bills now before Parliament are intended to remedy. Before doing so, it will be well to place before our readers the following summary of students' entries throughout the kingdom for each year since the Students' Register was first published.

| COUNTRY. | IN 1865 | IN 1866 | IN 1867 | IN 1868 | IN 1869 | IN 1870 | IN 1871 | IN 1872 | IN 1873 | IN 1874 | IN 1875 | IN 1876 | IN 1877 | IN 1878 | From 1865 to 1878 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| ENGLAND ... | 313 | 470 | 457 | 483 | 530 | 551 | 563 | 636 | 676 | 635 | 633 | 708 | 783 | 881 | 8,319 |
| SCOTLAND ... | 61 | 321 | 258 | 266 | 317 | 341 | 340 | 324 | 343 | 346 | 414 | 414 | 471 | 500 | 4,719 |
| IRELAND ... | 208 | 157 | 212 | 175 | 317 | 268 | 351 | 357 | 199 | 386 | 264 | 357 | 430 | 353 | 4,034 |
| TOTAL ... | 582 | 948 | 927 | 924 | 1,164 | 1,160 | 1,254 | 1,317 | 1,218 | 1,367 | 1,311 | 1,479 | 1,684 | 1,734 | 17,072 |

An analysis of this table is instructive in several ways. If it be supposed to represent truthfully the numbers of students actually engaged in learning medicine, it would prove—

(*a*). That the average number of students educated in England is equivalent to the total of Scotland and Ireland taken together ;

(*b*). That Scotland outruns Ireland in the number of its students by nearly one-fourth ;

(*c*). That in both England and Scotland there has been a steady increase in the "out-put" of students for the thirteen years under consideration, and

(*d*). That in Ireland there has been rather a falling away than an enthusiasm for admission to our profession.

We desire to warn those who might be led to adopt these figures as representing the true state of affairs, and to make deductions from them, that, in regard to Ireland at least, the figures are entirely illusory and inaccurate, and that, in that division of the Kingdom, there is no registration of students worthy of the name.

The General Medical Council, as most of our readers know, made a regulation long since, that—

"No medical student shall be registered until he has passed a preliminary examination, as required by the General Medical Council, and has produced evidence that he has commenced medical study, and a 'recommendation'" that

"The several qualifying bodies are recommended not to admit to the final examination for a qualification under the Medical Acts, any candidate (not exempted from registration) whose name has not been entered in the Medical Students' Register at least forty-five months previously."

It is as well to say at once, that in Ireland these decrees are systematically set at nought, and that many of the medical schools not only ignore, but discourage student registration. Thus, it happens that not more than 288 students, on an average, appear as having been educated in Ireland each year for the last fourteen years ; whereas, we know that two of the Dublin schools exceed that number of students each year. We believe we should not much exceed the real number of Irish medical students, if we estimated these at 1,200 in actual study in each year, or an average of 400 new entrants who should be registered.

The causes of this disregard of the Medical Council's recommendations must be stated plainly, if we are to hope for a change for the better. To register a student at the commencement of his study, is to fix a date from which to count his period of education—to do so would ensure that he should enter at his school at the proper period—it would show whether he really spent in study the four years which he is supposed to give to the learning of his profession ; and, furthermore, the enrolment of his name would tell at what school he was entered, would identify that school with his subsequent failure or success, and would inform the profession as to which institution was doing the best work in the way of medical education. Thus we submit that student registration is a very important part of the supervision system "recommended" by the General Medical Council, and that the Council has sacrificed much of the efficiency of the medico-educational system because it has confined itself to "recommendations," and has flinched from enforcing its orders. As we have said, student registration is avowedly set at nought in Ireland. It is worth while to inquire the reason for the unwillingness of schools to comply with the recommendation and the result of their refusal to do so. We have pointed out that to register a student at the commencement of his study is to fix a date from which to count his period of education, to ensure that he should enter at his school at the proper period, and to secure that he shall really spend in study the four years which the regulations allot to him. It is exactly because a considerable number of students do *not* enter at the proper time, and do *not* study for four, or even three, years, and because certain medical schools make a profit by accepting entrants at irregular times, and granting them certificates for courses never attended, that the proprietors of those schools omit, or refuse to register, the student.

In Ireland the medical session commences nominally on the 1st of October in each year, but actually, the schools cannot be said to be open until the first week in November, when the Introductories are delivered. The student is, however, allowed, by the rules, nearly a month's "days of grace" after this date, within which to enter for his course of study, so that, practically, a large proportion of the class does not get to work until the first week in December, when a fifth of the course of lectures has been already delivered. Laxity of rule, however, favours the idle student still further, for it is notorious that certain Dublin schools will accept entries up to Christmas, and even in the third week in January, when the student returns from his holidays; and report says that, not unfrequently, late comers, who are known by the *soubriquet* of "March hares," are enrolled close upon the beginning of April. Such gentlemen no doubt receive certificates that they have "diligently attended" the courses of lectures which began in the previous November, and the three weeks remaining of the winter lecture session stands in their case for six months of study. It is also sometimes permitted for such students to present themselves for the February examinations "on current certificate"—*i.e.*, on the representation that they are in attendance on courses of lectures which will not be completed until the succeeding May—so that a "March hare" may complete his curriculum, and obtain his diploma upon a period of study, extending from the March of any year until the February twelvemonth succeeding—*i.e.*, in a few months over two years.

But there is another reason why certain Irish schools refuse to register their students. They know that such registration would inform the profession and the public as to the number of students enrolled by them, and would lay bare the naked truth as to the share of these schools in medical education, and it seems to be their desire to keep these matters as secret as possible. The only records kept in Dublin of the number of entrants at each school is that kept by the Anatomical Committee, which conclave consists of delegates from the various schools, and is entrusted with the providing and distribution of subjects for dissection. To this Committee each school applies for its supply, making a return to them of the number of dissecting students, and paying £1 1s. for each. It has been hinted that such returns often represent the number of dissectors as being much higher than it really is, by which means the school gets

credit for doing a thriving business, and obtains an abundant supply of subjects. Be this as it may, the Anatomical Committee refuses to give any information —such as is made public in England—as to the number of students entered; and, therefore, no one but the members of the Committee is able to form a judgment as to which school is doing the largest educational work, or is most deserving of confidence.

It is unnecessary for us to add comment to this statement. We have narrated our "round, unvarnished tale," not at all for the purpose of depreciating the Irish system (which, for aught we know, may have a parallel elsewhere), but in order to show how the medical education of our country and the efficiency of the practitioner have been wrecked upon the pusillanimity of the General Medical Council, which has shown by its decrees that it knows well the necessity for safeguards, yet fears to enforce them.

## USES OF IPECACUANHA IN UTERINE HÆMORRHAGE, AND DURING PARTURITION.

We have long considered the many therapeutic virtues of ipecacuanha to be less widely known than they ought to be. Every one knows that this drug is an emetic and expectorant, but few are so well acquainted with its contra-stimulant, diaphoretic, cholagogue, purgative, and anti-hæmorrhagic properties. The wonderful effect of large doses of ipecacuanha as a cholagogue purgative, and in the treatment of dysentery and certain diseases of the liver, has been well demonstrated by Dr. Maclean, whose experience of this drug in India has been very great. But of its anti-hæmorrhagic and oxytocic properties the profession generally have but little knowledge. We were, therefore, struck with an able article which appeared recently in the *New York Medical Journal* from the pen of Dr. John H. Carriger, of Tennessee, on the influence of ipecacuanha in increasing the expulsive contractions of the uterus, in facilitating the dilatation of a rigid os, and in arresting uterine hæmorrhage. Its power of checking hæmorrhages, especially from the womb, has been acknowledged by many writers on materia medica and therapeutics. Dr. W. Chapman ("Elements of Therapeutics," Philadelphia, 1821), says that the powers of small doses of ipecacuanha are frequently astonishing in checking uterine hæmorrhage. Dr. Osborne, of Dublin, states that the treatment of menorrhagia by emetic doses of ipecacuanha has never yet failed in his hands. Braithwaite (July to January, 1845, p. 136), states that John Higginbottom, in profuse uterine hæmorrhage, succeeded with it when ergot failed. Dr. J. Eberle ("Materia Medica and Therapeutics," Philadelphia, 1842), observes that in uterine hæmorrhages it is more decidedly beneficial than in other hæmorrhages. Mr. Trenor (*Dub. Journ.*, vol. xviii), goes so far as to say that nauseating doses of ipecacuanha were, in numerous cases under his care, attended with marked benefit, the hæmorrhage being arrested, and heat and life restored to patients who were in a state of collapse from excessive loss of blood. Dr. Graves ("Clin. Lect.," vol. iii, p. 141), who observes that Richter was the first to point out the anti-hæmorrhagic effect of ipecacuanha, placed great confidence in nauseating doses of the drug, both in hæmorrhage from the stomach and from the bowels. He did not think this effect was due to its nauseating properties, but to some specific action. Its influence over uterine hæmorrhage and menorrhagia, Dr. Tyler Smith explained in the following manner: "Ipecacuanha," he says, "by its emetic properties, excites contraction of the abdominal muscles and compression of the uterus, which may in turn re-excite some amount of reflex action, but beyond this it appears to have a special action upon the uterus, increasing its contractile power beyond what could be imagined to occur from the merely secondary effects of vomiting."

It is, however, of its utility during parturition that Dr. Carriger has had most experience—an experience extending over several years. He believes that its power over uterine hæmorrhage is due to its power of co-ordinating uterine action and stimulating tonic contraction. He believes that in ipecacuanha we have an oxytocic, potent and safer than ergot for both mother and child, because it stimulates the uterus into a more normal action, and at the same time facilitates dilatation of the rigid os. Dr. Carriger cites several cases in which the administration of two or three grains of the drug was followed by relaxation and dilatation of the os, great increase of the uterine contraction, bearing down pains, and the safe and speedy termination of the labour. In one case, after the exhibition of two grains of the drug, a labour, at first believed to be impossible (owing to some contraction at the brim), was by the natural efforts alone safely terminated in less than four hours. "I might add," he says, "case upon case in which, during the past twenty years, I have thus used ipecacuanha at some period of the labour, in all of which the result has been the same—a great lessening of the sufferings of the patient, and a shortening of the duration of labour." Again he observes that in about thirty minutes after taking the ipecacuanha the restlessness, rollings and tossings, of the patient cease, she becomes quiet, is sensible of the favourable change, the os dilates the child descends, and the case is soon over, and yet the labour does not possess any of the characters of an ergotised labour, the pains being more regular, more natural, and succeeded by intervals of rest. Moreover, in a very large number of cases of rigid and undilated os, where every pain, for hours previously to its administration, had been accompanied by loud outcries, jactitation, irritability of temper, &c., this drug has rarely failed in a few minutes to cause marked change in the condition of the patient, and to conduce to the speedy termination of the labour. It is to its power of causing relaxation and dilatation of the os, that Dr. Carriger is inclined to attribute the influence of ipecacuanha over the sick stomach of pregnancy—an opinion which receives some corroboration from the fact that some obstetricians of the present day have found certain cases of obstinate vomiting to depend upon a morbid condition of that part of the womb.

It may be that Dr. Carriger has been induced to form a higher opinion of the oxytocic action of ipecacuanha than will be warranted by future experience. At the same time the results which he appears to have obtained from the administration of this drug during parturition deserve the careful consideration of all who are anxious to add to our means of lessening the delay, the pains, and the distress which so frequently attend the first stage of tedious labours.

There are occasions when neither chloroform, nor opium, nor chloral, is indicated, or admissible; or when, if admissible, they fail to have the desired effect. Chloroform may render the patient insensible to the pain, but it has little influence in relaxing the os, and rather hackens than shortens the labour. To opium, many objections may be made; while chloral is simply a soporific. Nauseating, or emetic doses of tartar emetic, used to be given in some of the cases for which ipecacuanha is here recommended; but the action of that drug is too violent, too depressing, and too prolonged to make it, in these circumstances, a safe and convenient remedy. Whether or not Dr. Carriger has exaggerated the utility of this drug in cases of tedious labour we shall not presume to say; but at all events it is a question that might be very soon decided. Half-a-dozen practitioners, with large midwifery practices, might settle it in as many months; and it would be certainly worth while giving a fair trial to this alleged efficacy of ipecacuanha as an oxytocic remedy. There cannot be the slightest doubt that hundreds of women are allowed to endure much unnecessary pain and suffering during the first stage of labour through the want of some agent that will at once facilitate dilatation of the os, and increase the expulsive force of the uterus itself. That agent may not be ipecacuanha, but if not, it remains to be found; for none of the drugs above mentioned can be said to have supplied this desideratum.

# Notes on Current Topics.

## The Insane Poor and their Food.

At the late Press Fund dinner, a noble lord said: "That local provincial weekly newspapers afforded some very interesting reading," but he might have added "more especially if you look at reports of proceedings of Boards of Guardians." We have often favoured our readers with some choice extracts illustrating the muddleheadness of the elected representatives who have to deal with our Poor-law system. We have received a copy of the *Halifax Guardian*, Saturday, 17th inst., which affords another instance of the very peculiar ways of the very peculiar people who compose such boards. It well illustrates how the insane poor are treated in workhouse wards, and shows clearly the necessity and wisdom of the Lunacy Commissioners removing all such patients to our public asylums, where they will be under the intelligent management of educated governors, who appreciate the responsible duties resting upon them, and who will also value, to its full extent, the advice of medical men. The facts are very simple. The Medical Officer of the Halifax Union condemned some bacon, or pig's cheek, certifying that it was unfit for human food. This opinion, if given in a court of justice, would have been at once accepted, unless contradicted by some other medical expert. To this case, however, there was no other evidence against the medical officer's opinion, but that of the Master and some members of the Board who for the nonce presumed to put themselves upon an equality with the Medical Officer.

Probab y affected by the pig's cheek, they proceeded in a very pig-headed way to question the certificate of the Medical Officer and to substantiate their own views. The discussion, however, as reported in our local contemporary, confirmed, in our opinion, the views taken by the Medical Officer, that the article in question was quite unfit for consumption, although the resolution passed by the Board is a most singular contradiction, and clearly proves that it was perfectly incompetent to deal with the question. It thus runs: "The Board of Guardians think that the 'ruzed' (sour) portion of the bacon ought to have been cut off before sending it in to be cooked, and they could not endorse the doctor's decision that decomposition had taken place."

We trust the attention of the Local Government Board, and also that of the Lunacy Commissioners, will be drawn to this subject. From the whole tenor of the report it is quite evident that the Halifax Board of Guardians do not like a medical officer who is disposed to do his duty, and the remarks of a Mr. Riley confirm us in this view. He observed "that he always liked to see officers sticking well together." In fact, this gentleman would doubtless like the medical officer to forget his social position and professional standing, and chime in with the master, and have all complaints shelved.

We congratulate the Medical Officer, Dr. Dolan, for preserving his independence and self-respect, and for his zeal on behalf of the insane poor under his charge.

## University of London.

Earl Granville presided last Wednesday at the presentation of prizes and certificates to the successful competitors in the last academical year at the University of London. The noble Earl made an eloquent speech, in the course of which he observed that, however much some people might have been opposed to the granting of degrees to women, he believed there was no one present who would not rejoice that the result of the first examination of women had proved so satisfactory. Six had passed, one was second in the whole list of candidates, and only one failed.

There can be no doubt that the liberal manner in which this University has dealt with the higher education of women will go far towards silencing the great and somewhat injudicious opposition that has been raised both to the granting of Arts degrees to women and to their admission into the medical profession. The argument that women are not intellectually fit for studying and afterwards practising medicine has always been a very weak one, the invalidity of which is now seen on the very first occasion on which the mental qualifications of women have been put to the test of a searching examination.

The death-rate last week in the large towns from the seven principal zymotic diseases averaged 2·6 per 1,000. Whooping-cough showed fatal prevalence in Manchester and Newcastle-upon-Tyne; scarlet fever in Oldham, Newcastle-upon-Tyne, and Hull; and measles in Salford. The deaths from fever, principally enteric, were proportionally most numerous in Portsmouth and Norwich. Small-pox caused 5 deaths in London, 11 in Dublin, but not one in any of the other large towns.

## A Gynæcological Museum for Manchester.

Dr. Thorburn, Professor of Obstetric Medicine in Owens College, has issued an appeal to the profession for the purpose of establishing, if possible, in Manchester, a Museum or collection of Obstetric and Gynæcological instruments, illustrative of their gradual scientific improvement from the earliest periods, as well as of their most recent developments. He asks for any old instruments, the inventors, date, or uses of which can be identified ; the donors will thus confer a great favour on the college, besides ensuring a permanent place of deposit, and a useful public service. Dr. Thorburn also hopes that inventors of modern instruments, or firms of surgical instrument makers, may be induced to present the college with novelties which, by their perpetual exhibition, would be brought under the permanent notice of the profession in the largest extra-metropolitan centre of population in Great Britain.

We are happy to assist by noticing the laudable undertaking.

## A Specimen Medical Act.

The State Legislature of Wisconsin has just passed a Medical Act, which is worth notice now that the "old country" is in violent parturition of the same offspring. The sections of this sample of medical legislation are as follows :—

Section 1.—A person practising in the State must have a diploma, or pass an examination before the State Board of Examiners.

Sec. 2.—The governor shall appoint a board of examiners, of six physicians (four regular and *two homœopathic*), and those six shall choose a seventh.

Sec. 3.—Defines the organisation of the board.

Sec. 4.—The board shall examine diplomas and candidates. Holders of genuine diplomas shall pay 2 dols.; of *spurious diplomas*, 20 dols.

Sec. 5.—Persons not holding diplomas may be entitled to practise after examination.

Sec. 6.—Every such license shall be recorded within thirty days.

Sec. 7.—The Registrar of Deeds shall keep the records.

Sec. 8.—Fee for candidates for examination to be 5 dols.

Sec. 9.—Payment of examining board.

Sec. 10.—Examinations defined.

Sec. 11.—Dishonourable conduct may forfeit certificates.

Sec. 12.—Defines a practitioner of medicine.

Sec. 13.—If any physician practising medicine in this State shall write, or cause to have printed upon any prescription, the words, "No Duplicate," any druggist, apothecary, or vendor of medicines who shall duplicate a prescription so written or printed upon, without the consent of the physician writing the prescription, shall, on conviction thereof, be subject to a fine of 10 dols. for each and every offence, together with costs of suit.

## French Costume under the Revolution.

From the *Union Médicale* we cull the following :—A letter, on the subject of costume, addressed, in the year 1792, to the Société Républicaine des Arts, by Césarine Boissard, was read on this occasion by the President. This citoyenne, being a lover of Nature, demands that the use of all articles of dress stiffened with whalebone, should be proscribed.

Espercieux announces that another citoyenne, mother of a family, is desirous of attiring herself according to the antique mode. He demands, therefore, that delegates should be sent to the manager of the Théatre de la République to ask for a model, in order to procure for the citoyenne the means of cutting the material in a suitable manner. The request was granted.

## Sanitary Conference.

The Conference that has been recently sitting under the auspices of the Society of Arts will undoubtedly give some impetus to the movement now going on to supply the villages and towns of this country with purer water than has hitherto been within their reach. That such water is much needed has been shown, not only by the reports that have lately appeared with respect to the pollution of the Thames and the quality of the water supplied by some of the water-works, but also by the history of certain outbreaks of fever that have occurred in certain rural districts. In the discussion which took place at the Conference, Mr. Bright, of Leamington, said that in that town a perfect river of underground water had been discovered at a depth of 110 feet. Whatever importance may be attached to this fact, it at all events points to a question that has often been mooted, namely, whether we have taken all the advantage we might have done from the large quantity of rain that falls in these islands, and whether we do not ignore the possibility of there being beneath the earth's surface large reservoirs of water which might be utilised for drinking purposes. We think Mr. Homersham, C.E., was justified in contending that the water below ground was enormous in quantity and of good quality, and that boring was efficacious if carried out scientifically. There is, however, much to be said with regard both to the sources of a good water-supply, and to the incidence of rating for this and other sanitary purposes in rural districts, and therefore it is satisfactory to find, from a letter that has been addressed by the Prince of Wales to the Society, that in all probability Government will appoint a Royal Commission to inquire into the subject of a national water supply.

## The Sick at Ekowe.

By the latest mail from the Cape we have full particulars of the relief of Ekowe, and of the position in which the beleaguered garrison were placed during the two months of forced inactivity of the troops on the Tugela. Colonel Pearson reports that the hospital patients were removed daily—those, at least, who could bear removal—to a shelter constructed of boughs of trees, on an eminence near the Fort. This arrangement gave them abundance of fresh air, the hospital itself got purified, and the cleaning could be done more effectually. At first the health of the troops was extremely good, but before the end of February the percentage of sick had largely increased, and when relieved on the 4th April there were nine officers and 100 men on the sick list. Some of these are still seriously ill, and four deaths have occurred since leaving Ekowe. The chief disorders were diarrhœa, dysentery, common, continued, and typhoid fever ; no doubt much of the sickness was attributable to the constant wet weather and the overcrowding in the Fort, the work having been constructed for a much smaller garrison. The large percentage of deaths was probably due to the want of proper medicines and medical comforts. As regards shelter, there was only

room in the fort for a very few tents in addition to those required for hospital purposes, and both officers and men lived under the waggons, over which the waggon sails were spread, propped up with tent poles: thus the waggons being all round the parapets, the troops actually lived at their alarm posts, and could be on the banquettes in a few seconds.

## Chloroform Administered to Children.

In *La France Médicale*, M. de Saint Germain gives a list of 83 boys and 41 girls, varying from ten months up to fifteen years, in whom he had produced anæsthesia by chloroform. The time required to produce anæsthesia varied from 15 seconds to 4 minutes. Among other conclusions are these. Certain conditions, as anæmia or bronchial catarrh, require great care. Anæmic children come very rapidly under its influence, but demand especial care on account of extreme liability to syncope. Sudden movements, especially elevation of the head, are dangerous. Children with bronchial catarrh come very slowly under the anæsthetic, and consequently require a relatively larger quantity of chloroform. Artificial respiration, by rythmical pressure on the thorax, is considered better than electricity or intra-laryngeal sufflation.

Drawing the tongue forcibly out of the mouth is rarely if ever necessary. Cardiac affections do not contra-indicate the use of chloroform in surgical procedures. It is most dangerous in operations in the pharynx or buccal cavity, hare-lip, uranoplasty, &c., &c., on account of hæmorrhage into the trachea. Strong coffee should be given after the anæsthesia passes off to counteract the tendency to profound sleep which often follows chloroform inhalation. No attention whatever should be paid to the condition of the pulse. Attend to the respiration.

## Lectures at the London Hospital.

Arrangements have been made by the staff of the London Hospital for the delivery of short courses of lectures on special subjects, commencing to-day (Wednesday), at 4 p.m. The lecturers are: Dr. Palfrey, Diseases of Women; Dr. Morell Mackenzie, Diseases of the Throat; Dr. Stephen Mackenzie, Physical Diagnosis; Mr. Rivington, Minor Surgery; Mr. Hutchinson, Diseases of the Skin; Mr. Maunder, Physical Examination; Mr. Couper, Diseases of the Eye; Mr. Gardiner Brown, Diseases of the Ear. Members of the profession and students will be admitted to these courses on payment of one guinea. We understand that these arrangements have been made in deference to the wishes of several gentlemen engaged in general practice, who have frequent need of the experience which a large hospital like the London can alone afford.

## The Pest in Russia.

We read in the *Golos*, of April 15th—27th, that the epidemic from which Astrakhan and its environs has suffered so severely, has now totally disappeared. It is even stated, that judging from the official reports, forwarded by the authorities, and by Russian and foreign physicians, the danger has been greatly exaggerated. At Vetlianka, the centre of the disease, 375 persons died during the space of two months; in the surrounding country, isolated cases only have been observed, these, however, have invariably exhibited in full all the symptoms of this terrible disorder. By order of the governor of the province 82 houses have been burned. All furniture, clothing, &c., contained in these houses, have also been destroyed in presence of the authorities.

## Lady Doctors.

We receive the following, dated April 16th—28th, 1879, from St. Petersburgh:—We learn from the *Medical Gazette*, dated April 15th—27th, that the Russian government has no intention of denying to women, who have obtained the title of M.D., the right of practising in competition with men. On the contrary, it has been decided that they shall, for the future, always possess this right. The question concerning the rights of lady doctors in general, will not be decided until the committee appointed for the consideration of this subject, shall have terminated its inquiries.

A fearful epidemic has broken out in the Gori district of the province of Tiflis; it is said to be nearly as deadly as the plague.

Lord Aberdare has consented to become chairman of the Committee of Management of the Hospital for Sick Children in Great Ormond Street, London.

The Prince of Wales has consented to lay the first stone of the new buildings about to be erected in connection with the Norfolk and Norwich Hospital. Tuesday, June 17, is the date fixed for the ceremony.

A grand concert, at which many of the leading *artistes* of the day kindly gave their services, took place last week at Grosvenor House, the residence of His Grace the Duke of Westminster, in aid of the funds of the National Dental Hospital. The concert was well attended, and doubtless proved a pecuniary success for the charity.

A grand fancy bazaar was held last week, on Wednesday, Thursday, and Friday, in the Duke of Wellington's Riding School at Knightsbridge, in aid of the funds of the West London Hospital for Paralysis and Epilepsy. The arrangements were complete, and an ample supply of fancy articles were shown, but the weather we fear must have militated against its success financially.

Fancy bazaars in aid of medical charities seem to be the order of the day, a week scarcely passes now that one is not held in London. Yesterday, one was opened (to be continued to-day and to-morrow), in aid of the funds of the National Consumption Hospital at Ventnor, under the patronage of H.R.H. the Princess of Wales, at the Duke of Wellington's Riding School, which will doubtless bring in a considerable sum.

The rates of mortality per 1,000 last week in the principal large towns of the United Kingdom were—Norwich 13, Brighton 16, Bradford 17, Edinburgh 18, Portsmouth 19, Bristol 19, Hull 20, Birmingham 20, Leicester 21, Nottingham 22, Plymouth 22, Liverpool 22, London 23, Glasgow 24, Sheffield 24, Sunderland 24,

Salford 24, Leeds 24, Manchester 25, Oldham 25, Wolverhampton 27, Newcastle-upon-Tyne 29, and Dublin 32.

THE annual conference on National Water Supply, Sewage, and Health, was held on Thursday and Friday last, in the rooms of the Society of Arts, the Right Hon. James Stansfeld, M.P., in the chair, at which papers were read and discussions held on the following subjects :—1. Methods of securing a sufficient supply of pure water. 2. Evils of impurity, and consequent connection of the question of water supply and sewage. 3. Methods of sewage.

THE rates of mortality in the principal foreign cities according to the most recent weekly returns, were—Calcutta 35, Bombay 38 ; Paris 29 ; Geneva 25 ; Brussels 30 ; Amsterdam 23 ; Rotterdam 26 ; The Hague 27 ; Copenhagen 26 ; Stockholm 28 ; Christiania 19 ; St. Petersburgh 52 ; Berlin 27, Hamburg 29, Dresden 21, Breslau 29, Munich 44, Vienna 33, Buda-Pesth 42 ; Rome 27, Turin 25, Venice 22 ; Alexandria 34 ; New York 26, Brooklyn 22, Philadelphia 19, and Baltimore 19 per 1,000 of the population.

# Scotland.

(FROM OUR NORTHERN CORRESPONDENT.)

HEALTH OF GLASGOW.—Dr. Russell, at a meeting of the Town Council, held on the 12th inst., stated that during the fortnight ending 3rd May there were 502 deaths registered, as compared with 529 in the fortnight preceding, representing a death-rate of 23 in place of 24 per 1,000 living. The deaths under 1 year were 102 in place of 97 ; and those of persons aged 60 years and upwards 63 in place of 82, as compared with the fortnight preceding. The deaths from pulmonary diseases were 198 in place of 197, representing a death-rate of 9 per 1,000 living, and constituting 39½ per cent. of the total deaths as against 9 and 37 respectively in the past fortnight. The deaths from fever were 6, viz., 3 from typhus, and 3 from enteric fever. The deaths from infectious diseases of children were 27 in place of 32, viz., 19 from whooping-cough, 5 from scarlet fever, and 3 from measles. The cases of fever registered were 31 in place of 35, viz., 5 from typhus, 23 of enteric fever, and undefined. In addition to these cases of fever, 127 cases of measles, 51 of whooping-cough, 31 of scarlet fever, and 7 of diphtheria, were the occasion of sanitary assistance and supervision at home. There are at present in the hospitals, Belvidere, 42 cases of scarlet fever, 37 of enteric fever, 18 of typhus, 18 of measles, and 10 of whooping-cough, in all 125 cases, as compared with 122 of the previous fortnight.

LEGACIES TO GLASGOW CHARITABLE INSTITUTIONS.—By the will of the late Mr. Charles Kay, the following institutions have received the annexed bequests : Glasgow Royal Infirmary, £100 ; the Western Infirmary, Glasgow, £100 ; The Maternity or Lying-in-Hospital, Glasgow, £100 ; the Glasgow Asylum for the Blind, £150 ; the Glasgow Eye Infirmary, £50.

DISPOSAL OF GLASGOW SEWAGE.—The Health Committee of the Town Council had, on the 15th inst., a long conference with Mr. Bateman as to the disposal of the Glasgow sewage. No plan was fixed upon, the proceedings consisting for the most part of questions answered by Mr. Bateman.

WEST OF SCOTLAND CONVALESCENT SEA-SIDE HOMES, DUNOON.—On behalf of the directors of this institution, the honorary treasurer (Mr. John Gray, secretary to the Union Bank of Scotland) gratefully acknowledges the receipt of £1,170 from the trustees of the late Mr. William Cumming, of Greenbank, Partick. Owing to the large number of convalescents applying for admission, and the directors having had upwards of 2,000 patients to provide for during the past season, increased subscriptions, donations, or bequests are still most urgently required, £10 of income being daily necessary.

DISEASES OF WOMEN AND CHILDREN AT GLASGOW.—The annual meeting of the Glasgow Institution for Diseases of Women and Children was held in the Religious Institution Rooms last week. The report read by Dr. Bell, who is physician to the Institution, is one of the best in this department of literature with which we have come in contact for a long time. *Inter alia* it states, "there were scores of women in Glasgow to-day who were rejoicing in the enjoyment of perfect health, who would in all probability have been still the subjects of intense bodily and mental anguish had it not been for the benevolence of this Society. It was most gratifying to note day by day and week by week the altered looks and ultimate restoration to health of women, who, when they first came to the institution, carried nothing but despair in their countenance, and who were suffering intense bodily pain on the least exertion. Patients had sought the Institution out from many distant parts of Scotland, and even England, and this because they had heard from some of our old patients of the good they had derived. . . . But what was a source of great regret was that many cases of severe disease had been obliged to go away (*sic*) without any treatment at all, and this because they had not been able to provide beds wherein any such patients could be treated. To make up for this to some extent, the doctor had taken in hand a few needy cases at their own houses ; but it was to be regretted that the many calls upon his time would prevent him continuing doing so any longer." An unfortunate contingency, truly, for human suffering carrying "nothing but despair" in its countenance.

EDINBURGH LADIES' ASSOCIATION FOR REPEAL OF CONTAGIOUS ACTS AND STATE REGULATION OF VICE.—The annual meeting of this Association was held on the 13th inst., at 5 St. Andrew's Square, Mrs. Nichol, of Huntley Lodge, presided. A report as to what had been done during the year to further the objects for which the Society exists was read, and satisfaction expressed at the probable appointment of a Parliamentary Committee to inquire into the matter. Several ladies took part in the proceedings.

# Literature.

## HEALTH PRIMERS.

THERE can be no doubt that among the practical sciences which administer to the wants or add to the luxuries of the community, *preventive medicine* is taking a position such as it has never before held. As an illustration of this fact we have only to refer to the excellent series of "Health Primers" that is now issuing from the press of Messrs. Hardwicke and Bogue, and in praise of which we cannot speak in too high terms. We need scarcely remark that they are intended to instruct the public on subjects connected with the preservation of health, and that they are written and edited by authors

whose position and reputation are a guarantee of the able and satisfactory manner in which that object has been carried out. If, indeed, the public could be brought to practise all that these good little books preach, most of our preventible diseases might be, in the course of time, of rare occurrence, and the day might come when there would be only one druggist and one medical man for every ten that now exist.

The primers which we have at present received are respectively on "Premature Death: its Promotion and Prevention," "Alcohol: its Use and Abuse," "Personal Appearances in Health and Disease," "Exercise and Training," "The House and its Surroundings," "Baths and Bathing;" and we understand that several more are in course of publication.

The title of the first-mentioned primer is a very good one, but as the "promotion" of premature death is a a subject on which the public do not need much instruction, we think that the first half of the book might have been a little curtailed, and a few more pages devoted to "prevention." The subject, however, is considered from a general, more than from an individual, point of view, and is supplemented by other parts of the series.

Perhaps there is none of these primers which was so much wanted, and which will therefore be found so generally useful as that on "The House and its Surroundings." So much ignorance exists among the public with regard to the conditions on which a healthy house depends, that we hope this primer will have a large circulation. Everything that concerns a properly constructed and furnished house, from its situation, drainage, and water supply, to the kind of carpet which is advisable in a bed-room, is well and popularly discussed—so well, indeed, that even members of the profession may profitably devote half-an-hour to the perusal of its contents.

Next in importance to this primer may be mentioned those on "Baths and Bathing" and "Exercise and Training." So very beneficial are baths, exercise, and training in the maintenance of health, and in the prevention and cure of chronic disease, that too much attention can scarcely be given to these subjects. In the former of those primers the reader will find a very good account of the "physiological action of baths," the "varieties of baths," of "bathing localities," and of "the use of baths." In the latter we have a chapter on the general principles involved in exercise and training, another chapter or two on the exercise suitable for different ages, sex, and physical conditions, and a very interesting and suggestive account of the principles and practice of "training."

With regard to the primer on "Alcohol: its use and Abuse," we are only afraid it will not reach that class of society where it is most wanted; but we are glad to see that the writer has taken a very "temperate" view of a question on which there has been lately a great difference of opinion.

We must, however, in conclusion, state that, in our opinion, the number of these primers is being extended beyond what was necessary to fulfil the object for which they are written. Besides those above mentioned, there are to be primers on "The Head and its Troubles," "Clothing and Dress," "Water," "Fatigue and Pain," "The Ear and Hearing," "The Eye and Vision," &c.

We doubt whether this plan is a good one either with regard to the interests of the public or of the publisher himself. It is questionable whether the same primers that are written with the intention of instructing the public in the rudiments of sanitary science should, on that account, be multiplied for the sake of taking up subjects of a purely anatomical or physiological character. Can it, moreover, be expected that the public would take the trouble, or be at the expense, of purchasing and reading all these primers *seriatim*? And yet they must do this if they wish to be acquainted with the important facts scattered through them. We would therefore suggest that the last primer issued be one containing a summary, or general view of all the more important facts detailed in the preceding series, so that those who are so inclined may have the opportunity of obtaining for a shilling, and within the compass of fifty or sixty pages a knowledge of the principal points connected with the preservation of health.

---

## Short Notices.

(1). "Infectious Diseases in the Army." By Professor Rudolph Virchow. Translated by John James, M.B. London: H. K. Lewis. 1879.

(2). "On the Neglect of Physical Education and Hygiene." By Dr. Roth. London: Baillière, Tindall, and Cox, 20 King William Street, Strand. 1879.

3). "Physiological Therapeutics: A New Theory." By T. W. Poole, M.D. Toronto: The Toronto News Company. 1879.

(4). "The Nature and Diagnosis of Neurasthenia." By George M. Beard, M.D. New York: D. Appleton and Company. 1879.

(1.) Anything from the pen of the veteran Professor Virchow is interesting; and Dr. James has done good service by translating into English the discourse of Virchow on "Infectious Diseases in the Army."

At page 64 we find the following suggestive words:—"At least once in his life every scientific man ought to find himself thoroughly abreast of the present standpoint of his department and of the fundamental sciences, otherwise he becomes superannuated before he has scarcely begun to act on his own responsibility."

Without a knowledge of what is done in France and Germany, it is impossible to keep pace with the scientific medical knowledge of the age, and hence translations become all the more valuable to those who are unacquainted with modern languages.

This address deals with subjects pregnant with particular importance to army medical officers, and Virchow's returns (pp. 10-13) of the mortality of some of our modern wars, as the Crimean, American, and Franco-Prussian, should teach our War-office authorities a useful lesson on the value of trained army medical officers. We anticipate for this pamphlet a wide circulation.

(2). Earnestness is one of the secrets of success, and Dr. Roth has shown unmistakeable signs that he possesses this essential quality, for he has, at considerable expense and trouble, gathered together a vast amount of information and facts to establish the necessity of attending to the physical education of our youthful population.

The title page of Dr. Roth's little book is not only an index to his views, but is a veritable impeachment of the present Ministry. It thus reads:—"On the Neglect of Physical Education and Hygiene, by Parliament and the Educational Department, as the principal cause of the Degeneration of the Physique of the Population, of the excessive Infantile and General Mortality, and of many Diseases and Deformities; with an Abstract of a Report on the present state of Physical Education on the Continent, by Dr. Roth's special Commissioner; and Suggestions relative to the Introduction of these neglected Branches of National Education."

This is a sufficiently comprehensive exposition of the object of the author. Let us briefly see how he carries out his programme.

He opens with an extract from a speech of the present Prime Minister, who is represented to have said at the Free-Trade Hall, Manchester, April 3rd, 1872: "After all, the first considerations of a minister should be the health of the people. . . . If the stature of the race every ten years diminishes, the history of that country will soon be the history of the past." On this passage Dr. Roth observes, "According to the views of the Prime Minister, the history of England will soon be the history of the past." Why? Because Dr. Roth found that the standard of recruits had lowered since 1845. We do not wish to be accused of jingoism, but we must certainly protest against this primary conclusion—based on such insufficient data—from the Prime Minister's words. Because recruits have been admitted at a lower standard into the army, it does not follow that the stature of our race is lowered, for there are other factors to be taken into account in estimating the causes which led to a lowering of the standard—*e.g.*, as the difficulty of inducing the same class to enter the army in 1873 as that which entered in 1845. The unexampled commercial development of England, emigration from Ireland, the unpopularity of the Service, must all be estimated as tending to diminish the supply of available candidates, so that we cannot admit that the Right Hon. B. Disraeli's prognostications have been fulfilled, or that on reasoning, such a deduction as that of Dr. Roth, can be drawn from the words attributed to him. In the Introduction we have a sketch of the aim of the pamphlet, followed by some extracts from speeches, showing how physical education has been neglected by Parliament, by the Educational Department, and by learned societies, with opinions on thorough education, and some data to prove the progressive degeneration of the physique of the population of Great Britain.

Dr. Roth next favours us with the questions submitted to

various Continental Governments, with the answers he received. We have then a report by Mr. Bernard Roth, F.R.C.S., on Physical Education in Continental Schools; and, finally, a review of the present state of scientific physical education in England, and some concluding chapters on the advantages of hygiene, and suggestions. We need hardly say we thoroughly sympathise with the author in the laudable work he is engaged in, and Dr. Roth deserves the success which he is sure to attain. Within the compass of 86 pages, he has contrived to compress an amount of information unequalled of its kind, and upon which no one is more qualified to speak.

We would like to see this pamphlet circulated amongst our members of Parliament, principals of schools, school-board managers, and, in fact, amongst all who have to do with our young growing population.

(3). We cannot do justice in a short notice to this essay, which presents us with a new theory of the inter-relations of nerve force and muscular tissue throughout the body, and with a new theory on the mode of action of that large class of drugs which operate through the medium of the nervous system. It is a thoughtful, well-reasoned and ambitious book, bristling with authorities, and evidently the work of one who has paid great attention to contemporary literature.

Any of our readers who will refer to page 114, "The Alcohol Question," will be convinced of this. Dr. Richardson's views come in for considerate, though severe handling, and Dr. Poole observes in reference to Dr. Richardson's reasoning, "This is not what was to be expected from such a source; while the graver errors referred to, are the more to be regretted in the champion of a noble cause, because they weaken confidence in his other arguments, which, unfortunately, are not wholly free from the taint of a too zealous partisanship," p. 228. We believe the majority of the profession will endorse this verdict. We hope to return to this work again.

(4) Neurasthenia is the term applied by Dr. Beard to that very common disease known under the name of "nervous exhaustion," and this pamphlet is a reprint from a paper read before the New York Neurological Society, the purport of the essay being to study in detail the differential diagnosis of this condition, and of the functional nervous diseases allied to it, and to which it leads. As a contribution to the literature on the subject, the paper is well worthy of perusal.

## DANGER OF INJECTING THE UTERUS WITH PERCHLORIDE OF IRON.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—I am one of those practitioners who have always considered that the injection of perchloride of iron into the uterus was a very serious, unwise, and unscientific proceeding, and I am glad to see that you have given due prominence to a fatal case brought before the Obstetrical Society of London. It may be—and I am not inclined to dispute the point—that where death does occur it is due to shock rather than to the perchloride of iron; and swabbing the mucous surfice, as recommended by Dr. Barnes, ought in every instance to be adopted. There are cases on record where the violent injection of cold water has produced death in highly sensitive women (and these are not unfrequently the most prone to vaso-motor influences and hæmorrhages). I have always maintained that if it is necessary to apply perchloride of iron, nitric acid, or any other caustic or styptic to the uterine mucous surface, it is far less dangerous to do so by using strong solutions of these agents by means of a moistened sponge or piece of lint, than to forcibly inject the uterine cavity with any fluid, even if that be water.

I am, Sir,

Your obedient servant.

T. STRETCH DOWSE, M.D., F.R.C.P.E.

Old Burlington Street, London, W.
May 16, 1879.

## THE CONTAGIOUS DISEASES ACTS.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—At the risk of being considered a transcendental lover of justice, I side with Dr. M'Clintock and Mr. Stokes in the late debate at Dublin on the Contagious Diseases Acts. I hold that the only fair way to stamp out syphilis (gonorrhœa, alas! will never be stamped out, as long as the race exists) would be to treat men and women alike. I would, therefore, repeal the present Contagious Diseases Acts, and, in their place, have a statute to admit of the prosecution of all persons communicating syphilis—not gonorrhœa nor soft sores—to their neighbours. I am well aware that "the mass of the profession" favours the Contagious Diseases Acts; but the mass of the profession was quite against them twenty years back, and may be so again.

I am, Sir,

Your obedient servant,

C. R. DRYSDALE, M.D.

17 Woburn Place, W.C.
May 17, 1879.

# Medico-Parliamentary.

## HOUSE OF LORDS—THURSDAY, MAY 15TH.

### HABITUAL DRUNKARDS BILL.

THE House went into Committee on this Bill.

Earl BEAUCHAMP moved an amendment, the effect of which would have been to limit the operation of the Act to seven years. He thought it was desirable that at that time Parliament should have an opportunity of considering whether this legislation was to be maintained or extended.

The Earl of SHAFTESBURY said that if the amendment were carried, medical men would not set up establishments of the kind contemplated by the Bill, if there was a risk of the Act expiring at the end of seven years.

On Clause 6, the Archbishop of YORK moved an amendment, "That no licence should be given to any person who was licensed to keep a house for the reception of lunatics."

Agreed to.

The remaining Clauses were agreed to, and the Bill passed through Committee.

## HOUSE OF COMMONS—THURSDAY, MAY 15TH.

### THE DUBLIN COLLEGE OF SCIENCE.

IN reply to Dr. Playfair, Lord G. HAMILTON stated that it was quite true that an intimation had been conveyed to Professor Galloway, Professor of Chemistry in the College of Science, Dublin, that his services would not be required after the close of the present session in the College of Science. As Professor Galloway had been connected with the College of Science for twenty-three years, he could assure the right hon. gentleman that this decision had not been arrived at by the Lord President and himself without careful and anxious consideration; and the only reason he could assign was that it was absolutely necessary for the welfare of the College that such step should be adopted. There would be no objection to lay on the table the papers relative to the matter.

### SLAUGHTER-HOUSES.

In reply to Sir E. Wilmot, Mr. SCLATER-BOOTH observed that the whole of the country was under the direction of urban or rural sanitary authorities. The urban sanitary authorities had power to provide slaughter-houses, and in addition to that they had likewise the power, under the sanction of the Local Government Board, of making rules for the regulation of slaughter-houses, whether public or private, with a view not only to sanitary conditions, but also to prevent cruelty in the slaughter of animals. The Local Government Board have issued a model series of bye-laws for the convenience of sanitary authorities. The rural sanitary authorities might also apply to the Local Government Board to do either of the two things which

were in the power of the urban sanitary authorities. He did not think it would be expedient to proceed further in this matter, and to introduce Government supervision over slaughter-houses.

# Novelties.

## PEPTOLEINE.

THERE is a growing and praiseworthy tendency among pharmaceutists to disguise the taste of drugs, and to make all kinds of nauseous medicines as palatable as possible. Messrs. Burgoyne, Burbridges, and Co., have introduced, under the above name, a preparation of cod-liver oil, of which we have had some experience, and which we can recommend to those who wish to reap all the advantages, without feeling any of the disagreeable affects, of this valuable medicine. It consists of an emulsion made with gum acacia, along with some balsam of Peru and phosphate of soda, and containing 50 per cent. of the oil. It is of an agreeable milky appearance, it mixes well with water or milk, and sits well upon the stomach. The Peruvian balsam and phosphate of soda are very useful adjuvants, and, in our opinion, add much to the value of the preparation. We find that some patients complain that the fishy taste of the oil is not so much disguised as they expected it to be ; but this may be regarded as a failing rather than as a fault, for were the peculiar taste of cod-liver oil completely obliterated, people would think they were taking some inert concoction, and not cod-liver oil at all.

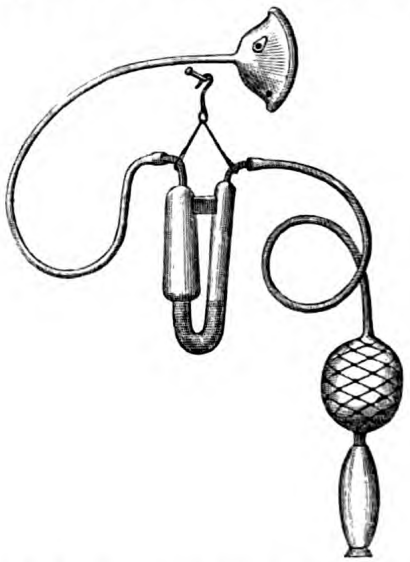
## A SOLUBLE ESSENCE OF GINGER.

AT the meeting of the British Pharmaceutical Conference, held in Dublin last year, the subject of Soluble Essence of Ginger created some interest, and two papers were read upon this preparation by Mr. Thresh and Mr. Procter. These papers gave rise to a considerable discussion, and were probably inspired by the soluble essence made by Mr. Hay, of Hull, who has *produced a soluble essence* which certainly is a clever pharmaceutical preparation. The difficulty in making an essence of ginger which, at the same time that it is soluble in water contains the aroma and also the pungency of the drug, is very great. The aroma is due to a volatile oil, very much changed in quality by distillation, whilst the pungency is due to some active principle which is so associated with the resinous part of the drug, that it is difficult to separate them sufficiently to render the resulting preparation miscible with water. It is probable that the difficulty of preparing a soluble essence has invested this question with more importance than it would otherwise have received. However, this does not detract from the merit of Mr. Hay's formula, which at present has not been discovered by any other chemist. If Mr. Hay's preparation is mixed with cold syrup it makes a syrup of ginger, which although bright at first becomes a little cloudy on standing forty-eight hours, but if it is mixed with boiling syrup, a permanent bright preparation can be obtained superior to the pharmacopœial syrup in appearance and stronger if necessary. Mr. Hay's essence of ginger does not contain any capsicum. He seems to have succeeded in preserving the aroma, and at the same time removing the objectionable resin. We have examined some so-called soluble essences of ginger now in the market, which certainly have not the slightest pretensions to the name soluble, and in one case the so-called ginger essence was largely adulterated with capsicums.

## APPARATUS FOR THE ADMINISTRATION OF ANÆSTHETICS.

DR. TEUFFEL, of Stuttgart, describes, in a recent number of the *Medicinisches Correspondenzblatt die Wurtembergischen ärztlichen Vereins*, a new apparatus for inhaling chloroform and other anæsthetics :—

It consists of an india-rubber mouth-piece, a U-shaped receptacle, hand-bellows, and connecting tube. The mouth-piece, which has a thickened edge, is of the usual shape, intended to enclose the mouth and nose hermetically. In its upper portion it has an opening 14 millimetres (9-16ths in.) wide, which is closed by a very sensitive valve of india-rubber opening outwards ; and near its lower edge it has another opening of half the diameter of the former, likewise provided with a sensitive valve, opening inwards. The mouth-piece is connected with the U-shaped vessel by a rubber tube 50 cm. (20 inches) long, and 1 cm. ($\frac{3}{8}$ inch) wide. The U-shaped receptacle is cm. ($7\frac{3}{4}$ inches) high, and one of its arms, as well as the lower bent, has a diameter of 5 cm. (2 inches), while the



upper part of the second arm (see cut) is dilated in the shape of an inverted cone. Between the two arms of the receptacle a piece of cork is inserted, to make the apparatus less liable to be broken, and a wire hook is likewise attached to it for the purpose of suspending it at any convenient point near the patient. Both arms of the receptacle terminate in narrow curved tubes, for the attachment of the rubber connection. The air-bellows attached to one of the outlets are sufficiently intelligible without special description. When using the apparatus, a quantity of the anæsthetic, say for instance, chloroform, is introduced into the receptacle, sufficient to fill the lower part of the U-shaped tube, as far as the shaded lines indicate, and a small pellet of loose cotton is inserted between the outlet from the dilated arm and the connecting tube. The object of this is to prevent any drops of the liquid being mechanically thrown into the tube when air is blown through the apparatus. A quantity of 60 cubic centimetres (ab. 2 fl. ℥) of chloroform will be sufficient, and will be able to keep up narcosis for two to four hours. At first the mask is loosely placed upon the face of the patient, and a slow current of air driven through the apparatus, which becomes saturated with the chloroform. The patient having gradually become accustomed to the anæsthetic, the mask is applied more closely and finally air-tight, and the air now forced through the apparatus only during the act of inspiration, which is plainly marked by the working of the lower valve in the mask. During exhalation the current is interrupted. Dr. Teuffel states that under the use of this apparatus the stage of excitement is very rapidly passed, the narcosis rapid and complete, and unattended by the usual struggles or other inconveniences. The apparatus is sold at a very moderate price which is amply repaid by the great saving in chloroform.

## THE VACCINATION (IRELAND) AMENDMENT BILL,

WHICH stands for re-committal in the Commons, has made no progress since our last. This Bill was drawn by the Irish Medical Association, submitted by them to the Chief Secretary, and introduced by him, after much badgering, spoiled by the removal of clauses which were of great importance, and by the interpolation of others which were foolish and impracticable. As to the details of the Bill, and of the amendments which Mr. Meldon, on behalf of the Irish Medical Association, now proposes, those of our readers who are Irish Poor-law medical officers are already informed. They are technical changes calculated to improve the machinery of the system, and why they were struck out of the original Bill no one can say, save that the Chief Secretary was desirous of showing that the Bill was his own conception. The original Bill contained clauses which would raise the Irish vaccination fee to the same level as that of England, *i.e.*, half-a-crown, and would introduce into Ireland the award system, which has worked so well in England. The Chief Secretary met these suggestions by fixing the fee for Ireland at 1s. 6d., and striking out the proposal to reward Irish vaccinators for their success as English vaccinators are remunerated. He has since raised the fee to 2s., but Mr. Meldon has an amendment to fix it at 2s. 6d., and Mr. Mitchell Henry another to enact the award system. Such amendments have common justice to recommend them, and we could hardly understand what objection Mr. James Lowther will be able to urge against their adoption.

## DUBLIN CONVALESCENT HOME.

AT the meeting of the Committee, held last week, the cash account showed a total of £1,188. The sub-committee appointed to visit sites mentioned as suitable for a convalescent home, handed in their report. It was resolved that the visiting committee be requested to continue their search for a site for the home, and to report again to the committee to-day.

## DEATH FROM SMOKING A TOBACCO PIPE.

LAST week an inquest was held in the co. Sligo on the body of a boy of fourteen years of age. It was given in evidence that the deceased went into the house of a neighbour and lifted an old or much-used tobacco pipe, which he lighted and smoked for some time, after which he became ill, and was seized with vomiting. He was taken home and put to bed, but the sickness continued till half-past three o'clock the next morning, when he died. The coroner, suspecting that death had resulted from poisoning, adjourned the inquest in order that a post-mortem examination of the stomach and intestines might be made, so as to ascertain the exact cause of death. At a later hour of the evening the jury assembled, and the medical gentlemen said, as the result of their examination, that the boy came by his death from irritation and congestion of the stomach, acting on a heart previously rendered weak by fatty deposit; and considering the evidence given, they believed that the smoking of the pipe would cause the irritation and congestion of the stomach, which resulted in the collapse of the action of the heart.

## THE REGISTRARSHIP OF THE DUBLIN SCHOOL OF PHYSIC.

LAST week the Rev. Dr. Samuel Haughton was presented with an address and piece of plate by the professors, lecturers, and demonstrators of the School of Physic in Ireland, in testimony of his services as medical registrar. The chair was occupied by Dr. Alfred Hudson, Regius Professor of Physic, who, in presenting the address, remarked that previous to the time of Professor Haughton's appointment the school held a very inferior position. Within the past fifteen years it had made rapid progress, and had been raised from comparative insignificance to one which had few rivals. They attributed in a great measure to his influence the warm interest taken by the Board of Trinity College in the school, and the establishment of chemical rooms and museums, and the importance and efficient working of every department.

The Rev. Professor Haughton expressed his acknowledgements, and said it would be wrong if he were to take advantage of their too great kindness and appropriate to himself too large a share of credit for the unquestionably prosperous and flourishing condition which the medical school of this university occupied, He reviewed the past history of the school, pointing out the effects of the labours of Dr. Todd, and alluded to the fact that the justly celebrated Dr. Macartney attracted crowds of students, not only from every part of Ireland, but from England, to benefit by his instructions. It should not be forgotten however, that of those large classes of Macartney's 90 per cent. were content to learn their profession as a trade, and did not cultivate the highest education in arts. Macartney was there from 1813 to 1837, and Dr. Haughton showed how from '63 to '78 the number of pupils who, in addition to learning their profession, attained proficiency in the highest branches of arts, bore more than favourable comparison with Macartney's time—in fact, the proportions were reversed in favour of the students of the past fifteen years. There were between 1,700 and 1,800 persons who enter the profession in these countries annually. Less than 100 are graduates in arts, and more than one-half of those were from Trinity College. They therefore competed with no other school, but were at the head and front.

**College of Physicians in Ireland.**—At the May examinations the following gentlemen, having passed the necessary examinations, obtained the licenses in Medicine and Midwifery:—

MEDICINE.—William Richard Bates, Samuel Eitz Richard Beamish, Wallace Brown Croskery, William Edward Fitz Gerald, William Francis Heffernan, John Crawhall Nichol, Thomas Heazle Park, Jane Elizabeth Waterston.

MIDWIFERY.—Samuel Fitz Richard Beamish, Wallace Brown Croskery, William Edward Fitz Gerald, Thomas Heazle Parke, Benjamin Thomas M'Creery, Jane Elizabeth Waterston.

## NOTICES TO CORRESPONDENTS.

ROYAL MEDICAL BENEVOLENT COLLEGE.—Notice is given in our advertisement columns of the Annual General Meeting to be held on the 29th inst., when certain alterations in the bye-laws will be proposed by Dr. Hare. The election of ten members on the Council will also take place at the same meeting.

NAVAL HYGIENE.—You will be able to obtain the book at any London house. We do not know the price, but it is not an expensive work.

ANALYTICAL.—We cannot recommend any particular analytical chemist in our columns. Yours would not be a difficult matter, the most ordinary analyst could do it. Avoid those who are known to go the round of commercial houses with high promises as to *what they can do*: their fee is always ten times what it should be, and their names, moreover, offer no guarantee to the profession.

*To the Editor of the* MEDICAL PRESS AND CIRCULAR.

SIR,—In your issue of May 7 you published the following article from Mr. Frazer, F.R.C.S.:—

CAUTION IN THE USE OF VASELINE AND SIMILAR PETROLEUM DERIVATIVES

By W. FRAZER, F.R.C.S.

"Recently some persons using Vaseline were affected with eruptions on the face resembling eczema and causing rather persistent scabs; as all the persons thus affected got their remedies from a common source, inquiry was made whether any accidental circumstances could account for this unusual accident; fortunately, the vessel in which the substance was contained was preserved. It had been sent from a wholesale druggist with a covering of red paper, from which the dye was dissolved in great measure by the mineral oil. In fact, the irritation resolved itself into another example of the well-known action of an arsenical colouring matter of the magenta class upon the human skin."

Will you permit me to say that we are the only manufacturers of "Vaseline." The process by which it is made is patented, and is our property, and the word "Vaseline" is registered as our trade mark. In order to protect our article from adulteration with paraffine, wax, or other substances, and to prevent the occurrence of just such an accident as Mr. Frazer reports, we put it up in 1s. 6d. and 5s. 6d. tins, with our name and trade mark stamped thereon. If the wholesale house

had sent their customer one of our 1s. 6d. tins instead of transferring a portion from one of our 5s. 6d. tins to a jar of their own, the circumstance referred to could not have happened.

We are, very respectfully yours,
THE CHESEBROUGH MANUFACTURING COMPANY,
7 Snow Hill, London, E.C.,
May 12, 1879.

MR. J. ADAMS.—We shall be glad to see the case, and report in our columns if of interest. In future communications kindly address the Editor in your division of the kingdom, in order to avoid delay.

NE SUS MINERVA.—The subject of your communication is a proper one, and the system liable to great abuses; but we must adhere to our rule of demanding the name and address of the writer, not necessarily for publication but as evidence of *bonâ fides*.

L.R.C.P.Ed.—You will find the question answered in our "Notices to Correspondents" last week.

CLINICAL SOCIETY OF LONDON.—On Friday, May 23, at 8½ p.m., Dr. Coupland and Mr. Hulke, "A Case of Intussusception associated with Polypoid Tumour; Laparotomy; death.—Dr. Skerritt (of Bristol), "On the Simulation of Ascites in Cases of Intestinal Obstruction."—Dr. Stephen Mackenzie, "Cases illustrating the Communicability and some other points connected with Molluscum Contagiosum."—Dr. Lees, "Two Cases of Paralysis of the Serratus Magnus as a part of Infantile Paralysis."—Mr. Brodhurst, "A Case of Genu Valgum with some Remarks on Subcutaneous Osteotomy."—Mr. George Brown, "Gas in the Peritoneal Cavity in Typhoid Fever relieved by Puncture." Mr. George Brown will also exhibit a Child in whom an Operation for Congenital Hypertrophy of the Tongue has been performed.—Mr. Morrant Baker, "A Case of Amussat's Operation for Artificial Anus."

DR. PATERSON.—1. The degree is not a registrable one in this country. 2. On the strength of your diploma from the College of Physicians of Edinburgh you can assume the title of "Dr.," and use it on your door-plate. 3. You cannot legally put "M.D." after your signature, as such initials imply the attainment of a degree from a university legally recognised in this country.

POSTHUMOUS LARCENY OF MEDICAL TITLES.—Our attention is called to the frequent affixing to the names of deceased medical men of titles which they never possessed. One defunct gentleman has recently been advertised in the daily papers as M.D., F.R.C.S.I., he having been really neither one nor the other. It reminds us of the distich put in the mouth of a dying lady of fashion by Pope:—

"Narcissus! give this cheek a little red,
One would not be quite hideous when one's dead."

POOR-LAW MEDICAL OFFICERS' ASSOCIATION.—The Annual Meeting of this Association will be held at the Freemason's Tavern, Lincoln's Inn Fields, on Tuesday, June 3, at 3 p.m. precisely. The members of the Association will dine together at 6 p.m.; dinner-tickets, exclusive of wine, 7s. 6d. The Council express a hope that poor-law medical officers will make every effort to be present on this occasion, and that they will signify the same as soon as possible to Dr. Rogers, 33 Dean Street, Soho, or to Mr. J. Wickham Barnes, F.R.C.S., 3 Bolt Court, Fleet Street, London, E.C.

THE LAY PRESS AND MEDICAL TERMS.—The author of "Medical Men and Manners" writes to us: "In dealing with medical affairs by cross-examination of witnesres, or otherwise, "gentlemen of the bar" take strange liberties with our profession from time to time. Nor are those wonders of natural history, the peripatetic correspondents of penny newspapers noted for the accuracy of the terms they use in "getting up" the literature of a post-mortem or sensational murder case, or the indisposition of some prince, general, or statesman. The newest thing, however, in the above line is given in the daily papers of Saturday, on the authority of a Reuter's telegram, dated—"Rome, Friday. General Garibaldi's indisposition has increased, and he suffers greatly from arthritic pains in the stomach." I remember nothing quite so funny as this of late, but some thirty-five years ago the then popular nigger melody of *Ole Dan Tucker* made us, as youngsters, "burst our sides" to hear that poor Dan had got "the toothache in his heel." The General has now "inflammation of the great toe in his stomach!"

TO BE SOLD.—The following advertisement appears in a recent number of the *Medicinisch-Chirurgisches Centralblatt*: "Through the death of the late proprietor, a good practice (surgery) in a wealthy part of the country is to be disposed of, either by sale or lease. The present owner, daughter of the deceased, is young and single, and would not object to marriage with the buyer or tenant, if suitable arrangements were made. Address, &c."

ANCIENT EYE SALVE.—In the discoveries made at Uriconium a patent medicine was brought to light or rather, says Dr. Winter, "the seal of the physician who vended it,"—an eye salve, marked, like Rowland's Macassar, with his name, to prevent "unprincipled imitation," as follows:—"TIBerii CLaudii Medici DIALIBAnum AD OMNE VITium Oculorum EX OVO. Translated as "The dialibanum of Tiberius Claudius, the physician for all complaints of the eyes, to be used with egg."

PICTURES FROM THE PARISIAN HOSPITAL.—Professor (who has his class in the wards) to patient, "What is your occupation?" Patient (who has pulmonary disease), "Musician, Sir." Professor, to class: "There, gentlemen, at last I have the opportunity of demonstrating what I have often told you in the lecture-room, that the wear and tear on the respiratory tract caused by the blowing of musical instruments, is a fertile source of just such difficulty as our patient here labours under. (To patient), "What instrument do you play, Sir?" Patient: "The bass drum!"

COMMUNICATIONS, Enclosures, &c., have been received from—Si Henry Thompson, London. Dr. Day, London. Dr. Atthill, Dublin. Dr. Jones, Cork. Dr. Black, Glasgow. Dr. Tilt, London. Dr. Löwenberg, Paris. Dr. Byrd, Quincy, United States. Dr. Clarence Blake, New York. The Registrar of the Medical Council. The Registrars-General for England, Ireland, and Scotland, Surgeon-Major Taylor, Royal Horse Guards. Dr. Cowling, Louisville, United States. Dr. Morell Mackenzie, London. Dr. Pavy, London. Dr. Thorowgood, London. Mr. O'Grady, Dublin. Mr. Ormsby, Dublin. Dr. Griffith, Pimlico. Mr. Hillary, Dublin. Dr. Stretch Dowse, London. Dr. Bevan Lewis, Wakefield. Mr. Jabez Hogg, London. Dr. Bernard Kelly, Rotherhithe. Mr. Morrant Baker, London. Mr. W. C. Poole, Dublin. Mr. Allingham, London. Mr. Haviland, Northampton. Dr. Prosser James, London. Prof. Tichborne, Dublin. Dr. Johnstone, Leicester. Dr. Cunningham, Edinburgh. Dr. Tuckey, Castletownroche. Dr. McKenna, Mountmellick. Dr. Whitaker, Broadway. Dr. Ward, Parstonstown. Dr. Atkin, Oldacstle. Dr. Murdock, Dublin. Dr. Russell, Thurles. Dr. Rawson, Carlow. Dr. Miller, Derry. Dr. Saunderson, Philipstown. Dr. Malcomson, Cavan. Dr. Powell, Roscrea. Dr. Rice, Galway. Dr. McLaughlin, Strongford. Dr. Russell, Cashel. Dr. Peirce, Newcastle. Dr. O'Reilly, Clones. Dr. Whittaker, Valentia. Dr. Wilmot, Dublin. Dr. Tweedy, Dublin. Dr. Porter, Dublin. Dr. Brennen, Kiltonner. Dr. Brodie, Lismany. Dr. Bodkin, Tuam. Dr. Beatty, Dublin. Dr. Frost, Newmarket. Dr. Barr, Liverpool. Dr. Cornelius, Mountrath. Dr. Stokes, Cahir. Dr. Farre, London. Mr. Barnard Holt, London. Mr. Douglas Hemming, Bournemouth. ## VACANCIES.

Carmarthen Infirmary.—House Surgeon. Salary, £125. Applications to the Secretary, 58 King Street, Carmarthen.

Liverpool Dispensaries.—Assistant House Surgeon. Salary, £108. Applications to the Secretary, 34 Moorfields, Liverpool, before May 26.

London School of Medicine for Women.—Lectureship on Materia Medica. Applications to the Dean before June 12. (See Advt.)

Ongar Union, Essex.—Medical Officers for Nos. 1 and 2 Districts. Salary, £105 for the first; £55 for the second named. Applications to the Clerk, at Chipping Ongar, before May 29.

Portsmouth Lunatic Asylum.—Medical Superintendent and Assistant Medical Officer. Salary of the former to commence at £450; of the latter at £120, with board. Applications to the Town Clerk before May 26.

Rathdown Union, Powerscourt Dispensary.—Medical Officer. Salary, £110, with fees. Election, May 29.

Royal College of Surgeon, Ireland.—Curator of the Museum. Salary, £250. Election, June 5.

St. Mary's Hospital, Paddington, W.—Demonstrator of Anatomy. Salary, £100. Applications to the Dean of the School before June 7.

Tullamore Union, Clara Dispensary.—Medical Officer. Salary, £100, with fees, and £20 as Sanitary Officer. Election, May 30.

University of London.—Examinership in Medicine. Salary, £120. Applications to the Registrar. Election, June 18.

## APPOINTMENTS.

ALLARD, J. H., L.R.C.P.Ed., M.R.C.S., Medical Officer for the Tewkesbury District and Workhouse of the Tewkesbury Union.

BLAKE, R. M., L.R.C.S.I., L. & L.M.K.Q.C.P.I., Medical Officer to the Ravensdale Dispensary, Dundalk Union.

BURNES, H. F., L.K.Q.C.P.I., Acting Surgeon to the 28th Middlesex (London Irish) Rifle Volunteers.

CRITCHETT, G. A., M.R.C.S., Ophthalmic Surgeon to the Royal Free Hospital.

DUNLOP, A., L.R.C.P.Ed., L.R.C.S.Ed., Junior Resident Medical Officer to the Belfast Royal Hospital.

EVANS, J. W., M.R.C.S.E., House Surgeon to the Liverpool Eye and Ear Infirmary.

HAYES, T. C., M.D., M.R.C.P., Physician for the Diseases of Women to the Royal Free Hospital.

JOHNSON, J., M.R.C.S.E., Medical Officer for the No. 3 District of the Coventry Union.

LAMBERT, W. F., M.B., M.Ch. Univ. Dub., Medical Officer to the Abbey Dispensary, Tuam Union.

LEAHY, A. W. D., M.R.C.S.E., Surgical Registrar to the Charing Cross Hospital.

LOW, A. B., M.B., C.M., House Surgeon to the Sunderland and Bishopwearmouth Infirmary.

MCCOY, T. J., L.K.Q.C.P.I. & L.M., L.R.C.S.I., Medical Officer, Medical Officer of Health, &c., for the Cappagh Dispensary District of the Tipperary Union.

MORRIS, J. H., M.R.C.S.E., Honorary Surgeon to the Salford and Pendleton Royal Hospital and Dispensary, Manchester.

NICHOLLS, A. G., L.R.C.S.I., Medical Officer to the Drumlish Dispensary, Longford Union.

REID, G., M.B., C.M., Medical Officer of Health for the Stafford Rural Sanitary District.

RICE, W., L.K.Q.C.P.I. & L.M., F.R.C.S.I., Resident Medical Superintendent of St. Patrick's Hospital for the Insane, Dublin.

SALTER, J. R., M.R.C.S., House Surgeon to the Kidderminster Infirmary.

## Births.

AGNEW.—On May 8, at Lurgan, co. Armagh, the wife of S. Agnew, B.A., M.D., of a daughter.

FINLAY.—On May 14, at 21 Montague Street, London, W., the wife of David W. Finlay, M.D., of a son.

LLOYD.—On May 14, at the Lambeth Infirmary, the wife of R. H. Lloyd, M.D., Medical Superintendent, of a son.

## Deaths.

CLARKE.—On May 8, at Dinapore, P. J. Clarke, F.R.C.S.I., Surgeon-Major, Army Medical Department.

HEELIS.—On May 11, at Carshalton, Surrey, Robert Heelis, M.R.C.S., eldest son of Mr. R. Heelis, M.R.C.S., of West Brighton.

MARTIN.—On May 11, at The Grange, Dronfield, near Sheffield, Harriett Alice, wife of John W. Martin, formerly of Portlaw, aged 27.

THOMAS.—On May 5, at Highfield, Shepperton, Edmund F. Thomas, L.R.C.P.Ed., aged 31.

# IRISH POOR-LAW INTELLIGENCE.

## IRISH MEDICAL ASSOCIATION.

*(Continued from "Supplement" of May 7.)*

### PRISONS' MEDICAL OFFICERS.

It will be remembered that since the new "Prisons (Ireland) Act" came into operation the General Prisons Board attempted to force the duty of compounding medicines on the prisons' medical officers, and that a deputation from these officers waited upon the representatives of the Government to remonstrate against the illegality of such a procedure; and it being feared that the Board might possibly persist in its attempt, the Committee of Council instructed Mr. Clifford Lloyd, solicitor to this asssociation, to prepare and submit a case to Mr. Purcell, Q.C., who, in reply to the questions put to him, is of opinion:—

1. That the General Prisons Board has no power to impose upon the medical officers appointed prior to the passing of the "Prisons (Ireland) Act, 1877," the duties of an apothecary, or to compel them to compound medicines.

2. That the refusal by a medical officer (appointed prior to the passing of the Act) to undertake the duties of an apothecary would not constitute a legal ground of dismissal by the Board.

3. Should the Board dismiss a medical officer on the ground of his refusal to act as an apothecary, that an action would lie by the medical officer against the Board to recover damages for such wrongful dismissal, and that he would be entitled to a *mandamus* to be restored to his office.

4. That the medical officers have a legal right to retain their offices on the terms of the old Act (7th Geo. IV., c. 74), and that the Board can only dismiss them for incompetency or misconduct.

### MEDICAL WITNESSES AT SESSIONS.

A communication was received from a member of this association complaining that he had been summoned as a Crown witness to attend sessions and give evidence, and that, although he resided a considerable distance from the sessions town, he had been paid only one guinea a day and one guinea for travelling expenses. The correspondent was advised to direct the attention of the Crown solicitor to the recent change made (at the instance of this association) in the attorney-general's rules, by which he was entitled to two guineas a day for attendance at court, besides the amount of his travelling expenses. The advice was adopted, and the proper fees and expenses were forthwith paid. In this case the Crown solicitor demanded *a fee of sixpence* in his first letter, but subsequently made no reference to it. The Committee of Council are not aware that any fee, *even sixpence*, has ever been demanded in such a case before, or that such a claim can be legally made.

### SUBSTITUTES FOR DISPENSARY MEDICAL OFFICERS IN CASES OF ILLNESS.

The Committee of Council ordered a supply of printed copies of their letter on this subject (published in the appendix to the last annual report) with a view to circulate it whenever they became aware of cases of difficulty or dispute arising between dispensary medical officers and guardians with regard to the appointment and remuneration of temporary substitutes in cases of illness of dispensary medical officers; and it is to be hoped that the information therein contained will, to a considerable extent, obviate the frequency of disputes occurring on this subject.

### SUPERANNUATION.

The earnest attention of the Committee of Council has been given to this subject with a view to improving the at present most unsatisfactory state of the law regarding it; but the question is a very difficult one, requiring legislation, and as all previous attempts to obtain the concurrence of the Government and the authorities have failed, the Committee of Council have under their consideration the practicability of drafting a Bill to amend the Medical Charities Acts which may meet wtih the necessary approval; and whilst proposing a satisfactory amendment of the law regulating superannuation of medical officers, they will also endeavour to suggest acceptable remedies for the many abuses of the Medical Charities' system of Ireland. Such a Bill will, of course, require deep and lengthened consideration; not the least point to be dealt with—though a very essential one—is the definition of "poor persons," who *only* should be entitled to receive dispensary medical relief.

### MEDICAL ACT (1858) AMENDMENT BILL.

The following document has been drawn up on the subject of the legislation required to amend the Medical Act; with your approval the Committee of Council would circulate it amongst the members of Parliament and all persons concerned, viz.:—

The Council of the Irish Medical Association, having in view the probability that during the approaching session of Parliament measures will be submitted for the alteration and amendment of the laws which affect the medical profession, desire to make known their views upon the principal points which are likely to be dealt with in those measures.

Any proposals to alter, amend, or supplement the existing laws must of necessity take cognisance of the following matters:—

1st. The education of persons seeking admission to the profession.

2nd. The tests of fitness for admission to the practice of the profession.

3rd. The constitution of the authority which is to control the education and testing of candidates for admission to

the profession, and which is to regulate generally the conduct of the teaching and examining bodies, as well as of the members of the profession.

4th. The powers and privileges of existing medical colleges and corporations, and their relations, on the one hand, to candidates for entry to the profession; and on the other, to the controlling authority.

The Council recognise that all the above matters require to be dealt with by a comprehensive scheme of legislation.

The Council are fully aware that the professional education of candidates for the medical profession is not such as it should be, while the preliminary education of medical students is especially defective; in many instances of so low a class that it should debar the student from admission to *any* profession. Furthermore, that the tests for fitness to enter the profession are so unequal and so irregularly applied, that candidates rejected by one licensing body can obtain diplomas to practise from another; and that candidates who have successfully passed examinations for diplomas in medicine are rejected at examinations for diplomas in surgery, and *vice versâ*.

The Council believe that a complete alteration of the constitution of the General Medical Council, now the controlling authority of the education and examination of candidates, is essential; inasmuch as the defects in education and examination which have been above pointed out, could not have continued during the whole twenty years of the existence of the General Medical Council had that body been a properly constituted, vigilant, and influential authority. The Council consider that the conduct of the existing universities and medical corporations is not, and has not been, such as to entitle them to be continued in the unrestricted exercise of their present privileges in relation to the admission of candidates to the profession. The competition going on at present between the various licensing bodies tends to lower the standards of education and examination to such a degree, that the admission of unsuitable persons to the profession, through the portals of some of the licensing bodies, is a matter of very common occurrence.

A large number of the points noticed above are clearly matters of detail which cannot be directly altered by legislation, but must be dealt with by administration.

The Council, therefore, think it well to deal first with the question—What should be the constitution of the administrative body? The present General Medical Council has clearly failed to perform the functions for which it was constituted, otherwise the proposed legislation would be unnecessary. It has many defects, the principal of which are: 1st. That it represents chiefly the licensing bodies, which it is its principal duty to control, and usually only the executives of those bodies. 2nd. That it to a very slight degree represents the medical *profession*. 3rd. That there is little or no relation between the amount of representation and the professional importance of the bodies represented.

* * * * *

If it be admitted that adequate representation of professional interests in the General Medical Council is desirable, it is clear that the method of election to that body must be changed and the constituencies widened. The Council are of opinion that each member of the body corporate of each medical corporation should have a vote for the representative of that corporation, and that those who do not possess such a vote should be directly represented on the General Medical Council; such representation being the best means by which the General Medical Council could obtain correct information as to the opinions and desires of the great majority of the medical practitioners throughout the United Kingdom.

It has been urged as an objection to the proposal for direct representation, that it would unduly increase the number of the Councillors, which is by many considered to be already too large, and to meet this objection the Council suggest that the number of existing seats might be reduced with advantage. The work done by the University of Durham, as a licensing body, is quite insignificant, and might therefore be fully represented if conjoined with the University of London. It does not appear probable that the Apothecaries' Company of London will long continue as a licensing corporation, and its representation in the Medical Council might therefore be dispensed with; while the Apothecaries' Hall of Ireland cannot be considered to be, or ever to have been, anything more than a body for the licensing of pharmaceutists, and for this reason has no more claim than the Pharmaceutical Society of Ireland to be represented on the General Medical Council. The Faculty of Physicians and Surgeons of Glasgow might be fairly grouped for representative purposes with one of the groups of the Scotch Universities, and in this way direct representatives of the profession might easily be admitted without unduly increasing the number of the General Medical Council.

The absolute control of professional education and examination should be vested in the newly constituted General Medical Council, subject, of course, to an appeal to the Privy Council, in case any regulation issued by it seemed to be improper or oppressive.

With respect to alterations in the power and privileges of the licensing corporations, the Council are of opinion that while it is inadvisable either to extinguish or diminish the beneficial influence which the medical corporations exercise upon the profession, yet it is essential that such corporations should cease from the downward competition which at present exists among them; and the Council consider that a judiciously devised scheme of conjoint examinations for each division of the United Kingdom would be sufficient to terminate this injurious competition; but such a scheme would prove inefficient unless it provided for absolute uniformity amongst the three proposed conjoint examining boards in standard of examination, in extent of curriculum, and in amount of fees. Such conjoint boards should not, under any circumstances, be licensing bodies, but the persons who have passed exam nations by such boards should be required, as heretofore, to obtain their qualification for practice from the existing licensing authorities, for the Council believe that it would be most disastrous to the public welfare if the members of the medical profession were removed from the moral control which licensing corporations are capable of exercising.

The Council of the Irish Medical Association therefore recommend that any legislative measures which may be enacted should include—

1. A revision of the constitution of the General Medical Council—
   - (*a*) By a more equitable distribution of seats amongst the licensing authorities.
   - (*b*) By widening the constituencies which elect the representatives of several of these bodies.
   - (*c*) By a more direct representation of the general body of the profession.

2. The grant to the Medical Council of complete control over the education and examination of candidates for admission to the profession.

4. The compulsory establishment of a single conjoint examination for each division of the United Kingdom, which examination should be essential for admission to the licence or degrees of any of the medical authorities.

5. The enforcement of absolute uniformity in standard of examination, extent of curriculum, and amount of fees payable, required by each and all of the conjoint examining bodies.

The Council of the Irish Medical Association believe that if the above principles be adopted in the measures which may come before Parliament, they will receive the general support of the profession and the public.

THOMAS PURCELL,
Chairman of the Council.

JOHN WILLIAM MOORE, M.D.,
Hon. Secretary to the Council.

JOHN H. CHAPMAN,
Hon. Secretary.

## THE DAIRIES, COW-SHEDS, AND MILK-SHOPS (IRELAND) ORDER OF 1879.

*Preliminary.*

1. This Order may be cited as "The Dairies, Cow-sheds, and Milk-shops (Ireland) Order of 1879.

2. This Order shall take effect from immediately after the 10th day of February, 1879.

3. This Order extends to Ireland only,

4. In this Order :—The Act of 1878 means "The Contagious Diseases (Animals) Act, 1878." Other terms have the same meaning as in the Act of 1878.

*Registration of Cow-keepers and others.*

5. (1.) Every local authority shall, with all practicable speed after the making of this Order, open, and shall thenceforth keep, a register for the registration with them under this Order, of all persons from time to time carrying on in their district the trade of cow-keepers, dairymen, or purveyors of milk, and shall from time to time revise and correct the register. (2.) The local authority shall give public notice by advertisement in a newspaper circulating in their district, and, if they think fit, by placards, handbills, or otherwise, of the time at which the register will be opened, and of the mode of registration. (3.) After the expiration of the time prescribed in this behalf in the advertisement, not being more than two months, and not being less than fourteen days from the publication of the advertisement, it shall not be lawful for any person to carry on in the district of the local authority the trade of a cow-keeper, dairyman, or purveyor of milk unless he is registered as such under this Order.

*Dairies and Cow-Sheds.*

6. It shall not be lawful for any person following the trade of a cow-keeper or dairyman to begin to occupy as a dairy or cow-shed any building not so occupied at the making of this order, unless and until he first makes provision, to the reasonable satisfaction of the local authority, for the lighting, ventilation, cleansing, drainage, and water supply of the same, while occupied as a dairy or cow-shed.

7. It shall not be lawful for any person following the trade of cow-keeper or dairyman to occupy as a dairy or cow-shed any building, whether so occupied at the making of this order or not, if and as long as the lighting, ventilation, cleansing, drainage, and water supply thereof are not such as are necessary or proper—(*a*) For the health and good condition of the cattle therein ; (*b*) For the cleanliness of milk vessels used therein for containing milk for sale ; and (*c*) For the protection of the milk therein against infection and contamination.

*Cleansing.*

8. A local authority may, from time to time, make regulations for prescribing and regulating the cleansing of dairies and cowsheds in the occupation of persons following the trade of cowkeepers or dairymen, and the cleansing of milk stores, milk shops, and milk vessels, used for containing milk for sale by such persons.

*Contamination of Milk.*

9. If at any time disease exists among the cattle in a dairy or cow-shed, or other building or place, the milk of a deceased cow therein—(*a*) Shall not be mixed with other milk ; and (*b*) Shall not be sold or used for human food ; and (*c*) Shall not be sold or used for food of swine, or other animals, unless and until it has been boiled.

10. It shall not be lawful for any person following the trade of cow-keeper, or dairyman, or purveyor of milk, or being the occupier of a milk-store or milk-shop, to allow any person suffering from a dangerous infectious disorder, or having recently been in contact with a person so suffering, to milk cows, or to handle vessels used for containing milk for sale, or in any way to take part or assist in the conduct of the trade or business of the cow-keeper, dairyman, purveyor of milk, or occupier of the milk-store or milk-shop, as far as regards the production, distribution, or storage of milk, until all danger therefrom of the communication of infection to the milk, or of its contamination, has ceased.

11. It shall not be lawful for a person following the trade of cow-keeper, or dairyman, or purveyor of milk, or being the occupier of a milk-store or milk-shop, to use a milk-store or milk-shop in his occupation, or to permit the same to be used for the purpose incompatible with the proper preservation of the cleanliness of the milk-store or milk-shop, and of the milk-vessels and milk therein, or in any manner likely to cause contamination of the milk therein.

12. The Order in Council dated the 22nd day of March, 1878, and made by virtue and in exercise of the powers conferred by the Cattle Disease (Ireland) Acts, 1866-1874, is hereby revoked.

Given at the Council Chamber, Dublin Castle, the 6th day of February, 1879.

JAMES LOWTHER. O'HAGAN.
JAMES A. LAWSON HENRY ORMSBY.
EDWARD GIBSON.

## THE POSITION OF IRISH SANITARY OFFICERS.

THE Irish Medical Association has been, for some time, in active correspondence with the Irish Local Government Board, respecting the status and emoluments of medical officers of health under the new Public Health Act. We may remind our readers that when the Bill was before the House, and after its reference to a Select Committee, the Association worked with great vigour by the aid of a deputation in London to have it amended, so that the fixed scale of payment of sanitary medical officers set down by the former Act might be removed, and future remuneration determined according to the merits of each case.

This and other important points were conceded by the Government, and the Bill became law. For more than a year the Association waited for the Local Government Board to put the new law in force, and to issue a circular or new instructions to the sanitary authorities and medical officers. Having waited in vain, the Association at last addressed the Local Government Board on the subject, and, to their astonishment, were informed that, in view of the Local Government Board, the medical officers of health were not new officers under the new Act, but were subject to everything contained in the old Act, the new one being supposed to apply only to those who might be appointed in future. This reading of the law seemed utterly a variance with the intention and wording of the new Act, that the Association at once submitted a case for the opinion of Mr. Purcell, Q.C. The queries and replies of that case are as follows :—

*Questions.*

1. Whether the Local Government Board are not obliged by the Public Health Act, 1878, to regard the dispensary medical officer of each district as a new officer, under the title of "Medical Officer of Health," and consequently, to assign to him his duties as such ; and also whether such duties should be assigned separately from those of the other sanitary officers ?

2. Even should the Local Government Board thereby assign to the medical officer of health the same duties as the dispensary medical officer previously had to perform in his capacity of sanitary officer under the Public Health Act, 1874, are not the sanitary authorities and the Local Government Board bound to re-consider his salary, and to fix it as prescribed by the 11th section of the Public Health Act, 1878, and not according to the old scale laid down by the former Act ; and does not the 11th section of the Public Health Act, 1878, apply to all medical officers of Health, whether they were previously sanitary officers under the Act of 1874 or not ?

3. Are the urban and rural sanitary authorities bound to fix new salaries for all the medical officers of health, whether they had been sanitary officers under the Act of 1874 or not; and is the Local Government Board, under the 11th section of the Act of 1878, bound to consider same, without being prejudiced by any maximal limit, as the scale fixed by the repealed Act was abolished by the new Act?

*Reply.*

1. I am clearly of opinion that the "Medical Officers of Health" appointed by the 11th section of the Public Health (Ireland) Act, of 1878, are new officers, and not a continuation of, or identical with, the "sanitary officers" appointed under the 10th section of the Public Health Act, 1874; and that the Local Government Board is bound, under the provisions of 11th section, to assign to them, as such new officers, their duties and functions, which (as implied by the word "respective" used in that section) it is contemplated by the Act shall be of a distinct and different character from those of the other "sanitary officers." The effect of the repeal of the Act of 1874 was to determine every existing office created by that Act and to supersede all existing arrangements made under it, save so far as such offices and arrangements might be specially saved or excepted by the Act of 1878. I am of opinion that there is no such saving or exception as to the office formerly filled by the dispensary medical officers under the 10th section of the repealed Act, or of the arrangements made under that section in respect to that office. In my opinion the construction put by the Local Government Board on the 294th section is altogether erroneous, and that all that is excepted, under clause (*b*) of that section, are "rights or liabilities" incurred, &c., under the repealed Act, or under any order or regulation made in pursuance of it, and not the orders or regulations themselves.

The only section in the Act of 1878 which, at first view, might appear to except the appointment of the dispensary medical officers under the Act of 1874, from being repealed, is the 280th, which provides that the "officers and servants" of the several sanitary authorities "shall continue to hold their several offices and employments on the same terms and subject to the same conditions, as to duties, remuneration, and otherwise, as they would have held them if this Act had not been passed." But I am of opinion that this does not include the "office, duties, or remuneration" of the dispensary medical officers under the Act of 1874, as they were not, under that Act, officers of the sanitary authority, but statutable officers, appointed directly by the Act, and not by the sanitary authority.

2. I am of opinion (in accordance with my view of the construction of the Act of 1878) that all arrangements made by the several sanitary authorities as to the additional salary to be paid to their respective dispensary medical officers, under the 10th section of the Act of 1874, were determined by the repeal of that Act, and that the several sanitary authorities are now bound to appoint the additional salary to be paid to their respective medical officers of health, under the 11th section of the Act of 1878, subject to the approval of the Local Government Board; and that, in determining the amount of such salary, neither the sanitary authority nor the Local Government Board should have regard to any fixed or particular scale of remuneration, but only to the extent and nature of the work to be performed by the medical officer of health in each particular case.

(Signed),

T. A. PURCELL.

26th April, 1879.

The decision of Mr. Purcell is quite decided that the interpretation of the law by the Local Government Board is altogether wrong. There can be no reasonable doubt that it is so, and we have every reason to hope that it will be altered at once, and steps taken to put the Act in force.

The fact is, that Sir Alfred Power, the past King of the department, was determined to defeat the Public Health Act at any cost, and, *more suo*, he simply broke through it whenever he pleased. Let us hope that under the new *regimé*, this mischievous policy is at an end.

## LIST OF ENTRIES IN THE REGISTER OF THE BRANCH MEDICAL COUNCIL (IRELAND) FOR THE MONTHS OF APRIL, 1879.

APRIL 3rd.—Nicholls, Archibald John; Ballinalee, Edgeworthstown, co. Longford; Lic. 1878 and Lic. Mid. 1878 K. Q. Coll. Phys. Irel., Lic. R. Coll. Surg. Irel. 1877.

8th.—Pentland, Henry; Steeven's Hospital, Dublin; Lic. R. Coll. Surg. Irel. 1878, Lic. 1879 and Lic. Mid. 1879 K.Q. Coll. Phys. Irel.

12th.—Coghlan, Patrick Francis; Carrick-on-Suir, co. Tipperary; Lic. R. Coll. Surg. Irel. 1878, Lic. R. Coll. Phys. Irel. 1879.

14th.—Dunlop, Albert; Royal Hospital, Belfast; Lic. R. Coll. Phys. Edin. 1878, Lic. R. Coll. Surg. Edin. 1878.

24th.—Rorke, Charles; 21 Cabra Parade, Dublin; Lic. R. Coll. Surg. Irel. 1878, Lic. 1879 and Lic. Mid. 1879 K. Q. Coll. Phys. Irel.

28th.—Knight, Charles Frederick; 56 Synge Street, Dublin; M.D. Q. Univ. Irel. 1877.

28th.—Hayes, Richard Atkinson; 2 Herbert Street, Dublin; M.B. 1878 and M.D. 1878 Univ. Dub., Fell. R. Coll. Surg. Irel. 1879.

29th.—Myles, Edmond; 4 Crescent Limerick; M.B. 1878 and B.Ch. 1878 Univ. Dub.

## ABUSE OF DISPENSARY TICKETS.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—At one time I asked a Local Government Inspector to describe for me a class of persons to whom I would *not* be obliged to afford medical relief. He replied he could not do so, as the Medical Relief Acts were interpreted by the Local Government Board in a "very comprehensive spirit." Comprehensive with a vengence! Last Saturday I was presented with a scarlet runner by a police constable to visit a child who died suddenly, and whose parents were suspected of maltreating it, in a village six miles from my residence. Not understanding the limits of this "comprehensive spirit," and fearing the wrath of the Local Goverment Board, I visited the child, in whom I could detect no trace of violence. In fact, I have such vague notions as to my responsibility when furnished with the dreaded red ticket, that I really think I should be obliged to visit a cow if required by a scarlet runner to do so. I would like to know was I in duty bound to visit the child referred to?

Yours truly,

A DISPENSARY HACK.

[Our correspondent was certainly not called upon to attend, unless the child was alive, nor was he called to do or say more than what was necessary to the treatment of the patient.—ED. M. P. & C.]

## TO READERS.

THE Editor will feel especially obliged by receiving copies of newspapers which contain any Poor-law or other intelligence of medical interest, in order that he may, if fit, republish it for the benefit of the readers of the *Medical Press*. Although twenty-one of the leading Irish newspapers are received at the Irish office, many things may escape notice which are deserving of attention. Newspapers should be marked, and addressed to Dr. JACOB, at the Dublin offices of this paper.

### THE RIGHT UNDERSTANDING OF THE CHANGE OF LIFE.

By EDWARD JOHN TILT, M.D.,

Past President of the Obstetrical Society of London.

Some years have elapsed since the publication of the last edition of my work on "The Change of Life," and as I have had many opportunities of studying its diseases, it is worth while attempting to improve what has been done in this neglected field of observation. Woman exchanges the fulness of sexual power, for a neutral state of existence, as far as sexuality is concerned, by a process of sexual involution. The ovaries gradually shrivel up, and lose more and more their power of controlling the womb and pelvic circulation; so the menstrual flow becomes scanty or too abundant; it puts on a hesitating appearance, and at last ceases. The change of life is often spoken of as if it were worked out at cessation, but sexual involution is then only half accomplished. There is still left to the ovaries a remnant of their former power, evidenced by a periodical disturbance of pelvic circulation. This may give rise to extensive congestion and to a trifling blood flow, or to leucorrhœa, or to biliary derangement, diarrhœa, and piles. After a further period of time the ovaries become little lumps of corrugated fibrous tissue; the womb *pari passu* diminishes and hardens; pelvic circulation is no longer subject to periodical fluctuations; and the system is no longer troubled by sexual sympathies. Such is *normal* involution—and I underline the word, because my present object is to study the differences that characterise *normal* and *morbid* sexual involution. By morbid involution I mean the manner in which sexual involution is worked out when interfered with by organic disease of the sexual organs. Sexual involution has an ill-defined beginning and end, and one fixed date, that of the cessation of the menstrual flow—a date very different in normal and morbid involution. There is too much pathology, in the tables by which I have illustrated the physiology of the change of life, for these tables were constructed by taking women just as they came, without stating whether they were sound or suffering from disease of the reproductive organs. It is evidently desirable to have a correct knowledge of the average normal date of cessation, for we shall then more carefully look out for any uterine affection that may be rendering involution morbid. The date of cessation in *morbid* involution is likewise important, for it marks a turning point in the progress of a case. That date stands at the end of a more or less troublesome period of pathology, and points to the gradual mending of many sexual diseases. Doubtless the date of cessation in any given case can only be certified after the event, but it then enables a practitioner to give a trustworthy prognosis.

*Date of Normal Cessation.*—During the last ten years I have become more and more aware of the fact that when cessation is retarded to the fiftieth year, and still later, it may be generally explained by the co-existence of uterine disease. I therefore conclude that there was a considerable amount of uterine disease among the women who were stated to have ceased to menstruate at fifty and much later in Table I of my work on "The Change of Life"—that is, in 120 women out of 1,082. It must be, moreover, noted that in twenty-seven out of these women sudden cessation, before the fortieth year, was accounted for by sudden shock to the sexual system, by cold or fright or a fall during a menstrual period. Carefully weighing what I have learnt on the subject, I conclude that the average normal date of cessation in England is more likely to be under forty-five than forty-five years and nine months, as made out in the table alluded to. Of course, women may cease to menstruate at any age, but practitioners should suspect some uterine disease when cessation is said to have occurred before the fortieth and after the fiftieth year.

*Date of Morbid Cessation.*—From what precedes it follows that when cessation is delayed beyond the fiftieth year I consider the delay to be often caused by some uterine disease, which gives the date of morbid cessation.

*Normal Pre-Cessation Period.*—The beginning of involution is announced by menstrual irregularities, or by the absence of the menstrual flow; but as these are the symptoms of uterine disease, medical men should rather think menstrual irregularities depend on uterine disease, than on the change of life, when these common symptoms of both states occur before forty. When consulted about women said to be "changing" before forty I generally find the menstrual flow is merely checked by constitutional disease, or by some organic affection of the sexual organs, and that menstruation returns when the system is strengthened or the disease cured. This makes me now understand why, out of 1,082 women, cessation occurred before forty in only 115, and in 27 of these it could be accounted for by shock. It would take long to relate the cases that have come under my notice in which careful consideration of the symptoms would have led to the discovery of a surgical disease, the successful treatment of which was followed by regular menstruation for many years. I have been repeatedly consulted about flooding, respecting which the patients had been assured "that the loss depended on the change of life, and that it could not be interfered with without danger." In many of these cases, on examination, I have found cancer in various stages, sub-mucous uterine fibroids, and various kinds of polypi, most of them easy to remove, and in severe cases flooding was a symptom of internal metritis. A lady, æt. 40, had presented marked symptoms of uterine disease, with prolonged menorrhagia, frequently recurring for about two years, during which time she was repeatedly told by an eminent practitioner, that it all depended on the change of life, and that it must not be interfered with. He had not examined, but I found an enlarged podgy cervix, with a ragged surface. It took long to cure this patient, and cessation did not occur till six years afterwards. I have been repeatedly consulted by women about forty-five who had been much weakened by long-continued inter-menstrual dribbling of blood from the womb, which had been ascribed to the change of life. In all such cases I have found an irritable vascular ulcer around or in the os uteri. When a married lady, æt. 51, consulted me, she had profusely menstruated for the previous four years, and there had also been a constant dribbling away of blood from the womb between the menstrual periods. She was a complete invalid, and suffered much from the cerebral symptoms of the too great loss of blood. In this case there was a vascular ulcer dipping into the cervix, and one application of acid nitrate of mercury stopped the blood flow.

Uterine disease should be thought of rather than the change of life, particularly before forty, when pus is said to be mixed with the blood that comes away between the periods, or when there is a mere dribbling of blood from the vagina, or an habitually prolonged menstrual flow. The fortnightly recurrence of the period points to uterine disease, for out of 637 women, there were only 33, in whom the period recurred at shorter periods than twenty-one days. The flooding of uterine disease occurs irregularly, and keeps less to menstrual periods than the flooding of the change of life. The change of life may be predicated when, after forty, there is a gradual diminution in the quantity of the menstrual flow, for this was noted in 171 out of the 637 women; the gradual prolongation of the inter-menstrual periods is another good sign, and it occurred in 99 cases. An occasional flooding at a menstrual period is a good sign. The co-existence of sweats and flushes with any of these symptoms is strongly confirmative of the change of life.

As I generally find some kind of uterine disease whenever the dodging time is protracted from three to ten years, I feel it right to conclude, that there was a considerable amount of uterine disease in 58 out of the 265 women in whom "the dodging time" was protracted for periods varying from four to ten years. Instead of estimating the average length of the dodging time at two years and two months, as was done in my work, I think it is more likely to be, from twelve to eighteen months, and uterine disease should be suspected when it has lasted over three years.

*Morbid Pre-Cessation Period.*—A morbid dodging time often lasts from three to five years and I have known it last for ten or twelve years.

*Normal Post-Cessation Period of Involution.*—We guess at the completion of sexual involution by the recovery of health and its resettlement on a new plan. It is only when we are obliged to examine a woman, for some other reason, that we occasionally ascertain, that the womb is much smaller and harder than it used to be. When there is no disease in the sexual organs, I believe cessation divides involution into two periods of pretty equal length, and that after its occurrence it takes from twelve to eighteen months to complete sexual involution.

*Morbid Post-Cessation Period of Involution.* — The nature of the disease that bars the progress of involution determines the length of time to which it may be protracted. An enlarged and caco-plastic body and cervix delay uterine involution for many years. When there are large fibroids in the womb, there is no prospect of uterine involution, although ovarian involution may have already occurred. I have said that it is characteristic of normal involution, that the process should proceed *pari passu* in the womb and ovaries, whereas morbid involution proceeds at different rates of progress in the different parts of the sexual system. The ovaries are often found reduced to amorphous lumps of fibrous tissue, while the womb is still large, and although the body and the cervix are united by continuity of tissue and by disease, they have a somewhat separate pathology, and the body of the womb may remain large after involution has taken place in the cervix.

*Effects of the Change of Life on Uterine Diseases.*—"You will be all right after the change" is the well-known answer a woman of forty gets when complaining of any chronic ailment, particularly pelvic. This haphazard prediction oftener fails than comes true. The very unusual state of congestion to which the womb is liable during the largest half of the time allotted to sexual involution renders women liable to inflammatory affections of the uterine mucous membrane, even when their sexual organs have been previously sound; but in that case it may be admitted that complete sexual involution is preventive of most uterine diseases. When, on the contrary, more or less diseased sexual organs have to be involuted, the dodging time is generally marked by a stationary, if not by an aggravative pathology. The dodging time is, however, less a cause of disease than a detective of disease that has been insidiously progressing for a long time. The congestion caused by the suspension of the menstrual flow sometimes makes inflammatory affections more acute, and often gives an impetus to simple hypertrophy, and to caco-plastic formation. Even after cessation periodical pelvic congestion does not immediately abate, and organic diseases are often rather made worse than better. As the ovaries become more and more involuted, there is less and less tendency to pelvic congestion, then inflammatory affections of the uterine mucous membranes disappear, the womb diminishes in size, and even large fibroids may become harder and smaller, or calcified. What Nature can thus do is often seen on opening the bodies of very old women who die at La Salpetrière.

## HERNIOTOMY—IMPOSSIBILITY OF REDUCTION OWING TO ADHESION.

By GEO. A. MOORHEAD, L.R.C.S.I., L.K.Q.C.P.I., &c.,
Assistant Medical Officer, Tullamore Workhouse.

On August 18th, 1878, at Colon, I was called to meet Dr. J. W. Christie, of the W. I. & P. ss. *Carribean*, in con-

sultation on an adult negro. The patient had been ill for nine days, and, experiencing no relief from the native "Obi" treatment, sent, on the first opportunity, for a white doctor. He was much collapsed, with cold clammy skin and feeble pulse; emaciated, constant hiccough, and stercoraceous vomit. An inguinal hernia occupied the scrotum on the right side, which defied all efforts of "taxis." It had come down nine days previously whilst lifting a heavy load, and he earnestly besought us to give him relief from his distressing symptoms.

Under chloroform the bowel was cut down on, the sac opened, and a constricting band at its neck divided. The gut was deeply congested, hard to the touch, and resisted all efforts to return it into the abdomen. The incision being prolonged downwards, the index finger was passed into the scrotum anterior to the bowel, breaking down adhesions, with no better result. The abdominal rings were now enlarged, and another attempt at reduction failed. With Dr. Christie's concurrence I then raised the bowel clear of the integuments with a tenaculum, and opened it by an incision one and a-half inch. A copious discharge of liquid and semi-solid fæces followed, on the cessation of which the gut was stitched on each side to the edges of the wound with double twisted silk ligature, the whole washed with carbolic water, and a piece of lint steeped in carbolic oil laid over the wound. A full opiate administered, and strict rest enjoined.

*Four hours after operation.* — Pulse 82, temp. 98·2°. Feels much relieved, but has not slept. Fæces abundant. Smeared edges with carbolic ointment, over which linseed meal poultice. To have twenty drops of Battley.

19th, 8 a.m.—Passed a good night; feels comfortable and in good spirits. Skin dry; slight thirst. To have a mixture of quinia sulph. and potass. nit. every four hours; ice to suck; barley water and slop diet. Temperature and pulse normal. Free discharge of fæces.

20th.—Wound looks angry; some pus; no offensive odour; but sutures lying on the abdomen with knots intact. Look as if had been clean cut. Replaced them with carbolised catgut; skin retracted, exposing abdominal muscles, with marked cellulitis round wound. Temp. 101°; pulse 94.

22nd.—Saw him for last time. The wound was bathed in offensive pus; tenderness more diffuse, with a dry furred tongue. Taking a fair share of nourishment, and hopeful of result. He survived two and a-half days after my departure, as I have since learned from my friend Dr. Ernest Aubin, of R.M.S. *Nile*, who kindly attended him subsequently, and in whose hands he finally succumbed to gangrene and general peritonitis.

The remarkable tolerance of the negro to operative measures of serious nature is well exemplified in this case. With a system below par at its best we found it still more enfeebled by nine days suffering and vomiting! The chronic subject of ague, living under the most gross hygienic conditions, in, perhaps, the most malarial atmosphere in the world, and in almost a moribund condition when visited—it is a matter of no small wonder, with so many adverse circumstances, that he survived so formidable an operation six and a-half days!—a fact, I trust, that may prove useful to those who may have before them the prospect of practising amongst the negro races.

## ADENOID TUMOURS OF THE NASO-PHARYNX; THEIR INFLUENCE ON HEARING, RESPIRATION, AND PHONATION; AND THEIR TREATMENT.

By Dr. B. LÖWENBERG, Paris,

Translated by H. Macnaughton Jones, M.D., &c., Professor, Queen's University, Ireland.

(*Continued from page* 404.)

### Differential Diagnosis.

According to our own experience, we very frequently meet with adenoid tumours in childhood and in youth, causing a train of symptoms which soon attracts the attention of the patient or of the parents. The physician is daily consulted in cases of this nature. It is a grave mistake if he ignores the existence of this disease, and attributes the cause of the accompanying symptoms to other affections, with which he is familiar, especially to simple chronic coryza, or to hypertrophy of the tonsils (it is far less frequently confused with nasal, or naso-pharyngeal polypus). Coryza, and hypertrophy of the tonsils, are usually considered of but slight importance, and we deceive ourselves with the hope that all will be set right at the age of puberty, a period which is popularly supposed to exert a powerful influence, not alone on these affections, but also on others, for instance on diseases of the ear.

Unfortunately, none of these affections are cured spontaneously, and the injurious effects of this therapeutical negligence soon becomes apparent, in the expression of stupidity, the ridiculous pronunciation, &c., &c.

Let us endeavour to avoid an error which is so injurious, and investigate the means by which we may form an accurate diagnosis before the affection has advanced so far that it can no longer be relieved.

We will examine, one after the other, the four affections which may be confounded with adenoid growths—1, chronic coryza; 2, hypertrophy of the tonsils; 3, nasal polypus; 4, naso-pharyngeal polypus.

### Simple Chronic Coryza.

The symptoms of chronic coryza are: permanent stuffing of the nose, alteration of the voice, which becomes more or less nasal, an abnormal secretion, giving rise sometimes to an abundant discharge, sometimes to dried and firmly adherent crusts. The senses of smell and taste are dulled; there is often a still more distressing symptom, the unpleasant odour of the air expired. The obstruction of the nose, when complete, is followed by the manifold results of buccal respiration.

We may then make the mistake of believing in the existence of adenoid tumours in a case of coryza; but the danger does not lie here; the first of these affections, being comparatively unknown, it tends, on the contrary, to the opposite error, that of believing in the existence of simple coryza, where the naso-pharynx is the site of the characteristic morbid growths. Besides, if we remember that these latter are often complicated with chronic rhinitis, the frequent error which attributes all these symptoms to this latter affection (*sic*) will be found still less surprising.

In cases in which this similarity of symptoms exists we have but one advice to give, that is, to practise physical examination of the naso-pharynx, in all patients presenting symptoms more or less resembling those of chronic coryza. We recommend especially palpation, for while the rhinoscopic examination often only succeeds after many trials, this latter can always be employed *extempore*, and it immediately solves the difficulty. In the case of adenoid tumours the nasal cavity is found diminished, or even abolished, filled by the morbid growths, or by exuberant excess of the pharyngeal tonsil. In the other case the finger moves easily in the interior of a free cavity, sometimes restricted only by the posterior swollen extremities of the inferior turbinated bones. In this latter case the examination of the nasal fossa by the anterior or posterior nares (rhinoscopy) will enable us to recognise the nature and extent of the chronic coryza.

### Hypertrophy of the Tonsils.

Many authors, and amongst them distinguished surgeons and physicians (beginning with Dupuytren and Robert), have described cases of considerably advanced hypertrophy of the tonsils which exhibited functional troubles, completely resembling those which we have described as characteristic of pharyngeal adenoid tumours (compare with regard to the chapter on arrested development of the thorax). In these cases the great increase in the volume is considered to be the only cause of these disorders.

This mistaken view is so general that a great number of patients affected with adenoid growths, have been sent to us as merely suffering from hypertrophy of the tonsil.

Although it is easy to understand the great importance of a correct diagnosis, which alone can and should direct surgical interference, this point has not been treated of by other authors, as we have discovered, not without some surprise. We have thus been induced to study this important question from a special point of view, and in order to have at our disposal the greatest possible number of cases, we have not been limited to the resources of our own practice, but many of our colleagues have contributed materials for our use from both the city and the hospitals.

In a great number of patients who have been brought to us as attacked by simple hypertrophy of the tonsils, causing deafness, mouth respiration, &c., even the most superficial examination of the throat decides the question in the negative, by immediately showing that the tonsils were not sufficiently enlarged to interfere by their volume with the functions of the soft palate, or the naso-pharyngeal passage, &c. There is nothing easier than to recognise the exact nature of such cases.

But it becomes extremely difficult when there really exists excessive enlargement of both tonsils, and at the same time the symptoms that we have described are distinctly attributed to them. It is here that we undertake to prove the incorrectness of the general opinion which attributes these symptoms to the frequent and perhaps necessary consequence of this enlargement. We should mention, in the first place, in support of our assertion, that we have often seen cases of enormous hypertrophy of the tonsils which were free from all appreciable trouble, especially as to nasal respiration and the important consequences which result from its suppression. On the other hand, in some cases of hypertrophy of the tonsils, in which these troubles also existed, we found adenoid growths completely hidden behind the very much enlarged tonsils. On the removal of the tumours the symptoms disappeared, while the tonsils, to which these unpleasant results were attributed, have not been interfered with.

We have studied attentively the cases mentioned in the classical works, and we cannot help thinking, in most of the cases of hypertrophy of the tonsils which have been quoted as presenting the group of abnormal phenomena already described proceeding from the naso-pharynx, that at the same time adenoid tumours must have existed in this region, and that these were the cause of so many injurious results. We should be even tempted to ask whether hypertrophy of the tonsils can really provoke the suppression of nasal respiration, as is generally believed, if we had not met with some cases which would appear to reply in the affirmative. In the first place, it would seem much more plausible that obstacles which almost completely close the passage from the mouth to the naso-pharynx, should impede the circulation of air by the mouth rather than by the nose; in fact, we have seen some cases where it was unquestionably thus, but on the other hand many distinguished authors affirm that the contrary is possible. M. Desnos, for instance, in his article in the *Dictionnaire* (*a*) says, "The soft palate, raised horizontally, partly obscures the posterior aperture of the nasal fossa; the tonsils, pushing the swollen and elongated uvula before them, almost come in contact with each other in the median line, and leave only a very narrow space for air and food."

For our part we admit that the question seems to us open. We think that it will be well to resume this study, and ascertain whether in many cases it has not been an error to ascribe an evil to the tonsils the real cause of which is found in the existence of adenoid tumours, particularly in an excessive development of the pharyngeal tonsil. Perhaps this is the clue to the frequent want of a successful result after removal of the tonsils.

(*a*) *Loc. cit.* page 140.

We can only repeat the advice given in the preceding chapter, to employ physical examination in every case of considerable hypertrophy of the tonsils, accompanied by the group of symptoms which we have already sufficiently described. This examination immediately shows us whether there are adenoid tumours or not; and when we are informed on this point, an attentive study of the symptoms will enable us to decide which is the impediment that must be removed in order to restore to the patient the integrity of the naso-pharynx, and the organs depending on it. These researches will at the same time help to solve the question that we have proposed.

In concluding these considerations we cannot but refer to the excessive part attributed to the tonsils in the production of *catarrhal deafness*, a mistake which has been rectified by able observers. Perhaps we shall be fortunate enough to prove that their influence has been equally exaggerated in relation to nasal respiration, and the questions involved in it.

### Polypus of the Nose.

The suppression of the passage of air by the nasal fossa, and the alteration of the voice, are symptoms common to both adenoid tumours of the pharynx and nasal polypus, when either of these two affections has attained a certain development. How are they to be distinguished? Physical examination will immediately elucidate the diagnosis by proving the existence of the characteristic excrescences in the naso-pharynx, in the one case, or in the other by showing that there are one or more tumours in the interior of the nasal cavities. Polypi are visible by examination of the nasal fossa anteriorly, even with the assistance of a simple concave reflecting mirror, with a hole in the centre, such as is used in examining ears; and it is useless to resort to the rhinoscope in most cases.

But if a practitioner is not familiar with the two methods of physical examination, what course is he to pursue when he meets with troubles which require energetic, as well as suitable, measures?

We will now give some facts which will assist him in obtaining a successful result. While adenoid tumours are formed usually in childhood and youth, nasal polypus is found at all periods of life, more usually even in adult age. Often the patient becomes first aware of the presence of a polypus by a certain obstruction, by the sensation of a foreign body in the nasal fossa, a sensation which is not present in the adenoid affection. The deafness, which is an almost constant accompaniment of this latter, does not usually co-exist with nasal polypus, to which, on the contrary, disorders in the excretion of tears are peculiar. Polypi often ultimately project from the anterior or posterior apertures of the nose; adenoid tumours never reach beyond the pharynx, their seat of origin.

When tumours of the nose have attained such a development that the nasal fossa of a normal capacity can no longer contain them, they grow beyond their position, frequently to an enormous extent, and finally invade the adjacent cavities. Disorders then rapidly break out, so grave and so characteristic that the nature of the case is evident to the most inexperienced observer. To the arrest of the sense of smell are rapidly added troubles in mastication, in deglutition, and in the integrity of the ear; finally life may be menaced, and safety can only be obtained at the cost of a serious operation. Even then there may be relapses—an occurrence as yet unknown in the case of adenoid tumours when once the surgeon has succeeded in removing them.

We will now only mention the cases in which *soft polypus* exists, arising from the posterior extremities of the inferior turbinated bones, with or without the simultaneous existence of adenoid growths. The treatment is the same in the one case as in the other, and an error in diagnosis between the two can, consequently, be of but little importance.

### Naso-Pharyngeal Polypus.

In proportion as naso-pharyngeal fibrous polypus becomes developed it encroaches successively on all the interior of the pharynx, the nasal fossa, and the adjacent cavities, such as the frontal sinus and the orbit, everywhere producing the most distressing disorders. When once this degree of development is attained, and these terrible results are definitely established, there can no longer be any fear of confusing this affection with adenoid tumours, which are neither of rapid growth nor of a destructive nature.

But while the dimensions of the polypus permit it to remain within the limits of the naso-pharynx, the diagnosis may be attended by great difficulties. We will give, nevertheless, some facts, which may assist in distinguishing between the two affections in question; this distinction is of the greatest importance, since adenoid growths are relatively harmless when compared with naso-pharyngeal polypus, which is of a most destructive character. These latter generally (some authors say "always") spring from the periosteum of the inferior surface of the basilar process, where, in the normal condition, the fibro-mucous membrane is enlarged (*a*); adenoid tumours may spring from every portion of the walls of the naso-pharynx, and are inserted more superficially in the soft parts. They are generally first developed at an early age, while polypi appear usually between the fifteenth and twenty-second years (Nélaton). These latter (according to Nélaton, M. Gosselin, and a great number of other experienced surgeons) are observed only in young boys; adenoid growths attack both sexes indifferently. Polypus gives rise to difficulties in deglutition, accompanied by the regurgitation of fluids into the nose, to nausea, to nasal discharge often tinged with blood, and even to hæmorrhage, to habitual dyspnœa, occasionally accompanied by wheezing, and interrupted at times by actual attacks of suffocation. We will not mention cephalalgy as a means of differential diagnosis; some authors consider it as equally characteristic of adenoid tumours; moreover, it does not coincide with our own observations.

In short, the differential diagnosis between these two affections may offer serious difficulties, especially when we are examining a small polypus (or a mucous or glandular polypus, another form of naso-pharyngeal tumour); but when neither the symptoms nor the optical or tactile methods of examination can afford us absolute certainty, we must in either case proceed to the removal of the tumours by surgical means. It is important here to remember that, although our first treatise, and those of other authors, do not appear to have sufficiently attracted the attention of the profession, some surgeons have nevertheless had the shrewdness to recognise the fact that there may be a kind of tumour totally different from true pharyngeal polypus; these observers have not failed to make a distinction between an affection almost always fatal (whether by its rapid growth, or by surgical interference, which is so frequently a source of danger), and another comparatively harmless one, which can be operated on with a certainty of success, and without danger. Thus M. Trelat has clearly pointed out this important matter in several communications to the Surgical Society (*b*), and other experimental surgeons have quoted analagous cases.

### Prognosis of Adenoid Tumours of the Naso-Pharynx.

What becomes of adenoid tumours once they have attained their maximum development? It is not easy to reply to this question in a decisive manner, for as this affection has only been recognised for a few years, we have not as yet had sufficient opportunity to follow the course of a large number of cases, or to observe them for a period so prolonged as to enable us to understand clearly their spontaneous evolution.

However this may be, it is certainly true that pharyngeal adenoid tumours are usually developed in childhood and youth, and become more rare in proportion as age advances, but as neither these tumours nor any of their habitual consequences are ever fatal, it would appear as a result that *they may disappear spontaneously at a certain period of life.* They are, then, developed in childhood, they remain stationary during youth, and finally disappear spontaneously, although their more or less serious complications still remain.

It is interesting to refer, in relation to this subject, to the destiny of certain other affections which attack the regions approximate to the pharynx. We know that hypertrophy of the tonsils, sometimes disappears spontaneously towards the age of puberty, without artificial interference, as similarly we see mucous polypus of the nose atrophy spontaneously, without either medical or surgical treatment (see on this subject the works of Robert, Nélaton, and M. Gosselin). It further appears that chronic catarrh of the naso-pharynx and of the nose, resulting in hypertrophy of the mucous lining of these cavities, often, in proportion as the patient advances in age, leads to atrophy of the same mucous membrane. According to some authors, the pharyngeal tonsil itself, an abnormal development of which forms the substratum of so many adenoid tumours, appears to diminish in volume from infancy to advanced age (see Tentleben) (*a*).

All analogy supports the hypothesis of the spontaneous retrogression of adenoid tumours, but we repeat, no positive fact has as yet been discovered which proves the truth of this theory.

What we have already said of the greater frequency of adenoid tumours in youth applies strictly only to the period of their origin, for they are met with in persons much more advanced in life. We find a proof of this assertion in case 4, where we found the morbid growths in 1865, the patient being then forty-one years of age. He refused efficient operative treatment, as we already stated, and we have lately verified the presence of the tumours, the patient being now fifty-three years of age. According to our observations in other cases, the affection when treated in an adult appears far more obstinate than when treated in a child.

Although adenoid tumours, once they are radically destroyed by one of the methods which we shall explain shortly, never recur so far as we have observed up to the present time, operation, which constitutes the *sine quâ non* of all treatment, does not, at the same time, remedy the deleterious results of the affection. In order to accomplish this we must employ special measures, of which we shall speak presently.

In discussing the prognosis of the *various groups of consecutive affections*, we have first to consider the *aural troubles*, which, when appropriately treated, are often completely cured.

With respect to the other pathological groups of disorders, caused by suppression of the passage of air by the nose, we can sometimes prevent respiration by the mouth from becoming habitual, with all its results previously described; but after the affection lasts for a certain time any attempt to re-establish the normal physical conditions by a radical operation will prove useless, the functions only slowly and with difficulty regain their physiological action; this is similarly the case with regard to all functions which have been arrested for a long time, especially in childhood. With reference to this we may allude to congenital fissure of the palate, the results of which have been observed to remain for a long time, if not permanently, after even the most successful operation.

Here, likewise, when buccal respiration, resulting from adenoid tumours, has once become habitual, respiration does not again become nasal, merely by the restoration of the nasal passage to its normal condition, by operation; this is evidently on account of the abnormal position of the soft palate, which still remains raised, and thus intercepts the access to the nasal fossa. Many authors con-

(*a*) Lorrain, *Bull. de la Soc. de Chir.*, 260, 1860.
(*b*) See, amongst others, the Report of the Meeting of October 28, 1874.

(*a*) *Archives d'Otologie*, xiii., 160.

sider that this is due to a semi-paralytic condition of the muscles of the soft palate, but it appears more reasonable to consider it in the light rather of a spastic condition. We think that the habit of keeping the soft palate raised, a state necessary for respiration by the mouth, must communicate to the muscles, involved in this action, a condition of permanent contraction which, when it has lasted for a certain length of time, does not again yield, although we may succeed in restoring the normal passage.

THERAPEUTICS OF ADENOID PHARYNGEAL TUMOURS.

The therapeutics of the adenoid pharyngeal affection is divided into three parts.

*a.* The measures employed for the restoration of the general health.

*b.* The surgical treatment of the adenoid tumours; and finally,

*c.* The measures to be taken with regard to consecutive or concomitant affections.

*a.—General Treatment.*

Although we must rely almost entirely upon the local treatment, those cases are very rare in which it is not necessary at the same time to attend to the general health of the patient. Thus, for our part, we have seen but a very limited number of young patients affected with adenoid pharyngeal growths, amongst the considerable number who have come under our notice, who at the same were exempt from all signs of a lymphatic diathesis. We combat this diathetic tendency by the usual treatment—good hygiene, plenty of exercise in the open air, and reasonable gymnastics, intended to improve both respiration and circulation; and finally, the general nutrition. Besides this we order tonic *regimé*, cold baths (*sponging bath*, or *tub* of the English), cod-liver oil, bitters, iodide preparations, iron, sea baths, and saline and sulphurous mineral waters. Mild diet is necessary to avoid all irritation of the pharynx. We must prohibit very hot or irritating food, whether liquid or solid, alcohol, tobacco, excessive use of the voice, respiration in impure air, &c.

Even in cases where the individuals present no sign of such a diathesis, we have often had recourse to these general measures to recruit the health, weakened by abnormal respiration, and its effects on hæmatosis and nutrition.

## LONDON HOSPITAL.

*Notes of Cases.*

Under the care of Dr. ANDREW CLARK.

Reported by R. W. BURNET, M.D., M.R.C.P.

THERE is at present under Dr. Clark's care a patient, whose case is interesting, both because it presents some unusual characters, and because of its important practical bearing.

A. S., æt. 30, married, was admitted into a surgical ward of the London Hospital, suffering from disease of the left elbow-joint, and from abscess of the abdominal wall. She was then in a weak and emaciated condition, and of an unhealthy appearance. Sometime after her admission to the hospital, Dr. Clark was asked to see her, to determine the state of the chest, as symptoms of lung disease had made their appearance.

The woman, when Dr. Clark saw her, was complaining of pain in her right side, of cough without expectoration, and of great prostration. She was breathing hurriedly, had a rapid pulse, and a somewhat elevated temperature. It was reported that she had been ailing for a week, and had become somewhat suddenly worse. There was an old history of hæmoptysis, and it was suspected that she had become tubercular, and that the disease was progressive.

Dr. Clark found several circumscribed dull regions scattered through the right side. Over these regions were heard modified tubular breathing, bronchophony, and some fine crepitations. One of the regions occupied the summit of the lung. There was no dulness over the left lung, but at various places in front and behind fine crepitations were heard. There were no abnormal heart sounds.

Dr. Clark considered the case to be one of disseminated pneumonia, perhaps of an embolic kind, and he recommended that the patient be transferred to his own wards, which was at once done (March 24).

The following is an outline of the history which was obtained:—

There was nothing in the family history which directly pointed to tubercle. Patient stated that she had on the whole enjoyed fair health. She had small-pox when she was six years old, and with that exception she had had no definite illness. In February, 1878, however, she spat a small quantity of blood, and was treated as an out-patient at this hospital. At that time she was pregnant.

Her present illness began four months ago. She caught cold soon after her confinement. She had inflammation of the bowels, and at the same time the disease of the elbow-joint and the abscess of the abdominal walls commenced. She then had cough and some expectoration. On admission she was found to be pale, thin, and anæmic. She complained of pain in her right side, and of great weakness. Temperature was normal; respiration 26; pulse 120, somewhat soft and feeble; tongue, slightly furred; appetite very bad. She had nausea, but no vomiting, and the bowels acted regularly. There was no swelling of abdomen; no œdema of feet or legs; no increase of splenic dulness. Liver dulness commenced at the 6th interspace, and extended one inch beyond the margin of the ribs. There was slight tenderness on pressure along the edge of the liver. The heart's impulse could neither be seen nor felt when patient was lying down, but the sounds were heard in the normal position. Heart's action was quick and feeble, but there was no murmur.

There was flattening of the right side of the chest in its upper part anteriorly, and in the right infra-clavicular region there was dulness extending down to the lower border of the 3rd rib.

In the supra-clavicular region — Breath sounds were harsh; expiration prolonged, slightly bronchial, and accompanied by what appeared to be a superficial crackling; vocal resonance increased, not distinctly bronchophonic; no râles on coughing.

In infra-clavicular region—Breath sounds bronchial; at end of inspiration there was a valvular click with crepitations: after a cough the click disappeared, and inspiration was accompanied by crepitations; voice sounds bronchophonic. From this to the nipple, in an area widening towards the sternum, the breath sounds were harsh, with fine crepitations, which on forced breathing became almost continuous.

In the mammary region—Inspiration was harsh; expiration prolonged; voice sounds bronchophonic. On right side posteriorly there was in supra-spinous fossa, dulness, which diminished towards the lower part of the scapula and again increased, till at the base it was absolute. Tactile vocal fremitus was increased above and below, less in the middle region. In the supra-spinous fossa, at the outer part, inspiration was bronchial; expiration harsh and prolonged, with moist crepitations; voice sounds increased. A similar condition existed just below the middle of the lung—there was heard true tubular breathing, with bronchophony. In the axilla there was dulness with increased T. V. F.; also increased voice sounds; below there was harsh breathing with crepitations. There were no signs of changes in the left lung: it was practically free.

After careful examination, the diagnosis arrived at by Dr. Clark was, "Pleuro-pneumonia of right lung—in scattered masses—including the apex, probably embolic in origin. Question of pre-existing tubercle. Nothing defi-

nite in left lung. Old disease of left elbow, and abscess of abdominal wall. Prognosis favourable."

Whilst he admitted the possibility of tubercle, Dr. Clarke was inclined to exclude it for the following main reasons :—

1. A considerable period had elapsed since the slight attack of hæmoptysis, and during that time the patient had apparently been in good health.

2. The fact that with extensive disease of the right lung, there was no conclusive evidence of disease in the left lung.

3. The subsidence of constitutional disturbances which, while it occurs not unfrequently in anomalous forms of pneumonia, almost never occurs in tubercular phthisis.

4. The fact that the physical signs, in so far as they could be interpreted, indicated clearing of the lung and not an increased consolidation.

Dr. Clark admitted the difficulty of the slow development of the disease and its unilateral character in considering it as an anomalous form of embolic pneumonia, but he held that the history of the case was sufficient to justify the diagnosis, and he predicted resolution, and recovery of the consolidated lung.

The progress of the case has been steadily towards recovery, as the notes taken from time to time will show.

March 25th.—The tubular breathing was less marked, the voice sounds less bronchophonic, and no crepitations were heard.

31st.—Patient described herself as being much better. On examining the chest it was found that in the supra-clavicular region on the right side, expiration was rather hollow and prolonged ; voice sounds slightly increased. In the infra-clavicular region expiration was also somewhat prolonged ; no crepitations ; vocal resonance increased. Posteriorly—T. V. F. was rather greater than normal in right side. In the upper part, inspiration was feeble : there were no crepitations. Expiration was slightly prolonged and hollow ; vocal resonance normal. In the interscapular region the breath sounds were feeble towards the inferior angle of the scapula on the right side ; expiration slightly tubular ; occasional crepitations.

On the 8th April it was noted that patient continued to feel better ; her appetite was good, and she slept well.

Since the middle of April she has been up part of each day, and improvement has continued steadily. She has now a much healthier appearance, and has gained flesh very considerably.

On the 8th of May the following note was made :— "Patient is now quite well. She has gained in flesh, strength, and colour. A careful examination of the lungs elicits no evidence of disease."

The treatment throughout has been rest, and simple nutritious diet, with attention to the state of the bowels, and at first the use of the effervescing citrate of potass, afterwards the effervescing citrate of potash with iron. Dr. Clark has found this combination useful in cases of this kind, and we subjoin his favourite formula—

℞ Quiniæ sulphatis, gr. ijss ;
Acidi citrici, gr. xvij ;
Aqua, ad ℥j.
Fiat haust. Sig. Nc. 1. M.

℞ Potassæ bircarb,, gr. xxv ;
Potassii iodidi, gr. ijss ;
Syr. auranti, ℥ss ;
Aqua, ad ℥j. M.

Fiat haust. Sig. No. 2. To be taken together in effervescence twice or thrice daily.

This, with an occasional gentle aperient was all that was given in the way of medicine during the first two or three weeks ; afterwards there was added to each dose gr. v. of the ammonio citrate of iron.

*Remarks.*—As we said at the outset the case seems of some interest because of its unusual features, and on account of its steady and rapid course towards recovery. Admitting the probability of its embolic origin, it differs from an ordinary case of pulmonary infarct, in the absence of hæmorrhage and of hæmorrhagic expectoration, the position of the affected parts in the lung, as well as their number and size, together with the somewhat anomalous character of the symptoms. The very moderate rise in temperature and its rapid subsidence to the normal standard is a striking feature in the case. This is not incompatible with the embolic theory ; indeed, the writer of the article on embolic pneumonia in Ziemssen's "Cyclopædia of Medicine' goes so far as to state as his experience of such cases, that a febrile movement is not necessarily set up, and that the temperature cannot in any sense be regarded as a positive diagnostic sign. At first sight, it might have seemed nothing more or less than an ordinary case of tubercular phthisis, but on closer examination and by carefully weighing the evidence, it was seen that this idea was not sufficiently borne out by the whole of the symptoms. The importance of this in prognosis is obvious, for had it been viewed as an ordinary case of tubercle, a favourable issue could not in the same way have been predicted. Another view that was entertained and that was discussed, was that the case might be one of cheesy pneumonia. The position and extent of the consolidation tended to favour this idea, as did also the manifest strumous tendency of the patient, evidenced by the joint affection, and by traces of some old glandular enlargement. The history and course of the case were considered sufficient to exclude this view.

# Department of Lunacy.

## THE ROYAL COLLEGE OF PHYSICIANS AND PRIVATE ASYLUMS.

At a general meeting of the College of Physicians on the 9th inst. for the purpose of formally admitting the Fellows who had been elected by the College, the President was asked whether the report was true that at the recent meeting of the Council to nominate the Fellows a resolution had been passed to exclude proprietors of private asylums from being admitted to the Fellowship of the College.

In reply he stated that as the proceedings before the Council were *strictly secret*, he did not feel himself bound to answer the question, but that he would do so by saying that no such resolution had been made, and if it had it would be in the power of any future Council to upset it. A discussion here took place, when one of the Fellows, a Councillor, remarked that the question was not in order. This, however, the President, overruled. The same Fellow stated that he wished to clear himself from a report in circulation to the effect that he had proposed this resolution. We do not for one moment say that a formal resolution was passed, but it is quite possible for any member of the Council to have compared proprietors of asylums to hotel keepers, as has been done in one of the medical journals, and to have stated that it would have been derogatory for the College to have elected such persons to its Fellowship, and so prejudiced the minds of the Council, who might have agreed to this without passing any *positive* resolution. We are credibly informed, that such was the case, and it answered the same purpose as a resolution. It was doubtless to this that the President alluded when he remarked that such a resolution might be thrown out next year if it had been passed.

We consider that if such a statement were really made and carried it was an insult to a large body of men, who have advanced science and literature in a way equal to most of their professional brethren.

## THE HABITUAL DRUNKARD'S BILL.

During the second reading of the proposed Act to legislate for the care of chronic inebriates, the Archbishop of York proposed that a clause should be introduced prohibiting dipsomaniacs from being taken care of in licensed houses as existing at the present day for the reception of the insane. This appears to us very absurd, and we regret that such a clause was allowed to be carried. Insanity and dipsomania are so closely allied, and the latter so often the cause as well as the effect of the former, that it appears difficult to draw a line of demarcation between them. The physicians who have the care of the insane should also be entrusted with the responsibility of supervising the individuals over which the new Act is intended to legislate. We are of opinion that there should be some provision in the Bill enabling those under confinement for drink to be transferred to asylums upon their condition proving that the craving is the effect of some cerebral mischief, and not a disease *per se*, and presumably curable by restraint for some months. We cannot see how the present Act, framed as it is, can fulfil what was intended by the agitators in the matter who drew the attention of Parliament to the existing crying evil, and when we find, in addition, that the care and treatment of these individuals is, by an absurd clause of the Archbishop of York's, taken out of the hands of those medical men who have made insanity and its ally, dipsomania, their special study, we shall not be surprised to find that the Bill will be a failure as to effecting any permanent cures.

## CASE OF INCIPIENT CEREBRAL ATROPHY, WITH GENERAL CUTANEOUS HYPERÆSTHESIA.

By BEVAN LEWIS., L.R.C.P. Lond.,
West-Riding Asylum, Wakefield.

A. B., æt. 58, admitted for the third time. On previous occasions had suffered from acute melancholia. At present she refuses food persistently, sleeps but little, and has developed numerous delusions. The main features prcsented by her present attack are intense, bewildering mental pain, acute subjectiveness, restlessness, agitation, without absolute failure of consciousness. She is so introspective that her attention can only be commanded with difficulty. Her memory is found to be confused and hazy upon most recent events. She exhibits the tendency to regard every topic from a gloomy point of view, and is morbidly sensitive as regards her domestic relationships, believing she has involved her relatives in great pecuniary embarrassments. These groundless fears are also associated with other delusions of a painful, distressing nature, while other hallucinations of the special senses of sight and hearing prevail. Her delusions are of a very indefinite nature, and explanations are vague. She constantly sighs, moans, and acts in a cringing manner. Her pupils are normal in size and reaction. Complexion extremely sallow. She is very thin, and greatly reduced in bodily condition.

*Remarks.*—This case being regarded as one of commencing cerebral atrophy, observations were made with the æsthesiometer, and the results compared with a standard table as follows. The sensorial anomalies are of interest:

| Case of A. B. | | Standard of Healthy Sensibility. |
|---|---|---|
| Tip of index finger | ·05 inch. | ·1 |
| Palm of hand ... | ·1 „ | ·4 to ·5 |
| Back of hand ... | ·025 „ | ·1 |
| Forearm ... | ·025 to ·2 | 2·5 |
| Dorsum of foot | ·15 to ·2 | 1·5 |
| Patella ... ... | ·9 ... ... ... | 1·5 |

Gynæcology in Lunatic Asylums.—Dr. Seguin remarks: By peripheral irritation I mean not only a nervous disturbance elsewhere in the brain, but an irritation of any of the organs. Dr. Storer has written a small work on the influence of uterine diseases over mental troubles, and has shed considerable light on the subject. I have no doubt that to-day a large number of female patients in asylums need a specialist, and many could be cured by the replacement of a uterine version, or the curing of an inflammation. Superintendents of asylums, as a rule, are incapable of attending properly to these maladies, and they have an aversion to calling in an outsider. Some have great repugnance to such cases, for fear of being accused of assault. For very many reasons every asylum should have consulting physicians and surgeons. Dr. Storer cites case after case, showing a cause of insanity to be due to some uterine difficulty, and European statistical reports point the same way.—*Hosp. Gaz., N.Y.*

Peculiarities of Inebriety.—In his fourth annual report of the Asylum for Inebriates at Walnutt Hill, Hartford, Dr. T. Crothers gives the particulars of a number of cases which had been under treatment. Many curious facts are presented, in a history of these cases, illustrating the periodic character of the drink craving, which returns after an interval that can be definitely calculated within an hour; or the insane-like madness which ignores everything but the gratification of its impulses; or the precipitate revulsion of character and motive passing swiftly from one extreme to the other; or the sudden explosion of the diseased impulses, under conditions of excitement and change, &c. All these are significant of laws and forces moving in regular cycles as fixed and definite as that which governs the planets.—*Medical and Surg. Rep.*

# Transactions of Societies.

## ROYAL MEDICAL AND CHIRURGICAL SOCIETY.

THE ADJOURNED DISCUSSION ON CROUP AND DIPHTHERIA.

Owing to the length of some of the speeches and the pressure upon our space we shall confine our notice to the chief points made by the several Fellows who spoke during the meeting of this Society on the 13th inst.

Dr. Barclay, in criticising the Report, said that the Committee did not embrace any consideration of the disease formerly known as "croup"—a membranous tracheitis, and not, as had been assumed, a laryngitis. It was this adoption of the term "membranous laryngitis" as an alternative for croup that constituted his chief objection to the report of the Committee. He doubted whether the membranous croup which he had known as a student was often seen at the present day. At the same time, he admitted that the croup of olden days might have been a sporadic form of diphtheria, just as there are mild sporadic and endemic forms of scarlet fever. He felt inclined to go back to the old definition of croup, which implied its limitation to the trachea. Were this not so he would give up the point, and declare in favour of identity. Lastly, he recalled cases of membranous croup in which the children died asphyxiated from membrane driven against the glottis from below; also other cases of non-membranous croup, in which the inflammation was limited to the trachea.

Sir W. Jenner commenced by saying that his experience had led him to incline more to the view of the identity of these diseases—not to declare it absolutely, for he had no other grounds of basing so certain a statement upon the unity of croup and diphtheria, as, for example, there existed in distinguishing measles from scarlet fever. He looked to the report in the hope, but not in the expectation, that it would solve what little doubt was left in his mind. He thought that men's opinions would colour the facts they narrated. That suspicion was fully verified, and the committee had acted wisely in coming to no conclusion, for they had no facts upon which to come to a conclusion. The com-

mittee had not the data for final conclusions. Their able report was a clear reflex of prevalent views, and would prove a starting point for further research and future opinion. He was told that croup and diphtheria could not be identical because there was a sort of universal feeling in the profession that they were two distinct diseases. The mere strength or universality of an opinion did not prove its truth. There was a time when the whole nation believed in the existence of witches, nor should it be forgotten that in our own profession it was once generally held that measles and scarlet fever were identical. But he did not find this general agreement; on the contrary, there was the greatest diversity of opinion. He was surprised to hear Dr. Barclay say that in croup the false membrane was limited to the trachea, so that if this were found in the larynx the case would be one of diphtheria. He would ask Dr. Barclay if in any post-mortem examination made in the last thirty years he had ever found membrane limited to the trachea. He would ask any who were in the habit of making such examinations if that was ever their experience, and he quoted Dr. West in support of this statement. Then some made the distinction that the one disease, croup, is sthenic; the other, diphtheria, asthenic. This was so baseless and void of anything tangible (for some cases of diphtheria were sthenic, and membranous laryngitis was both sthenic and asthenic) that he could find no resting point here for his foot. It was also asserted that croupous membrane was distinctive in its chemical and physiological characters. If this were the fact, it would be most important, but he found in the same report one of the pathologists who was most thoroughly versed in the knowledge of the lesions of the two diseases, one of the soundest and best informed of pathologists—he meant Dr. Wilks—he found him stating that after careful and long consideration he could establish no anatomical difference between the diphtheritic and the croupous exudation. So here again no firm distinctions could be found. And with regard to the alleged non-contagiousness of croup, there were two reasons why those cases of membranous laryngitis should be less contagious than the pharyngeal form of diphtheria. There was the great difficulty in coughing, and, at any rate, of scattering the membrane, after the trachea was opened. Then, when the child has diphtheria in its early stage it is running about. A notable instance of this occurred in the lamentable affair at Darmstadt. The child goes about, kissing his brothers and sisters, but as soon as the membrane attacks the larynx he is isolated and placed away. So that there is less liability and opportunity for contagion to take place from the laryngeal cases. As to albuminuria, Sir William noticed that Dr. Fagge states that in Class A, "in only one of these nineteen cases was albuminuria noticed to have been present." But these nineteen cases extended over twenty-one years; the albumen might have been overlooked. Dr. Gee's cases of a similar kind gave a considerable proportion in which albuminuria was present. The same criticism would apply to the absence of false membrane on the pharynx. He did not suppose that clinical clerks were different at Guy's from those elsewhere, and when it was remembered how difficult it was to examine the throat of a child thoroughly, it was almost impossible that this could be done by a clinical clerk. The value of enlargement of the glands had been greatly over-estimated. In the pharynx the mass of absorbents go to the superficial glands, which readily enlarge on inflammation about the fauces; whereas the absorbents from the larynx go to the deep glands, glands which, small in size, and deeply seated beneath the fascia, showed no visible external signs of their involvement. After death such glands were found enlarged, which could scarcely be felt during life. Therefore neither as regards the presence of the false membrane nor the presence of albuminuria, nor the relative contagious nature, nor the involvement of the glands, could he find any firm footing to establish a distinction between the two diseases.

Dr. WILKS had not intended to speak; but the whole complexion of the subject had been so altered by the speeches of Mr. Hutchinson and Dr. Johnson that he could not refrain from making some remarks. He perfectly agreed with Sir W. Jenner in denying the existence of a membranous tracheitis apart from a laryngitis. Such a view dated from pre-pathological times, and was based on the expectoration of material which resembled membrane. The question before the committee was very definite. It lay in a nutshell, and in answering it he gave it in his own words, "Is there such a thing as an idiopathic membranous inflammation of the air-passages?" But according to some it seems this question should not have been answered; the committee should have stated what they meant by specific diphtheria. He had always understood a specific disease to be a disease like one of the exanthemata, contagious and protective—*e.g.*, small-pox. Mr. Hutchinson had made a remarkable and conclusive speech, and he (Dr. Wilks) was much inclined to go with him. Mr. Hutchinson did not regard diphtheria as specific, and spoke of epidemic sore-throat originating in diphtheria. Hitherto Dr. Wilks had thought that Dr. Johnson was one of the great champions for the specific nature of diphtheria, but he found him quoting case after case in which "diphtheritic" affections arose *de novo* from bad drainage, and surely that was then an idiopathic disease. So we came to this, that diphtheria and membranous laryngitis were not specific diseases—that is to say, they were as idiopathic in their origin as cirrhosis of the liver in a gin-drinker, or granular kidney in a port-wine bibber. Then, are the circumstances producing diphtheria the same as those producing membranous laryngitis? There was no reason for dissociating membranous laryngitis from diphtheria in the same sense. He differed from Dr. Semple as to the use of the word "croup." He held it to be a very convenient term, used by all in a very definite sense. He had never been called to a case which was not "croup." It might not be possible to show the presence of false membrane; the child might die, and no post-mortem examination being obtained, it would never be known if false membrane were present or not. But the case would be one of croup—a disease of sudden onset with, in a few days, implication of the larynx. It was a correct term, and should be retained.

Dr. PAVY said that he would temporarily discard the terms "croup" and "diphtheria," and describe two classes of cases showing how integrally different they were. In one class of cases—he would call it class A—which may occur in children, but frequently in adults, there is a membranous exudation chiefly on the fauces and pharynx, extending to the mouth and nose, perhaps to the œsophagus and air-passages. Nor was the formation of membrane limited to these regions. If there be a wound in the skin or an excoriated surface, it would probably become covered with membranous exudation; and on account of this liability to the occurrence of this membrane it was a maxim in practice not to use a blister to the skin in such a case; for it was thought that the larger the surface covered by the exudation the greater the amount of blood-poisoning. In these case the sub-maxillary and lymphatic glands were enlarged, a point upon which he had been led to lay great stress. It was one of the main or primary features, and was often as much marked as the swelling in mumps. In a large number of cases the urine was albuminous, and contained tube-casts, the condition which is noticeable in septicæmia or pyæmia, and indicative of blood-poisoning. Further, in this class of cases paralytic sequelæ occurred, not only local in connection with the throat condition, but involving the upper and lower extremities. Then this class of cases was highly infectious. Striking evidence of this had lately been afforded at Guy's Hospital, where a nurse and a patient contracted the disease from a child admitted with it. In another case a patient took it from a case in a neighbouring bed and died. The other class he would style Class X, for it was to be placed at some distance from Class A. Hospital experience constantly brought under notice children of one, two, or three years of age suffering from croup. It was true that in many cases no proof of membranous exudation was present, but in some cases it was. In this class no diphtheritic exudation is met with elsewhere. There is no fear about the results of applying blisters. There is no glandular enlargement. An experienced sister in the clinical ward at Guy's Hospital informed him that she had never known such a case marked by glandular swellings, and this quite accorded with his own experience. Albuminuria was not a marked feature; when present it could easily be explained by the semi-asphyxiated condition of the patient. Paralytic symptoms were absent. At Guy's Hospital these cases are not regarded as infectious; isolation is not thought necessary for them as it is for those of Class A, nor had it been known to extend to other children in the ward. Regarding the matter in this light, Dr. Pavy thought that there are here two distinct diseases. He could not see why membranous inflammation should not be caused differently in

different cases, sometimes due to traumatic causes, sometimes to internal conditions, and sometimes to a definite poison—diphtheria. He urged in the strongest way that we ought to look upon diphtheria as a specific disease and a disease extremely infectious, requiring strong measures for the prevention of its spread.

Dr. FITZPATRICK quoted a case which lent support to the view advanced by Dr. Johnson—namely, that exposure to cold, which ordinarily would give rise to simple catarrh, led, under unhealthy influences, to the formation of diphtheritic membrane on the inflamed surface.

Dr. THORNE THORNE said that in several outbreaks of diphtheria he had investigated he had found that the deaths early in the epidemic were recorded as due to membranous "croup," and the later to diphtheria. It might be that the cases first observed in epidemics were recorded as cases of croup, but that when, from the spread of the disease, its real nature was made manifest, then all subsequent deaths would be recorded as due to diphtheria. As the report of the committee dealt with the etiological side of the question, Dr. Thorne thought this point worthy of notice. He had had to inquire into epidemics of diphtheria in isolated districts, and generally found that the declared disease was preceded by attacks of a throat affection not obviously diphtheritic. At first it was often observed that over a large zone extending over many miles cases of sore throat prevailed; that within that zone, at a later period, groups of cases clearly infectious occurred, in some of them with patches of faucial exudation, in some with laryngeal symptoms; and, finally, within only one village genuine diphtheria broke out. So that it seemed as if in the progress of a long epidemic of throat affection this developed into true diphtheria. Whenever he had met with membranous croup in such epidemics there had also been slighter cases before the marked ones occurred, these earlier cases being apparently less infectious than the later ones; and some time elapsed before infection was detected. It might be that the membrane formed in the larynx in cases before the stage of infection was reached. It seemed that in diphtheria we have a disease which has a history passing from one extreme, that of sore throat, to the other extreme, that of genuine diphtheria. Is it not possible that membranous croup occupies a stage in this pedigree short of true diphtheria? If it be so, then surely the two affections own a common origin. He believed that in diphtheria we have a disease the specific poison of which has not yet acquired that stability to which other specific diseases—*e.g.*, small-pox—had attained; and that it depends upon sanitary legislation whether the poison of diphtheria ever is allowed to become so stable as these disorders. He was aware that this opinion was one-sided; but his experience was one-sided also, for it related only to the investigation of epidemics of diptheria.

Dr. ANDREW confessed himself a dualist; nor was his opinion altered either by the report or the debate. His own experience confirmed that which he had been taught, that cases of membranous croup could, and did, occur idiopathically. He could not put himself in the position of the modern scientific athlete who commenced by stripping off every vestige of old doctrine, for he had lived in the prescientific period, and consequently had read the report in the hope of finding support to his pre-conceived opinions. Even if the report did condemn the dualist position, it was yet clear that it embraced the views of at least three parties—the dualists, the unicists, and those who were neutrals, who held that the doctrine of unity was "not proven." He agreed that the answer given in the conclusions to what was stated to be the scope and object of the inquiry tells nothing logically; but read with its context it was clear that the now famous sentence meant that membranous laryngitis may or may not be due to the diphtheritic poison.

Dr. HILTON FAGGE, as one of the Committee stated that the report was an attempt to combine different views, and he confessed he was in a minority in his view of the subject. Dr. Andrew was right in saying that the conclusion arrived at was that other causes besides diphtheria give rise to membranous laryngitis. If the specific origin of diphtheria were abandoned, as Mr. Hutchinson and Dr. Wilks urged, it would end the question, for it would take away the backbone of the matter. He admitted the justness of Sir Wm. Jenner's criticism of his cases, but the point he wished to bring out was the existence of a large proportion of cases of membranous croup without contagion as compared with pharyngeal diphtheria. Sir Wm. Jenner's explanation of the rarity of contagion from membranous croup was feasible, but that did not explain why cases of diphtheria originating in hospital never assumed the characters of membranous croup. He also referred to the fact that in the last edition of Sir T. Watson's lectures, the whole description of croup has been transferred, not to diphtheria, but to simple laryngitis.

Dr. GREENFIELD'S remarks were chiefly in reference to the criticisms which had been passed upon the report. With regard to the Committee not giving a direct negative to the alleged existence of membranous laryngitis apart from diphtheria, he said, not to mention that they had distinct evidence that membranous laryngitis did exist apart from diphtheria, he would ask whether it was reasonable to expect that any eight men would assert an universal negative which they could not prove. Dr. Greenfield then referred to the various kinds of membrane that had been exhibited on various occasions, some that was in no way comparable to that of ordinary membranous laryngitis, another kind that was little more than coagulated muco-pus, and a third that appeared to be hydatid. With regard to the objections that had been made to the mode of inquiry, it had been said that they ought to have taken up the subject of paralytic sequelæ as a possible means of distinction between diphtheritic and non-diphtheritic cases. But not a single case of paralysis of any form following membranous laryngitis only had been reported to them. He ventured to think that too much stress had been laid on the question of paralysis. Even in ordinary pharyngeal diphtheria the occurrence of paralysis is very variable in different epidemics, and the statistics of its occurrence most divergent. The highest estimate from any large number of cases only gave one in twelve as the proportional frequency of all the forms, ocular, pharyngeal, and other rarer paralyses being taken together. Now the proportion of recoveries in cases of membranous laryngitis of all forms did not reach more than one in ten in statistics of any large number of cases. So that, roughly speaking, in only about one in one hundred and twenty cases of diphtheritic membranous laryngitis could this sequelæ be observed, so far as our present knowledge goes. And if of these we took only the cases in which no false membrane existed elsewhere than in the larynx, we should reduce the number to considerably less. It was, therefore, obvious that the paralytic sequelæ could be of no value in separating a certain class of cases until an enormous number of instances had been collected. He also reminded the Society that the committee had referred in their report to the uncertainty which existed as to whether diphtheria was as distinct and definite a disease as scarlet fever or small-pox, or whether its poison is not readily generated under conditions of foul air and decomposing sewage. Dr. Greenfield concluded by saying that he felt that the question could not be absolutely settled with our present knowledge. There seemed to him, however, a strong balance of clinical evidence in favour of the view that the large majority of cases met with in practice were due to one set of causes, which were also concerned in the production of diphtheria.

Dr. DICKINSON was greatly surprised to hear Dr. Wilks say that he thought the term "croup" a sufficient and satisfactory definition of a disease. In the course of his remarks he drew a distinction between membranous and non-membranous croup. The latter is as remarkable for its favourable issue as membranous croup is for the reverse. That the one was not a lesser degree of the other seemed proved by several reasons. Many of the non-membranous cases are very severe, some are long-continued; so that it is not the mildness or shortness of the attack that makes the difference. Other distinctions are—that non-membranous croup attacks boys more than twice as often as girls; it is apt to occur in the same individual, while the membranous disorder is not; it is not attended with glandular swelling, though this distinction is not of great value, as glandular swelling is not necessarily present when the affection is membranous; and, lastly, with non-membranous croup the urine is seldom albuminous; with the membranous affection it is albuminous more often than not. In eighteen non-membranous cases albuminuria occurred but twice, and in one of these it was uncertain. In membranous laryngitis there was albuminuria in two-thirds of the cases examined. Then non-membranous croup is often definitely traced to distinct exposure to cold; membranous croup seldom so, if ever. On the other hand, there is indubitable evidence that the membranous affection is often produced by infection by foul air or foul water, or some such cause. Dr.

Buchanan has calculated how often the various exanthematous diseases should fall together with diphtheria, supposing their concurrence to be a mere matter of chance. He shows that for one quarter of a year, for which he made the calculation, diphtheria fell with scarlatina about as often as chance would give independently of any pathological association. But the membranous affection fell with measles about twice too often to be thus explained. So far as these figures go, they are in favour of the view that certain conditions, apart from the special diphtheritic influence, may develop membrane in the air-passages. The probability is that these febrile and accidental irritants are able themselves to produce the membrane in question. But, putting aside such cases, no ground of distinction can be found in ordinary cases which would enable one to say that this is due to common inflammation, and that to diphtheria. Turning to Mr. Hutchinson's remarks, Dr. Dickinson said, that no doubt diphtheria is not so definite a disease as typhoid or scarlet fever, but it is communicable, and he did not see why it should not be called specific. Then there is curious evidence that diphtheria may be only one of several disorders engendered by one and the same cause. Of a group of persons who drank of a specially poisonous well, drainage going into it, two had obstinate diarrhœa, one erysipelas, one purulent ophthalmia, one pharyngeal and one laryngeal diphtheria. Dr. Dickinson concluded by thanking the Society in the name of the Committee for the most ample and indulgent consideration which had been given to their report.

The Society then adjourned.

## CROUP AND DIPHTHERIA—III.

OPINIONS, Arguments, Facts—these are the grounds on which we have to base our conclusions respecting the result of the great discussion which has for three long evenings occupied the attention of the Fellows of the Royal Medical and Chirurgical Society. Before summing up the evidence that has been adduced on both sides of the question as to whether or not croup and diphtheria are one and the same disease, we intended to notice, as we did on a previous occasion, the chief points in the speeches of those who took part in the adjourned discussion. The space at our disposal, however, will not admit of that, and therefore we shall do no more than briefly consider the respective merits of the various arguments that have been adduced on the subject. We say "arguments" advisedly, for although we have just said that "opinions, arguments, and facts" constitute the grounds on which we should gauge the practical outcome of this great discussion, as well as of the Report of the Committee, a little consideration will show that neither have the facts adduced been sufficiently numerous and conclusive, nor the opinions of the profession sufficiently widely canvassed, to warrant our attaching very much importance to them. Neither did the committee collect, nor did any of the Fellows of the Society bring forward, such a number of well-observed and well-recorded cases —*facts*, in other words—as would amount to scientific evidence, and settle the question at issue for all time to come. Certainly, several interesting cases are to be found in the Report, and several cases were brought forward during the discussion, cases which no doubt raise points of great importance, and afford valuable suggestions for future inquiry. The question at issue, however, is not one that can be settled by a few interesting cases, but only by a large number of observations, in which the origin, causes, clinical history, and morbid anatomy o each case have been carefully investigated. How far this has been done it is not within the scope of this article to say, but that such evidence is at present wanting must be acknowledged by anyone who has read the Report or listened to the recent debates.

Nor can the "opinions" which have been expressed on the subject be said to be more satisfactory than the facts. There was a difference of opinion among the members of the committee, among the various medical practitioners to whom the committee addressed their queries, and among the Fellows of the Medical and Chirurgical Society who had the opportunity of expressing their views. As a result of that want of unanimity among the members of the committee we have them formulating their conclusions respecting the question at issue in language, the vague character of which was generally admitted, and which can only be accounted for by the fact that it embodied a compromise of the different views which they held on the subject. Still more unmistakable was the difference of opinion elicited in the course of the discussion. While Dr. Semple, Sir Wm. Jenner, Dr. Johnson, Dr. Dickinson, and others were convinced of the identity of croup and diptheria, Dr. Pavy, Dr. Barclay, Dr. Andrew, and, we might almost say, Sir W. Gull and Dr. Wilks, entertained an opposite opinion. It will, moreover, be observed that all the speakers who took part in the recent discussion were physicians engaged in consulting practice, and not that class of practitioners who would have the most opportunity of observing that form of the disease about the nature of which there is so much dispute. Were the great body of medical men practising in the country canvassed on the subject there would probably be a greater consensus of opinion

among them than has been found to be the case among the more eminent Fellows of the Society. It is true that we must not attach too much value to mere opinion, however general that may be. But if it were almost the universal opinion of medical men that croup and diphtheria were distinct diseases we should deem such an opinion worthy of very grave consideration, especially if entertained by a class of practitioners who had unusual opportunities of studying these diseases. When, therefore, Sir W. Jenner compared a general faith of this kind with the once universal belief in witches, the comparison was scarcely a fair one, as a general belief which is engendered by religious or superstitious impressions cannot well be compared with that which is engendered by scientific observation.

Facts and opinions, therefore, affording so little ground for arriving at a satisfactory conclusion respecting the question at issue, we fall back upon the "arguments" that were adduced in favour of, or against, the identity of these affections. On the one hand, it was argued that diphtheria is a specific disease, affecting the whole system, highly contagious, usually attended with great prostration of the system, always membranous, apt to cause a diphtheritic deposit on blistered surfaces, very commonly attended with enlargement of the cervical glands and albuminuria, often followed by certain paralytic symptoms, attacking both children and adults, and often occurring in an epidemic form ; whereas croup is a local affection, not contagious, of a more inflammatory nature, not always membranous, seldom attended with albuminuria, never with enlargement of the glands, chiefly attacking children and not adults, and occurring in a sporadic form. In croup, moreover, there were none of those paralytic lesions which have been noticed in diphtheria, and old practitioners were in the habit of using blisters freely, and yet no diphtheritic membrane formed on the blistered surface. On the other hand, it was argued that croup was as much a general disease as diphtheria was ; that it was very doubtful whether diphtheria was such a specific disease as is generally supposed ; that many cases of diphtheria are at the outset as distinctly sthenic as croup was said to be ; that there were good anatomical reasons why so-called croup, affecting as it did chiefly the larynx, would not be so contagious as diphtheria was, nor accompanied by those other symptoms which were supposed to distinguish the latter from the former disease, namely, the presence of albuminuria, the swelling of the lymphatic glands, and the formation of a diphtheritic membrane upon a blistered or excoriated surface. For when diphtheria attacks chiefly the larynx (so-called croup), the exudation was less likely to be coughed up, and by being scattered about, to become the focus of contagion. Nor was absorption so likely to take place, nor the kidneys to be affected, nor the glands of the neck to swell, when the membranous exudation was confined to the larynx, as would be the case when it was deposited on the tonsils and about the pharynx. The pharynx was abundantly supplied with lymphatics, which passed to the glands of the neck ; and where it was affected from any cause, these glands were liable to become enlarged. But the lymphatics of the larynx passed to the deep-seated glands, the enlargement of which would not be detected during life. And as to the paralytic lesions, the frequency of this lesion had been greatly exaggerated, for it was known to occur in but a very small proportion of cases of diphtheria. Besides, it had been observed that in several outbreaks of diphtheria the earliest deaths were referred to membranous croup, and the later ones to diphtheria, and that, taking observations extending over a large area, it seemed as if diphtheria was developed from what was originally a simple sore throat, the infectious and diphtheritic character of the affection gradually increasing until in some districts there would be an outbreak of diphtheria in its severe and fatal form. Might not, therefore, so-called membranous croup occupy a position in the development of the disease, intermediate between sore throat and diphtheria.

Such appear to be the main arguments of the many eminent men who have just expressed their views on this important question. Taking them in connection with the Report of the Committee, it may be doubted whether anything has been said or demonstrated that will shake the faith of those who have hitherto held to the old doctrine respecting the nature of croup and diphtheria. The best arguments adduced in support of the identity of these affections were undoubtedly those in which Dr. Johnson and Sir W. Jenner accounted for the absence of contagion, swollen glands, albuminuria, &c., in laryngeal diphtheria ; in whieh Mr. Hutchinson threw doubt upon the generally supposed specific nature of diphtheria ; and in which Dr. Thorne Thorne suggested croup to be but a link in the epidemic history of outbreaks of diphtheria. Sir W. Jenner's arguments, however, appear to us of a somewhat specious nature. Were the identity of croup and diphtheria a well established fact, and were the two diseases shown to occur under the same conditions, and from like causes, Sir William's propositions would be a very satisfactory explanation of the absence of the abovementioned phenomena in one class of cases and their presence in another. As, however, their identity or not is still an open question, Sir W. Jenner's argument looks more like an ingenious way of getting rid of certain facts which militate against the hypothesis of croup and diphtheria being one and the same disease. The argument is certainly an able one, the weak point of which is that it does not sufficiently reconcile the very broad discrepancies which characterise the phenomena of these diseases. Passing over the views of Mr. Hutchinson respecting the pathology of croup and diphtheria, the improbability of which disarms them of the opposition they would otherwise present to the dualistic theory of these affections, we come to the facts which Dr. Thorne Thorne has observed in connection with certain outbreaks of diphtheria. These observations are not, in our opinion, at all inconsistent with the supposition that croup and diphtheria are distinct diseases. It is very natural that the first cases of an epidemic outbreak of diphtheria should be of a mild form, and that these cases, wanting many of the most characteristic features of the more severe and fatal form of diphtheria, should be set down as cases of croup. Just as epidemics of cholera are preceded by an unusual prevalence of ordinary diarrhœa, so may epidemics of diphtheria be ushered in by several forms of throat affection, varying from a common sore-

throat to attacks of what can scarcely be distinguished from inflammatory croup.

In conclusion, we cannot help expressing our surprise that both the Committee who drew up the Report and nearly all the Fellows of the Society who joined in the discussion, should have altogether ignored tne existence of any kind of inflammatory croup which was not attended with the formation of a membrane. Croup, in the old and ordinary acceptation of the term, is an inflammatory affection of the larynx and trachea, which is more often, than not, unattended with membranous exudation. In many of the cases of croup admitted by Dr. Pavy into Guy's Hospital, there was no proof of the presence of membrane. And Dr. Sansom was quite justified in protesting against the definition which the committee imposed upon the word "croup." It was, as he said, equivalent to their begging the question. Nor should it be forgotten that in one respect the doctrine of the unicists places them in this dilemma—that while they admit there is on the one hand a spasmodic affection of the larynx, or false croup, and on the other the general and specific affection called diphtheria, they deny there is any local, idiopathic, inflammatory affection of the trachea, or larynx and trachea, which is as much as to say that this part of the body is, unlike all other parts of the body, quite exempt from idiopathic inflammation. When once it is admitted on all sides that so-called croup signifies laryngo-tracheitis, not necessarily attended with membranous exudation, the probability that there is really a local inflammatory affection of these parts, called croup, distinct from the more general disease known as diphtheria, will be more universally acknowledged. At all events, such a postulate would form a very convenient basis for future investigations into a subject which, it is to be hoped, will not, for the credit of scientific medicine, be long an open question.

## THE PRISON SURGEONS IN IRELAND.

THE dispute between the Irish prison surgeons and the Department has assumed formidable proportions in consequence of what we must characterise as the mean, discreditable, and illegal attempt of the Prisons Board to force new duties upon these gentlemen, and to expel them from their offices as a punishment for their remonstrances. The controversy is somewhat complicated, but, as it has been brought before Parliament by Mr. Errington, and may probably be the subject of legal proceedings before the Irish Queen's Bench, we think it well that it should be understood. The prison surgeons of Ireland are of two classes—1. Those who are regularly appointed, and who are not infirmary surgeons ; 2. Those who have held the prison surgeoncy in conjunction with the county infirmary, under the Grand Jury Act (6 and 7 William IV., cap. 116, sec. 86). The latter class may be again subdivided into—(*a*) Those infirmary surgeons who were specially and definitely appointed to the prison by its board of superintendence, under the powers of the 19th and 20th Vic., cap. 68, passed on the 21st of July, 1856; (*b*) Those who held prison office under the old Grand Jury Acts before that date, and who did not receive any special appointment to the prison.

Now it will be recollected that the 27th section of the new Prisons Act preserves in the strictest sense all the rights, privileges, and immunities of the surgeons "attached" to prisons at that date. Therefore, as regards Class 1, who are gaol surgeons and not infirmary surgeons, the Prisons Board is powerless to coerce, although it *has* attempted to bully them. Towards Class 2—*i.e.*, the infirmary surgeons—it will be remembered that the Prisons Board has acted in a manner which we have described with good reason as mean, discreditable, and illegal. Fortified by a legal opinion, made to order by the Crown Counsel, they seek to oust these officers altogether, and, having kept them without salary and without satisfaction as to their duties for a whole year, they have had the hardihood, by the following letter, to inform the infirmary surgeons that, according to the opinion of the Board, they are not "attached" to prisons ; are therefore not protected by the 27th section of the Act, and may be dealt with in any way the Board pleases; and that the Board pleases to dismiss the whole of them, and re-appoint, on its own terms, such of them as will do what they are bid.

[Copy.]

GENERAL PRISONS BOARD, DUBLIN CASTLE,
3rd May, 1879.

SIR,—The General Prisons Board has, for some time past, had under consideration the question of the present legal status of certain Surgeons of County Infirmaries acting, by virtue of such appointment, as medical officers to prisons, but who were, up to the 1st of April, 1878, bound by statutory obligations to perform the duties incidental to the latter offices without reciving for them any additional salary or other emolument.

The Prisons Act of 1877, 40 & 41 Vic., c. 49, s. 27, has entirely relieved these officers of this obligation from the 1st of April, 1878, the date at which the several local prisons came under the control of the General Prisons Board, and, under these circumstances, it was deemed nesessary to seek, for the guidance of the Board, the opinion of the law adviser of the Crown as to the precise position these particular officers were to be regarded as now occupying in relation to the prison service. The Board has now received this opinion, which is to the effect—that the surgeons in question are no longer prison officers, and can only become so in the event of their receiving this appointment from His Grace the Lord Lieutenant.

Pursuant to this decision the Board has been instructed by his Grace to acquaint you that the office of medical officer of the ——— prison is now vacant, and that it is his Grace's intention to proceed in due course to advertise for applications from properly qualified candidates, to supply these places at the rate of remuneration which has now received the sanction of the Lords Commissioners of Her Majesty's Treasury, and which will be duly notified in the advertisement.

It will be open for you, should you desire it, when the advertisement appears, to submit an application for the office to His Grace the Lord Lieutenant, but whether you may be eventually appointed or not, the Board desires to inform you, that they will be prepared to remunerate you for the service rendered by you subsequent to the 1st of April, 1878, in accordance with the scale now fixed for the class of prison to which that at ——— belongs.

I am, Sir, your obedient Servant,

CHARLES BOURKE, Chairman.

We justify our assertion that the conduct of the Board is mean and discreditable, for we hold that for a public department to avail itself of a legal trick to dismiss a batch of officers who have done their duty satisfactorily

for long years of service, can be described in no other terms. But the transaction appears still more dishonourable from the fact that, so far as the best legal advice can decide the matter, the proceeding is perfectly unlawful, and the Board would seem to be "trying on" a course which it ought to know it has no authority to enforce.

The rights of the prison surgeons who are *not* infirmary surgeons were defined some time since by the opinion of Mr. Purcell, Q.C. Those of the infirmary surgeons were submitted last week to Mr. John O'Hagan, Q.C., and (with a full statement of the entire case) the following questions were asked.

Counsel will be good enough to advise querists on the following points :—

1. Are the gaol surgeons holding office April 1st, 1878, entitled to continue to hold their places under the 27th section without re-appointment.

2. Can the Lord Lieutenant declare any such post now vacant ?

3. In what form can this question be most quickly and simply tried ? Can the appointment of new surgeons be prevented by an injunction or mandamus or otherwise ? or must querists await an appointment, and try the question by *quo warranto ?* or what course would Counsel suggest ?

The reply of Mr. O'Hagan to these queries is as follows :—

I have read and considered the sections of the several statutes bearing upon the questions submitted to me. I am of opinion that medical officers of prisons in Ireland, duly appointed by the respective boards of superintendence in pursuance to the 19th & 20th Vict., c. 68, s. 18, or by the Grand Jury before that Act, are continued in office by the 27th section of the 40th and 41st Vic., c. 46 ; and I am of opinion that this is so in the case of those gentlemen who also held the appointment of surgeons to county infirmaries. This opinion does not, I conceive, conflict with that which deals with the case of a gentleman who gave his medical services to the prison solely by reason of his being surgeon to the infirmary pursuant to sec. 86 of the 5th & 6th Wm. IV., c. 116. But as regards the question before me, that is, the status of medical officers of prisons duly appointed, I am of opinion that the Lord Lieutenant has not power to declare their offices vacant. A mandamus lies to restore to an office any officers illegally removed, but I think it will, on the whole, be wisest to await until there be an intrusion into the office, and then proceed *quo warranto.*

It will be perceived that Mr. O'Hagan is of opinion that all infirmary surgeons who were appointed since the 21st of July, 1856 (when the 19th and 20th Vic., cap. 68 passed), and all those who, though holding office previous to that date, had received a definite appointment, are fully protected by the 27th clause of the new Act, and that none are subject to the tender mercies of the Prisons Board save those who, being prison surgeons in connection with the infirmaries under the old Grand Jury Act, had not taken the trouble to obtain a definite appointment to the gaol.

The Chief Secretary for Ireland was interpellated on this subject last week, when he replied with the statement that there was no intention to oust the prison surgeons, who no doubt would be re-elected in most cases. Yes, but we ask, on what terms ? If the Prisons Board establishes its right to dismiss them (or rather to regard them as *functi officio*) then, if re-elected, they will be liable to any terms as to duties and salaries which the Board pleases to dictate ; but if on the contrary, they are held to be permanent prison officers, their privileges are strictly protected under the 27th section of the Act, and the Prisons Board has no power to add new duties or to diminish salaries.

We, therefore, advise the infirmary surgeons not to allow themselves to be satisfied by the Chief Secretary's promises, but to stand firmly upon the legal rights which they are declared to have, and which are safer than the promises of any Government department.

By the opinion of two of the most eminent counsel at the Irish Bar, the Prisons Board's attempt to oust the surgeons has been declared illegal. We go further and declare our firm conviction that the acceptance and recognition of the services of infirmary surgeons and their regular performance of duty under the old Grand Jury Acts gives them an unchallengeable right in equity to their offices, and that no jury would fail to recognise those rights. We certainly trust the infirmary surgeons will not hesitate about asserting their rights.

By way of postscript we may state that we understand on good authority that the future salaries proposed by the Treasury for prison surgeoncies in Ireland are as follows :

| | |
|---|---|
| Bridewells - - - | £40. |
| Small gaols - - - | £60. |
| Larger gaols - - - | £80. |
| The largest prisons - - | £150. |

# Notes on Current Topics.

## Opium-Eating in the Provinces.

It would appear from the columns of a daily contemporary that opium eating is practised much nearer home than the land of the heathen Chinee, and that even amid the simplicity and retirement of the country this noxious habit is practised to a much greater extent than any one would suppose. According to the venerable Dr. Moffatt some of the inhabitants of the attractive village of Hawarden, in Cheshire, have taken to drink laudanum with as much freedom as others drink beer. We are told that one chemist alone in the district has sold two quarts of laudanum in a week, that a single family has been known to spend as much as ten shillings in the same space of time, and that one man thrashed his wife because she did not obtain for him the desired sedative. Again, a chemist in one of the Eastern Counties states that he has known cases in which youthful women have drunk upwards of four ounces of laudanum at a draught in one day ; while another remarks, that a gentleman engaged in professional pursuits drinks daily two ounces of the deadly tincture. We are induced to think that report has much exaggerated the real state of the case, for were opium eating or laudanum drinking threatening to become a common habit among our countrymen or countrywomen, the medical profession would either directly, or indirectly, become aware of it. Up to the present time, however, no such complaints have been made by medical men, which, probably, would have been the case had the habit become so frequent as Dr. Moffatt would have us believe. At the same time it must be admitted that opium eating may be practised more secretly than dram-drinking, and that the former habit is not at first so easily detected as

the other is. It is, therefore, possible that, while on the one hand, Dr. Moffatt may, in a great measure, have raised a false alarm on the subject, medical men may, on the other hand, have underrated its importance, or even altogether allowed it to escape their attention. Should opium eating threaten to become one of our social vices, it will be the duty of the Legislature to put greater restrictions upon the sale of this drug than is now the case. It would also be our duty to take every opportunity of representing to the public the evil results likely to follow from an indulgence in this habit, and, at the same time, to study the symptoms by which it may be detected.

## Women as Pharmaceutists.

A CRITICAL battle was fought last week in the Council of the Pharmaceutical Society of England, as to whether women should or should not be admitted to the Society. This question has been already fought out more than once, the decision being always adverse to the ladies. On the present occasion the verdict was also a negative, but the exclusion of the women was carried by an infinitesimal majority, so that their champions are encouraged by hope of a certain victory next year.

The resolution for their admission was as follows :—"That all persons duly qualified (irrespective of sex) being eligible for admission into the Society in accordance with the bye-laws thereof, this meeting is of opinion that ladies should not be excluded from participation in the privileges of the Society."

An amendment was moved :—"That this meeting is of opinion that inasmuch as registration under the Pharmacy Act secures all trading rights to persons so registered, and membership of the Pharmaceutical Society in no way increases those rights, it is unnecessary, so far as females themselves are concerned, and undesirable on the part of the Society, to introduce so complete a change in its constitution as would be involved by the admission of females as members, associates, apprentices, or students of this Society."

The result of the division was as follows :—For the amendment, 81 ; against, 78 ; majority against the admission of women, 3.

## The Parkes Museum of Hygiene.

THIS museum, temporarily located at University College —of which Her Majesty the Queen is patron, and Sir Wm. Jenner, chairman of committee—will be opened to the public on and after the 1st of July next. The opening ceremony will take place on Saturday, June 28th, when a meeting will be held in the Botanical Theatre, under the presidency of the Right Hon. R. A. Cross, M.P., Secretary of State for the Home Department. Although the Museum is yet quite in its infancy, it contains a very valuable collection of objects and apparatus relating to every branch of sanitary science. As the only institution of its kind existing in London, it will supply a very great want to those in need of facilities for obtaining a practical knowledge of sanitary matters, and professional men, employers of labour, manufacturers, artisans, and other persons, both men and women, will be able to study at their leisure those subjects in connection with sanitary arrangements in which they may be interested, and the benefits of the museum will therefore be extended to all classes of the community. The executive committee, of which Sir Wm. Jenner is chairman, rely on voluntary subscriptions for the support of the new institution under their charge. Of the subscriptions already received they have invested £600 as the nucleus of an endowment fund. In all, something under £1,100 has been subscribed in sums varying from £1 to £50, the latter sum having been given by Her Majesty the Queen. Additional subscriptions are much needed.

## Prizes of the Royal College of Surgeons.

THE following is the subject for the Jacksonian Prize of the Royal College of Surgeons for the ensuing year, viz. : "The History, Principles, Practice, and Results of Antiseptic Surgery." For the present year, it is "The Disease of the Lymphatic System, known as Hodgkin's Disease or Lymphadenoma." The pecuniary value is represented by the amount of the dividend, about £12, received from the Trust. The Collegiate Triennial Prize, which has not been awarded since 1858, will, if an essay of sufficient merit be sent in, be awarded next Christmas. The subject is "The Anatomy and Physiology of the Third, Fourth, and Sixth Nerves, as illustrated by Observation and Experiment in Health, and by reference to the effects of Injury and Disease." This prize consists of the John Hunter Medal executed in gold, to the value of fifty guineas, or, at the option of the successful author of the dissertation, of the said medal executed in bronze, with an *honorarium* of fifty pounds.

## The Metropolitan Hospital Sunday Fund.

ON Monday week the Council of the Hospital Sunday Fund met at the Mansion House. Mr. Alderman McArthur, M.P., in the absence of the President (the Lord Mayor), occupying the chair. The Secretary announced that the Earl of Aberdeen had accepted the seat on the Council vacant by the death of Earl Russell. It was then moved and carried that the Lord Mayor and Sheriffs of London be asked, as heretofore, to support the claims of the fund by attending in state the services at St. Paul's Cathedral and Westminster Abbey on Hospital Sunday, the 15th June.

The report of the committee appointed to consider the advisability of publishing with the annual report a table showing the number of beds occupied, the number of in- and out-patients, the approximate cost of treating in-patients per week, the percentage of cost of management to that of maintenance, as determined by the committee of distribution, the average of payments made by patients, the gross annual income, and the average gross annual expenditure during the three years, was brought up for discussion. Dr. Glover expressed a desire to have the arithmetical basis of awards added, as well as that of the actual basis determined by the distribution committee, because he believed that the fuller the information afforded the less room would there be for those who were inclined to cavil at the awards. After a long discussion it was, however, thought advisable to omit this column for the present. Dr. Risdon Bennett and Sir Rutherford Alcock were more anxious that the table should furnish

the "actual number of patients" treated at the several institutions, in contradistinction to attendances, and it was ultimately resolved—"That under the heading 'number of patients' information should in future years be given, showing whether, and how often, the same person is entered more than once in the hospital or dispensary books, so as to enable the council to give the fullest information required."

## Royal Medical Benevolent College.

We would remind the governors and subscribers of the Royal Medical Benevolent College, that the annual general meeting will be held in London, to-morrow (Thursday), at 3 p.m., at the offices, 37 Soho Square. We will also say to those who have expressed a desire for a change in the mode of election, that their object will not be secured unless so *voted by a majority present.* Although an enormous number (2,770) of the governors have sent in a request to the Council to adopt a far better method of election than the haphazard one at present in force, it is believed that the Council will oppose Dr. Hare's motion, and it is absolutely necessary that a strong muster of those favourable to the Committee formed for improving the mode of election of beneficiaries should take place on this occasion.

## Irish Centenarian.

The Registrar of the Corrofin district (co. Clare), in his official report to the Registrar-General last month, says that there were twelve deaths registered by him during the past quarter of persons aged between 70 and 80, eight between 80 and 90, three between 90 and 100, and one at at the extraorditary age of 106, which, from inquiries made, seems to be correct, he being 25 or 26 years old in the year 1798. He has a daughter who is only 15 years of age.

## Homœopathic Confectionery.

In some parts of Germany physicians are not permitted to dispense medicines, when there is an apothecary in the place to do it for them. We learn from the *Allg. Hom. Zeit.* that three homœopathic physicians were practising in Regentsburg, when an apothecary of the same belief came among them and notified them to send their prescriptions to him. Two of them refused, and were brought before the court and fined about five dollars. The case was carried to a higher court, and the medicines (pellets) sent to the University of Erlangen for chemical analysis. The chemists of the university failed to find anything in them of a medicinal or poisonous nature, and so reported; whereupon the judge reversed the decision of the lower court, and declared that there was no law that prevented physicians from distributing sugar-plums (*Zuckerwaaren*) as freely as they chose.

## What is a Half Pint?

It may be advisable to remind chemists that the Weights and Measures Act of 1878 is now really in operation, and that every time they sell 8 oz. of anything as half-a-pint they are liable to a penalty. An inspector has already secured the conviction of two chemists who sold him 8 oz. of quinine wine as half-a-pint, and in a third case the chemist only escaped because the inspector was unable to swear that he used the words "half-a-pint."

## Latin in Prescriptions.

A Bill has been introduced into the Legislature of one of the American States the object of which is to abolish the use of Latin as the language of pharmacy. The Bill provides substantially that from and after its enactment all physicians' prescriptions shall be expressed in the common English terms by which the medicines prescribed are known, and that druggists shall employ these English distinctions in labelling their bottles and other dispensing receptacles.

The annual *conversazione* of the Royal College of Physicians of London will be held on the evening of Wednesday, July 2nd.

The annual meeting of the Queen's University Graduates' Association was held at St. James's Hall, Piccadilly, London, yesterday evening.

Lord Derby has declined to accept the presidentship of the next Social Science Congress, to be held in Manchester on the 1st of October next.

We understand that the Board of Trinity College, Dublin, has decided to build and fit out a histological laboratory for Professor Purser, the eminent physiological lecturer in the School of Physic.

A general meeting of the Irish Graduates' Association will be held on Tuesday, June 3rd, 1879, at the Holborn Restaurant, London. The chair will be taken by the President, W. MacCormac, Esq., F.R.C.S.I. After the meeting dinner will be provided.

Of the 117 candidates examined at the last week's meetings of the Board of Examiners, Royal College of Surgeons, England, 34 failed to reach the required standard, and were referred for three, and 12 candidates for six, months' further anatomical and physiological study.

The President of the British Medical Temperance Association, Dr. B. W. Richardson, F.R.S., will deliver his Address in the Medical Society's Rooms, Chandos Street, London, W., on May 30th, at 5 p.m. Medical men will be admitted on presentation of card. The dinner will take place at the Langham Hotel at 7 p.m.

The case of Sir Rowland Hill *versus* the Metropolitan Asylums Board, to abate the nuisance of hospitals near his property, having only occupied eleven days, and wasted many thousands of public money; a new trial has been granted to enable lawyers to have another fortnight's quibble over technicalities, and the public the privilege of paying for it.

The death-rate from the seven principal zymotic diseases in the principal large towns last week averaged 2·5

per 1,000. Scarlet fever showed the greatest fatality in Nottingham and Sunderland; measles in Norwich and Salford; and enteric fever in Sunderland. Small-pox caused 6 deaths in London, 11 in Dublin, but not one in any of the other large towns.

---

We were the first to draw the attention of the authorities to the apparent neglect of Surgeon-Major Reynolds, who so gallantly ministered to the wounded and fought alternately at Rorke's Drift, when Lieutenants Chard and Bromhead received immediate promotion for their bravery. We are, therefore glad to learn that Surgeon-Major Reynolds is to be rewarded with the Victoria Cross, than whom none deserve it better.

---

The annual rates of mortality per 1,000 last week in the principal large towns of the United Kingdom, were —Portsmouth 15, Brighton 16, Nottingham 17, Leicester 18, Edinburgh 19, Birmingham 21, London 22, Glasgow 22, Wolverhampton 22, Bristol 23, Bradford 23, Sheffield 23, Liverpool 23, Leeds 23, Sunderland 24, Plymouth 24, Salford 25, Norwich 25, Oldham, Hull, Manchester, and Newcastle-upon-Tyne 26, Dublin 33.

---

The rates of mortality in the principal foreign cities according to the most recent weekly returns, were—Calcutta 39, Bombay 33; Paris 28; Geneva 37; Brussels 29; Amsterdam 25; The Hague 26; Copenhagen 49; Stockholm 30; St. Petersburgh 45; Berlin 24, Hamburg 29, Dresden 24, Breslau 34, Munich 42, Vienna 33, Buda-Pesth 42, Rome 24, Naples 31, Turin 34, Venice 22; Alexandria 33; New York 25 per 1,000 of the population. Small-pox caused 23 deaths in Paris, and 31 in St. Petersburgh.

---

# Scotland.

(FROM OUR NORTHERN CORRESPONDENT.)

Hygiene and Public Health.—Dr. Christie, Medical Officer of Health for Hillhead, delivered the first of a course of lectures "On Public Health," in Anderson's College, Glasgow, on the 19th May. The subject chosen by the lecturer was "A Historical Sketch of Sanitary Science." Dr. Christie, in his opening remarks, said that this department of medical science had been cultivated from the most remote times, and the fact that it had a permanent position in the Mosaic code of laws, the ancient medical literature of the Hindoos, the Chinese, and the Egyptians, showed that it had even then been regarded as of great importance. Pythagoras, he said, was the first of the ancients to bring the principles of physiology to bear upon the study of medicine, and raise it to the dignity of a science. The Greeks were favourably circumstanced for obtaining a water supply; while the Romans, not so well situated, constructed a system of aqueducts and sewers—of so excellent a character that some of the sewers did duty even to the present day. From the downfall of the Roman Empire until more recent times sanitary science had made no advance—in fact, lay a dead letter. In the early times the streets were narrow, the houses deficient in accommodation, and no public arrangements were made for the removal of filth from the streets, courts, or alleys, and personal cleanliness was unknown; and we in the nineteenth century could form but an inadequate idea of the filth and wretchedness of the English habitations of the sixteenth century. The inevitable consequences of such a course of life was to be seen in the serious and destructive plagues which occurred in the fourteenth, fifteenth, and sixteenth centuries. The Black Death of the fourteenth century was one of the most important factors in the history of the world in preparing the way for the present high position of Europe. When Europe recovered from the shock of this great calamity, men began to reflect on the events which had just transpired, and it then became evident to reflective men that contagion had much to do with the spread of disease, and the possibility of protecting cities by isolation became apparent. After referring to the effects of the plague in the sixteenth and seventeenth centuries, Dr. Christie remarked that the first measure of sanitary reform was a Rivers Pollution Act, passed in 1388; and in 1489, an Act was passed prohibiting the slaughter of cattle within cities and burghs. Both of these enactments continued to be law until 1856, when, with other obsolete laws they were repealed. However, recent sanitary legislation in this country had been dependent upon events which had occurred within the experience of the present generation—namely, the three outbreaks of cholera in 1831, 1849, and 1854. The epidemic of 1831 thoroughly awakened the country to the necessity of sanitary reform. Parliamentary action was taken, and in 1848 was passed the great comprehensive measure of public health, which was the ground work of all sanitary legislation in this country, or in the world. The visitations of cholera in 1849 and 1854 further strengthened the opinion as to the necessity for sanitary reform, and several Acts were passed with that object in view. A most important measure was the English Act of 1875, which did not extend to Scotland, and in this country we were protected only by the tentative and permissive measures of 1865 and by the Rivers Pollution Act of 1878. Dr. Christie concluded a very interesting lecture by remarking that the great impulse given to sanitary science in this country was due to the labours of those of the present generation, some of whom were still with us and actively engaged in practical work.

The Registrar-General's Report.—The Registrar-General's Return for the first quarter of 1879, shows that the birth-rate was higher than usual, and the death-rate about an average, while the marriages were at the rate of only 66 per 10,000 of the estimated population, compared with 76 in the same period of previous years. The rate of illegitimacy was 8·6 per cent. As regards the principal towns, marriages were most numerous in Glasgow, where the rate, as in the corresponding quarter of 1878, was 81 per 10,000 inhabitants. On carefully examining the birth-rate and death-rate of Glasgow for the last few years, we find grounds for the impression that the population obtained by the annual enumeration of houses is probably more correct than the estimate which we are in the habit of deriving from census data, and which, till next census, must be used in these reports.

The Air of Glasgow.—A further report on the air of Glasgow has just been issued by the Health Committee of the Glasgow Town Council. From some explanatory remarks, it appeared that the least amount of sulphur in the air is usually found at the Western Infirmary experimental station. At all the other stations it is in excess of the quantity found there. There is less of it at present in the air at all the stations than in July, when work is practically stopped, and many people

are absent from the city. The sulphur reaches it highest point in the winter months. As to the nitrogen found, it appears that at each station there are two periods of excess—one in summer and one in winter—while comparing the sulphur with the nitrogen acmes, it seems shat the summer excess of nitrogen coincides with the summer minimum of sulphur, and the winter excess of nitrogen with the winter maximum of sulphur.

Loch Katrine Water.—The monthly report of the quality of Loch Katrine water, with which Glasgow is supplied, prepared by Professor E. J. Mills, D.Sc., F.R.S., of Anderson's College, has just been issued. The results are returned in parts per 100,000 : total solid impurity 3·00 ; organic carbon 0·130 ; organic nitrogen 0·016 ; ammonia ·000 ; nitric nitrogen 0·008 ; total combined nitrogen 0·024 ; chlorine 0·60 ; hardness 1·11. The water was sampled on May 19th. It was somewhat brown, and contained suspended fibres, together with an exceptionally large amount of iron.

## THE USE OF EMETICS IN PARTURITION.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—There can be little doubt but that an entirely too restricted a view is often taken of the actions and uses of therapeutic agents, and that medical men are only too apt to ignore or neglect the ample resources which nature and science have placed at their disposal. This scepticism, or whatever else it may be called, often arises from carelessness or want of skill in diagnosis, the blame, when failure ensues, being in the majority of cases freely imputed to an unoffending drug, but not unfrequently from the indelible impression of erroneous teaching.

To take the opinions, for instance, of some of the leading members of the profession, all that would be necessary to constitute a good physician would be a thorough knowledge of physiology and morbid anatomy. But mankind, unfortunately for this dogma, are generally not inclined to take such a profound view of things, and will instinctively, though it may be perversely, continue to consult those among us who are both willing and able to relieve them of their ailments. In this I fully coincide with them. It gives me much pleasure therefore to raise my feeble voice to vindicate in a measure the just claims of medicine, and to bear willing testimony to the valuable services of emetics in certain forms of tedious labour. And, although the practice is by no means novel (being recommended or alluded to in almost every text-book of midwifery in general use), still much credit is undoubtedly due to you for your able leader, and to Dr. Carriger for the elaborate and exhaustive manner in which he has lately brought the subject before the profession. When dystocy depends upon great muscular rigidity and general plethora, tartrate of antimony and potash is of all remedies the most effectual, if we except copious venesection, which, however, it has happily superseded. But the great majority of cases to be met with in private practice are due to simple atony or inertia of the uterus. Here ipecacuanha deservedly supplants its more powerful rival, as being less depressing and consequently safer and more manageable. But as with every great blessing in this world, both agents have their limits as well as sphere of usefulness. How many cases of protracted labour, for instance, may not be referred to other causes than those mentioned ? Unfortunately for the accoucheur and his patients, alas, too many. Of these I need only mention a few—malformations of the pelvis, tumous (fibrous, cancerous, &c.), exostoses, fœtal hydrocephalus, malpresentations, atresia-vaginæ, &c., where, should emetics (whether mineral or vegetable) be employed as oxytocics, the consequences, I need scarcely say, would be most disastrous. Of late I have been accustomed to combine ergot with ipecacuanha, and, as it seems to me, with decided benefit. The formula I usually employ is, liquid extract of ergot, two drachms ; wine of ipecac, half an ounce ; water to two ounces ; two teaspoonfuls to be taken, according to circumstances, every five, ten or fifteen minutes. When its effects, usually nausea, seldom vomiting, set in, the pains increase in force, duration, and frequency. To achieve all this, a few doses of the mixture usually suffice ; indeed, I have never to my recollection been obliged to use in any single case more than the quantity above mentioned. As to the power of ipecacuanha in arresting uterine hæmorrhage I cannot speak from experience, but judging from analogy (its great value in dysentery and hæmoptysis for instance), I have every reason to think it would be most effectual. In passive hæmorrhage of the organ—not depending, of course, upon polypi, fibrous, cancerous, and other tumours—I have found no remedy to equal a combination of digitalis and tincture of iron, unless it be a mixture recommended a few years ago by Dr. Horace Dobell, and which consists of ergot, digitalis, gallic acid, sulphate of magnesia, dilute sulphuric acid, all in a menstruum of the acid infusion of roses ; and to which he has appended for the greater safety, no doubt, of those who employ it, the qualification that "in any given case either of the ingredients may be omitted if the symptoms indicate that it is not required, or that it has already done its duty," a suggestion, I may add, that has stood me in good stead in many a critical case.

Bernard Kelly, M.D.,
Medical Officer for the 5th District of St. Olave's Union, Southwark.

Rotherhithe, May 22nd, 1879.

## THE O'CONNOR DON'S IRISH UNIVERSITY BILL.

This measure, which has been the *piece de résistance* of the House of Commons during the past week, has been the subject of much apprehensive controversy in the medical faculties of Irish universities and colleges, it being obviously a measure of utter revolution in the qualifying system of Ireland. For those who have not acquainted themselves with the O'Connor Don's proposal, or who have looked at it only as a move in favour of denominational education in Ireland, we may explain its proposals in regard to medical education. The Bill erects a new "University of St. Patrick," to which are to be affiliated such colleges as the Senate may consider to fulfil "the conditions hereinafter mentioned." These conditions, as set down in Clause 23, are threefold.

1. The College must not be in connection with any existing university. This excludes Trinity College and the Queen's College.

2. It must not receive result fees under the Intermediate Education Act.

3. It must have "some boarding-house or houses under the control of its authorities, in which at least twenty persons over the age of eighteen years shall be resident within six months previous to examination." This excludes all existing medical schools and colleges, unless they establish boarding-houses to meet the requirements.

The University is empowered to grant upon examination degrees in all faculties, including medicine and surgery, in which it is proposed to confer Doctorates and Bachelorships in Medicine, and Masterships in Surgery, to any student who shall have "passed his examination n the first session of the Faculty of Arts." This proposal—if it becomes law—would, as the Queen's University does, open the higher university medical distinctions to students who had not put in a full academic course of study.

The most directly important part of the O'Connor

Don's Bill is that which provides for the granting of lucrative exhibitions to students, and capitation grants to colleges as bribes to them to patronise the new university in preference to the old. A million and-a-half of the church surplus is to be seized for this purpose, and dispensed with lavish liberality to catch pupils. Every college which sends up a successful medical student will receive for each student yearly grants from £20 to £35, amounting in the gross to £110, or if the student takes honours, £150. For every ten students who pass the matriculation examination—one exhibition of £20 a year for three years—£60 is to be granted, and for every ten students who pass through one year and go on in Arts—a further exhibition of £30 a year—£90. For every ten medical students—one exhibition of £20 tenable for four years—£80 is to be given.

It is obvious that the wholesale system of purchase of pupils, coupled with the natural anxiety of the new university to fill its faculty with students on any terms, would, in all probability, clear the Irish medical schools and colleges of every student who did not care for prestige, or thought he might win one of the many exhibitions. The proposal is one simply to appropriate public money to the purchase of students for one school, *i.e.*, that of the Catholic University, which is the only college which answers the description set down in the Bill. Being of this character we can say without hesitancy that, as regards medical education in Ireland, the establishment of a new university on such terms would be an unalloyed evil and a disaster. There is not the remotest need for such an institution, for medical education and licensing is already over-supplied in Ireland, and can be had of any quality and cost, from the highest graduation down to the ten-shilling licence of the Apothecaries' Hall, and it seems to us that the effect of the establishment of the proposed university would be to further depreciate the educational and social standard of the profession in Ireland.

The Bill has been shelved for the present session, but enough has been heard about it to make it manifest that it will receive very powerful support, will be bitterly opposed by an influential party, and will be tolerated by the Government if it is found to have a sufficient number of friends to make opposition to it troublesome or dangerous.

## THE DUBLIN SANITARY ORGANISATION.

It will be recollected that some months since it was proposed to pension off the superintendent medical officer of health of the city of Dublin, and add his duties to those of the city analyst and medical officer of health. We protested with all our force against that proposition on the ground that it would practically leave Dublin—the most insanitary city in the three kingdoms—without any sanitary superintendence whatsoever. To our great satisfaction, the Irish Local Government Board put their foot upon the job, and it was accordingly sent back to the Public Health Committee to try their ingenuity at shuffling out of the difficulty which was presented by the necessity for making their officers do their duty, or else paying some one to do it for them. This the Committee has attempted to do by the following recommendation, embodied in a report to the corporation :—

> Your Committee beg leave to report that, in pursuance of the Order of Council of the 31st March, that the Report be sent back to the Public Health Committee to report further as to the mode they suggest to carry out the last paragraph therein, and to procure all necessary information from the Local Government Board for that purpose, your Committee beg to recommend that, subject to the approval of the Local Government Board, which is essential to any change such as is proposed, the resignation of Dr. Mapother as superintendent medical officer of health be accepted, and that (he having consented to this arrangement) his salary as consulting medical officer be fixed at £150 per annum, Dr. Mapother to discharge so far as required by the Committee the same duties as he did as consulting medical officer prior to his appointment as superintendent medical officer of health ; that Dr. Cameron be appointed superintendent medical officer in conjunction with his present office of medical officer of health, at a salary for the two offices of £300 a-year, and that (he having consented to this arrangement) his salary as city analyst be fixed at £200 a-year instead of £300 as at present, he to undertake to devote sufficient of his time for the proper discharge of the duties in priority to the duties of all and every of any office he may hold, or duty he may have to perform.

This recommendation we are bound to condemn with as much emphasis as we did the previous proposal, for it is, from our point of view, exactly the same. We care nothing about the money question, which we leave to the corporation, with the suggestion that a handsome salary would be well spent if it procured for the city what it has never yet had, *i.e.*, moderately efficient sanitary supervision. What we do care about is that Dublin should be relegated to the domination of uncontrolled dirt, as it has hitherto been, and this it certainly will be under the shuffle proposed by the Committee. The plain translation of this proposal is that the ex-superintendent health officer is to receive £150 a-year for doing absolutely nothing ; the city analyst is to be cut down in his salary for the only work which is done really well in the whole system, and he is to have a small increase of pay for pretending to discharge functions which all the world knows he cannot possibly fulfil. He is to retain all the thousand-and-one extra-civic labours which now occupy his energies, and is to give as much extra time as he can spare over and above the twenty-four hours of his working day to the sanitation of the city.

We pronounce the proposal nothing better than a job and a sham, to be perpetrated for the double purpose of providing what is really a pension for the ex-superintendent, and of saving the corporate money. As we write, the death-roll of the city of Dublin lies before us, *facile princeps* amongst the mortality bills of the most unhealthy towns in the United Kingdom. It is so—we assert advisedly and upon the best evidence—simply because neither the Public Health Committee or its officers have ever entered with any heart into the work of sanitation, but have consulted their ease and comfort by masterly inactivity, and we protest with every force to which we can give utterance, against the completion of this scandalous project to sacrifice the health of the city to a gross job. There is a simple course before the Public Health Committee ; to insist on their officers doing their duty and the whole of their duty, or else resigning ; and, if they refuse, to dismiss them peremptorily, and appoint at a salary fitting for such an office, the very best, most energetic, and freest sanitarian they can find. We enter-

tain no doubt, that three years' experience of such an officer would make itself manifest in the death-rate, and we say it is disgraceful that, with the dying poor and filthy habitations of the lower classes before their eyes, the Public Health Committee can think of nothing higher than how they can juggle a pension and escape their duty.

## THE PROFESSION AT THE LEVEE.

By Her Majesty's command, a Levee was held at St. James's Palace on Monday last, by H.R.H. the Prince of Wales, when the following members of the profession had the honour of presentation. Mr. George Critchett, F.R.C.S., by Lord Skelmersdale; Mr. Coupland, F.R.C.S., by Lord Gerard; Dr. G. Hastings, by Lieut.-Col. Laurie, M.P.; Dr. James Irving, by Lord John Manners; Surgeon-Major P. Jameson, A.M.D., by H.R.H. Prince Edward of Saxe Weimar; Surgeon-Major C. M. Jessop, A.M.D., by the Adjutant-General; Professor Lister, F.R.S., by the Lord Chamberlain; Surgeon J. Maitland, Madras Medical Department, by the Secretary of State; Dr. Quain, F.R.S., by the Duke of Richmond.

**Royal College of Surgeons of England.** — The following gentlemen, having passed the required examination, received the diploma of membership last week:—

Adolphus, T. F. Pennington, L.S.A., Lyndhurst road.
Baldwin, F. B. Judge, L.S.A., Warwick.
Baillie, J. H. Johnson, L.R.C.P.Ed., Old Bond Street.
Baillie, R. Houghton, L.R.C.P.Ed., Old Bond Street.
Barnes, J. G., Swindon, Wilts.
Barron, H. G., L.R.C.P.Lond., Southport, Lancashire.
Blair, A., Peterborough.
Callender, J. H., L.S.A., North Shields.
Chambers, A. E., Bolton.
Cox, F. A., Dean Street, Park Lane.
Creagh, S. H., Stoke, Devonport.
Crisp, T., L.S.A., Beaufort Street, Chelsea.
Curd, C., L.S.A., Coombe Down, Somerset.
Davies, M., M.B. Aberd., Llangwyryfan, Cardiganshire.
Dearden, R. J., Douglas, Isle of Man.
Dunn, W., L.S.A., Gordon Square.
Dyson, T. S., L.S.A., Sheffield.
Embleton, D. C., Newcastle-on-Tyne.
Evans, A. L., Wrexham.
Fooks, G. E., Harrow, Middlesex.
Hine, H., Nottingham.
Hoskin, T., Calstock, Cornwall.
Knapp, E. M. M., Clifton, Bristol.
Mantle, A., L.S.A., Stourport, Worcestershire.
Mudge, T. H. T., Paignton, Devon.
Mumby, B. H., M.B. Aberd., Gosport, Hants.
Noble, J. B., Newcastle-on-Tyne.
Palmer, W. P., L.S.A., Ilminster.
Parry, R., L.S.A., Festiniog.
Penly, E., L.S.A., Blandford.
Poland, J., L.R.C.P.Lond., Blackheath.
Rhodes, J. H. E., Bury St. Edmunds.
Rice, G., L.R.C.P.Ed., Derby.
Shelley, C. E., B.A. Cantab., Leamington.
Smith, F., Maida Vale.
Spurgin, T., L.R.C.P.Ed., Henrietta Street, Cavendish Square.
Taylor, W. C. E., Scarborough.
Thorpe, H. S., L.S.A., Hertford.
Wilde, F., Southampton.
Wilson, F., Worsley.

**Royal College of Surgeons in Ireland.**—At examinations held on May 2 and 3, the following gentlemen obtained the Fellowship of the College:—

Baxter, Patrick Charles. | Mason, Samuel Robert.
Purefoy, Richard D.

## NOTICES TO CORRESPONDENTS.

Dr. Nevins, Liverpool.—Reply to Dr. Thompson received. The length is so great that we fear we shall have to reduce it by omitting the published statistics, which every reader can see for himself without crowding them into our limited space.

Communication on "Tinea, or Herpes Circinatus," by Dr. Griffith, received.

X. Y. Z. will be answered fully in our next.

*To the Editor of the* Medical Press and Circular.

The following letter appeared in our last issue, but, by an error on the part of the printer, prices were substituted for weights. We give, therefore, the letter corrected as it should have appeared in the first instance:—

### CAUTION IN THE USE OF VASELINE AND SIMILAR PETROLEUM DERIVATIVES.

Will you permit me to say that we are the only manufacturers of "Vaseline." The process by which it is made is patented, and is our property, and the word "Vaseline" is registered as our trade mark. In order to protect our article from adulteration with paraffine, wax, or other substances, and to prevent the occurrence of just such an accident as Mr. Frazer reports, we put it up in 1 lb. and 5 lb. tins, with our name and trade mark stamped thereon. If the wholesale house had sent their customer one of our 1 lb. tins instead of transferring a portion from one of our 5 lb. tins to a jar of their own, the circumstances referred to could not have happened.

We are, very respectfully yours,
The Chesebrough Manufacturing Company.
7 Snow Hill, London, E.C.

Suicide by Medical Students.—Dr. Gillespie, Medical Registrar to St. Thomas's Hospital, requests us to state that Mr. Attwood was not of St. Thomas's Hospital, as erroneously reported.

Dr. Stretch Dowse.—"Notes on Neuroses of the Skin and its Appendages" received.

A Subscriber.—Examinations for admission to the Army Medical Service usually takes place in August at the University of London. If you address the Director-General, Army Medical Department, London, S.W., you will doubtless receive full particulars.

### VACANCIES.

Beckett Hospital.—House Surgeon. Salary, £150. Applications to the Hon. Sec., Beckett Hospital, Barnsley.
Carmarthen Infirmary.—House Surgeon. Salary, £125. Applications to the Secretary, 58 King Street, Carmarthen.
Coleraine Union, Articlave Dispensary.—Medical Officer. Salary, £90, with fees, and £22 as Sanitary Officer. Election, June 5.
Dundee Combination Poorhouses.—Resident Medical Officer. Salary, £100, with board, &c. Applications to Mr. Thos. Brown, Parochial Board Office, Dundee. (See Advt.)
Greenwich Union.—Medical Officer to the Infirmary and Workhouse. Salary, £250. Applications to the Clerk of the Guardians before June 2.
London School of Medicine for Women.—Lectureship on Materia Medica. Applications to the Dean before June 12. (See Advt.)
Manchester, Owens College.—Demonstrator and Assistant Lecturer on Anatomy. Salary, £150. Applications before June 13. (See Advt.)
Oldcastle Union, Crossakiel Dispensary.—Medical Officer. Salary, £120, with fees, and £15 as Sanitary Officer. Election, June 6.
Rathdown Union, Powerscourt Dispensary.—Medical Officer. Salary, £110, with fees, and £20 as Sanitary Officer. Election, May 29.
Royal College of Surgeon, Ireland.—Curator of the Museum. Salary, £250. Election, June 5.
St. Mary's Hospital, Paddington, W.—Demonstrator of Anatomy. Salary, £100. Applications to the Dean of the School before June 7.
Tiverton Union.—Medical Officer. Salary, £20, with the usual extra fees. Applications to the Clerk before June 9.
Wolverhampton General Hospital.—House Physician. Salary, £100. Also House Surgeon. Salary, £100, with board in each case. Applications to Mr. Vincent Jackson, Waterloo Road, Wolverhampton.

### APPOINTMENTS.

Barr, J., M.B., L.R.C.S.Ed., Resident Assistant Medical Officer to the Bolton Union Workhouse at Fishpool.
Battle, W. H., M.R.C.S., L.S.A., Resident Accoucheur to St. Thomas's Hospital.
Davies, D. S., M.R.C.S., L.S.A., Assistant House Physician to St. St. Thomas's Hospital.
Day, E. J., M.R.C.S.E., Public Analyst for Dorchester.
Edwards, F., L.R.C.P.Ed., Medical Officer for the No. 4 District of the Saffron Walden Union.
Evans, J. T., jun., M.D., C.M., L.R.C.P.L., a Medical Officer to the General Infirmary, Hertford.
Haslam, W. F., M.R.C.S., L.S.A., House Physician to St. Thomas's Hospital.
Jones, Ll. R., M.B., C.M., Assistant Medical Officer at the North Wales Counties Lunatic Asylum, Denbigh.
Jones, W. F., M.R.C.S., L.R.C.P., House Surgeon to the Denbighshire Infirmary, Denbigh.
Moorehead, R. L., M.D., L.R.C.S.Ed., Assistant Resident Surgeon to the Nottingham Dispensary.
Moynihan, J. F., L.R.C.F.Ed., L.R.C.S.Ed., Medical Officer, Medical Officer of Health, &c., for the Whitechurch Dispensary District of the Cork Union.
Smith, R. P., M.R.C.S., L.P.C.P., Senior Assistant House Physician to St. Thomas's Hospital.
Sparrow, T. F., M.D., L.R.C.P.Ed., L.R.C.S.Ed., Medical Officer, Medical Officer of Health, &c., for the Kilskeer Dispensary District of the Kells Union, co. Meath.
Steel, J., L.R.C.P.Ed., L.R.C.S.Ed., Resident Medical Officer to the Dudley Dispensary.
Wallace, J., M.D., L.R.C.S.Ed., Medical Superintendent of the Parish of Greenock new Lunatic Asylum at Smithstone.
Ward, M. A., M.B. Univ. Dub., F.R.C.S.I., Surgeon to Mercer's Hospital, Dublin.
Williamson, J., M.A. Oxon., M.R.C.S., L.R.C.P., Assistant House Surgeon to St. Thomas's Hospital.

## Deaths.

Blake.—On May 23, at The Grove, Camberwell, Lilly, widow of B. Blake, M.D., R.N., aged 84.
English.—On May 22, at 10 Thurloe Place, South Kensington, Thos. English, M.D., formerly of the Fulham Road, aged 57.
Fergusson.—On May 21, at 2 Blackburn Place, Liverpool, J. Chambers Fergusson, M.B., aged 71.
Fryer.—On May 12, at Sherburn, Yorkshire, Chas. Fryer, L.K.Q.C.P., of bronchitis, apoplexy supervening, aged 40.
Gentleman.—On May 20, ar Ballyhorgan, Listowel, co. Kerry, John Kittson Gentleman, L.R.C.S.I., aged 31.
Nicoll.—On May 14, at the Charterhouse, Charles Richard Nicoll, M.D., the Resident Medical Officer, aged 64.
Pinnock.—On May 19, at Marsden, William John Pinnock, Surgeon, aged 39.
Secker.—On May 20, at Hull, Samuel Secker, M.R.C.S.E., aged 65.
Taylor.—On May 18, at Gayton Terrace, Hampstead, Sir Alexander Taylor, K.B., M.D., of Pau, France.

# IRISH POOR-LAW INTELLIGENCE.

## CORRESPONDENCE.

### SUPERANNUATION.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—On the occasion of a new head being appointed to the Local Government Board it seems a fit time to agitate the great greivance under which we Poor-law medical officers labour—viz., the unfair and one-sided condition of the superannuation law, if law it can be called. It is plain to every one, who will for a moment calmly consider the matter, that this permissive law, which leaves the decision entirely to the guardians, is most unjust to the honest and conscientious medical officer.

The guardians (as you well know) are a body who generally look to their own interests and the pockets of the ratepayers, and rather think that what they are COMPELLED to give to the doctors and the poor is an imposition—which is not very unnatural. It follows, however, as plainly as "light from day," that—this being the case—they will not, as a rule, be disposed to reward the doctor for *merely*, or *chiefly*, doing his duty to the poor; and yet this is ostensibly and professedly what he is employed, salaried, and pensioned for. I fear the present system of rewards, or benefits, applicable to the Poor-law service, has the effect, almost necessarily, of creating a spirit of flattery (I had almost said flunkeyism) in the doctors towards those in whose hands their fate is thus virtually placed. At the same time, there are, no doubt, many guardians, and some doctors, whose minds, characters, and conduct are under the influence of higher and purer motives than those referred to; and I know of some instances of superannuation being granted where I am sure it was deserved, and where it would have been injustice—perhaps cruelty—to have withheld it. On the other hand, I know of men in the enjoyment of superannuation allowances, who are comparatively young and strong, and appear able for active duty; while others, who are the very reverse, are under the necessity of toiling on, because they know, or fear, their boards are not willing to do the generous thing.

A movement was set on foot last year to get the power of granting superannuation removed from the boards of guardians, and placed in the hands of the Local Government Board. This, you will agree, would at least be a step, perhaps a considerable one, in the direction of justice, inasmuch as the Local Government Board would, at all events be *impartial* in the distribution of favours.

Why should not our Association take up this matter, and expend a little of the energy, talent, and influence which they evidently possess, in trying to remove, or mitigate, this, the acknowledged greatest evil and blot at present attaching to the service? And allow me, Sir, respectfully put to yourself the same question, for it must, I think, be acknowledged that the talent and influence of your paper are at present increasing and considerable.

I am,

Yours truly,

AN OLD SUBSCRIBER AND MEMBER OF IRISH MEDICAL ASSOCIATION.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—Having seen the letter of "A Dispensary Hack," I believe he will be perfectly justified in seeking remuneration from the constabulary authorities on Form Y (to be obtained from the sub-inspector of his district), as "The Red Ticket" only requires the dispensary medical officer to "give *advice* and any necessary medicine to the person who is ill" and *nobody else*; and it certainly never was intended when the police were granted the use of the red ticket so as to insure medical attendance "on persons taken suddenly ill in the streets or having met with an accident," that they should make use of it for the purpose of obtaining criminal information, and thereby utterly ignore Form Y, which is especially intended to meet the case of your correspondent. Another point of hardship, and one that your correspondent should bring bring before his "board of guardians," is the issuing of a ticket by any authorised person for attendance on a dead person, thereby occupying the time in travelling twelve miles to see a dead person, which time was supposed to be devoted to attendance on the living. This is not the first time that a somewhat similar matter has come under my notice, and I think the matter deserves special attention.

J. B. H.

### DUBLIN MEDICAL OFFICERS OF HEALTH.

THE Public Health Committee reports as follows to the Corporation, with regard to the Dublin medical officers of health :—

Your Committee beg leave to report that, in pursuance of the Order of Council of the 31st March, that the Report be sent back to the Public Health Committee to report further as to the mode they suggest to carry out the last paragraph therein, and to procure all necessary information from the Local Government Board for that purpose, your Committee beg to recommend that, subject to the approval of the Local Government Board, which is essential to any change such as is proposed, the resignation of Dr. Mapother as superintendent medical officer of health be accepted, and that (he having consented to this arrangement) his salary as consulting medical officer be fixed at £150 per annum, Dr. Mapother to discharge so far as required by the Committee the same duties as he did as consulting medical officer prior to his appointment as superintendent medical officer of health; that Dr. Cameron be appointed superintendent medical officer in conjunction with his present office of medical officer of health, at a salary for the two offices of £300 a-year, and that (he having consented to this arrangement) his salary as city analyst be fixed

at £200 a-year instead of £300 as at present, he to undertake to devote sufficient of his time for the proper discharge of the duties in priority to the duties of all and every of any office he may hold, or duty he may have to perform.

## DUBLIN POLICE COURT.

### THE SMALL-POX EPIDEMIC.

MICHAEL NOLAN, labourer, was summoned by the Rathmines sanitary authorities for not permitting his children, under medical certificate, to go to a small-pox hospital when they were suffering from small-pox.

Dr. Browne deposed that there we three persons there suffering from small-pox. Defendant refused to allow them to be taken to hospital. The disease has since spread, having attacked ten or eleven families in the neighbourhood.

Defendant said he had been personally willing to allow the children to go to hospital, but a number of the women who lived close by came in and insisted that it was wrong to send them away.

Mr. Fitzgerald said that his clients found it necessary to press for some penalty, but not a very large one in proportion to the fine that could be inflicted, viz., £10.

Fined £1.

### ADULTERATION.

JOHN NOLAN, grocer, was fined £1 for selling mustard adulterated with 30 per cent. of farina and cayenne pepper.

## LIMERICK SANITARY BOARD.

THE following letter was read :—

"Local Government Board,
"Dublin, 29th April, '79.

"SIR,—The Local Government Board for Ireland acknowledge the minutes of proceedings of the Public Health Committee, Limerick, on the 22nd inst., containing an entry of a report from the medical superintendent officer of health on the sanitary state of the city, which discloses a very serious state of things, and which has now continued for some time, and deserves the careful consideration of the sanitary authority.

"The correctness of the statements of the medical officer of health admits of no doubt, and the sanitary authorities should lose no further time in making a serious effort to grapple with the evil.

"The Board observes that the sanitary authorities have adopted a resolution on the subject, but it seems framed with a view rather to throw doubt on the facts brought forward than to explain a remedy, and this can secure no good or useful purposes.

"The Board desire to urge upon the sanitary authority that steps should be taken by them for affording means of disinfection; providing a better supply of water for domestic and cleansing purposes; and for enforcing cleanliness and proper sewerage—all of which must have been too long neglected.

"By order of the Board,
"B. BANKS, Sec."

Arising out of Dr. Barry's report, Ald. Philips handed in the following :—"I see, in reference to Dr. Barry's letter of the 5th May, he declines to furnish the names and addresses of the 112 persons who are reported by him to have died recently in the city, and referring to the Local Government Board's letter of the 29th ult., urging the Board to act on Dr. Barry's recommendation."

Passed unanimously—"That this Board requested Dr. Barry to afford them information, not for the purpose of delaying and evading proper sanitary measures, but to enable the Board to advise the steps which should be taken to improve the sanitary condition of the localities wherein so much mortality is reported to have occurred. And the Board again ask Dr. Barry to let them have the names and addresses of the persons referred to in his former reports."

## BOYLE UNION.

Keadue, May 12th, 1879.

SIR,—With reference to the case of the old man, Thomas Duignan, which I brought under the notice of the board last week, Mr. Martin himself informed me on several occasions that neither the board of Guardians nor the auditor would sanction any out-door relief where the parties obtaining it held over one rood of land, no matter how poor or destitute they might be, unless he could produce a certificate from the medical officer, so that in fact he was obliged to call on us to visit cases of destitution in order to save himself. I only want to ascertain what the law is on the subject, or what my duty is in similar cases. Members of the committee also frequently issue tickets in order to procure the recipients out-door relief, and for no other purpose. Both Duignan and his wife distinctly told me tht he wanted no medicine, only a "line" from me to get them relief, as he was too old and feeble to work, and had no way to get nourishment.

I am, Sir,
Your obedient servant,
JOHN B. DRAPES, Medical Officer.

Chairman—What order will I make on this?

Clerk—I don't see what order you can make, except mark it "read."

The letter was marked "read."

[Familiarity with the proceedings of the Boyle Guardians induces us to suggest that the board might be advantageously dissolved, and the clerk—who seems also to be chairman, board's relieving officer, doctor, and master—installed in their place. He seems to have the only mind in the board.—ED. M. P. & C.]

## ENNISKILLEN UNION.

### MEDICINE CONTRACTS.

A LETTER was read from Mr. Leslie, contractor for medicines, admitting that he was to blame in sending poor man's plaster on calico instead of paper.

Mr. Carson said it was evident that Mr. Leslie had sent what suited himself. He might not have had the paper in stock, and he sent the other and charged double.

Mr. Wilson said a great deal of the time of the Board was taken up in watching Mr. Leslie and correcting mistakes.

## MOUNTMELLICK UNION.

### MEDICAL OFFICERS' SUBSTITUTES.

THE following letter was read by the clerk :—

Local Government Board, Dublin,
9th May, 1879.

Sir,—The Local Government Board for Ireland acknowledge the receipt of the minutes of the proceedings of the board of guardians of Mountmellick union on the 3rd inst.; and with reference to the resolution that in future no substitute for a dispensary medical officer shall under any circumstances be paid, the Board desire to point out that such a resolution has no binding effect, nor can it fetter the action of the guardians at any subsequent meeting.

By order,
To the Clerk. B. BANKS, Secretary.

## NAAS UNION.

### PAYMENT TO A SECOND MEDICAL OFFICER.

THE following letter was read from the Local Government Board :—

Sir,—The Local Government Board have had before them the letter of Dr. Kehoe, medical officer of the Kil-

dare dispensary district, which is entered on minutes of board's proceedings on the 30th ult., in which he details the circumstances connected with the attendance of Dr. Watson, of Rathangan, on a woman in her confinement, in whose behalf Dr. Kehoe had been presented with a visiting ticket, and whom he had been attending; and with reference to the minute inquiry as to Dr. Watson's claim to be paid a fee of one guinea, the Local Government Board desire to state that their sanction to such a payment would establish a bad precedent, as a medical officer is supposed to remain with his patient in a case such as that referred to until all danger is past. Under the circumstances set forth by the medical officer the Local Government Board will not, however, object to the payment in the present instance, on the distinct understanding that it must not be regarded as a precedent for a similar proceeding in future.

By order, B. BANKS, Secretary.

The Clerk said he agreed with the Local Government Board that it would be a very dangerous thing to sanction a precedent for the payment of a second medical officer in such cases; but this was an exceptional case, and he thought it might pass.

Mr. Doyle—I would not pay it.

Clerk—Surely you could not expect a medical man to remain there in a cabin for forty-eight hours to see if a certain thing would occur?

Mr. Driver—Is there a paid midwife in the district?

The Clerk said there was not.

Mr. Driver—That makes all the difference.

Mr. Farrell thought that under the circumstances Dr. Watson ought to be paid.

A copy of the letter was ordered to be sent to each of the medical officers.

## VITAL STATISTICS OF IRELAND.

*Abstract of Quarterly Return of Births and Deaths.*

DURING the quarter ended 31*st March last*, there were registered in Ireland 35,221 births—26·3 in every 1,000 of the estimated population—and 32,397 deaths, representing 24·2 per 1,000. A decrease of 3,738 would appear to have taken place in the population during the quarter.

In England last quarter, the birth-rate was 36·5, and the mortality 25·2.

The birth-rate in Ireland is the same as for the corresponding quarter of last year, but is somewhat under the average for the first quarter of the five years 1874-8; the death-rate is higher than in any of those periods. The excess in the deaths is owing to the severity of the weather during the past winter; zymotic diseases were not more fatal than usual for the March quarter, the annual mortality represented by the deaths from the eight principal diseases of this class is only 2 per 1,000 of the population.

Returns of pauperism show an increase in the number of persons in the workhouses of Ireland.

*Births.*—The births registered during the quarter amounted to 35,221, or 26·3 per 1,000. The average of the previous five years was 27·5.

The respective rates for the four provinces last quarter are—Leinster 25·5 per 1,000 persons, Munster 28·2, Ulster 24·7, and Connaught 27·6.

The county birth-rates range from 20·4, the rate for Monaghan, to 34·8 in Kerry. Between these, the five highest are Clare, 30·8 per 1,000; Antrim, 29·9; Dublin, 29·8; Mayo, 29·0; the Leitrim, 28·5; and the five lowest—Cavan and Kilkenny, 21·9 per 1,000; Fermanagh, 22·2; Down, 22·5; and Carlow, 22·6.

*Deaths.*—The deaths in Ireland during the quarter amount to 32,397—a ratio of 24·2 per 1,000, against an average rate of 21·0 per 1,000.

The death-rate in Leinster was 29·2 per 1,000, in Munster 24·0, in Ulster 23·0, and in Connaught 19·2.

The extremes of the county rates are 17·6 per 1,000 in Longford, and 39·1 in Dublin. Of the intermediate rates the five highest are;—Limerick, 30·2 per 1,000; Kilkenny, 28·9; Carlow, 28·2; Wexford, 27·4; and Louth, 26·8; and the five lowest, Leitrim, 18·0; Cavan and Sligo, 18·1; Mayo, 19·0; and Galway, 19·4.

*Health of the People.*—The deaths registered during the three months now ended are not only over the average for the March quarter, but are more numerous than in any previous quarter since registration was established in Ireland, in the year 1864. This result is directly attributable to the long-continued severe weather, which has rendered the winter of 1878-9 remarkable. The deaths of persons aged 60 years and upwards amounted to the high number of 14,556, or nearly 3,000 over the average for the first quarter of the last five years, and the Registrars' reports show that this excessive mortality resulted from diseases of the respiratory organs and other affections, which the inclement weather rendered exceptionally fatal. Deaths from the principal zymotic diseases exceeded the number of the preceding three months, but were but slightly over the average for the March quarter of the previous five years. Small-pox continued prevalent in Dublin, but since the close of the month of January no deaths from this cause have been registered in Galway, where the disease had been for some time very fatal.

*Diseases.*—The number of deaths returned by the Registrars as having resulted from the principal zymotic diseases is 2,807, or 8·7 per cent. of the total deaths registered, and equal to 52·3 in every 100,000 of the population. This number is two under the deaths from the same causes in the corresponding quarter of 1878, and 243 over the average mortality for the first quarter of the three years 1876 to 1878.

Small-pox: There were 334 deaths from this cause registered, being 87 over the number in the preceding quarter. The disease was almost exclusively confined to the province of Leinster, where 308 of the deaths occurred, including 254 in the two Dublin unions, 16 in Rathdown union, 7 in Tullamore union, and 5 in Athy union.

Measles: The mortality from measles, though in excess of that for the previous three months, was not heavy, and compares most favourably with the return for the first quarter of last year, the deaths numbering only 203—viz, 95 in the province of Leinster, 62 in Ulster, 31 in Connaught, and 15 in Munster. Sixty-five of the deaths in Leinster occurred in the two metropolitan unions. In Foxford district, Swineford union, of 22 deaths amongst persons under 60 years of age, 10 were caused by measles.

Scarlet Fever: Deaths from this disease, which rose gradually last year from 178 in the first quarter to 408 in the fourth, amounted last quarter to 420, but this number is not much over one-half of the average for the March quarter of the last ten years. Of the 420 deaths last quarter, 235 were in the province of Ulster, 122 in Leinster, 36 in Munster, and 27 in Connaught. In Donegal district, Donegal union, 22 of the 74 deaths of all ages registered were caused by scarlet fever; in Drumquin district, Omagh union, 11 of 25 deaths; in Cloghan district, Stranorlar union, 23 of 59 deaths; in Athleague district, Roscommon union, 10 of 38 deaths; and in Ballyleague district, in the same union, 6 to 60 deaths.

Diphtheria: There were 115 deaths from diphtheria registered—viz., 53 in Ulster, 35 in Leinster, 15 in Connaught, and 12 in Munster. Of 43 deaths from all causes in Portglenone district, Ballymena union, 5 resulted from diphtheria, which also caused 5 of 56 deaths in Coal Island district, Dungannon union; 4 of 15 deaths in Rinvyle district, Clifden union; and 4 of 26 deaths in Ballyhorgan district, Listowel union.

Whooping-cough: The deaths from this disease amount to 540, or 35 more than in the preceding three months, and 90 over the average number for the March quarter of the last five years. They were distributed thus:—182 in the province of Munster, 146 in Ulster, 130 in Leinster, and 82 in Connaught.

Fever: The number of deaths from the various forms of continued fever was 732, being slightly in excess of the average for the first quarter of the last five years. Two hundred and twenty-six of these deaths occurred in

Leinster, 178 in Munster, 245 in Ulster, and 83 in Connaught. One hundred and twenty-two, or more than 50 per cent. of the deaths from fever in Leinster, occurred in the two Dublin unions; and 77 of those in Ulster took place in Belfast union.

## EXTRACTS FROM REGISTARS' NOTES.—REGISTRAR GENERAL'S REPORT.

NEWRY; *Mullaghglass.*—Typhus fever has been prevalent, and a great difficulty exists as to getting patients to leave their crowded homes to go into hospital. I would suggest that section 141 of 41 and 42 Vic., cap. 52—Public Health Act—be printed in large posters for distribution in all dispensary districts, so that the public may be made fully aware of the powers of the sanitary authority, which at present they do not believe.

BALLYSHANNON; *Ballintra.*—The sanitary arrangements of the district are pretty fair, with the exception of a few places, and one in particular deserves attention; it is the lane of which I made a note before; although it has been reported repeatedly by the sanitary officer to the guardians, there is no improvement made.

GORTIN; *Gortin, W.*—By virtue of the powers vested in me under the recent Public Health Act, I am continuing to have various little sanitary improvements effected throughout the district under my charge, and I am but very rarely obliged now to call in the aid of the local sanitary authority in such cases, most of the people agreeing quite readily to the suggestions I offer them in those matters.

LONDONDERRY; *Glendermot, W.*—Health of district wonderfully good, taking into consideration the abominable sanitary condition of the dwelling-houses in rural district.

BALROTHERY; *Swords.*—If the poor people were better housed they could give ample proof of the desire for sanitary improvements that is being gradually infused into them. In their present abodes, owing to the limited space allotted to each householder, their houses cannot present an appearance otherwise than, if not disgusting, very uncleanly.

BALTINGLASS; *Baltinglass, W.*—Small-pox prevailed to a considerable extent in this union, and caused four deaths. Fever proved fatal in one case. I am at present attending a case of typhoid which was caused by defective house drainage. It seems unaccountable how the poor people escape this disease, especially at this time of year, when manure has to be carried *through their houses*, and then piled at the front door before being carted off.

CAVAN; *Kilnaleck.*—The habit of feeding pigs in the dwelling-houses of all classes, so highly detrimental to health, is carried on in spite of my efforts to abate it, and the good results to be derived from cleanly habits are almost to be despaired of in this locality; with the exception of the police barracks, and my own residence, I would find it difficult to point my finger to a clean and healthy dwelling. Thank goodnes, that "vile scourge," small-pox hss completely disappeared from about here.

MULLINGAR; *Mullingar, W.*—The town, although free from an epidemic, is, nevertheless, in a most unsanitary condition, owing to the want of a proper supply of pure water for drinking and flushing purposes. The wells used by the public are mostly unprotected from the sewage of the road, which is washed into them during wet weather, and some of the pumps condemned by analysis of Dr. Cameron are still in use.

CLIFDEN; *Clifden, W.*—The sanitary state of the district is stlll improving; the people generally take my advice, and seem to take pride in keeping their places freer from nuisance.

CORROFIN; *Corroffin, W.*—There were twelve deaths registered by me during this quarter of persons aged between 70 and 80, eight between 80 and 90, three between 90 and 100, and one at the extraordinary age of 106, which, from inquiries I made, seems to be correct, he being 25 or 26 years old in the year 1798. He has a daughter who is only 15 years of age.

DROMORE WEST; *Skreen.*—The births and deaths are somewhat under the average for corresponding quarters. The deaths occurred chiefly of persons in advanced life. Four were over 60 years and bordering on 70 years, four were over 70 years, and four were 80 years and beyond.

TABLE *showing for* EIGHT LARGE TOWNS, &c., *the* AREA, *in Statute Acres; the* POPULATION *in* 1871; *the* ANNUAL RATE OF MORTALITY *per* 1,000 *Inhabitants represented by the Number of Deaths registered during the Week ending Saturday, May* 17, 1879; *the Total Number of* BIRTHS AND DEATHS *registered during the Week with the Number of* DEATHS *at certain Ages, and from* SEVERAL CAUSES, &c.

### REMARKS ON THE ROUTINE USE OF THE OPHTHALMOSCOPE IN CEREBRAL DISEASE.

By J. HUGHLINGS JACKSON, M.D., F.R.S.,
Physician to the Hospital for the Epileptic and Paralysed, and to the London Hospital.

THERE is nothing in medical ophthalmology more important than the fact that a patient who has acute neuritis can read the smallest type and may not know that his sight is in any way defective. Let me say a word as to term neuritis.

For my own part I know of but one inflammatory condition of the optic discs from intra-cranial disease, with the possible exception of swelling of the optic disc in tubercular meningitis. But when I, in the following paper, use the expression optic neuritis, the reader may substitute choked disc, peri-neuritis, or any other term which seems to him better. For at present I concern myself with nothing more than showing *that extremely abnormal ophthalmoscopical appearances may exist when sight is good.* I have been urging this for about fourteen years. I should think I have written on its importance a score of times. Although it is a fact fully recognised by most ophthalmic surgeons, as quotations I shall give will show it is not accepted by very many physicians. To some the statement seems to be mere nonsense. Of course my experience of abnormal conditions of the fundus oculi is one-sided. I see what I may briefly designate "physician's cases." I would say of them that I oftener see extreme ophthalmoscopical appearances without any defect of sight than with any considerable defect of sight—say defect which the patient or his friends recognise. Lest this appear the extravagant statement of one who has become wedded to an early-formed opinion, I will give Gowers' conclusions from his field of observation.

"In reply (*a*) to your question as to my experience of optic neuritis without defect of sight, I should say that in at least half the cases of neuritis in cerebral tumours which I have seen there has been no defect of sight, either of acuteness of vision or in the extent of the field. In at least half the cases during the acute stage of the inflammation, and in a considerable proportion of cases throughout there has been no detect of sight. It is certainly more frequent for vision to suffer during the subsidence of inflammation (from the cicatricial contraction of the tissue formed) than during the active process. No doubt it is more common for sight to be affected in descending neuritis; but according to my microscopical observations, descending neuritis is rare, except in meningitis, in which observations on vision cannot often be made."

In the *Medical Times and Gazette* so far back as June 19, 1865, I recorded the case of a man who died of tumour under the tentorium, and who, during acute neuritis, read the newspaper every day, and read small print to me; I did not test his sight by test-types; he became blind later. Since that time I have seen scores of patients who, with acute neuritis, could read the smallest type of Snellen or Jaeger quite easily. The fact of conservation of sight in double optic neuritis was, I believe, first stated by Blessig.

Let me here quote from a paper "On Latency of Optic Neuritis in Cerebral Diseases" (*Medical Times and Gazette*, Feb. 8, 1868). The quotation begins by a quotation from a still earlier paper ("Observations on Defects of Sight in Diseases of the Nervous System") which I published in the "Royal London Ophthalmic Hospital Reports," vol. iv., pt. iv., p. 403: "*It is, I submit, imperative in all cases of severe cerebral disease, at all events in cases of an acute kind, to examine the eyes with the ophthalmoscope, whether the patient complains of defect sight or not.*"

(*a*) A good example of neuritis without defect of sight at any time is figured from a drawing by Gowers in Mr. Haynes Walton's book on "Diseases of the Eye," last edition.

"I should now make the statement much stronger by adding '*even if he affirm that he can see well and if he read small type readily.*' A patient, after an ophthalmoscopic examination revealing optic neuritis, will sometimes, on being asked how long his sight has been bad, make a remark like this: 'I did not know there was anything the matter with it,' and may be able to read the type called 'brilliant.'"

"If the above statement at first glance seems strange to any ophthalmic surgeon, I would beg him to bear in mind that patients are not likely to come under his notice until their sight fails. I have occasionally had the somewhat painful feeling that the accuracy of my ophthalmoscopical examination has been doubted by physicians whose opinions I highly value, when I have declared that patients with severe cerebral disease, who seemed to see quite well, had inflamed optic discs. But there can be no possibility of mistake in cases of severe optic neuritis, as the appearances are striking and are very easily recognised—no mistake, I mean, in recognising that the retinal veins are very irregular, that the course of the arteries is much obscured, or quite lost, that there are little clots of blood scattered near the swollen discs; for these things are face to face with us when we are using the ophthalmoscope. They may exist when the patient can read small print easily, not ordinary small type, but No. 1 of the test-types used by ophthalmic surgeons." The criticism upon this statement cannot legitimately be that it is an erroneous theory; it is not a theory at all; the reader, if unconvinced by the evidence, or rather, perhaps, I should say by the authorities quoted, may criticise it, but can only do so by denying its truth or its importance.

I believe there is an erroneous notion in the minds of some that one is speaking only of slight and doubtful appearances. It is for this reason that I made the remarks with which the above quotation concludes. I would refer the incredulous to a drawing of optic neuritis in the "West Riding Asylum Reports," vol. iv., taken from a patient under my care who had perfect vision. The drawing is reproduced in the "Lond. Ophth. Hosp. Reports," vol. viii., part ii., p. 316, Sept., 1875. The fact is, I have, until the last few years, been rather guilty of underrating slight ophthalmoscopical changes. I have several times spoken against the error of exaggerating the importance of slight ophthalmoscopical anomalies. For example, in a paper "On the Routine Use of the Ophthalmoscope in Cerebral Disease" (*Med. Times and Gazette*, June 3, 1871), I say, "Another error as bad as, or even worse than, overlooking *striking* ophthalmoscopic appearances, is to attach undue importance to slightly abnormal intra-ocular appearances, which may be only abnormal in the sense of being physiological peculiarities. Curiously, this is the fault, not of those who have used the ophthalmoscope much, but of those who have used it little. It requires much practice to give true clinical value to "congestion of the optic nerves" or to "congested retinæ," to slight changes about the edge of the disc or to alterations in the course and calibre of the veins. In the paper referred to, I spoke on this matter, and from it I quote the following:—"I have never laid stress on slight alterations in the colour of the discs, or on slight abnormalities in the size or course of the large retinal vessels. . . . We may get as far wrong by attaching too much importance to slight appearances as by altogether overlooking decided pathological changes." I certainly did not speak too strongly.

Professor Liebreich, at visits to the Hospital for the Epileptic and Paralysed, has frequently pointed out striking peculiarities in the fundus, which he declares to be really physiological variations. Speaking of the importance of ophthalmoscopical examinations of many normal eyes, Professor Liebreich remarked at the Clinical Society (see *Lancet*, November 5, 1870): "En effet, l'aspect du fond présente à l'état normal, on pourrait dire autant de variations que la figure humaine, et il faut l'étudier indéfinement si on ne veut pas être exposé à prendre quelquefois pour une altération pathologique ce qu n'est qu'une modification individuelle d'un œil sain." Obviously, then, whilst the student may observe any case he likes as minutely as he can do with precision, he should not dare to draw conclusions from very slight intra-ocular appearances.

Let me now quote authorities on this matter. Soelberg Wells refers to the case of one of his patients who had acute neuritis and good vision, in his "Treatise on the Diseases of the Eye," p. 339, second edition. He mentions, also, a case from his own practice of uniocular neuritis in which the acuity of vision remained perfectly normal throughout. I quote the following from his work: "Mauthner ('Lehrbuch der Ophthalmoscopie,' p. 293) narrates an interesting case in which a patient affected with optic neuritis retained a normal acuteness of vision *up to the time of his death* (which was sudden). The post-mortem examination revealed the existence of interstitial optic neuritis, but the retina was healthy up to the optic nerve." (The italics in this quotation are mine.) In remarks added to reports of several interesting cases of optic neuritis at the Clinical Society, October 28, 1870 (see *Lancet*, November 5, 1870), Brudenell Carter referred to the fact "that a considerable degree of optic neuritis may be present in certain cerebral affections without impairment of vision." In his book on "Diseases of the Eye," p. 425, Brudenell Carter writes: "The announcement of the frequent co-existence of great nerve-swelling with normal vision was received when first made with something like incredulity, but the fact has long been familiar to those who, following the example set by Dr. Hughlings Jackson, Dr. Clifford Allbutt, and Dr. Buzzard, have systematically practised ophthalmoscopical examination in all cases of suspected intra-cranial disease." In my former paper, 1858, I referred to the opinions of Hutchinson. The following quotation is from a note by him in the last volume of the "London Hospital Reports," 1867:—"In optic neuritis, it is often impossible, from the observation of the state of the disc, to form any opinion as to how much the patient can see." Bader, in his work on "Eye Diseases," p. 485, speaking of the state of vision in cases of inflammation of the optic disc and of the retina adjoining it, says: "Vision, according to the accounts given by patients, is often hardly disturbed, even if there is considerable loss of transparency of the optic disc and of the adjoining retina, with much hyperæmia. . . . Some patients (even at the height of the inflammation) only complain of a swimming of objects looked at for some time."

Noyes, of New York, commenting on a case of acute neuritis optica from tumour of the brain reported by Dr. Schiess Gemuseus, says: "This case adds to the observations already become numerous, where intra-cranial disease produces visible changes in the fundus oculi without causing injury to the sight." (*New York Med. Journ.*, February, 1871.)

Leber, in Graefe and Sœmisch's Handbuch, speaking of the papillitis (intra-ocular neuritis) in cerebral tumours, says: "*Vision may remain for a long time normal, in every respect, even with very great swelling of the papilla.*" (Italics in original.)

De Wecker writes ("Traité des Maladies du Fond de l'Œil," p. 81), "How many times have we not had the occasion to see a most characteristic neuro-retinitis with almost complete, and even complete, preservation of visual perception?"

Now I quote from the writings of the greatest of ophthalmic surgeons. Graefe, writing in 1866 (*Archiv. für Ophth.*, xii., 2, 130), says: "It has been on all sides admitted, and has been especially stated by Blessig, that there is no exact proportion between the amount of functional disturbance and the amount of change discoverable by the ophthalmoscope. The want of such proportion depends upon two factors. The first is the uncertain degree in which the conducting elements of the nerve may participate in the morbid process, a fact well ascertained in nephritic retinitis. Hence, we may find the existence of good vision—almost always only for a short period—in a high degree of con-

gestion papilla (Stauungspapille). The second factor is the degree of interferenc with the arterial blood supply."

So far I have quoted ophthalmic surgeons. I now quote a physician. Clifford Allbutt (*Med. Times and Gaz.*, May 30, 1868), speaking of ischæmia of the discs, says: "It is astonishing how changed and disfigured the optic disc and neighbourhood may become in this affection without disturbing central vision. I have lately had several such patients under my care who could read a badly-printed news-sheet with ease. The same fact is strongly insisted on by Graefe. For this reason, the condition is constantly (I may, perhaps, say generally) overlooked."

Buzzard writes: "There may be no impairment of vision accompanying extensive effusion of lymph upon the disc, and a considerable amount of sight may co-exist even when the disc is atrophied to some extent." ("Clinical Aspects of Syphilitic Nervous Affection," 1874, p. 35.) At page 98 of the same work, he describes a case of double optic neuritis in which, at the time the appearances were most strongly marked, the patient could read No. 1 Jäger with either eye. In a case of double optic neuritis, associated with cerebellar tumour (Clinical Society's "Transactions," vol. vii.), in which the appearances were well marked in each eye, but most advanced in the left, the patient could read No. 1 Jäger with the right eye, and the field of vision was on that side of normal extent. In the left, however, sight was lost over the right half of the field, but the patient could see fingers pretty well over the left half. So also of a patient affected with double optic neuritis with right hemiplegia (Clinical Society's "Transactions," vol. xi.), Buzzard remarks, "On examining her eyes with the ophthalmoscope I found in each the optic disc greatly swollen and of a reddish tint, from the development of numerous minute vessels. Its border was not defined. The large veins, distended and very tortuous, disappeared suddenly here and there in the opaque swelling, to emerge again into view beyond the disc. . . . Her sight did not appear to be much affected, as she could read small print, but the mental condition made accurate examination on this point impracticable."

The condition of the discs, Dr. Buzzard tells me, was discovered at an examination of the eyes, which was made as a matter of routine, and not because of any complaint regarding the sight. Indeed, but for the employment of the ophthalmoscope, no affection of the eyes could have been surmised from her manner and story.

Broadbent (Clinical Society's "Transactions," vol. ix.) has recorded a case in which, with "marked optic ischæmia or neuritis," vision was good.

Dr. Stephen Mackenzie has recorded in "Brain," part iii., p. 404, a case of embolic hemiplegia with double optic neuritis, in which the patient complained of no defect of vision, and was able to read without difficulty No. 1½ of Snellen's test-types.

Dr. Stephen Mackenzie tells me that a patient lately died under his care in the London Hospital from atrophy of the brain who had had double optic neuritis, in which patient's case there was no defect of vision. The optic neuritis was only discovered by the examination of the eyes with the ophthalmoscope on his being asked by a colleague to see the patient, who complained of pain in the head and vomiting. Dr. Mackenzie tells me that he has frequently demonstrated to his class cases of optic neuritis from cerebral disease without there being any appreciable loss of sight, and that he has watched such cases from the onset to the complete subsidence of the inflammatory process in the papilla of the optic nerve, without being able to detect by test-types any defect of vision. He agrees fully with me that optic neuritis is to be detected by the routine examination by the ophthalmoscope, irrespective of the statements of patients as regards their sight. Many of the cases he, as physician, has seen where the sight *is* affected, have passed through the ophthalmic surgeon's hands before they have reached the physician.

I thus urge the routine use of the ophthalmoscope on very good authority. Without it, optic neuritis may be overlooked in its early stage. Thus we miss an important help in diagnosis, and we begin treatment of pathological changes late. There is disease of the optic nerve to treat before the symptom amaurosis appear.

Without this help we should, in the early stages, underrate the gravity of very many cases which end fatally.

*(To be continued.)*

## CROUP AND DIPHTHERIA.

### REMARKS ON THE LATE DEBATE AT THE ROYAL MEDICAL AND CHIRURGICAL SOCIETY.

By PROSSER JAMES, M.D.,

Lecturer on Materia Medica and Therapeutics at the London Hospital; Physician to the Hospital for Diseases of the Throat and Chest; late Physician to the North London Hospital for Consumption, &c., &c.

THE recent debate at the Royal Medical and Chirurgical Society seems in some sort to echo preceding discussions which, during the last four or five years, have grown more animated.

In 1874 the Academy of Medicine of Florence concluded a discussion on the subject which had been carried on during an epidemic of diphtheria, by formally declaring that "clinical observation is in favour of the existence of true primitive croup, which may be observed even during an epidemic of diphtheria." Another resolution adopted, was that "diphtheria is a disease which arises in the manner of epidemics, and gives rise to a contagious principle."

Other discussions have since taken place at the Medical Society of London, at the Clinical Society, at one or two of the Dublin Societies, and at the New York Academy of Medicine; at all of which great differences of opinion have been expressed.

Soon after the Florence Academy pronounced in favour of dualism, Sir Wm. Jenner, in his oft-quoted clinical lecture, expressed himself as "inclined to the belief that there is no such disease as idiopathic, simple, membranous inflammation of the larynx." Since then, others have given expression to a similar opinion; some seem to have supposed the doctrine novel; a few even, pluming themselves with amusing innocence, on being, if not, its originators, at least among the earliest to adopt it. But though not generally received in England or Germany, this view has long been a common tenet in France, and as such must have been familiar to all conversant with French literature. Even in this country it is no new doctrine. Nearly twenty years ago, in the first edition of my "Sore Throat," I ventured to group together croup and diphtheria under the head "Exudative Sore Throat," and in reference to some of the distinctions drawn between them, said "both are alike the manifestations of an inflammatory condition tending to exudation." In the chapter on nomenclature, of the same work the two diseases were grouped under the term "inflammation, terminating in exudation," thus giving to the false membrane a place among the events of inflammation—a classification which, at least, reserves an appropriate place for such forms of contagious or epidemic sore throat, as those mentioned by Mr. Hutchinson. Further on, the chapter devoted to these two diseases in detail, was entitled "inflammation with exudation," such exudation being regarded as the "characteristic of this variety of inflammation." And yet this doctrine seemed to startle some of the Fellows of the Society when put before them as a proposal to discontinue the use of the term "specific fever" in connection with diphtheria, and to regard the disease rather as a "specialised inflammation."

The Report of the Committee, which has been so fully discussed, recommends that the word "croup be henceforth

used wholly as a clinical definition, implying laryngeal obstruction occurring with febrile symptoms in children." This definition furnishes an excellent clinical group, and corresponds closely with the manner in which the word is constantly employed; but it includes several distinct conditions, between which it is often desirable to discriminate. If any laryngeal obstruction in a child, with fever, ought to be named croup, no wonder we are told that this disease may be membranous or non-membranous. Signs of obstruction may be set up in children, and in adults too, though less readily, by any form of laryngitis; traumatic cases being specially remarkable. The narrow calibre of the infantile larynx, and the tendency to spasm in children, are important factors in croup. The narrow larynx of the child is easily obstructed; post-mortem—the infantile glottis may be closed by mere suction. How, then, if during life the larynx became inflamed, its mucous lining deeply congested, puffy, or even œdematous? Further, what may be expected if, when the calibre of the tube is thus diminished, extra secretion—perhaps thick, tenacious, and stringy—be poured out? Such secretion, if it do not block the tube, may provoke spasm. If the secretion be thicker still, a solidifying exudation or false membrane, it may completely line the air tube, and so contract its calibre as to cause obstruction; or it may—a more common event—become detached, partially or entirely, and play the part of a foreign body; as such it may mechanically block the air passage, or bring about the same result by provoking fatal spasm. Again, inflammatory infiltration into the muscles may disable them, the consequent paralysis leading to the same result as spasm. It cannot, then, be surprising that young children should often die from larnygeal obstruction before there is time for the development of further symptoms.

In adults the larynx is not only larger, and, therefore, less easily obstructed, but it would appear to be less liable to be invaded by exudative inflammation, though more obnoxious to other diseases. When exudation therefore occurs, it generally occupies a wider surface, and according to the locality it occupies, may penetrate deeper. Hence, sloughing and putridity. Do we then get septic infection from the decomposing materials—such auto-infection being the starting point of fresh general disease? Or is the blood previously contaminated—the disease from the first being general? Inoculation, which was expected to solve such problems, has not furnished uniform results. Trousseau, Peter, and others, failed to convey diphtheria by inoculation, but Nassiloff and Trendelenburg have infected animals by transfering the exudation to the trachea and cornea, while numerous instances of accidental inoculation seem to have occurred. This brings us to a point strangely neglected in the late discussion, viz., the presence or absence of any special infective agent in the exudation. In 1868, Buhl, Huebner, and Oertel, almost simultaneously announced that they had discovered certain peculiar organisms in the exudation of diphtheria. These organisms are, they maintain, characteristic of the disease, and suffice to distinguish it from croup. The parasites they describe not only differ from the leptothrix, spirilla, and other organisms, so constantly found in the mouth, but are fatal to them. The benign organisms are said to vanish on the advent of the deadly diphtherial bacteria, and only to return after these have taken their departure. Moreover, the bacteria are said not only to abound in the exudation, but to penetrate the tissues beneath, and find their way into the blood. The dogma has been laid down, that without bacteria there can be no diphtheria; and so widely has this statement been accepted in Germany, that it is to be regretted none of the speakers in the late debate attempted to justify the apparent indifference with which it is regarded by English pathologists. Perhaps the labours of the Committee might have proved more fruitful had they been directed towards the solution of this question by experiment, rather than to the collection and collaboration of the opinions of the Fellows of the Society.

## ADENOID TUMOURS OF THE NASO-PHARYNX; THEIR INFLUENCE ON HEARING, RESPIRATION, AND PHONATION; AND THEIR TREATMENT.

By Dr. B. LÖWENBERG, Paris,

Translated by H. Macnaughton Jones, M.D., &c., Professor, Queen's University, Ireland.

(*Continued from page* 424.)

### The Local Treatment.

We cannot effect a cure without the radical destruction of the adenoid growths, that is to say, local treatment takes the principal place among the means by which we contend with this affection. It can be accomplished in two ways:—1. By cauterisation. 2. By removal.

#### 1. *Cauterisation.*

In certain cases repeated cauterisations are sufficient to destroy adenoid tumours. It is true that it takes far longer to obtain the result in this manner, than by instrumental removal, but there are circumstances in which treatment by cauterisation is really the better method. In the case of sessile or flat morbid growths, tumours inserted on a broad base on which it would be difficult to operate with an instrument of any kind.

It is also indispensible when the patient or his parents, for this occurs usually with children, absolutely refuse all "operation," and only permit cauterisations.

We shall explain the instrument and the substances necessary for cauterisation, and describe in detail the methods which we have generally found of the greatest service.

The instrument which we employ as a caustic holder, is a cylindrical silver stem, 23 centimètres in length, and with a diameter of 4 millimètres.

The part which we introduce, by the mouth, into the naso-pharynx, so as to enable us to touch its whole interior, is curved, to correspond with the longitudinal axis of this cavity, and when it is necessary to reach the roof of the cavity, we can do so without coming in contact with the surrounding parts. This portion forms with the stem of the instrument an angle, similar to that which is formed by the axis of the mouth, and that of the pharynx; at the end of the curved part of the instrument there is an enlargement, in the form of a quadrangular prism, 17 millimètres in length, and 4 millimètres in width, the surfaces being roughened to insure the adherence of the caustic.

M. Meyer employs a caustic-holder of German silver, and uses instruments of various forms, roughened on different surfaces, to correspond with the several positions in the pharynx, on which the morbid growths are found; but M. Politzer has rightly suggested, that we should be satisfied with a single instrument, constructed as we have above explained, and roughened on all the surfaces. We must then charge with caustic only the surface which corresponds with the position of the tumours in each case.

The caustic-holder has a second curve at the end opposite to the prism. Where it is held by the hand of the operator, the instrument is curved downwards, so as to leave a clear field for operation, in front of the patient's mouth.

The fused nitrate of silver is the only substance which has hitherto been employed; when the patients are little children, or are very troublesome, so that it would be difficult to accurately limit the action of the caustic, we weaken the nitrate (following the example of oculists), by the addition of a certain quantity of nitrate of potash, an absolutely harmless substance: one part of the salt of silver is dissolved with two parts of the azotate of potash (according to M. Desmarres). Like pure nitrate this mixture can be well blended in a porcelain vessel, heated over the flame of a spirit lamp.

When once the position of the tumours is exactly recognised, we fuse the caustic, and plunge into it, either the whole, or some portion of the instrument, according as either the one or the other is necessary, in order that the portion covered with nitrate may correspond to the position of the growths, when the instrument has reached the pharynx. We must be especially careful not to dip the entire prism into the fused salt, except in the case where the morbid growths occupy the whole interior of the naso-pharynx; otherwise, we risk cauterising unintentionally the parts which do not require it.

We practice cauterisation with the aid of the rhinoscope. When dealing with patients in whom this is impossible, because they cannot for any time tolerate the pharyngoscopic mirror, or long enough for the cauterisation, we must have recourse to palpation. The left index finger, carried into the naso-pharynx, directs and limits locally the application of the instrument, it presses the portion covered with nitrate against the morbid growth, which is cauterised by contact with the prism or by rubbing it lightly with a to-and-fro movement.

As soon as we judge that the caustic has been sufficiently applied, or that the patient becomes restive and anticipates the surgeon, we rapidly withdraw the instrument, taking care to carry its extremity exactly in the middle line of the pharynx, to avoid all useless contact. Frequently the patient raises the soft palate, in this manner rendering the operation impossible. We then proceed as we have already described, and this manœuvre generally removes the impediment, which previously was insurmountable. This applies equally for cauterisation as for the other operative measures that we shall describe.

Such is the ordinary method, which it is not always easy to accomplish: many patients, especially children, whether from nervousness, or irritability of the pharynx, only tolerate a very rapid application of the caustic, and there is not time to introduce the finger previously.

If we persist, we risk causing contractions of the pharynx, thus exposing it to cauterisation equally on all parts, those which are affected, and those which are normal. This difficulty, which we have frequently met with, does not appear to have been noticed by other authors; so far as we know, it has never been mentioned.

But we pause here, because the aim of this work is to forewarn our readers against all accidents, as these may be very serious, considering the importance of the region we are discussing. We succeeded in avoiding this difficulty in the following manner:—We cap the prism to which the nitrate is adherent, with the end of a caoutchouc tube, 2 centimètres in length, and from 6 to 7 millimètres in diameter; having reached the morbid growths, we apply to it the end of the instrument: then the tube recedes, and the caustic comes in contact with the affected part.

In the same manner we have proposed to use, in Politzer's method, instead of the elongated *mouthpiece* employed by our distinguished friend, a small end of caoutchouc tube. We change this for each person, and thus combine delicacy of application with the certainty of avoiding any risk of communicating disease from one patient to another. (*a*)

When the cauterisation is finished, we withdraw the instrument, and the result of this movement generally is that the caoutchouc, striking against some projection in the pharynx, glides over the cauterising surface of the prism, and thus covers it, or, at least, the projecting edges of the tube protect the pharynx from all injurious contact.

Our method is easy of application, particularly where the tumours occupy the roof of the pharynx (hypertrophied pharyngeal tonsil), or the adjacent parts, and according to our experience, this is their position in the greater number of cases.

(*a*) We find an account of our modification in an article by the late M. Cousin. "Mèmoire sur me nouvelle procédé pour injecter, de l'air, &c., dans les trompes d'Eustache, &c." (*Bulletin General de Therapeutique*, 29 February, 1868).

Another point appears to us important to mention, on account of the inconveniences, even the dangers, which would arise from neglecting it. While the layer of nitrate of silver (pure or weakened), remains in contact with the morbid growths, the surface of these gives rise to a very abundant secretion, which always dissolves a greater or less portion of the nitrate. This solution ultimately flows down in accordance with the laws of gravity, and it may thus easily happen that after a time, and quite unintentionally, we cauterise the digestive tract to a surprising depth. It may even happen (and this gives far greater cause for uneasiness), that the caustic reaches the entrance, or sometimes the interior, of the larynx. These accidents are not the less injurious because they are rare. What is still worse, they are sometimes not discovered until after the patient has quitted the doctor's residence, or *vice versâ*, and therefore immediate relief is impossible.

We have been in the habit of guarding against any accident of this nature by employing after each cauterisation of any length two methods, intended to remove all the superfluous nitrate of silver, one acting by the nose, the other by the mouth. These are—The naso-pharyngeal douche, and Gargle in a special manner. These two methods are used with salt and water, which immediately precipitates the silver, in the form of insoluble chloride, rejected by the patient in the form of cheesy white flakes. In consideration of the importance of this point, we shall briefly delay in order that we may describe these two methods.

### *Naso-Pharyngeal Douche.*

The advantages of this method are very great, and of general application; it would be desirable to see it more universally employed. This plan has been described so well and so concisely by the author of a critical *résumé* which appeared in the *Union Médicale*, of our treatise of 1865, that we cannot do better than to quote this description word for word.

"This douche is used to cleanse the nasal fossa, the posterior nares, and the entrance to the tubes, and conveys to these parts certain medicated substances. For this reason it is of great use in affections of the nose and of the pharynx. This douche differs from the methods hitherto employed, since it passes a gentle and continuous current through the nasal and pharyngeal cavities. The extremity of the instrument is exactly the calibre of the nares, and thus the liquid cannot flow back. By gently injecting the lotion it fills the nasal cavity, then passes into the superior portion of the pharynx, where it cleanses the entrance to the tubes, fills the opposite nasal cavity, and escapes by the nares on that side, which had remained open. The fluid may be injected by means of a syringe.

"This method is based on the experience of a great physiologist, E. H. Weber, who proved that when the nasal cavity is filled with liquid, the soft palate is raised, and thus the superior portion of the pharynx is transformed into a cavity closed below. The liquid thus flows from one nares into the other without falling into the inferior portion of the pharynx, unless the patient performs the act of deglutition. During the injection he breathes by the mouth.

"If we wish simply to cleanse the parts, we use warm water and salt, a mixture which is better tolerated than pure water. We employ a solution of sulphate of zinc and alum in chronic catarrh. In ozena we inject solutions of chloride of lime and permanganate of potash to remove the unpleasant odour." (See also Cousin, *loc. cit.*)

This douche is equally useful in the therapeutics of adenoid tumours, and also during their surgical treatment, whether it be to prepare the way for operation by removing the secretions of the nose and of the pharynx, which are generally very abundant, or to apply hæmostatics or substances intended to limit the action of the caustic, by neutralising any that remains in excess after its application.

As the employment of this method does not always succeed at the first trial, we must begin by accustoming the patient to its use, which sometimes requires a certain amount of patience and time ; we should, however, persist in the attempt, and *we consider it very imprudent to proceed to surgical interference* without having previously familiarised the patient with the use of the douche ; we have not found other authors mention this precaution.

Unfortunately, the use of this douche is extremely difficult, if not impossible, in cases where there exist very large morbid growths, as these obstacles do not permit the passage of the liquid from one nasal fossa to the other.

We must be satisfied in such cases to accustom the patient at least to tolerate the injection so far as the nasal pharynx, and to allow it to remain there, if only for a short time.

But we repeat that we regard it as a condition *sine quâ non*, that we should accustom our patient, at least, so far to the use of the douche, before performing any operation in this region, in order to be prepared for cases in which considerable hæmorrhage may arise, or those in which there may be simply an excess of the caustic ; without the naso-pharyngeal douche it would be very difficult to guard against these two accidents. It is useful to combine with it the action of the gargle.

*Method of using the Gargle.*

We, in common with authors, recommend the use of the gargle in the following manner : The patient inclines the head horizontally backwards, and performs movements which we may call "quasi-deglutition," not including the last portion of this physiological action—definite swallowing. The liquid is passed much higher behind the soft palate than the ordinary method of gargling will permit ; some persons succeed so well in this manœuvre that they are able to reject by the nose the liquid which has been received by the mouth. Moreover, these rapid muscular contractions completely detach the abnormal secretions, which can then be easily expelled, and the greatest possible relief is thus given to the patient (see also Wendt, *loc. cit.*, p. 254). Compare, also, the method of M. Guinier (naso-laryngeal gargle).

Before proceeding to cauterisation, we prepare the warm salt water in order to have at hand, in case of necessity, the means of neutralising immediately an excess of nitrate.

If the pain is too intense, or too prolonged, we must recognise the fact that the action of the caustic salt may become too severe, or extend too far ; to neutralise further action of the nitrate of silver, we must then consecutively use the nasal douche and the gargle. The former, used with warm salt water, neutralises all the caustic which still remains in the naso-pharynx ; the same solution, at the temperature of the surrounding atmosphere, is useful as a gargle to prevent the action of the caustic extending lower than is requisite.

A fragment of nitrate of silver may become detached from the instrument and remain entangled amongst the numerous excrescences so frequently found in certain forms of adenoid growths ; we must confess that, notwithstanding all our precautions, this accident has already occurred to our patients on three occasions. We become aware of this occurrence first by examining the caustic-holder, which shows us that the whole, or a portion, of the azotic salt with which it was covered has become detached ; then, by a persistent and increasing pain, complained of by the patient, which may be easily distinguished from that caused by the degree of cauterisation which the surgeon intended. In addition to a too severe action, the nitrate may, in substance, or dissolved, descend into the stomach or into the respiratory passages, and there cause mischief.

We have avoided this in the three cases to which we referred by the following method, which appears to us both necessary and efficient in cases where this accident occurs.

We employ the naso-pharyngeal douche and gargles of salt and water ; the patient should even swallow some draughts of water containing sea-salt in solution ; we should not leave him till we are absolutely sure that the toxic substance is completely neutralised, or till we have seen it rejected. The cauterisation should be repeated after the sloughing and the inflammation caused by it have disappeared. In some patients this takes place within twenty-four hours ; in others, very much more slowly. We ascertain the disappearance of the slough by means of the rhinoscope, where this is possible, and the cessation of the accompanying irritation by the same means, or by the patient's sensations.

The number of visits necessary for a complete cure naturally varies, according to the size and consistence of the morbid growths, also according to the tolerance of the individual ; a considerable time is often necessary to insure complete recovery.

*2. Removal of Adenoid Tumours.*

Those authors who have studied this subject have practised the removal of adenoid growths by different methods. After having tried their modes of operation in a great number of cases, we have been induced to devise a *new method*, which appears to possess some advantages, and which we shall explain when we have described those already in use.

(*a*) *The Use of the Curette with Sharp Edges.*—The use of a curette with sharp edges is a method with has often given good results. Our instrument more or less resembles a small spoon with sharp edges, 1 centimètre in length and 7 millimètres in its transverse diameter, at the extremity of a stem, made like itself of steel, 15 centimètres in length. This is formed in a double curve, analogous to that of the caustic-holder, and, like it, resembling an S ; the first curve is at the end to be introduced into the mouth ; it enables us to explore the soft palate with the curette and to reach the roof of the pharynx ; the other curve is at the junction of the stem with a strong ebony handle. It forms, like the first, a very obtuse and rounded angle, but pointing downwards, while the other end is directed upwards. The former of these two angles prevents the hand of the operator from interfering with the field of vision, as in the case of the caustic-holder.

When we wish to use the curette we commence by depressing the patient's tongue ; if he cannot succeed in this himself we depress it with an instrument *ad hoc*. We then introduce the pharyngeal mirror, and guided by its aid we operate. In patients who do not submit to this kind of examination we introduce the index finger into the pharynx in order to fix the adenoid tumours, and at the same time to guide the instrument with which we operate towards them. We use the curette with the right hand. The morbid growths are removed by the pressure of one of the edges of the little spoon, or by a kind of sawing movement.

We have also met with a certain number of cases, not mentioned by other authors, in which, at the time of cauterisation, the patient cannot tolerate, even for the shortest period, the presence of the finger, or of the rhinoscopic mirror. We then proceed in the following manner : We first ascertain by rapid digital examination the exact position of the growths, we then withdraw the finger, immediately replacing it by the curette, with which, before removing the tumours, we carefully assure ourselves afresh of the position of the parts on which we must operate. Here, also, we must use caution by capping the end of the instrument with a caoutchouc tube ; at the moment of excising the tumours, we remove this protection with the index finger in those who permit its introduction, or by simply pressing the instrument, and thus withdrawing the elastic-tube.

The hæmorrhage which follows this operation is sometimes considerable, on account of the great vascularity of these tumours, but it never resists the application of the

naso-pharyngeal douche with water nearly cold, or with a solution of alum.

We may use instead of the douche a nozzle, the end of which is closed, but perforated with holes (Lincke), by which we inject the liquid, having introduced this tube into the naso-pharynx by the nasal fossa. We may also introduce an analogous tube by the mouth, and behind the soft palate; we need hardly say that it should then be suitably curved. The use of these instruments involves a fresh operation, however slight, which a patient, already enervated by the preceding operation would prefer to avoid. It is not usually necessary to apply any subsequent treatment to the parts from which the growths have been removed, but sometimes slight cauterisations may prove useful in effecting a final cure.

(*b*) *Snaring and Crushing.*—We may operate on the growths by the snare when they are pedunculated, and by crushing or bruising when they are sessile. In the first case we use a very resisting steel wire passed round the pedicle, with which we remove the entire growth by snaring it. The instrument must be strong and curved, so that it may reach the roof of the pharynx, passing behind the soft palate.

Instruments of this nature, although constructed differently, are always based on the same principle, and they resemble, except as regards their strength and their special curvature, the écraseur of M. Maissoneuve, and that which the regretted Wilde (of Dublin) invented to operate on aural polypus, and which we very frequently employ with complete success.

*Sessile tumours* may be operated on by the aid of a polypus forceps, which is curved suitably for this special purpose, as for instance, the instruments proposed by our learned colleague, M. Ch. Fauvel. The tumour must be seized between the teeth of the instrument, which compresses it forcibly, in order to crush it. The pressure is then relaxed and the instrument withdrawn, leaving a mass of *débris*, which will fall away of itself; the crushing should be repeated if necessary after the inflammation caused by the preceding operation has ceased, and the tissues, mortified by the intense pressure, have been eliminated. The forceps used by Stoerk (*a*) differs from other instruments of this nature, each branch being divided into two parts, united by a joint. In order to employ this forceps, we place these two pieces at an angle which will facilitate its introduction; when the instrument is *in situ*, and after it has grasped the tumour, M. Stoerk straightens it by means of two wires, so that the two portions of each branch together form only one straight line. It appears to us that this cannot occur without detriment to the soft palate, which is thus violently drawn forward.

The forceps used to crush the sessile tumours may be used to strangle the pedicles in the first class of morbid growths, thus removing them at the one visit.

We have invented with this double aim *a modification of our cutting forceps.*(*b*) The sharp blades of our instrument are replaced by strong toothed bits, which will enable us to strangle or to bruise the growths as we have explained.

Thus modified, our instrument appears to us very easily manipulated, not alone for the growths of which we speak, but also for true pharyngeal polypus.

In alluding to the precautions to be taken, while snaring the growths, in the use of the rhinoscope and palpation, for the dangers of hæmorrhage, &c., we have but to repeat what we have previously said while considering operation by means of the curette. These precautions apply equally to the method we have been considering. In certain cases of tumours of very soft consistency, we sometimes succeed in crushing them by the *pressure of the finger*, which must be repeated till the recovery is complete.

(*To be continued.*)

## CLINICAL SOCIETY OF LONDON.

FRIDAY, MAY 23RD.

Mr. R. BARWELL, Vice-President, in the Chair.

DR. COUPLAND and Mr. HULKE

ON A CASE OF INTUSSUSCEPTION OF THE ILEUM INTO THE CÆCUM THROUGH THE ILEO-CÆCAL VALVE, ASSOCIATED WITH A POLYPOID TUMOUR—LAPAROTOMY ON THE FIFTH DAY—GREAT IMMEDIATE RELIEF—DEATH ON THE SEVENTH DAY.

The case was that of a spare, old-looking blonde, æt. 16, of highly hysterical temperament, who was admitted into the Middlesex Hospital, on March 16th, 1879, having been seized the previous day with colicky pains and vomiting. She had just recovered from a similar attack lasting a few days, and was said to have suffered in the same way some two years before. There had been a natural motion that morning, but no blood had been passed. On admission, the paroxysmal pain in the abdomen was the chief symptom, but there existed a prominent cylindrical swelling in the upper part of the right iliac region, and an area of dulness below this. There was no general abdominal distension, and no constitutional disturbance. The case being regarded as probably one of typhlitis and fæcal accumulation, sedatives were given, and enemata administered, the latter without effect. Vomiting continued incessantly, being produced by everything that was taken, the pain less severe, on account of the opiates, still remained, and no change took place in the swelling and area of dulness. On the 14th she was obviously weaker, the vomiting was bilious in character, the abdomen more tympanitic. A large soap-and-water injection of four pints was returned discoloured, with a penetrating peculiar odour. Mr. Hulke was consulted. He found nothing on examination *per rectum et vaginam*, and after a further consultation with Dr. Cayley and Mr. Nunn, it was considered that the case being probably one of intussusception (and possibly already gangrenous), and the patient being extremely exhausted, that the abdomen should be opened. Mr. Hulke performed laparotomy, and on exploring the belly detected an intussusception of the ileum through its lower and into the cæcum. Reduction being found impossible, the ileum immediately above was secured in the lower angle of the wound and opened. Great relief followed, the vomiting and pain entirely ceasing, but thirty-six hours after the operation she sunk from the peritonitis, which was present at the time of operation. The post-mortem examination revealed an intussusception composed of fully three feet of ileum, through its lowermost six inches, and through the valve; the invagination extending for a distance of twelve inches into the colon. The lips of the valve and the surface of the invaginated gut were deeply ulcerated; much lymph occurred between the serous layers, whilst the central tube was filled with blood clot, except for its upper three inches which was occupied by a firm, fleshy, cylindrical polypoid mass, almost the size of the little finger. There was slight general recent peritonitis. The other organs were healthy. The obscurity in the diagnosis, the absence of melana, the time that elapsed before the symptoms became severe enough to favour the view of complete obstruction, and the fact that the vomiting was never stercoraceous were dwelt on; and it was pointed out that the variety of intussusception here present was of comparatively rare occurrence. The co-existence of a polypoid growth (it was ligamentous in character), and its situation at the last part of the bowel to become invaginated were also points of interest; the presence of the tumour doubtless preventing reduction as well as hastening the ulcerated process.

Mr. MARSH inquired if there were ever cases of fæcal obstruction which produced such symptoms as were found in this case. Because valuable time was lost in endeavouring to establish the diagnosis, and by the time the surgeon was asked to operate, the patient was almost *in articulo mortis*. He doubted if fæcal accumulation, although it often gave rise to severe symptoms, was ever attended with such rapidity and severity as characterised the outset of this case.

Mr. BRYANT also thought it chiefly a question of diagnosis; the symptoms would have been chronic and altogether slower if due to fæcal obstruction. Time was undoubtedly lost, and

when the surgeon was asked to operate it was almost a hopeless case. There were, however, no symptoms of tenesmus or of the passage of blood-stained fluid as were usual in intussusception, and this fact had probably led to the extra difficulty found in the diagnosis of the case. The cause of the intussusception was very interesting; there was such another preparation in the museum of St. George's Hospital, taken from one of Mr. Pollock's patients. Intussusception through the ileo-cæcal valve was common. Why the blood found in the ileum had not escaped to the colon, and so externally *per rectum* was not obvious.

Mr. HULKE said that the appearance of hæmorrhage or of blood-stained mucus in cases of intussusception was not constant. It was often present, and these constituted a valuable point in the forming of a diagnosis, but its absence could not be considered as of great moment. He thought that when the obstruction was acute the course of the blood was arrested in the invaginated gut, and none therefore came away. The patient, though she eventually died, had rallied wonderfully in a few hours after the operation; in fact, from being quite cold in the evening, she became warm in the morning.

Dr. COUPLAND remarked that the case did not at first appear to be very severe, and the symptoms then seemed to point to fæcal obstruction. In invaginations of the ileum through the ileo-cæcal valve, the cæcum commonly slipped into the colon, and dragged the ileum after it; simple invaginations of the ileum through the ilio-cæcal valve were most rare. The tumour, as it were, had led to increased peristalsis of the intestine, and the tumour, after its intussusception, had become so firmly fixed below the valve, that its return was found to be impossible.

### Dr. MARKHAM SKERRITT (of Clifton)

ON TWO CASES WHICH SHOWED THAT DULNESS IN THE DEPENDENT PARTS OF THE ABDOMEN CHANGING ITS SITE WITH ALTERATIONS IN THE POSITION OF THE PATIENT, WHICH WAS COMMONLY REGARDED AS THE MOST RELIABLE SIGN OF ASCITES, MIGHT EXIST WHEN THERE WAS NO FLUID IN THE PERITONEAL CAVITY.

The first case, fully reported to the Society on February 14th, was that of a patient admitted into the Bristol General Hospital with intestinal obstruction from what proved to be a plug of fibrinous exudation; when the patient lay on his back there was dulness in both flanks as high as the anterior superior iliac spines, but when he turned on either side the uppermost flank became resonant. Post-mortem.—The small intestine was found to be greatly distended with liquid fæces and gas, and there was no fluid in the peritoneal cavity. The second case was that of a boy, æt. 16, admitted into the Bristol General Hospital five days after the onset of symptoms of intestinal obstruction; here also there was dulness in both flanks when the patient lay on his back, and there was resonance in the uppermost flank when he lay on his side. Post-mortem.—A coil of small intestine was found to be bound down by tough adhesions; the gut above was greatly distended with fluid fæces and gas; and there was no fluid in the peritoneal cavity. The following explanation was given of the simulation of the physical signs of ascites in these cases. The gas and the liquid fæces in each coil of intestine necessarily obeyed the same physical laws as did the gas-containing intestines and the free fluid in ascites; that is, in each coil of intestine the gas would rise to the top in whatever position the patient lay, and the fæces would sink to the bottom; and that this was appreciable to percussion on account of the great distension of the individual coils, and also of the large proportion of fluid fæces contained in them. According to this theory, when the patient lay on his back the dulness in each flank was the sum of the dulness due to the liquid fæces in the individual coils; and when he lay on either side the resonance in the uppermost flank was the sum of the resonances produced by the gas in the same individual coils. The existence of this physical sign had apparently not been before described; and the fact was of some practical importance because this source of fallacy in diagnosis of ascites would be met with in cases where the presence of peritoneal fluid would be of considerable diagnostic value; it would present itself only in cases where there was arrest of passage of fæces; this stasis might be due either to a mechanical obstacle or to enteritis or peritonitis simply; and the apparent presence of a small quantity of peritoneal fluid would, in such a case, be strongly in favour of the existence of peritonitis, and, therefore, against the utility of surgical interference. It was, therefore, necessary to remember that in cases where there was great distension of the intestines with liquid fæces, the common physical sign of ascites might exist when there was no fluid in the peritoneal cavity.

Dr. COUPLAND described a somewhat similar condition in a patient with acute abdominal obstruction, in whom there had been supposed signs of ascites. After death, which had quickly supervened, there was found a volvulus around an unobliterated vitelline duct.

Dr. T. TAYLOR inquired if the other method of detecting ascites was employed, viz., that of the percussion wave. As percussion did not of itself give an infallible sign, he thought the percussion wave should have been practised.

Dr. SKERRITT said that no fluctuation could be obtained across the abdomen from side to side; but he thought he had noticed that when the quantity of ascitic fluid in the abdomen was very small, the percussion wave was often absent. He had brought forward his cases, as he had been unable to find any published reference to the question which they appeared to settle.

### Dr. STEPHEN MACKENZIE

ON CASES ILLUSTRATING THE COMMUNICABILITY OF, AND SOME OTHER POINTS CONNECTED WITH, MOLLUSCUM CONTAGIOSUM.

The cases were brought forward, not account of their rarity, but to illustrate the contagious character of the disease, a point on which English dermatologists were agreed, but which foreign dermatologists still appeared to doubt. In the first series a mother and four children were affected, and two of the latter re-infected. A maternal aunt living exactly opposite also suffered from the same disease at the same time. The fourth child was first affected, and communicated the disease to the baby. The latter was temporarily cured, but re-acquired the disease on its face, and communicated it to its mother, whose breasts were covered with as many as from 30 to 40 mullusca, as shown in a drawing. The sixth child was next affected, and the fourth, who first contracted the disease, was re-infected. The fifth child was affected at the same time as the preceding. The mother's sistar living exactly opposite had two tubercles of molluscum contagiosum on her face at the same time. She frequently nursed the children. In the next series an infant, eighteen months old, was brought with numerous molluscum tubercles on her face, and her mother had two mollusca on her breast, of which she appeared ignorant. These patients were exhibited. The next series were two little children, living next door, associating much together, both affected with the characteristic tubercles. These patients were also exhibited. Next were narrated the cases of two patients with molluscnm contagiosum, who were said to have come in contact with persons similarly affected. A case was also given in which a family predisposition seemed to exist, for four out of six children had been affected between the ages of two and three years, no two being simultaneously affected. The youngest had not reached the susceptible age. An account was then given of some unsuccessful attempts to inoculate the disease. The sebum and expressed gland substance had been rubbed into parts, and the matter introduced by sacrification, but in no case was the disease propagated. To ascertain whether the non-success was due to non-susceptibility in the persons experimented upon, a series of inoculations were made in persons the subject of the disease, the sebum from their own molluscum tumours being employed. No better success attended these experiments.

Mr. MORRANT BAKER had seen two or three instances in which the mother had molluscum contagiosum on the breast, and the child the same on its face. He had also seen the disease symmetrically distributed on the mother and child.

Mr. MALCOLM MORRIS said that no English dermatologists, with the exception of Mr. Erasmus Wilson, doubted the contagiousness of this disease, and Dr. Mackenzie's cases would still further confirm them in that opinion. He had seen at St. Mary's Hospital a child with the disease, from whom an infant had caught it, and afterwards the mother from the infant.

Dr. SANGSTER had had under his care at Charing Cross Hospital a child in which the disease began on one side of the thigh and vulva, whence it spread to the opposed surfaces of the other thigh and other side of the vulva. He attached but little importance to the non-contagiousness of the disease

when artificially inoculated ; and thought that constant contact with friction was probably necessary to its propagation.

Mr. G. BROWN had seen several cases of the kind, especially in children. In no instance was the child affected without the mother's breasts being also similarly diseased. He thought the disease very common, almost endemic, in the East of London.

Mr. HULKE had at Moorfields seen many cases of the kind, and thought the evidence of contagiousness very strong.

Mr. MARSH thought the same.

Dr. MACKENZIE said that dirt was not an essential of the disease. He thought that Dr. Sangster had hit the point in saying that constant friction, with warmth and moisture to assist, would produce the disease.

### Dr. D. B. LEES

#### ON TWO CASES OF PARALYSIS OF THE SERRATUS MAGNUS AS A PART OF INFANTILE PARALYSIS.

The cases were shown at a meeting of the Society a few weeks ago.

Elizabeth M. was seized with general paralysis at the age of 9 months. When brought to the Hospital for Sick Children the muscles in worst condition were those of the left shoulder and right leg. In most of the muscles of these limbs Faradic response was absent, and in many of the muscles of the left leg and also in the right deltoid it was much impaired. After the child had been brought to the hospital for a few weeks, it was noticed that there was marked falling-in of the left side of the front of the chest during inspiration, instead of the normal expansion. The position of the scapula was found to be altered on the left side ; it was drawn up to a higher level than the right scapula, the upper angle was drawn nearer to the spinal column, and the lower angle had left the chest wall and projected backwards in marked contrast to the scapula on the other side. These symptoms seemed to justify a diagnosis of paralysis of the serratus magnus. On applying the electrodes of a battery over this muscle, a forwards movement of the scapula at once responded to a current from 17 Leclanché cells on the right side, but no movement could be obtained by the use of a much stronger current on the left. It was possible that in this case the inter-ossei were also paralysed, and certainly the rhombodei had suffered, there being no muscular resistance when the scapula was pulled forwards. The child's general condition had since improved, but the position of the scapula and the electrical reactions were nearly unaltered.

Herbert P. æt. 12 months, was found completely paralysed one morning early in December, 1878. When brought to the Hospital for Sick Children on December 20, it was found that in him also the parts most deeply affected were the left shoulder and arm and the right leg. The right deltoid also was decidedly paralysed. It was observed that the angle of the left scapula projected from the chest wall. On turning the child on his back the left scapula fell away from the ribs. It was doubtful whether a less degree of a similar condition was not present on the right side also. Respiration was entirely diaphragmatic. There was no unilateral depression of the thoracic wall during inspiration. No response to electricity could be obtained in either serratus. This child had considerably improved under treatment. The right scapula was now in normal position and the left nearly so. Some response to Faradism had reappeared in both serrati, and both deltoids had regained much power. He could now raise the hand above the level of the shoulder on the right side, but was still unable to do so on the left. In both these cases the serratus was only one of many muscles paralysed, but the signs of its affection were distinct. Paralysis of this muscle was a rare condition, and Dr. Lees was not aware that attention had been previously drawn to it as an occasional complication of infantile paralysis.

### Mr. B. BRODHURST

#### ON A CASE OF GENU VALGUM.

Lucy T., æt. 17, was admitted into the Royal Orthopædic Hospital, on Dec. 30th, 1878, with very severe genu valgum and talipes varus of the right side, which had existed from the earliest childhood. The internal malleolus was 10¼ inches removed from the median line. A cast of the case taken on admission to the hospital was exhibited. On January 13th, 1879, the biceps tendon was divided, and one week later the external lateral ligament of the knee-joint and the ilio-tibial band. After three days a long external thigh splint, with a cog-wheel, and with a Scarpa's shoe attached, was applied. On February 3rd ether was administered, and the limb was somewhat extended. Afterwards gradual extension by means of the cog-wheel was made day by day without causing pain, and at the same time the talipes varus was overcome. On March 4th the knee was found in a straight position. The splint was removed, and another cast, which was also exhibited to the meeting was taken. Mr. Brodhurst thought this one of the most severe cases of genu valgum he had ever met with ; yet in seven weeks after an operation which interfered with no bony structures, the limb was straight, and he reported that it was then strong enough to bear the weight of the body. There was also a certain amount of motion of flexion and extension at the knee. Mr. Brodhurst combatted the supposition that in genu valgum there was lengthening of the inner and wasting of the outer condyle of the femur, and said that Professor Billroth also denied the existence of this pathological condition. He thought the operations of Dr. Ogston, Dr. MacEwen, Mr. Barwell, and that known as subcutaneous extra-articular osteotomy for genu valgum, were all liable to be attended with danger of inflammation, suppuration, and loss of joint motion, and even with fatal results. He asserted that the deformity was not always removed by those operations, or that it recurred, or that a worse condition (viz., genu extrorsum), examples of which he had seen, was thereby set up. Recently, in such a case, after both inner condyles had been operated on he had found the inner malleoli nine inches apart. For these reasons he drew attention to the above described less hazardous operation of division of the biceps tendon and the external lateral ligaments, which he had never known to give rise to any ill effects, or to fail to remove the deformity.

Mr. REEVES congratulated Mr. Brodhurst on the result of his case up to the present, but thought it too early for it to be possible to come to any conclusion as to the ultimate result. He felt that perhaps he was egotistical in complimenting Mr. Brodhurst, because the operation adopted was that which was first adopted by him, and recommended in the *British Medical Journal* early last year. Langenbeck, who had divided the external lateral ligament for knock-knee forty years ago, had abandoned the method because it left a weak joint, and Mr. Reeves thought that the patient shown would have permanently to wear an artificial leg, *i.e.*, an orthopædic support. He thought that all impartial surgeons were agreed that different cases of knock-knee required different treatment, according to the main cause of the deformity, and that, in some cases McEwen's or Barwell's plan, and in a large number the extra-articular mode, which he had done in a great many cases, was the preferable plan, especially if the internal condyle were elongated, as occurred very commonly, and particularly in the frequent rachitic cases. He could not agree with Mr. Brodhurst's remarks as to subcutaneous osteotomy, as, in his own experience—which, he thought, all round, was, in this matter, larger than that of any other surgeon—although in a few cases there had been temporary effusion, there never had been suppuration, anchylosis, extrorsum, or a return of the deformity. He presumed that Mr. Brodhurst did not mean—as he had said—that the internal condyle was removed, because nothing of the kind was done, the condyle being simply pushed up out of the way. Mr. Reeves showed photographs of a case on which he had operated on Tuesday last at the London Hospital. Until this case was sent to him the case exhibited by Mr. Brodhurst was the most severe he had seen. The subject was a lad, æt. 17, with right extreme genu valgum the malleoli being 13¼ inches apart, and the affected leg 4 inches shorter than the left. The internal condyle was very much elongated, and the lower part of the femur much flattened. An extra-articular method was not attempted, and when the condyle was chiselled nearly through, and the biceps tendon divided, the limb was forcibly brought nearly as straight as the other. There had been some hæmorrhage and effusion, but this had disappeared, and the boy was that afternoon doing very well. It had been clearly proven that subcutaneous osteotomy in the continuity of bones, and the extra-articular method of it, for knock-knee, was not dangerous. No mischief had occurred in any of Mr. Reeves's knock-knee cases, nor in any cases similarly operated on by other surgeons, and in the three cases of osteotomy of the tibia for rachitic curvature, which had suppurated, the ultimate perfect recovery

with straightened limbs was but slightly retarded. The modern rapid method had certainly done indirect good by inducing orthopædic surgeons to adopt more speedy means, such as tenotomy, followed by immediate forcible straightening. The advantages of subcutaneous osteotomy were putting the limb straight at once, saving much time in the treatment and dispensing with any subsequent apparatus.

Mr. GOULD said the weakness of the knee was not due to lengthening of the external lateral ligament, but to elongation of the internal lateral ligament.

Mr. BARKER had recently examined all the recorded cases in England, France, and Germany, and had found that not a single death, or of ill-effects arising from osteotomy in these cases had occurred after any of these operations, not even after Dr. Ogston's, which was, perhaps, the most serious. He was, of course, excepting the single fatal case following Ogston's operation, which he himself had already recorded in this Society during the present session.

Mr. HOWSE said that it would be a great pity if suppuration, anchylosis, or death, had followed any of these operations, and it should not be recorded. He had done ten operations of the kind himself, and seen several more done by other surgeons, and had never seen any bad results follow. Moreover, no orthopædic apparatus was required after the operation had been performed. Mr. Brodhurst seemed to have been under misapprehension altogether as to the nature of Ogston's operation; the internal condyle was not removed, only shifted. Further, the division of the lateral ligament gave the patient a sense of insecurity, owing to the looseness of the parts about the joint. One could scarcely judge of the result of the operation until after about four years. Up to the present time the results seemed to be by no means so successful as they would have been seven weeks after an Ogston's operation.

Mr. BRODHURST said that he had now done this operation for six years, and that nothing could be better than the result in some of his earlier cases. The external lateral ligament was not stretched, but divided, and the limb was gradually, though somewhat forcibly, brought into good position. Langenbeck had given up the operation, because he had not the means in his day of applying afterwards the necessary instruments. Mr. Brodhurst now introduced his patient, who could not walk except with her orthopædic apparatus applied.

Mr. MARSH suggested that she should be brought for a second inspection at the end of another year, or during the next session of the Society.

Mr. BARKER thought that in such cases there was a great tendency to recurrence of the disease after a time. Mr. Brodhurst had said the internal condyle of the femur was not elongated, but in a very able paper in *Langenbech's Archives*, accompanied by pictures of sections of the bones, there was undoubtedly such elongation; as also there was in a case of the kind recently seen at his (Mr. Barker's) own house.

The CHAIRMAN said that if Mr. Brodhurst had brought down the other patients operated upon six years ago, it would have been of great interest to the surgeons then present. It was difficult to see how the external lateral ligament could again become strong. The joint was now very loose, and he did not think it possible that the patient would be able to walk for some time without wearing the orthopædic instrument.

Mr. BRODHURST repeated that his opinion was that of Billroth, who had said that the internal condyle of the femur was not elongated in these cases. He promised that the patient should be brought again, and thought it probable that the instrument would have to be worn for some time to come.

### Mr. GEORGE BROWN

#### ON A CASE OF GAS IN THE PERITONEAL CAVITY IN TYPHOID FEVER, RELIEVED BY PUNCTURE.

The patient, a young man, æt. 21, was under Mr. Brown's care for typhoid fever in October last. The temperature was high throughout, ranging from 102 to 105·2° during the height of the fever. The case was complicated with double pneumonia. In the third week of the fever tympanitis developed, which was at first localised to the parts of the abdomen occupied by the intestines, but a few days later the physical signs indicated that gas had escaped from the intestines into the peritoneal cavity, or was being generated in the cavity itself. The distension of the abdominal wall gradually became more and more extreme, the tympanitic note entirely masking the hepatic and splenic dulness, and could be elicited over the sternum as high as the articulations of the fourth costal cartilages. Through upward pressure on the diaphragm there was urgent dyspnœa, the respirations reaching as high as 50 per minute, and the heart was displaced upwards and outwards, so that the apex beat was half an inch outside the nipple and in a line with it. Mr. Brown pierced the abdominal wall with a small aspirator trocar an inch below the umbilicus, and on withdrawing the canula a rush of gas took place which continued for several seconds. The gas was odourless. The relief was immediate, the heart regained its normal situation, and in a few minutes the respirations fall from 50 to 36 per minute. No ill-effects followed the operation. The patient succumbed, however, from the lung complications thirty-six hours after. As to the source of the gas, Mr. Brown dismissed the idea of perforation of the intestine on the following grounds, viz.: 1st, The gradual development of the gas in the peritoneal cavity; 2nd, Absence of symptoms of collapse which might have been expected had perforation taken place; 3rd, The fact that the tympanitic condition of the colon and small intestines was unrelieved by the operation. Had perforation existed, gas would probably have continued to escape into the peritoneal cavity after the operation, but of this there was no evidence, although the patient lived thirty-six hours afterwards; 4th, The fact that the gas was odourless. Mr. Brown advanced two theories as probable sources of the gas: 1st, The gas might have passed by diffusion through the intestinal wall, or 2nd, the gas might have been derived directly from the blood by exosmosis through the delicate walls of the peritoneal capillaries, and this was the more probable from the fact that, for several days previous to the distension taking place, the blood was highly charged with carbonic acid gas in consequence of imperfect aëration in the lungs. Mr. Brown said he was unable to decide this point, and preferred to merely record the case in the hope that other observers would be able to throw more light upon the subject should similar cases occur in their practices.

A MEMBER stated that he had seen two such cases. One occurred in a child who had scarlatina; the abdomen was perforated to allow the gas to escape, and the child died. In another case, no perforation was performed, and the child recovered.

Dr. COUPLAND also made a remark, and

Mr. BROWN replied. He thought the gas was probably carbonic acid gas.

### Mr. MORRANT BAKER

#### ON A CASE OF IMPERFORATE RECTUM FOR WHICH AMUSSAT'S OPERATION WAS PERFORMED.

The case related was that of a female infant who, when nineteen days old, came under the care of Mr. Morrant Baker at St. Bartholomew's Hospital on account of imperforate rectum. The abdomen was enormously distended; there was frequent vomiting, and the child was much exhausted. Chloroform having been administered, an attempt was made to find the lower end of the bowel through the short *cul-de-sac*, which represented the anus. The bowel, however, could not be found, notwithstanding very free incisions; and in spite of the great distension of the abdomen, no bulging of the parts could be detected, even during the action of the abdominal muscles. It was decided, therefore, after a consultation, to desist from further operative procedures in the neighbourhood of the anus, and to perform colotomy by Amussat's operation in the left loin. This operation was accordingly performed. Meconium freely escaped, and within a few hours the infant was greatly relieved. An elastic tracheotomy tube was inserted into the bowel through the wound in the loin, and had been worn continuously ever since. In this way all troubles which might have arisen from contraction on the one hand, or prolapse on the other, were avoided. A year after the operation it was noted that the child was well, and wore the elastic tube; fæces passing only once or twice in the week. The abdomen was, however, not distended. Two years after the operation, the note was the same, and the child, now nearly three years old, was shown to the Society, perfectly well in health, and still wearing the elastic tube in the loin. Instances of recovery, it was remarked, after the performance of colotomy for the relief of imperforate rectum, were curiously rare, and, probably, the case shown to the Society was the only one now in this country. The question as to the best operation to be performed in cases of imperforate rectum, in which the bowel could not be found at the outlet of the pelvis, was discussed, and Mr. Baker thought that, on the whole, a preference should be given to Amussat's rather than to Littrés method of colotomy.

Mr. M. BAKER, in answer to the chairman, said that a probe had not yet been passed down the bowel towards the anus, to find the termination of the intestine. He hoped to bring the case forward again at some future day.

Mr. G. BROWN thought that the operation in the infant in these cases might usually be deferred until actual bulging of the distended bowel occurred, as it was then more easy to cut down upon it, and find it. He had kept a child under observation for ten days before bulging had occurred, when the operation was performed.

The Society then adjourned.

REGISTERED FOR TRANSMISSION ABROAD.

THE

MEDICAL PRESS AND CIRCULAR

Is published every Wednesday morning. Price 5d. Post free, 5½d.

POST FREE TO ANNUAL SUBSCRIBERS . . . . £1 2 6

,, IF PAID IN ADVANCE . . . . 1 1 0

*** Post-office Orders and Cheques to be drawn in favour of—

A. A. TINDALL, 20 King William Street, Strand, London, W.C

A. H. JACOB, 3 Molesworth Street, Dublin.

MACLACHLAN and STEWART, South Bridge, Edinburgh.

SUBSCRIPTIONS FOR FRANCE are received by Messrs. BAILLIERE, Rue Hautefeuille, Paris—post free in advance, £1 3s. 6d. per annum.

SUBSCRIPTIONS FOR THE UNITED STATES are received in New York, by Messrs. WILLMER and ROGERS; Baltimore, by Messrs. KELLY and PIET; Philadelphia, at the *Medical and Surgical Reporter* Office post free in advance, six dollars (£1 3s. 6d.) per annum; or direct from the Offices in this country for the same amount, if remitted by International Post-office Order

'SALUS POPULI SUPREMA LEX.'

WEDNESDAY, JUNE 4, 1879.

## THE IRISH PUBLIC HEALTH SYSTEM.

THE policy of the late Vice-President of the Irish Local Government Board, who sought to throw every difficulty in the way of the working of the Irish Public Health Act, and who persuaded the Government to refuse proper sanitary supervision of Irish districts, continues to bear fruit in the total disregard of sanitation by local authorities, and in the high death-rate of the Irish provinces.

The Act contains a provision for the appointment of a superintendent medical officer of health where required, who should be responsible for inspecting the district and advising reforms. This proviso the Irish Local Government Board most illegally annulled, changing the designation to that of "consulting sanitary officer," and arranging so that that officer should be a mere name, without either duty to do, or payment to receive. The result has been that the Public Health Act has produced almost no result whatever. The sanitary authorities are, almost with one consent, unwilling to enforce cleanliness—the central department is in a state of blank ignorance of the sanitary state of any individual place, because, not having any inspectors, it has no means of ascertaining the truth; and, lastly, the medical officer has speedily discovered that his masters, the guardians, and their masters, the Local Government Board, are of one mind in their anxiety to leave matters as they are, and not to make use of the Act. Therefore, he draws his salary and makes just as much show of work as will entitle him to payment, and no more.

Each quarter the Registrar-General's report brings the truth of this statement to light. Out of the 890 medical officers of health in Ireland about thirty think it worth while to make report as to the sanitary condition of their district, and those reports disclose, almost without exception, an abominable state of neglect.

Here are a few examples:—

NEWRY; *Mullaghglass.*—Typhus fever has been prevalent, and a great difficulty exists as to getting patients to leave their crowded homes. I would suggest that section 141 of 41 and 42 Vic., cap. 52—Public Health Act—be printed in large posters for distribution in all dispensary districts, so that the public may be made fully aware of the powers of the sanitary authority, which at present they do not believe.

BALLYSHANNON; *Ballintra.*—The sanitary arrangements of the district are pretty fair, with the exception of a few places, and one in particular deserves attention; it is the lane of which I made a note before; although it has been reported repeatedly by the sanitary officer to the guardians, there is no improvement made.

LONDONDERRY; *Glendermot, W.*—Health of district wonderfully good, taking into consideration the abominable sanitary condition of the dwelling-houses in rural district.

BALROTHERY; *Swords.*—If the poor people were better housed they could give ample proof of the desire for sanitary improvements that is being gradually infused into them. In their present abodes, owing to the limited space allotted to each householder, their houses cannot present an appearance otherwise than, if not disgusting, very uncleanly.

BALTINGLASS; *Baltinglass, W.*—I am at present attending a case of typhoid which was caused by defective house drainage. It seems unaccountable how the poor people escape this disease, especially at this time of year, when manure has to be carried *through their houses*, and then piled at the front door before being carted off.

CAVAN; *Kilnaleck.*—The habit of feeding pigs in the dwelling-houses of all classes, so highly detrimental to health, is carried on in spite of my efforts to abate it, and the good results to be derived from cleanly habits are almost to be despaired of in this locality; with the exception of the police barracks, and my own residence, I would find it difficult to point my finger to a clean and healthy dwelling.

MULLINGAR; *Mullingar, W.*—The town is in a most unsanitary condition, owing to the want of a proper supply of pure water for drinking and flushing purposes. The wells used by the public are mostly unprotected from the sewage of the road, which is washed into them during wet weather, and some of the pumps condemned by analysis of Dr. Cameron are still in use.

CROOM; *Castletown.*—The death-rate in this district for this quarter is exceptionally high. The task of educating the poor in the commonest hygienic principles is up-hill work, as it is very difficult to make them even understand that a cow, a pig, or a horse, is not a desirable inmate of their sleeping apartments; and it is only by the strictest surveillance that such a state of affairs is not the rule instead of the exception.

We have stated, without exaggeration, the true state of the Irish sanitary system.

As we are not liable to be dismissed from our office by the Local Government Board for saying so (as a medical officer recently was), we assert that the Irish Public Health system is a discreditable sham, and that the Board presides over that system well knowing it, and being content that it should be a sham.

They well understand that, to enforce sanitation would bring down upon them the ire of the multitude of influential people who are interested in perpetuating dirt, and they accordingly refuse to make any real effort to administer the law which Parliament placed in their hands. They have refused to issue any new orders under the new Act, and they veto every attempt to provide a means for searching out the sanitary nakedness of the Irish land. Truly, a creditable position for the great Local Government Department for Ireland to occupy!

## THE ROYAL MEDICAL BENEVOLENT COLLEGE.

We offer our hearty congratulations to the Commitee of Governors of the Medical Benevolent College, through whose agency the signal victory of Thursday last was gained. We have from the outset given our support to the movement (since, on close investigation, we were convinced that the voting system does not even pretend to aim at getting in the most deserving case), which substitutes a vigorous working of a carefully devised machinery for an honourable judgment on the strict merits of the cases brought before the subscribers for their consideration. So soon as the body of governors of any charity could be brought to see this we felt certain that some change must follow. The document issued two months ago by the Reform Committee testified, through those who had had the most painful experience of the voting system, that the plan was not suited to relieve the most fitting objects of our solicitude. The replies, one and all, unmistakably proved that the most deserving amongst the candidates had but the remotest chance of success. In fact, the distribution of the charity was a mere lottery.

We were, therefore, by no means surprised to find this question had drawn together the largest gathering we ever remember to have seen present at any of the annual meetings of the College; and also this, that there was a large sprinkling of country subscribers, many of whom had travelled long distances to record their votes in favour of the resolutions about to be submitted to the meeting. Mr. Manby, who has for years shown a determined opposition to the voting system, was amongst the most enthusiastic present. There was, however, a remarkable unanimity of feeling displayed in favour of the resolutions, for in the Medical Benevolent College we have, if it is to be found anywhere, a fair example that a high principle is certainly applicable. It was then in no wise marvellous that the most enlightened amongst the governors should have determined to cast the future of the Charity upon Christian faith and love, and declining longer to have anything to do with any lower motive.

The views of the Council were expressed at considerable length in the report read to the meeting by the secretary of the College, and these were subsequently enforced by what the treasurer intended to be arguments, but which evidently failed to convince any one, that many of the subscribers will fall away because it is the wish of the majority to exercise the liberty of voting and electing on some rational principle. But, as Dr. Hare said, if a slight falling off should take place from this cause, there was every reason to believe that a far greater increase of subscriptions will take place from an opposite feeling. Let those who have the desire and the leisure, collect subscriptions if they will, to secure the election of some favoured candidate, either to our College or some other educational institution, by an act of real, instead of spurious, charity. But let there no longer be a misdirected energy, a waste of time and money lavished on printing and postages without any return either to the candidate or the charity. By the present system a sum of not less than £900 a year, the money of the professedly necessitious, is absolutely thrown, as it were, into the gutter, without benefiting one of the poorest amongst the candidates. It was said that the proposed reform in the mode of election had led to a falling off in the subscription list and in other ways proved a failure to some other societies. This, however, is scarcely a fact. In the Soldiers' Daughters' Home it has been in existence for eighteen years, and given perfect satisfaction to a large body of subscribers. In the charity alluded to there was, we are aware, an attempt to perpetuate the worst evils of a system fostered by imposition; for, without any pretence to investigate the claims of the several candidates, a certain number of those longest on the list were annually elected by the committee of the charity. So soon as this practice became known, persons subscribed their half-guinea for the purpose of proposing a candidate, a dependent possibly of their own, and then immediately ceasing to subscribe, left them to be elected by virtue of their having been unable to obtain votes, and consequently longest on the list. It is hardly necessary to say that such a plan was well calculated to stereotype the worst abuses of the charity voting system.

Notwithstanding all that was said by the Council in support of the present system, we hope they will, and without hesitation, carry into effect the wishes of the majority of the governors of the College. So far as the consequences likely to ensue from the change, the Council are certainly absolved from further responsibility; for have not 2,775 governors taken this upon themselves? Indeed, the treasurer very properly said, that whenever the governors gave full expression to an opinion upon any question affecting the interests of the College, it was the duty of the Council to give the matter its fullest consideration. The governors, after three or four years' consideration of the system of voting, have very emphatically condemned it, and emphatically request the Council to frame a bye-law founded upon the resolution passed by the meeting—in justice and mercy to the widow and orphan.

## THE HEALTH OF DUBLIN.

The returns of the Registrar-General for the week ending May 24 supply us with a commentary upon the "Sanitary officer" job of the Dublin Corporation referred

to in our last issue—more forcible than anything we could write. At the moment when the Public Health Committee is trying to shuffle through a plan for pensioning its Superintendent Health Officer, and leaving the city without sanitary supervision, we find that the mortality within the city district is terribly excessive, and shows signs rather of increase than diminution. Three months ago the Public Health Committee excused itself for the high death-rate by saying that the weather had been bad, and that the cold had carried off a multitude of old people. We are now in June, with beautiful spring weather, yet the death-rate is almost as bad as ever. In the week ending May 24, the figure stood at 34·9 per 1,000 of the population—the deaths being in that one week sixty in excess of the monstrous average of the city, and for the same week the London death-rate stood at 21·6, that of Glasgow at 21·0, and of Edinburgh at 23·5.

The deaths from small-pox did not materially contribute to the heavy mortality, for that disease only caused eight deaths; but we may shortly expect a different state of affairs, inasmuch as the new cases of small-pox admitted to hospital rose from, within the week, 33 to 63, and there are now 130 cases under treatment.

We have again to repeat the inquiry as to whether the Government is going to intervene, and why it is that the promised inquiry into the causes of the excessive death-rate—which we were promised that Dr. MacCabe and Mr. Rawlinson would hold—has been delayed.

It is no small matter that in the middle of a mild and healthy season—the benefits of which have been felt by all places but Dublin—sixty lives a week are being sacrificed to inaction.

It is nearly a year now since the Government were asked for this inquiry by a deputation of the Sanitary Association, and we are still in expectancy. We understand that Mr. Rawlinson is busy. If so, it would certainly be right to associate some other person with Dr. MacCabe, rather than permit the mortality to continue unabated, or to increase still further. As for the existing sanitary organisation of the city, it is simply beyond criticism.

Its whole energies are required for the development of its pension job, and no brain power remains available for an effort to save the lives of the citizens. We are accused of being *exigeant* and harsh in our censure; but with the sanitation of the city of Dublin in a state of chronic collapse, and the inhabitants, as it were, plague-smitten, our pen refuses to write dignified platitudes. For twelve months we have watched in vain for the least honesty of effort on the part of the Public Health Committee to stem the tide of disease and death amongst the citizens, and, instead thereof, we have seen an engrossing anxiety on their part to perpetrate a job which would make the existing confusion worse confounded. When those who object to the tone of our criticism can answer it by giving us a list of efforts made and reforms effected by the Public Health Committee in pursuit of sanitary improvement, then, and not till then, we shall be pleased to abandon censure, and assume an unwonted vein of praise and admiration for the deeds of the Committee.

# Notes on Current Topics.

## The Anti-Vivisectionists at Peterborough.

It is evident from some papers which have reached us that the anti-vivisectionists are not having it all their own way. It is a favourite habit with agitators of all kinds when they wish to prejudice the mind of the public in favour of their peculiar views, to send into the provinces some plausible and sensational lecturer, whose assurance and pretentious manner are well calculated to impose upon an audience which is probably but imperfectly acquainted with the subject on which he discourses. He may not know much about it himself, but that is of little consequence, provided he can make his credulous hearers believe he does. As a rule, too, he often succeeds. His volubility, arrogance, and dogmatism are most commonly on a par with his ignorance. His audience is generally composed of that class of people who are disposed to believe all they hear, and to take for gospel everything that comes from a platform, especially when that platform is graced by the presence of a "gentleman from London." Besides, as a rule, the more sensible portion of the community (one or two clergymen and old spinsters excepted), stop away from these meetings, and if there are a few wise heads among the assembly, they may be too modest, too timid, or too disgusted to express their opinion on the subject. Consequently, the "lecturer" has it all his own way. The public gape with wonder, applaud, pass resolutions in favour of their hero's cause, and then go home complacently talking of the clever man they have just been hearing.

Such are often the history and outcome of these interesting episodes in social and provincial life. This time, however, the people who filled the Assembly Rooms at Peterborough, were made of different stuff, and were not to be so easily cajoled by the plausible utterances of an itinerant lecturer. When, therefore, the representative of the London Anti-Vivisection Society honoured that town with his presence, in order to enlighten its inhabitants on the subject of "vivisection, morally, socially, and scientifically considered," he must have found himself in something like a hornet's nest. Whether, however, his conscience was stung we will leave the reader to guess, but, at all events, the tables were completely turned upon him, his magniloquent resolution came to naught, and he had to "eat the leek" in the form of a counter resolution, which was passed by a large majority, amid loud and prolonged applause. Truly, this gentleman must have felt himself very uncomfortable on his return to town, whither he was, of course, bound in order to give an account of his stewardship to the "Anti-Vivisection Society."

We shall not trouble the reader with any select passages from the lecturer's discourse, suffice it to say, that it was about as frivolous, one-sided, and incoherent as such discourses usually are. The audience found a bold and eloquent exponent of their opinions in the person of Dr. T. J. Walker, who had not much difficulty in refuting what little argument the lecturer could bring forward on behalf of the society he represented. Dr. Walker

showed how vivisection had really done a great deal of good; such good, as he and every other medical man had been able to apply to the practical duties of his calling. The amendment which he proposed, and which was so vigorously applauded, was "That vivisection as at present restricted by law, is a justifiable means of advancing science in the interests of humanity and the human race," a proposition, the truth of which few, but the most prejudiced, will deny. The *Peterborough Standard* very wisely hopes it will "hear no more of a society which seems to subsist on a mistaken sentimentalism scarcely to be credited in this age of scientific research and discovery." We hope so too, but our contemporary should remember that such parasitic growths of our social economy are not easily dislodged when once they have taken a good hold upon the community.

## Opium-Eating.

APROPOS of our Note on this subject last week there is some reason for believing that our Transatlantic neighbours have also a *penchant* for this objectionable habit. In a new medical periodical, called the *Medical Herald*, we are informed that "reports from cities, towns, and villages throughout the land, indicate the alarming fact that the opium habit is not only very extensively indulged in, but is largely on the increase." Our young contemporary (which, by the way, shows a good deal of vigour), goes on to remark that the medical profession should be very careful to acquit itself, as far as possible, of the charge of letting this demon loose amongst the people. Nothing short of special legislation of the strictest and, at the same time, most judicious character, will close the several avenues through which this drug is made an article of commerce, rather than a remedy to be prescribed by the doctor.

## Freedom of New York from Small-pox.

As a favourable contrast to the above Note, we are told by another American journal that, "It has been a very long time since as many as three cases of small-pox have been known to occur in New York." A short time ago, however, a child was reported to be dead in a tenement-house in the eastern part of the city, and when a health inspector went to investigate the case he found a well-marked variolous eruption covering the body. Of course, every effort was promptly made to disinfect the premises and vaccinate the inmates, but a number of them, being ignorant Bohemians (to which nationality the dead child belonged), refused to have the vaccination performed. Three days afterwards two other children in the same house were taken down with small-pox, and when Dr. Janes, of the health department, and his assistants came to visit them preparatory to removing them to the Riverside Hospital, on Blackwell's Island, the parents and the rest of the family, learning their intention, became desperate, and endeavoured to escape with the children, so that it was necessary to guard the trap-door on the roof and all the other doors of the house until the arrival of the ambulance. The tenement-house has again been thoroughly disinfected, and a still more strict watch will now be maintained in the neighbourhood. As yet no further sickness has been discovered, and no apprehensions of an epidemic are entertained. The origin of the first case stil remains a mystery.

## The Solar Rays as a Caustic.

FOR some years (*La France Médicale*), an Italian physician has successfully used the heat of the sun for the destruction of nævi, warts, and other excrescences on the skin; while more recently this method of cauterisation has been applied to the treatment of syphilitic ulcers and condylomata. It is characterised by absence of hæmorrhage or inflammation, it causes very little pain, and the cicatrix which it leaves is small and little noticed. The eschar separates on the fourteenth or sixteenth day, leaving a wound which rapidly closes. The instrument employed consists of a bi-concave lens, of 2½ inches in diameter, and having a focus of about 10 inches. Directly the solar rays penetrate the skin the characteristic crepitation of combustion is heard, while the coagulation of the blood and the retraction of the blood-vessels are quite visible. The name of the physician is not mentioned, but further particulars of this method of cauterisation will be found in the *Gaz. Méd. Ital., prov. Venete.*

## The Sentence passed upon Adam Addison.

THE medical profession cannot but acquiesce in the justice of the sentence which has been passed upon the prisoner Addison. Had it been in their power to have meted out the punishment for such a crime as that for which he has been found guilty the sentence would not have been less severe, inasmuch as he has not only committed an offence against society, but is a disgrace to the profession to which he belongs. We must own, too, and with a feeling akin to shame, that the judge had some reason to pass such a sentence as would be "a warning to others in a similar position," for, unfortunately there are some "black sheep" amongst us who do not shrink from committing such an odious and dangerous offence as that of producing criminal abortion. The sentence passed upon the nurse Boyce may also be a salutary warning to all who, in a similar position, may be tempted to take a part in any criminal practices or proceedings of a suspicious nature. A remarkable feature about the death of the woman Robinson was, that no marks of any injury to the pelvic viscera were, as is often the case, found on post-mortem examination. The prisoner's counsel contended that there was evidence of peritonitis having been present two or three days before that on which the operation was alleged to have been done; and had it not been for circumstantial evidence of another kind the prisoner might not have been convicted. It follows, therefore, that the production of abortion or premature labour is not unattended with danger, however carefully or skilfully the operation may be performed. There is also another point about the case which is of some importance in a medico-legal point of view, for it shows the possibility of a perfectly innocent practitioner being charged with, or suspected of, producing abortion, when, after all, the woman has been the victim of her own or some other person's malpractices. So that the greatest circumspection is necessary before passing judgment respecting the guilt or innocence of a man accused

of this crime. In the present case the evidence of the prisoner's guilt was pretty clear, but it may not be so in all cases.

## The London Temperance Hospital.

THE sixth annual general meeting of the subscribers and friends of this institution was held last week at the Memorial Hall, Farringdon Street, under the presidency of Mr. George Palmer, M.P. The report of the board of management stated that during the past year nothing had occurred to interrupt the steady course of usefulness of the institution, whilst the experience of five preceding years had received the corroboration of another year's evidence in favour of the principles upon which the practice of the hospital was based. It had not been deemed necessary during the year by the medical staff to act in a single instance upon the proviso allowing the exceptional use of alcohol. The board expressed their belief that the success attending the institution was, in a great measure, consequent upon the absence of all administration of alcohol, whether in the form of beverages and tinctures, or simply as a drug. The directors, judging from past results, considered that, with a wider field and a much greater increase of verified data, the non-alcoholic treatment would attract public attention and regard in a high degree, and that medical observers who valued scientific truth more than traditional rule would give due weight to the facts thus accumulated and guaranteed.

In reference to the above statement, we are surprised that, considering the non-alcoholic treatment of disease is so successful at this institution, the medical and surgical staff do not take more pains to demonstrate to their professional brethren the truth of their doctrine and the happy results of their method of practice. It is not every one who can go to the London Temperance Hospital and watch the progress of the cases there treated. Perhaps, although we much doubt it, a report containing a precise and detailed account of the management and progress of a number of those cases in which it has been hitherto the custom to allow alcoholic stimulants, might remove much of the prejudice that at present exists against the non-alcoholic treatment. Or the publication of cases in the medical journals might have the same effect. We are quite open to conviction, provided adequate proof is adduced in support of the sufficiency of that treatment, and shall be happy to publish any of the clinical records which the authorities of this hospital may feel inclined to send to us.

## Disease amongst Swine.

IT will be seen from a discussion which took place in the House of Lords last Thursday night, that swine arriving in this country from America have been found to be affected with trichinosis. The Duke of Richmond and Gordon stated that in consequence of reports from abroad he had caused some of these swine to be examined by officers of the Veterinary Department with the result of discovering trichinosis in several of these animals. Investigations were still going on, but he was unable to say what steps, if any, had been taken, to check the evil that would necessarily result from the importation of diseased pigs. Owing to the high price of beef and mutton the poor are now consuming more pork than they ever did before. It is to be hoped, therefore, that the Government will exercise a close supervision over the sale of trichinosed pork, so that it may be condemned by the proper authorities before it finds its way into the shops of the retail dealers. The Duke of Richmond, however, was quite right in saying that the best way to prevent trichinosis extending to the human species was to see that the pork, ham, or bacon, was thoroughly well-cooked before it was eaten. This is an important matter, and one reason why the disease has been both prevalent and fatal in Germany, is that many of the inhabitants of that country are in the habit of eating pork, bacon, sausages, &c., in a half raw state. In 1863, out of 103 persons who ate sausages made from an affected pig, at Hettstadt, no less than 83 died from trichinosis. It is a well-known fact that, in order to prevent much loss of weight by cooking, the proprietors of our "beef and ham" shops are in the habit of under-boiling their hams. Consequently we caution the public against eating any that are not well-cooked.

## "Charge of Murder against a Physician."

SUCH is the sensational announcement which, in large type, meets the eye of every one as he takes up a newspaper, or hurries past a railway station. Much as we should regret a charge being brought against a physician such as that which has been brought against Mr. Adam Addison, we should have no reason to complain of his crime being as widely exposed, and as open to public reprobation, as if he had been the poorest in the land. But it is scarcely advisable for people to believe, or for the press to foster the belief, that every practitioner is a physician who puts on his door-plate "Physician and Surgeon," or who may have received from some College of Physicians a licence to practise medicine. The prisoner, who is now charged with the murder of Mary Ann Robinson, through his attempt at producing criminal abortion, was simply a general practitioner, engaged in general practice, and had no more right to call himself, or to be called a physician than the boy who carried out his medicines. It would, therefore, be as well if our contemporaries, for whose good judgment we have the greatest respect, were not to encourage a fallacy that is only too prevalent among the lower classes, especially as such inadvertency reflects the scandal upon a class of men to whom the prisoner does not belong, and who would not have reckoned him among their number, however respectable he might have been. The public are very prone to take men at their own value, and if "gentlemen of the press" honour these *soi-disant* physicians with a title to which they have no claim, we cannot wonder that the ignorant poor should do the same.

## Cæsarian Operation in Rome.

WE extract the following from an Italian lay contemporary:—"Yesterday in the Tiberine District, Rome, the death was announced of Angela Caperna, residing at No. 1 Via della Lungara, and at the same time the Registrar was informed that the deceased was *enceinte*.

A messenger was at once despatched for a surgeon, but he returned without having found one. The Duke di Torlonia happened to be in the Registrar's office, and he at

once gave orders that Professor Cocchi be sent for in his name. The messenger hurried to Cocchi's house, and, luckily found him at home, and he at once proceeded to Caperna's residence, and successfully performed the operation of extracting a living child from the body.

From the announcement of the decease of the woman to the result of the operation, three quarters of an hour had had hardly elapsed.

## A Cure for Leprosy.

A CORRESPONDENT of an Indian contemporary writes :—A native physician, of great repute in Southern India, addressed the Local Government Board, stating that he has a specific for the above disease, and requested that he be permitted to try his remedy in the Leper Hospital at Madras. The Madras Government, after careful consideration, informed the native doctor that they are unable to give him a ward in the Leper Hospital, and referred him to the Surgeon-General, Indian Medical Department, who gave him a few lepers to be treated, and brought back to him in six months.

The native, with the zeal and energy which characterises them, commenced his treatment at the beginning of the year, and up to this date has effected the cure of three lepers, the others are on a fair way to recovery. The Government, on the report of the Surgeon-General, are to take measures to procure the services of this native in the Leper Hospital.

## Registration of Medical Students in Ireland.

HAVING taken the trouble of calculating in the "Medical Students' Register," lately published in London, the number of students attached to each of the medical schools in Ireland, who were registered during the year 1878, we submit the following analysis :—

| | No. |
|---|---|
| School of Physic | 58 |
| Queen's College, Galway | 43 |
| Queen's College, Belfast | 85 |
| Queen's College, Cork | 53 |
| Catholic University School | 15 |
| Carmichael School | 10 |
| Ledwich School | 58 |
| Steevens' Hospital School | 12 |
| Royal College of Surgeons School | 28 |
| Miscellaneous | 8 |
| Total | 370 |

As the actual number of students entered at the various schools is, as far as Dublin is concerned, kept secret by the Anatomical Committee, it is our intention to publish in each year a statement similar to the foregoing, in order that the profession may arrive at an approximate estimate of the number of students in each school, and may see which of the schools discourage registration.

## Marriageable Age.

THIS is in Austria 14 for both sexes ; in Germany, 18 for men and 14 for women ; in Belgium, 18 for men and 15 for women ; in Spain, 14 for men and 12 for women ; in France, 18 for men and 15 for women ; in Greece, 14 for men and 12 for women ; in Catholic and Orthodox Hungary, 14 for men and 12 for women ; in Protestant Hungary, 18 for men and 15 for women ; in Italy, 18 for men and 15 for women ; in Portugal, 14 for men and 12 for women ; in Russia 18 for men and 16 for women ; in Roumania, 18 for men and 16 for women ; in Saxony, 18 for men and 16 for women ; and in Switzerland, in different cantons, from 14 to 20 for men and from 12 to 17 in women.

A MOVEMENT is on foot for the purpose of raising some memorial of the late Dr. Murchison in connection with the University of Edinburgh, of which the deceased was a graduate. A meeting in furtherance of this object will be held in London to-morrow (Thursday), at 5 o'clock, in Willis's Rooms, St. James's.

A STUDENTS' memorial has also been started at St. Thomas's Hospital to perpetuate his memory, and to show the gratitude of all who have been educated at that hospital, of which Dr. Murchison was a distinguished physician and teacher, by the erection of a marble bust, should sufficient funds be collected. The hon. secretaries are Messrs. W. H. Battle and T. D. Acland, at the hospital, to whom subscriptions should be sent.

THE rates of mortality per 1,000 last week in the principal large towns were—Brighton 16, Leicester 17, Bristol 17, Portsmouth 18, Leeds 19, Bradford 19, Oldham 19, Plymouth 19, Sheffield 19, Nottingham 20, Sunderland 21, Glasgow 21, London 22, Wolverhampton 23, Birmingham 23, Hull 23, Newcastle-upon-Tyne 23, Liverpool 24, Manchester 24, Edinburgh 24, Salford and Norwich 25, and the highest rate, Dublin 35.

LAST week the annual death-rate in the large towns from the seven principal zymotic diseases averaged 2·6 per 1,000. The fatal cases of whooping-cough were proportionally most numerous in Sheffield, Birmingham, and Salford ; scarlet fever in London and Newcastle-upon-Tyne ; and measles in Salford. Small-pox caused 17 more deaths in London, 8 in Dublin, but not one in any of the other large towns.

THE rates of mortality in the principal foreign cities according to the most recent weekly returns, were—Calcutta 34, Madras 37 ; Paris 29 ; Geneva 25 ; Brussels 26 ; Amsterdam 27 ; The Hague 27 ; Copenhagen 29 ; Stockholm 28 ; St. Petersburgh 43 ; Berlin 24, Hamburg 30, Dresden 23, Breslau 31, Munich 40, Vienna 34, Buda-Pesth 41, Rome 21, Naples 31, Turin 25, Alexandria 40 ; New York 22 per 1,000 of the population. Small-pox caused 20 deaths in Paris, 34 in St. Petersburgh, 15 in Vienna, and 12 in Buda-Pesth.

# Scotland.

(FROM OUR NORTHERN CORRESPONDENT.)

ANTI-VIVISECTION PRAYER MEETING.—An anti-vivisection prayer meeting was held on the 27th May, at 5 St. Andrew Square, Edinburgh.

THE DEATH-RATE IN GLASGOW.—The deaths for the past week (ending 24th May) were at the rate of 21 per 1,000

per annum, against 22 in the preceding week, and 23, 30, and 25, in the corresponding periods of 1876, 1877, and 1878.

GLASGOW UNIVERSITY—CHAIR OF BOTANY.—Dr. Balfour, son of Professor Balfour, late Professor of Botany in the University of Edinburgh, was installed on the 26th ult., as Professor in connection with this Chair. Amongst others present were—Professors Balfour, Gairdner, MacKendrick, Ferguson, Cleland, &c. Professor Gairdner, in the absence of the Principal, introduced Professor Balfour.

GREENOCK POORHOUSE AND ASYLUM.—The new buildings at Smithstone, erected by the the Greenock Parochial Board for a poorhouse and asylum were formally opened on the 29th ult. Their total cost has been nearly £100,000, and they will accommodate about 1,000 inmates and officials. The lunatic wards are finely finished, and are licensed for 240 patients. The architect is Mr. Starforth, of Edinburgh.

STRANGE MORTALITY AMONG CHILDREN IN NEW MONKLAND.—A peculiar mortality prevails among children in this district, whether owing to hard times and the exceedingly inclement weather for this season, it is difficult to say. Scarcely a day, indeed, elapses but sudden and unaccountable deaths of children are reported to the police, and to-day (May 28th) another has been announced to the county police at Airdrie as having occurred at Whiterigg, an infant three weeks old, the son of Peter Hewart, a miner, having been found dead in bed, although it was perfectly well in its mother's arms only a few hours before.

REGISTRAR-GENERAL'S RETURN.—The weekly return of births, deaths, and marriages in the eight principal towns of Scotland for the week ending with Saturday, the 24th May, says:—The death-rate in the eight principal towns during the week ending with Saturday, the 24th May, 1879, was 23·3 per 1,000 of the estimated population. This rate is 1·7 above that of the corresponding week of last year, and 1·3 above that for the previous week of the present year. The lowest mortality was recorded in Aberdeen, viz., 20·2, and the highest in Paisley, viz., 38·3. The death-rate from the seven most familiar zymotic diseases was 3·7 per 1,000, being 0·2 under the rate for the previous week. Deaths from measles occurred in Glasgow, in Aberdeen, and in Paisley; and from whooping-cough in all the principal towns except Aberdeen.

# Correspondence.

## DIPHTHERIA AND CROUP.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—I have been favoured with a brief communication from Mr. Moore, of Bourton-on-the-Water, respecting some cases of diphtheria that occurred some time ago, which may be of interest now in connection with the question of the identity of diphtheria and croup.

The first case was that of a child who died of diphtheria in an outlying village. The second case was that of a man aged 40 years, who had lain down on the bed by the side of the sick child. He took the disease and died. Three other children also died in this same house. Examination of the premises showed a percolation of drainage into the well through a rat hole. A girl, aged 12 years, belonging to the family, came home from school, but by the doctor's order was located with a relative at a distant farm, and strictly forbidden to approach the infected quarter. In four days this girl sickened and died of diphtheria, and it was then ascertained that she had been taken to see her brother as he lay dead in his coffin in an outhouse. Possibly she kissed the corpse. She did not enter the house. No other cases of diphtheria had occurred on that side of the village.

In the village where these fatalities took place, there occurred during one year 92 cases of diphtheria, of varying degrees of intensity. Of these 19 were fatal. The wells with which these people were supplied with water were all more or less contaminated by sewage percolation.

During this epidemic Mr. Moore observed that a blistered surface became affected by diphtheritic exudation, and in the instance of a newly-born infant a diphtheritic exudation appeared about the navel.

Croup in these districts up to 1858, when diphtheria first appeared, is described as being chiefly of a spasmodic form. Since diphtheria has appeared this form of croup has been less frequent. Inflammatory croup, when met with, has not appeared to spread by infection.

From the foregoing facts, recorded by an experienced and unprejudiced observer, I am confirmed in the belief I have always held, that true inflammatory croup (exudative tracheitis) is a distinct disease from diphtheria. When, however, diphtheria prevails in a district, no more will be seen for a time of inflammatory non-infective croup, for owing to epidemic influence, this complaint, if it occur, will most probably assume a malignant and infectious character, and present all the characters of a true diphtheroid tracheitis.

Under unfavourable hygienic conditions, such as exposure to drainage emanations, and imbibition of polluted water, I believe that tonsillitis or tracheitis, originally simply inflammatory and non-contagious, may be developed into malignant and contagious pharyngeal, laryngeal, or tracheal, diptheria.

The disease would be of the so-called sthenic or asthenic type, according to the predominance of the inflammatory or of the septic poison element in its constitution.

I am indebted to Mr. Moore for drawing my attention to Huxham's Dissertation on Diphtheria, published in 1764. What Huxham, and also Fothergill, describe as an ulcerous sore throat, "contagious, and attended with a fever of a malignant and pestilential kind, in which the blood became highly acrimonious, dissolved, and putrescent," must have been a disease very closely allied to, if not identical with, the diphtheria of the present day.

I remain, sir, yours, &c.,

JOHN C. THOROWGOOD, M.D., F.R.C.P.

## USES OF IPECACUANHA IN UTERINE HÆMORRHAGE.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—I regret to say that owing to your having placed it between the pages of another journal the enclosed letter has until now (Saturday, May 31) quite escaped my notice. I trust, however, it will not be too late for insertion, and I leave it to you to answer as you think best.

I am, &c.,

THE WRITER OF THE ARTICLE ON "IPECACUANHA."

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—Will you kindly ascertain the amount of "contraction at the brim" referred to in a leading article in your last issue which two grains of ipecacuanha is able to overcome. Also if four grains would enable the fœtal head to pass through a brim which has hitherto necessitated the use of the perforator?

AN INQUIRER.

[The above queries are evidently intended to discredit if not to ridicule, certain statements made by Dr. Carriger, of New York, respecting the action of ipecacuanha in some cases of tedious labour. But "An Inquirer" was not justified in insinuating that either we or any other sane person would be so foolish as to suppose that four grains of ipecacuanha could ever obviate the use of the perforator. We said nothing of the kind, this instrument not being so much as mentioned in the article referred to. It is true that our American *confrères* are now and then apt to indulge in a little hyperbolism, but that is no reason why "An Inquirer" should question the deliberate statement of a practitioner whose experience may be as trustworthy as his own, especially when that experience is supported by other evidence

the validity of which can scarcely be impugned. When our correspondent throws doubt on the possibility of nauseating or emetic doses of ipecacuanha relaxing a rigid os and augmenting the expulsive forces brought into action during parturition, he should remember that such means are, after all, simply carrying out a suggestion which Nature herself so often throws out during the progress of a tedious labour. We are, moreover, not alone in drawing attention to Dr. Carriger's paper, for in turning over the pages of the *Practitioner* for May we find that an epitome of that gentleman's views and practice has not been deemed unworthy of a place in the pages of that journal. In conclusion, we cannot help remarking that it would have been in better taste had our correspondent sent his criticisms under a cover instead of through the medium of a post-card.—Ed. M. P. & C.]

## Literary Notes and Gossip.

We understand that it is the intention of the *Lancet* proprietors to commence the next volume by cutting the edges. When this is done, all the leading medical journals will have emulated the example set by us so many years since. Conservative to old traditions and usages, they have, one by one, had to yield to the requirements of their patrons; and "though the circulation was so large" in former years that "it was impossible to cut the edges," the leek has had to be eaten at the risk of a gentle purge.

* * *

In an interesting biographical sketch of the life of the late Dr. George B. Wood, the eminent American physician, it is stated by his nephew, Dr. H. C. Wood, that he never, even during his student life, witnessed the complete process of parturition. According to his own statement, the nearest he ever came to seeing a child born was when he was hastily summoned, in the night, to a fashionable boarding-school, to see one of the pupils who was said to be suffering from colic. Placing his hand upon her abdomen during a paroxysm, the true condition of affairs flashed upon him, when, saying to the anxious principal, "Send for Dr. Hodge," he turned upon his heel and fled.

* * *

The death of a gentleman intimately allied with medical and scientific literature has recently occurred in Paris, in the person of Victor Masson, the well-known and esteemed medical publisher of that city. Next to Messrs. Baillière, M. Masson had the most extensive business relations with the profession throughout France; his dealings being, at all times, characterised by an intelligent appreciation of an author's work and his requirements, by liberality and strict honesty. Nor is his name unknown in this country, as many of his best books have been translated with his permission, and are now standard treatises with us. He also founded that excellent medical journal, the *Gazette Hebdomadaire*, and the well-known *Dictionnaire Encyclopœdique des Sciences Médicales* was issued by him.

* * *

A recently published French work "Les Peuples Etranges," gives some curious information about medicine among the Chinese. A regular gradation, it appears, is established among medicines; there are 120 remedies of the first order, holding the rank of sovereign in the medical empire; 120 of the second order, with rank of ministers or higher mandarins, and 125 of the third and last order, like subaltern officers.

* * *

Mrs. Gladstone has made a specialty of cottage nursing, and appears to have acquired a fair and practical knowledge of the inside of cottagers' homes. The directions given in her modest little pamphlet do not exceed the possible needs of the attendant, who has often to conjure up appliances of the most primitive description for cottage patients; and none of her suggestions appear to be of the annoying character by which nurses have been led to disturb the patient with a view to carry out some extreme principle of nursing. The "Guide" may therefore be safely placed in the hands of those for whom it is designed.

We have in type reviews of Eustace Smith's "Wasting Diseases of Infants and Children," Blyth's "Manual of Practical Chemistry," Thudichum's "Pathology of the Urine," Eulenberg and Guttman's "Pathology of the Sympathetic System of Nerves," Richardson's "Nature of Life," Bale's "Anatomy and Physiology of Man," McKendrick's "Outlines of Physiology in its Relation to Man," together with about a dozen short notices of minor works and pamphlets; all of which we hope to find space for during the present month, as we have an accumulation of other works sent by authors or publishers to elicit our opinions.

* * *

We are glad to receive a copy of the second thousand of Routh's trenchant pamphlet against the Checks to Population-mongers. Such a wholesome onslaught cannot have but good effect, and its rapid sale proves the interest excited. Wilson's "Naval Hygiene" just to hand, is much wanted, albeit a much better treatise could be written; the second edition is an improvement on the first, but there is room for the third to put Nos. I. and II. entirely in the shade.

* * *

"They do these things differently in France" was an everyday expression in the Napoleonic Era. This might now be changed to America, as Republican France is *de trop* for the time being. We are uncertain as to the number of medical journals of all shades and grades in the States, but they number something like ten times those of the United Kingdom, with a smaller reading population; and as a leading authority recently remarked, the whole might advantageously be reduced to a number represented by a unit. Still, a month rarely passes but that, mushroom-like, fresh ones crop up; and to day we have before us the first number of a new journal called the *Medical Herald*. Now Louisville is a State of about a million and a half inhabitants, with about 2,500 members of the profession, and as the existing two medical journals were not sufficient for the consuming powers of the said 2,500, a third is now started, and a fourth will appear shortly. Number one of the *Medical Herald* is as good as all number ones are; number two is usually disappointing; in number three all the promises of the initial issue are usually forgotten; we hope the new venture will discover an improved method of procedure.

* * *

During the past month there have been issued in all languages, works in medicine and collateral sciences the following:—In Anatomy, including Histology, 11; Physiology, 9; Chemistry, 5; Medicine (General Diseases), 38; Nervous System, Insanity, &c. (including Asylum Annual Reports), 31; Circulatory System, 12; Generative Organs, Urinary, &c., 17; Skin, 9; Climatology, 3; Hospital Reports (exclusive of Asylums), 8; Materia Medica and Therapeutics, 19; Surgery (general and especial), 33; Gynæcology, Obstetrics, &c., 21; Diseases of Children, 6; Ophthalmology, Otology, &c., 21; Dentistry, 2; State Medicine, Hygiene, &c., 50; Medical Jurisprudence and Toxicology, 5; Veterinary Medicine, 4. This *résume* is, of course, exclusive of pamphlets, of which over 500 were issued during the same period.

* * *

The past month has been very fertile in the production of new works and new editions in medicine and surgery. Since the publication of our last list, April 30th, we have received the following for review: "Lectures on the Diseases of Women," 4th ed., by Drs. Charles West and Mathews Duncan (London: J. and A. Churchill). "Lectures on Syphilis of the Larynx," by W. McNeill Whistler, M.D. (London: J. and A. Churchill). "The Notation Case-Book," by H. Veale, M.D. (London: Smith, Elder & Co.). "Atlas of Histology," Parts 3 & 4, by Drs. Klein and Smith (London: Smith, Elder & Co.). "Organic Chemistry," by Hugh Clements, C.E. (London: Blackie and Son). "A Manual of Midwifery," by Fancourt Barnes, M.D. (London: Smith, Elder, and Co). Godlee's "Atlas of Human Anatomy," Part IX. (London: J. and A. Churchill). "The Dissector's Guide," by D. J. Cunningham, M.D. (Edinburgh: Maclachlan and Stewart). "Student's Guide to the Practice of Midwifery," by D. L. Roberts, M.D. (London: J. and A. Churchill). "Principles and Practice of Gynæcology, by T. A. Emmett, M.D. (London: J. and A. Churchill). "Aids to Chemistry," Part III., Organic, by C. E. Armand Semple, B.A., M.B. (London: Baillière, Tindall, and Cox). "A Manual of Examination of the Eyes," by Professor Landolt; translated by Dr. Swan Burnett (London: Baillière, Tindall,

and Cox). "An Introduction to Pharmaceutical and Medical Chemistry," by J. Muter, M.A., Ph.D. (London: Baillière, Tindall, and Cox). "An Introduction to Analytical Chemistry," 2nd ed., by J. Muter, M.A., Ph.D. (London: Baillière, Tindall, and Cox). "Diseases of the Urinary Organs," by Sir Hy. Thompson, F.R.C.S. 5th ed. (London: J. and A. Churchill). "The Diseases of Live Stock," by Lloyd and Tellor, M.D. (London: Baillière, Tindall, and Cox). "Manual of Naval Hygiene," by J. Wilson, M.D. 2nd ed. (London: Baillière, Tindall, and Cox).

* * *

PAMPHLETS.—The following have been received since the publication of our last list, April 30th:—"The Treatment of Pott's Disease," by F. R. Fisher, F.R.C.S. (London: J. and A. Churchill). "Réunion Primitive," par le Dr. Azam (Bordeaux: Feret et Fils). "The Difficulty and Dangers of Battey's Operation," by G. J. Engelmann, M.D. (Philadelphia: Collins). "The Metropolis Water Supply and Sewer Questions Answered," by G. P. Pond. "Capital Punishment," by James Ellis. (London: Allen). "The Climate of Davos," by A. C. Pope, M.D. (London: Gould). "Annual Report of Mortality from Zymotic Diseases in Leicester," by W. Johnston, M.D. "Clinical Remarks on Gleet," by J. C. Ogilvie Will, M.D. (London: J. and A. Churchill).

## THE ROYAL MEDICAL BENEVOLENT COLLEGE.

The Annual General Meeting of the Governors of the Medical Benevolent College was held on Thursday last, the 29th ult., at the offices in Soho Square. There was a very full meeting of Governors interested in the charities who met to consider the system of electing the beneficiaries of the College, and a very decisive vote was taken adverse to the principle of voting in connection with the College.

Dr. C. G. Jonson, the chairman of the Council, presided, and there were present Sir Rutherford Alcock, K.C.B., Dr. Broadbent, Dr. Sieveking, Dr. Hugh Macpherson, Percy Wyndham, M.P., Messrs. John Birkett, Erasmus Wilson, Ernest Hart, N. Clifton, J. France, F. Manby, Jabez Hogg, J. W. Mason, Dr. Joseph Rogers, Dr. McIntyre, Dr. Heywood Smith, Dr. Hawkesley, Dr. Lavies, Dr. Day, Dr. Langmore, Dr. Harry Leach, Dr. Harcourt, Dr. Hoar, Dr. Bryant, Walter Lears, Dr. White, Messrs. Thos. Bryant, Fuller, Streathfield, Spencer Watson, Mocatta, &c., &c., together with number of lady governors who were present to testify to the ladies' interest in the question. Letters of apology were announced from Lord Lichfield, who was to have moved the first resolution, but was prevented by illness, but desired to express a strong opinion on the subject, also from Sir Wm. Gull, Sir Thomas Watson, Dr. M. de Bartolomé and various others.

After the reading of the report Mr. Hogg took exception to certain words in reference to himself, and Mr. Mason objected to its adoption, lest it should be thought that the meeting endorsed the views expressed by the Council on the question of the voting system. It was ultimately agreed that it should be formally received and entered on the minutes. After the formal election of members of the Council and declaration of the poll, Dr. Hare rose, and, in a very argumentative, and able, and conclusive speech, moved—

"That the Council be instructed to frame a bye-law to the following effect:—

> (1) That a Committee of Examination be appointed by the Council, whose duty it shall be in the month of April of each year (*a*) to carefully investigate the relative claims of those who have been admitted by the Council as candidates, severally for Pensionerships and Foundation Scholarships; (*b*) To select of each class a number of names exactly equal to the number of vacancies in each class, the names selected being those of the respective candidates who, in the opinion of the Committee, best deserve election; (*c*) To send to the Council the names of the candidates so selected.
>
> (2) That the Council, with each ballotting paper made out as at present—and, of course, leaving to every Governor the absolute right of voting for any candidate as he or she may please—do inclose a slip of paper on which shall be printed the following words, or words to the following effect: 'The Committee of Examination recommend the following cases as being in their opinion the most urgent,' after which shall be printed the names of the candidates for Pensionerships and Foundation Scholarships selected as above by the Committee of Examination."

This was seconded by Mr. Ernest Hart, who argued that the charity would be benefited by the change, which was necessary alike for the advantage of the subscribers and the candidates who expended large sums of money needlessly in begging for support, a large majority of the Governors having declared that it was time to abolish a system that was cruel, mischievous, and unjust.

Mr. Hird, in a temperate speech, supported the views expressed by the Council in their report. He was followed in the same order by Mr. France, and the resolution was then put to the meeting and carried by a very large majority.

A vote of thanks to the chairman brought the meeting to a close.

## THE SELECT COMMITTEE ON THE MEDICAL BILL

WILL be appointed on the 9th of June, and has been already nominated by Lord George Hamilton. It consists of—

*English Members*—Messrs. Forster, Heygate, Goldney, Simon, Lord George Hamilton and Wheelhouse, Dr. Lush, and Mr. Dalrymple.

*Scotch Members*—Drs. Cameron and Playfair, Sir Trevor Lawrence, and Mr. Arthur Mills.

*Irish Members*—Mr. Errington, Mr. Mitchell Henry, and Mr. David Plunket.

The proposals for Medical Reform which are already before the House are represented by Messrs. Mills and Goldney, Dr. Lush, Sir Trevor Lawrence, Mr. Errington, and Lord George Hamilton. The Scotch obstruction has its exponents in Dr. Lyon Playfair and Dr. Cameron: and the quacks and herbalists in Mr. Sergeant Simon.

We consider the proposed Committee an excellent selection, and creditable to Lord George Hamilton's judgment. Its members are, as a rule, progressive men possessing a special knowledge of the subject, and we hail with unqualified satisfaction the promise afforded by the constitution of the tribunal that reform is near at hand. It may be taken for granted that reconstitution of the General Medical Council is decided upon, possibly by the method of direct representation, for there does not seem to be a man on the proposed Committee likely to stand up in its defence. We are not without hope that in the two months of the Session still remaining a decision may be arrived at and passed into law. If not, there will at least have been a great stride taken towards medical reform which will make its attainment almost certain next year.

## THE ANNUAL MEETING AT THE IRISH COLLEGE OF SURGEONS

For the election of the Council of the College for the ensuing year, and the yearly assemblies of the Irish Medical Association, and of the Royal Medical Benevolent Fund Society of Ireland, took place on Monday last—being the first Monday in June. The day's proceedings opened with the breakfast of the Irish Medical Association at the Shelborne Hotel, at which the Chair was occupied by the President, Dr. Robt. MacDonnell, and about sixty gentlemen sat down. At noon the Association reassembled at the College of Surgeons, and proceeded to receive the Report of the Council, and to debate the resolutions submitted for adoption. The meeting was largely and influentially attended, and was in all respects successful—the proceedings of the Council and Executive Committee being warmly approved.

At one o'clock the chair of the Royal College of Surgeons was taken, in accordance with the Charter, by the President, Mr. Smyly, and the minutes having been read, the ballot for president, vice-president, and council,

was opened. In addition to the vacated seats for which outgoing councillors offered themselves for re-election, there was an unfilled seat vacated by the recent appointment of Mr. Croly as an examiner. For admission to the Council new candidates offered themselves, Messrs. Baker, Wheeler, Swanzy, Bennett, and Curtis, and Drs. Roe and Meldon.

On the declaration of the poll, it appeared that Messrs. Wheeler and Swanzy had obtained seats in addition to the re-elected councillors, Mr. Croly going out. The election resulted in a tie between the three candidates lowest on the poll.

The Royal Medical Benevolent Fund Society also held its annual meeting at the College, and the day's proceedings concluded with the dinner of the Irish Medical Association.

We hope to publish in abstract next week the proceedings of these Societies.

## NOTICES TO CORRESPONDENTS.

☞ CORRESPONDENTS requiring a reply in this column are particularly requested to make use of a *distinctive signature or initials*, and avoid the practice of signing themselves "Reader," "Subscriber," "Old Subscriber," &c. Much confusion will be spared by attention to this rule.

READING CASES.—Cloth board cases, gilt-lettered, containing 26 strings for holding each volume of the MEDICAL PRESS AND CIRCULAR, can now be had at either office of this Journal, price 2s. 6d. The postal regulations not allowing the Journal to be stitched, these cases will be found very useful to keep each weekly number intact, clean, and flat after it has passed through the post.

MR. J. WILSON.—Full particulars will be found in our "Students' Number," Sept. 18, 1878. There are not likely to be many changes of moment for the next session.

PHYSIOLOGIST.—Messrs. Corbyn, Stacey, & Co. manufacture a reliable preparation of the drug.

MR. J. ADAMS.—"Case of Psoas Abscess with Disease of one of the Lumbar Vertebræ" received.

### MEDICAL COMMUNICATIONS TO LAY PAPERS.

OUR attention is called to the publication in the *Limerick Chronicle* of May 22 of cases of "Excision and of Perineal Section," which are stated to have occurred in the Limerick Union Hospital "under the care of Dr. T. O'D. Russell. The cases are not quoted from any professional periodical, and we are therefore bound to assume that they were communicated by Dr. Russell to the *Limerick Chronicle*, and our opinion on the propriety of doing so is asked.

We give it without hesitation.

Apart from the questionable taste of printing in a public paper minute details about the nature of a fistula of the perineum arising from "gonorrhœa" and involving the "scrotum," the publication of medico-chirurgical contributions in the lay papers is unusual, most objectionable, and altogether improper from a professional point of view. It cannot be conceived that such matter is published by the *Limerick Chronicle* as of interest to the general public, and we must, therefore, regard it as a simple advertisement of Dr. Russell's skill which differs nothing from the other advertisements of pseudo-doctors, except in being published in a different part of the paper, and probably not paid for in money.

OBSTETRICAL SOCIETY OF LONDON.—To-day (Wednesday), at 8 p.m., Specimens: Midwifery Forceps, by Dr. Thorburn; "Abdominal Tumour removed during Pregnancy," by Mr. Knowsley Thornton; "Tubal Gestation," by Mr. Alban Doran; the adjourned discussion on the "Use of the Forceps and its Alternatives in Lingering Labour."

DR. SEMPLE.—Your letter is unavoidably postponed until our next.

QUERY.—There does not appear to us sufficient demand for professional appointments for ladies to justify the publication of a list of vacant appointments for them.

THE SALE OF SPECIMENS.—A few weeks back there was a correspondence in a contemporary in which one or two of the writers felt themselves dreadfully shocked at the sale of specimens of "drunkards' liver" and similar subjects of pathological interest. The Editor of the *Philadelphia Medical Times* turns this to good account as a reminder to defaulters thus: "These correspondents are shocked by this public barter of human viscera, but we should like to see the custom extended. We have seen specimens of 'sclerosis of cheek' on the part of patients trying to dodge the payment of bills, which, properly mounted, could be made most effective as warnings to young and inexperienced doctors inclined to trustfulness."

DR. H. D.—The letter has been addressed and posted to the proper quarter.

DR. R. H. will find the subject treated in the April numbers.

THE LEGION OF HONOUR.—We are asked to mention, as evidence of the supremacy of British industry, that, in addition to the Gold Medal (L'Academie Nationale) and the Silver Medal awarded to Messrs. John Brinsmead & Sons, the founder of the firm has been created Chevalier of the Legion of Honour, this being the highest award to any British Pianoforte Manufacturer.

DR. TILT'S paper, "On Uterine Inflammation at the Change of Life," received, and will appear, if possible, in our next.

### BOGUS DEGREES.

*To the Editor of the* MEDICAL PRESS AND CIRCULAR.

SIR,—I thank you for your kind attention to my last letter in your "Notices to Correspondents. Would you oblige me by answering the following questions:—

What is the meaning of a "Bogus Degree?" My M.D., as I told you, came direct from one of the Medical Colleges in New York. I observe that several Scotch clergymen have got D.D.'s from American colleges, and when any of such publish one of their sermons, or any book written by them, I find they have D.D. on their title-page, and in our Scotch newspapers also.

Ought not medical men to have the same privilege given them? I mean those who have got American M.D.'s.

The point I am drawing your attention to: Is an M.D., when conferred and sent direct to an already qualified medical man, of any use? Can I put M.D. after my name in the local directory?

Yours, &c.,

X. Y. Z.

[*** The word "Bogus" is, we believe, of American origin, signifying "bought," as distinguished from an educational qualification obtained in the regular legal form.

The danger of "Bogus Degrees" does not arise when they are conferred upon an already legally qualified practitioner; but because what he can obtain the most disreputable quack can purchase for a consideration, without the remotest knowledge either educational or medical. With the degree of D.D. the matter is altogether different; the snob who plies his trade six days and rants religion in his village Bethel, or at the corner of the street on the Sunday, can call himself a "Rev." or "Rev. Doctor," and the law takes no cognisance thereof, he not being engaged in the "cure of bodies," and, therefore, not deceiving the public to their hurt. In one respect only are the holders of Bogus Degrees alike—the M.D. cannot gain access to the "Medical Register," nor the D.D. to the "Clergy List." The one cannot legally sign a death certificate, the other cannot legally unite persons in marriage.

Our correspondent's Scotch qualifications are quite sufficient for all purposes, and if he were anxious to have the privilege of signing "M.D." after his name he could have obtained the legal permit in his own own country; "St. Andrew's" would doubtless have been glad of the money.

With reference to the last question, our correspondent would doubtless gain access for his "M.D." to any book or print, except official organs, provided he placed after those magic initials "New York,"]

ABBATOIR means a slaughter-house.

THE lectures at the Royal College of Surgeons of England will be resumed to-day (Wednesday), June 4, by Mr. B. Lowne, who will deliver on this day, and on the 6th and 8th of this month, three lectures on the Physiology of Sensation; Mr. Jonathan Hutchinson will conclude the course for the present year by delivering six lectures on the Influence of the Nervous System in the Production of Disease, chiefly with reference to the Skin, Eye, and Joints.

### VACANCIES.

London School of Medicine for Women.—Lectureship on Materia Medica. Applications to the Dean before June 12. (See Advt.)

Manchester, Owens College.—Demonstrator and Assistant Lecturer on Anatomy. Salary, £150. Applications before June 13. (See Advt.)

### APPOINTMENTS.

BUTLIN, H. T., F.R.C.S., Demonstrator of Surgery to St. Bartholomew's Hospital.

LOVEROCK, R. G., L.K.Q.C.P.I., L.R.C.S.I., Medical Officer, Medical Officer of Health, &c., for the Ballyjamesduff Dispensary District of the Oldcastle Union, co. Meath.

MACDOUGALL, A. R., M.B., C.M., M.R.C.S., House Surgeon to the Royal Hospital for Sick Children, Edinburgh.

RUDKIN, G. M., L.K.Q.C.P.I., Visiting Surgeon to Dunnington House Private Asylum, near York.

SCORESBY-JACKSON, T., M.D., M.R.C.S.E., Medical Officer for the Claines District of the Droitwich Union.

SELLS, C. J., L.R.C.P.L., M.R.C.S.E., Medical Officer to Abbotts Hospital, Guildford.

SHEA, J., M.D., Physician to the Royal Berks Hospital, Reading.

TAYLOR, G., M.B., C.M., Medical Officer for the Borrowby District of the Northallerton Union.

WINGFIELD, Mr. J. L., Registrar to the Adelaide Hospital, Dublin.

## Deaths.

FROST.—On May 27, at Newcastle-on-Tyne, Samuel M. Frost, M.D., aged 88.

HIRD.—On May 20, at Bramshott, Hants, James Hird, M.R.C.S.E., F.S.A., aged 38.

LEESE.—On May 19, at Camden Road, George Macartney Leese, M.R.C.S.E., aged 68.

MACNAB.—On May 21, at Skipton, William MacNab, L.R.C.P.Ed., aged 45.

POLLARD.—On May 20, at 55 Milnrow Road, Shaw, near Oldham, John Henry Pollard, L.S.A.L., aged 34.

SMITH.—On May 19, at Clevedon, Alfred Smith, M.R.C.S.E., aged 65.

SMITH.—On May 26, at Forfar, Andrew Robertson Smith, L.R.C.S.Ed., late Staff Surgeon-Major, Army.

TOMS.—On May 27, at Plymouth, Philip Toms, Ext. L.R.C.P.L., F.R.C.S.E., Surgeon R.N., aged 79.

# IRISH POOR-LAW INTELLIGENCE.

## ROYAL MEDICAL BENEVOLENT FUND SOCIETY OF IRELAND.

### BELFAST BRANCH.

THE Committee of this Society held their quarterly meeting in the Chambers, 33 High Street, on the 7th ult.

On the motion of Dr. Higginson, Bangor, the chair was taken by Dr. Browne, J.P., R.N.

Dr. Wilberforce Arnold (Honorary Secretary), read the minutes of last meeting, which were confirmed.

The Hon. Treasurer then made his financial statement, and added that he had to close his accounts early in this month. He would feel obliged if subscribers who had not yet paid their subscriptions would kindly send them to him at once. The reports from honorary collectors were then received.

A Member—Before passing from the subject of finance I would desire to give a word of friendly counsel to any medical man, if such there be, who, having the means to do so, denies himself the privilege of contributing to the funds of this royal society. I would say to such a man, look at the roll of the illustrious living men in our profession ; I would say, further, look to the roll of the illustrious dead who lived during the period of this society's benevolent operations, and point to a single man who was not a member and a generous contributor to the funds of this institution. Such a man is not to be found. I agree with the great and good William Stokes, who at the annual meeting of the Royal College of Surgeons in the year 1848, said, when speaking of the membership of this Society, that he expected "every year to see the signatures to so honourable a roll increase."

The time being near at which the funds at the disposal of the present society are annually distributed at the meeting of the general society in Dublin, several applications were submitted for the consideration and disposal of the meeting in order to being transmitted to the parent committee for placing on the roll for grants in sums proportioned to the exigencies and urgency of each case. After careful consideration, all the cases which came before the committee were approved of as suitable to receive assistance. All of them were the cases of widows of deceased physicians or surgeons. It was remarked that no application for aid from any medical man within the bounds of this branch had been received for many years, all medical gentlemen having relation to this branch being aid givers, and none aid receivers.

The Hon. Secretary intimated that the committee of the parent society in Dublin were exceedingly anxious to procure for preservation copies of the annual reports of the Royal Medical Benevolent Fund Society of Ireland from the years 1843 to 1850 inclusive, as also those of the years 1860, 1861, and 1873. Bearing in mind the noble and purely benevolent aims of the society, the hon. secretary was sure when this wish for copies of the old reports became known to their professional brethren who took an interest in the society in its early struggles, and would, therefore, not unlikely have these documents within their reach, they would gladly respond to the invitation of the Dublin committee, and forward these interesting papers either to the committee of this branch or directly to Dublin.

Dr. Moore, R.H.A., having been called to the second chair,

Dr. M'Gee moved that the best thanks of this meeting are due, and are hereby tendered, to Dr. Browne, J.P., R.N., for his proper and dignified conduct in the chair, and for the lively interest he had so long maintained in promoting the best interests of the Royal Medical Benevolent Fund Society of Ireland.

Dr. Higginson seconded the resolution, which was passed amid applause.

The chairman conveyed the resolution, and the meeting separated.

## NAAS UNION.

### LEAVE OF ABSENCE.

MR. FENELON said as the subject of leave of absence to one of their medical officers was now before the board, he wished to call attention to the return he had moved for that day month with respect to the leave of absence to the doctors, and the cost of their substitutes. By the return, which the clerk had just now handed him, it appeared the medical officer of Kildare dispensary was granted six weeks' leave of absence in 1876 through ill health, and five weeks' leave of absence in June 1877, on the occasion of his marriage. The medical officer of the Newbridge dispensary was granted three weeks' leave of absence in 1876, one week in 1877, and two weeks, afterwards renewed for two more weeks, in 1879. The medical officer of the Rathmore dispensary was granted four weeks' leave of absence in 1876, and four weeks' in 1879. The medical officer of the Clane

dispensary was granted four weeks' leave of absence in 1878. The medical officer of the Blessington dispensary was granted eight weeks' leave of absence in 1878, with a renewal of four weeks'; and the medical officer of the Robertstown dispensary was granted four weeks' leave of absence in 1878. His object in moving for this return was to elicit an expression, not from any member individually, but from the board generally, as to the expediency of adopting some rule by which leave of absence would be regulated for the future. What he (Mr. Fenelon) would suggest was that where any medical officer applied for leave of absence for recreation, pleasure, or any other business, he should be compelled to pay his own substitute; but, on the other hand, if a medical officer wanted leave of absence through ill health or some disease caught in the discharge of his duty, then it would be only fair to pay his substitute the whole time he was ill. The times were at present very depressed, and the outside public would look to the guardians to be as economical as possible. For the last three years a sum of £141 15s. was paid for substitutes for medical officers. It may seem a small sum, but small or large it was £141 15s. In conclusion, Mr. Fenelon said he was not going to move any resolution, but would be satisfied with an expression of opinion from the board.

The Clerk said the question of leave of absence was one which would have to be settled by dispensary committees.

Mr. Mansfield concurred, observing that when the matter came before the board they had only to say whether they would sanction it or not.

The Chairman said he clearly perceived what Mr. Fenelon's views were, and he agreed with him in so far as saying that when a medical men went away for his own convenience or pleasure he ought to pay his substitute; but if he went away on ill health, then it would be only right that the committee should pay his substitute.

Mr. Fenelon said he saw the other day where the Local Government Board stated that such a resolution would not be binding on a subsequent board. He was much better pleased with what had fallen from the chairman than any resolution.

In the course of further discussion, a guardian observed that a doctor might sometimes require rest.

Mr. Fenelon said he could quite understand a doctor being fatigued after a serious epidemic or something of that kind. He would say then he should have recreation and pay for it.

## DROGHEDA UNION.

Mr. McKenna, in a lengthened speech, moved that the salaries of the medical officers of the union should be reduced ten per cent. as the times were so bad.

Mr. Daly, P.L.G., in a very able speech observed that it was in bad times the people suffered most from sickness, consequently the doctor's duties were doubled, and therefore it would be *very unjust to reduce* their salaries, Much to the credit of this respectable board, no one seconded the motion, which consequently fell to the ground.

## CASE ON BEHALF OF THE PRISON SURGEONS OF IRELAND, FOR THE OPINION OF COUNSEL.

A question of great importance to the members of the medical profession in Ireland, and coming home directly to the status of those members of the profession who are, or consider themselves, prison surgeons, has arisen, on which the opinion of counsel is desired.

The question involved turns upon the true meaning or proper construction of a few Acts of Parliament, passed from the year 1826 to the year 1877, to which the attention of counsel is requested as referred to in the following case:—

An Association was formed some years ago of county infirmary and gaol surgeons, to look after and protect their rights and interests, and Dr. Brunker, of Dundalk, for many years surgeon of the County of Louth Infirmary, was appointed honorary secretary of that Association.

By 7 Geo. IV., c. 74, sec. 72, passed 31st May, 1826, the Grand Jury was authorised to appoint and present salaries for the medical officers of prisons, such person to be either a member of one of the Royal Colleges of Surgeons, or a member or licentiate of one of the Royal Colleges of Physicians.

The next Act of Parliament bearing on the question is the Grand Jury Act, 6 and 7 Wm. IV., cap. 116, passed 20th August, 1836.

By sec. 86 of that Act, the Grand Jury are enabled to present to each assizes any sum not exceeding £47, to be paid to the surgeon of the infirmary, provided he gave attendance at the gaol, if within five miles, without further payment.

Schedule S. to that Act gives table of salaries, &c.

Next comes the Act 19 and 20 Vic., cap. 68, passed 21st July, 1856, entitled "an Act to further amend the laws relating to prisons in Ireland." Years ago by the 18th and 19th sections of that Act, the appointment of Prison surgeons was taken from the Grand Jury, and given to the board of superintendence of each gaol.

It was under this Act that the surgeons to the gaols have ever since been appointed, and their appointment was not merely incidental to their being infirmary surgeons, as seems to be supposed by Mr. Bourke, in his circular of the 3rd May, 1879, hereinafter referred to.

The governors of the infirmary elected the infirmary surgeon, and the board of superintendence, which often consisted of the same individuals, usually, but not necessarily, elected the gaol surgeon.

The appointments, however, were separate and distinct, and made by totally different bodies.

It was obviously convenient to have the same surgeon filling both offices, but he might have been elected to one and rejected for the other.

The next Act to which the attention of counsel is requested is the Act 36 and 37 Vic., c. 51, passed 28th July, 1873, and entitled "an Act to amend the law relating to the superannuation of prison officers in Ireland." This is a very short Act containing five sections. The 3rd section repeals the Act 6 and 7 Wm. IV., cap. 116, sec. 125; 3 and 4 Vic., cap. 44, sec. 5; and 19 and 20 Vic., cap. 68, sec. 23.

The two first dealt with the superannuation of turnkeys and matrons of prisons. The last Act extended the provisions for superannuation to all other officers of prisons, medical officers included, whether such medical officers act in virtue of their office as surgeon of the county infirmary or by direct appointment as medical officer of the gaol.

The 4th section of the Act 36 and 37 Vic., cap. 51, enables the Grand Jury, in certain cases to grant a superannuation annuity not exceeding two-thirds of his salary and emoluments.

Such was the state of the statute law when the General Prisons (Ireland) Act, 1877, was passed, 16th August, 1877, 40 and 41 Vic., cap. 49, which bears directly upon the question being submitted to counsel.

The especial attention of counsel is requested to the 27th section of this Act. It provides that the officers attached to prisons on April, 1878, shall hold their offices by the same tenure, and upon like terms and conditions, as if the Act had not passed. This clause in the Bill was considered by the profession as giving security to existing officers.

The section further provided that after the 1st April, 1878, no surgeon of an infirmary was to be bound (by 6 and 7 Wm. IV., c. 116, sec. 86), in order to get his presentment to attend the gaol gratuitously.

This was introduced after a correspondence with the attorney-general deliberately and designedly.

By the 28th section, from and after April 1st, 1878, all medical officers were to be appointed by the Lord Lieutenant.

Sections 52 and 53 impose very considerable additional duties and very grave responsibilities on the medical officers, which make the post one involving immensely greater time and labour, as well as anxiety, than under the old Acts. The amount of daily written reports is alone a serious duty, in fact, if anything go wrong, the surgeon is the responsible party. The rules which the prisons board have the power of making may increase this indefinitely. By a circular from the prisons board dated 30th November, 1877, the medical officers of prisons were required to enter at once in the new and increased system of duties.

A deputation of the prison surgeons on the 15th April, 1878, waited on the prisons board, and were assured by the chairman that the surgeons' salaries was under consideration, in order to be submitted to the treasury, but no reference made nor intimation given as to their not being officers any longer.

Various communications since passed between the board and the surgeons in which they are directed, ordered, and addressed as the medical officers of the prison.

March 28th, 1879.—In answer to a question by Mr. Macartney in the House of Commons, Sir Selwyn Ibbetson stated that a scheme had been drawn up for the payment of the medical officers, and that the salaries would be paid from the date of the transfer of the prisons from the county to the Government authorities.

On the 3rd of May, 1879, a circular signed Charles Bourke, Chairman of the General Prisons Board, Dublin Castle, was addressed to all the medical officers of prisons stating—that the opinion of the law adviser having been taken as to the precise position those officers were to be regarded as now occupying in relation to the prison service, and *that that opinion* was to the effect that the *surgeons in question were no longer prison officers*, and could only become so in the event of their receiving that appointment from his Grace the Lord Lieutenant.

The circular then proceeds to inform the parties that their office was vacant, and that his Grace would in due course advertise for properly qualified candidates, &c. but that they could apply to be re-appointed, and would in any case be paid from the 1st April, 1877, according to the new scale of salaries—not communicated.

May 9th, 1879.—The surgeons having held a meeting in the Royal College of Surgeons, sent a reply to the chairman of the prisons board.

The opinion of the law adviser referred to in the letter has not been sent, but in the case of Dr. Boxwell, who in October, 1878, had resigded, in consequence of failing health. the following opinion of the law adviser was communicated, "That Dr. B. is not legally entitled to claim any salary or remuneration after April 1st, 1878. The appointment of medical officer of prisons (40 and 41 Vic., c. 49) vested and still vests with the Lord Lieutenant, and the rate of remuneration must be fixed by the Lord Lieutenant with the consent of the treasury (27th clause Prisons Act). If Dr. B. thought fit to continue to act as medical officer without being appointed, he cannot legally claim any salary. It will be for the prisons board to say whether under all the circumstances they woud recommend his Grace to advise any sum to be given."

February 14th, 1879.—Mr. Charles Hemphill, Q.C., gave a not dissimilar opinion, though not free from doubt.

If these views be correct, then the effect of the 27th section was not to afford any protection whatever to the then existing officers, though it appears to have been specially framed for that object and no other, and was supposed by the profession to effect that object.

The prison surgeons contend strongly for very different views—

1. *They were appointed to the gaols quite separately from he county infirmaries by the 19th and 20th Vic., c. 68.* Those appointments were valid on the 1st April, 1878, and therefore they were then "officers *attached to the prisons*"—a very wide expression.

As such they required no *re*-appointment, but were entitled to continue to hold office until they resign, or are dismissed for cause. They conceive themselves medical officers despite any act of the Lord Lieutenant. The question of *salaries* is quite distinct, and does not really touch the real question.

2. They conceive the 28th section to apply only to new appointments made after April 1st, 1878, *in case of vacancies*. If it were not so then the 27th section would have no meaning or effect at all.

3. The prisons board have from the first recognised them as medical officers, ordered their duties—often very arbitrarily—promised them salaries, and adopted them by their acts and correspondence while it suited their convenience. A question now arises: Is it not too late legally to repudiate them?

Even if the legal interpretation of the 27th section does not protect the holders of office, it was evidently meant and supposed to do so, and it is presumed it would have been at once amended if it were known not to do, and therefore it is a clear breach of good faith to render it nugatory.

4. The surgeons were, and are aware that the question of the amount of salaries was left wholly to the prisons board and treasury, and they rest their claim to such mainly on the *vastly increased duties and responsibilities*, imposed on them by the new Act, of which the prisons board is fully aware. It is not correct to *say that* under the *old Act* they were bound to perform these new duties gratuitously to April, 1878. They were only bound to perform the duties imposed by the old Act—a very different matter.

Counsel will be good enough to advise querists on the following points:—

1. Are the gaol surgeons holding office April 1st, 1878, entitled to continue to hold their places under the 27th section without re-appointment.
2. Can the Lord Lieutenant declare any such post now vacant.
3. In what form can tnis question be most quickly and simply tried? Can the appointment of new surgeons be prevented by an injunction or mandamus or otherwise? or must querists await an appointment, and try the question by *quo warranto*? or what course would counsel suggest?

I have read and considered the sections of the several statutes bearing upon the questions submitted to me. I am of opinion that medical officers of prisons in Ireland, duly appointed by the respective boards of superintendence in pursuance to the 19th and 20th Vic., c. 68, s. 18, or by the Grand Jury before that Act, are continued in office by the 27th section of the 40th and 41st Vic., c. 49; and I am of opinion that this is so in the case of those gentlemen who held the appointment to county infirmaries. This opinion does not, I conceive, conflict with that which deals with the case of a gentleman who gave his medical services to the prison solely by reason of his being surgeon to the infirmary pursuant to sec. 86 of the 5th and 6th Wm. IV., c. 116. But as regards the question before me, that is, the status of medical officers of prisons duly appointed, I am of opinion that the Lord Lieutenant has not power to declare their offices vacant. A mandamus lies to restore to an office any officers illegally removed, but I think it will on the whole be wisest to wait until there be an intrusion into the office, and then proceed *quo warranto*.

JOHN O'HAGAN,

22 Upper Fitzwilliam Street.
May 15th, 1879.

## MOUNTMELLICK UNION.

### FEES FOR EXAMINING DANGEROUS LUNATICS.

A letter was received from Dr. Tabuteau inquiring why he had not received a fee of £2 for examining a dangerous lunatic, for which the magistrates at Portarlington Petty Session, Mr. Kirkpatrick and Mr. Thomas Arlington, R.M. had certified some time ago.

The clerk said the board had refused to pay Dr. Tabuteau more than £1.

Mr. W. H. Cobbe—Let him process the board; that is all he can do.

Mr. Gaze—There were two processes at the last sessions, and there were decrees against the board in both.

Mr. Thomas Cobbe thought that any doctor would make these examinations for £1.

The Chairman—I don't know the circumstances of this case, whether there was a second visit.

The Clerk—I believe there was no second visit, but he had to go to Bishopswood.

The Chairman thought that £1 would have been sufficient remuneration; but as the magistrates have certified for £2 he thought they should pay the amount.

The Clerk thought it right to inform the board that he heard it was Dr. Tabuteau's intention to fight the matter. He (Dr. Tabuteau) would apply for a mandamus, and anyone who voted against paying the £2 would have to pay the costs.

Mr. Thomas Cobbe said that if the magistrates went on granting certificates for such large amounts the guardians should grant out-door relief to every one who applied for it. The magistrates were showing them an example of wrong-doing.

Mr. J. Dunne, jun., thought £2 was too much, but then they had no right to refuse to pay it when the magistrates had certified for it.

The Chairman—Is it the order of the board that it be paid?

Mr. W. H. Cobbe—We protest against it, and we won't vote.

The Chairman—The amount to be paid under protest. Will that do?

An order was then made for the payment of the amount.

## THE LOCAL GOVERNMENT BOARD AS TO REDUCTION OF SALARIES.

THE following letter has been addressed by the Local Government Board to the Dundalk guardians in reference to their proposal to reduce the salaries of all union officers :—

Local Government Board, Dublin,
May 23rd, 1879.

Sir,—I am directed by the Local Government Board for Ireland to acquaint you for the information of the board of guardians of Dundalk union, that the Board have given the resolution of the 19th inst, relating to the proposed reduction in the officers' salaries, their careful consideration, and have had the advantage of an interview with three of the members of the board of guardians, whose views and arguments on the subject have received due attention.

It appears to the Local Government Board that on the occurrence of any vacancy in an office it would be a legitimate question for the guardians to consider whether the salary of such office might not properly be altered and reduced, but the board think that when a person engages in the service of the guardians at a certain salary, and that the terms of his appointment are that he shall be paid such a salary, it is not reasonable or just to reduce that rate of payment on such grounds as those now assigned by the guardians, while he satisfactorily discharges the duties which he undertook to perform.

The board find, however, that this is the course which the guardians propose to adopt in several instances, and that in the case of six of the workhouses, viz., the master, schoolmaster, schoolmistress, infirmary nurse, fever hospital nurse, and porter, they wish to reduce the salaries which are not by any means exorbitant, to a lower rate than at which those persons were elected.

With reference to other officers whose salaries have been raised after many years' efficient service, the board are of opinion that it would be ungenerous to deprive them of part of the advantages so gained while their duties remain unchanged, and that such a proceeding would tend to produce discontent, and a feeling of insecurity in regard to their position which would have an ungenerous effect on the administration of the affairs of the union, as it would discourage zeal and attention on the part of the officers in the performance of their duties. The board observe that in two instances the persons whose salaries the guardians desire to reduce are the medical officer of the workhouse, who has acted in that capacity for about thirty-seven years, and the clerk of the union, who has been in office for about twenty-nine years, and it would certainly appear reasonable that the length of service of these officers should render them deserving of consideration in regard to the continuance of their existing emoluments.

With respect to the poor-rate collectors, whose remuneration varies every year according to the amounts of the warrants, the board will not raise any objection to the guardians reconsidering their poundage when the next rate is made, and as mentioned in my letter of the 26th ult., it is open to the guardians to propose a reduction of salary in any other instance in which there has been a change in the circumstances under which it has been fixed or increased, but for the reasons given above, the board feel it necessary to withhold their sanction to a general reduction of the officers salaries in the manner proposed, which, while it would effect a saving of less than one farthing in the pound on the reduction of the union, would operate unjustly on several of the persons affected thereby.

By order of the Board,
B. BANKS, Secretary.

## REPORT OF HEALTH OF DUBLIN AND SUBURBS FOR WEEK ENDING MAY 24, 1879.

| | |
|---|---|
| Total registered deaths in Dublin and suburbs* ... | 211 |
| Ten years average of same week ... ... ... | 152 |
| Decrease of mortality below average ... ... ... | 59 |
| 10 weeks' ratio of deaths Rathmines | 29·2 per 1,000 |
| " " " Donnybrook† | 29·0 " |
| " " " Blackrock | 17·3 " |
| " " " Kingstown | 24·4 " |
| " " Entire Dublin District | 34·9 " |
| COMPARATIVE RATIOS—London ... | 21·6 " |
| " " Glasgow ... | 21·0 " |
| " " Edinburgh ... | 23·5 " |

* District extends over 10,050 acres, and contains 314,666 persons.

† This district includes City of Dublin and Incurable Hospitals.

Forty deaths from zymotic diseases were registered, being 6 under the number in the preceding week, but 13 over the average for the 21st week of the last ten years: they comprise nine from fever (3 typhus, 5 typhoid, and 1 simple continued fever), 8 from small-pox, 5 from scarlatina, 4 each from measles and croup, 2 each from diphtheria and diarrhœa, 1 from erysipelas, &c.

There were not many cases of measles, scarlatina, typhus, typhoid fever, or pneumonia admitted into the principal Dublin Hospitals during the week.

Three accidental deaths were registered.

### REMARKS ON THE ROUTINE USE OF THE OPHTHALMOSCOPE IN CEREBRAL DISEASE.

By J. HUGHLINGS JACKSON, M.D., F.R.S.,

Physician to the Hospital for the Epileptic and Paralysed, and to the London Hospital.

(*Continued from page* 441.)

From a scientific point of view the necessity of not overlooking a decided pathological condition is obvious. Then it is of some importance in a case of severe cerebral disease to be able to tell the patient's friends that sight may become impaired or be lost, for this prediction, when verified, will satisfy them that we have not misunderstood the nature of the case in its early stage. There are few cases on which such different opinions are given as those of cerebral tumour and other kinds of coarse disease." They often begin by symptoms which are not specially nervous, although really dependent on brain disease. The early symptoms are often put down to stomach derangement, to over-work, or to some other minor cause. The patient is naturally very anxious to put forward the view that his severe headache, vomiting, &c., are owing only to some temporary derangement, and mostly accuses the liver. He may urge that his illness began by "attacks of bile." I have known the friends of a patient lament bitterly the different opinions that have been given at the early and late stages of a case of cerebral tumour. Every practitioner will know of cases of young men who have first severe headache, and, perhaps, urgent vomiting, and scarcely other symptoms, and who occasionally for weeks, or even for months, remain able to do their work somehow, especially if, as occasionally happens, the severe pain in the head only comes on in the night. The absence of renal disease being ascertained, the symptoms are strong evidence of the existence of "coarse" disease inside the head. We often see patients blind from optic neuritis, especially in children who are reported to have had "bilious fever." It is frequently the "fever" that attends coarse disease of the brain. I feel sure that the use of the ophthalmoscope would sometimes save us from the mistake of declaring the symptoms of a case to be of non-cerebral origin, because superficially considered, they seem to refer to other organs than the brain. In all such cases the ophthalmoscope should be used, *whether the patient complains of defect of sight or not, and when he can read the smallest type.* Although the absence of optic neuritis would not negative the existence of coarse disease within the cranium, the presence of the neuritis (double) would, I think, render the existence of this kind of change *almost* certain in many cases of very severe headache without renal disease; we cannot be quite certain. I had, about a year ago, a patient under my care, the whole course of whose symptoms—and double optic neuritis was discovered—seemed to point to coarse disease of the brain; but there was no such change found post-mortem; the brain was very much wasted. Nevertheless, I repeat, double optic neuritis occurring along with intense headache, and especially with vomiting (perhaps bilious), is *almost certain* evidence of the existence of coarse disease of some kind—not of any particular kind—within the cranium.

Let me relate a case showing, in a very striking way, the value of the recognition of the fact (case recorded *Med. Times and Gaz.*, Nov. 16, 1872). The patient was a blooming healthy-looking girl, æt. 20. Although she had attacks of headache and vomiting, yet she was apparently so perfectly well in the intervals of these attacks that the diagnosis of intra-cranial tumour must have seemed *preposterous* to those who did not use the ophthalmoscope or who could not interpret its meaning.

Now this patient had a nervous symptom, or rather a pathological nervous condition; that is, as above implied, she had acute double neuritis; but, as she could read the smallest type, and did not know that there was anything the matter with her sight, this valuable evidence did not exist for those who do not use the ophthalmoscope by routine. Her sight failed before death. (Tumour and cyst of the right lobe of the cerebellum were found.)

For some time this patient had only three symptoms,

the three so often found together—viz., headache, vomiting, and double optic neuritis. Now, at the most important stage of the case, the third symptom (optic neuritis), as I have said, would not exist for those who do not use the ophthalmoscope *by routine*. Without it the diagnosis would have been erroneous. It is true that from *very* severe headache and vomiting we may *guess* intra-cranial tumour, but who *would* ever guess it in a perfectly healthy-looking blooming girl, who was in good flesh, and occasionally apparently absolutely well. This indeed, is the *beau-ideal* of a case to be mistaken early in its course for "disease of the liver." How often do we hear of amaurosis caused by "bilious" fever? To encourage such a mistake was the fact that the girl had always been subject to "bilious attacks." Another mistake would be hysteria. Neither of these mistakes could be made in such a case if the patient's optic discs were looked at. We did look at them, and from what we saw we were absolutely certain that there was intra-cranial disease, and we predicted tumour.

But we may overlook the neuritis altogether. The patient may die of intra-cranial disease before his sight begins to fail, or the neuritis may pass off, leaving sight quite good. It is obviously a serious matter to overlook so striking a pathological condition. In cases of loss of speech (aphasia), there may occasionally be discovered severe optic neuritis when there is nothing in the patient's bearing to suggest that his sight is defective.

In young children it is absolutely necessary to use the ophthalmoscope when they suffer from severe cerebral disease. We occasionally discover optic neuritis in a child whose parents have never noticed anything the matter with his sight. In cases of acute cerebral disease, the patient may be too ill to take any notice of our attempts to test his sight. Here, again, we must use the ophthalmoscope.

In the following cases, without ophthalmoscopical examination, we could never have inferred that the cerebellar abscess which was found post-mortem had produced any changes in her optic discs. I saw this woman by Mr. Maunder's permission. I take the report from the "Mirror" of the *Lancet*, March 29, 1873:—

"For the notes of the first of the subjoined cases we are indebted to Mr. Wallace Drew.

"S. B——, æt. 16, admitted May 25, 1872. The patient, a fair, delicate-looking girl, stated that about a fortnight before admission she had earache, which was soon followed by giddiness and discharge from the ear. The discharge and giddiness continued up to the time of admission. Previous to this she had always been healthy. She had scarlet fever and measles when a child, and small-pox six months ago, from which she completely recovered. No history of injury; no history or signs of syphilis.

"On admission there was a thick yellow discharge from the left ear, and she complained of deafness, frequent attacks of violent retching and vomiting, and said her 'head felt going round and round.' She had great pain 'all over her head,' which was increased by pressure over the mastoid process. Temperature normal.

"May 28th.—Condition and symptoms unaltered. Ophthalmoscopic examination disclosed double optic neuritis. She passed urine in the bed during the night.

"June 5.—The nurse states that at 7 a.m. 'she gave a scream, and a stupor came over her, from which she could not be roused. The eyeballs and eyelids kept moving during the attack.'

"6th.—At 4 a.m. patient had a fit, described by the nurse as 'clenching of the hands and feet and foaming at the mouth,' which lasted about four minutes. She did not bite her tongue. She remained in a stupid condition all day.

"7th.—Patient can be roused with difficulty. Continues vomiting. Dr. Hughlings Jackson saw her and dictated as follows:—'There is double optic neuritis; minute examination impracticable. She is very much thinner than she was a week ago. There is no paralysis apparently, but she is too ill to get out of bed for careful examination.'

"8th.—Two fits this morning, one at 9 a.m, the other at 10 a.m. Nurse states that before the first she had a rigor, which lasted a quarter of an hour. During the fit she had twitching of the muscles of the face and eyelids, but both upper and lower extremities were apparently powerless. The second fit was similar to the first, except that the twitching of the face was absent. Passes urine in the bed. Tongue is moist, tremulous, and red.

"14th.—She has improved very much since the 8th. Vomiting, pain, and giddiness much less. Discharge from the ear is very profuse. Passes better nights. Bowels constipated.

"29th.—Her general symptoms have been much the same since the last report; some days she has been sufficiently well to get up and do needlework, at others as bad as ever. Has had no more fits. Dr. Hughlings Jackson made the following remarks:—'The optic discs are still swollen, and very prominent over a small area. Veins are very dark. Effusions of blood at the edge of the swelling. General manner much improved since I last examined her.'

"July 31st.—Dr. Hughlings Jackson saw her again, and made the following remarks:—'She has been much worse for the last two days; but since I saw her on June 29 she had been very much better, had been up, and had done needlework. She made two aprons. The last observation shows that her sight has not been considerably affected, although it has not been tested by types. She would read, and the nurse thought she saw well. She had taken her diet (half 'fancy'), and had also eaten part of other patient's diet. Indeed, she seemed to be getting well. Now she is very ill, and has great pain in the head. There is no paralysis. It is of course impossible, as the patient is in bed, to say that her legs are not weak; but before she took to her bed there had been no difficulty in her gait. Certainly there is no paralysis of any cranial nerve; and it is particularly to be noted that speech, articulation, and voice are good. There is, however, still double optic neuritis. The existence of this pathological condition of the optic nerves would never be guessed from her manner. The disc patch is about three times the diameter of a healthy disc. There is no distinct edge, but a general boundary of swelling over which the large veins turn to be lost to sight, re-appearing beyond. No arteries are traceable in the patch.'

"The patient died a quarter of an hour after the ophthalmoscopic examination was made, and the above remarks dictated by Dr. Hughlings Jackson. From the nurse's description of her death, she appears to have become rapidly comatose. Her temperature (night and morning) all through her illness was normal, excepting on the 8th of June—the day she had two fits—when it reached 99°. Trephining was suggested by Mr. Maunder, but was counter-indicated by the absence of any localising symptom.

"The friends refused to allow any examination of the body, and removed it, but on the following day (Aug. 2), after great difficulty, permission was obtained to examine the head. The left half of the cerebellum was found to be completely hollowed out, forming a large abscess cavity. The cyst-wall was soft, with little or no fibroid thickening, and the pus it contained was of a yellow colour, tinted in some parts with a green hue. At the receding angle in posterior fossa of skull, formed by the junction of the mastoid with the petrous portions of the temporal bone, where the lateral sinus makes a bend, a spot was found which communicated directly with the abscess in the cerebellum, and from which pus oozed when the periosteum was removed. At this point the bone was found softened, and readily broke under the point of a probe. There was rather more fluid in the lateral ventricles than normal, otherwise the brain was quite healthy. There was not the slightest trace of lymph or even dulness of any portion of the arachnoid."

Illustrations of the second statement, that neuritis may exist with good sight and may pass off, leaving sight good are often given. I refer again to the two drawings in the "West Riding Asylum Reports." The uppermost draw-

ing shows acute neuritis ; the second, the disc on recovery almost normal, No one would dare to say that the patient had had neuritis from the appearance depicted in the second drawing ; the patient never had any defect of sight from first to last.

*(To be continued.)*

## ADENOID TUMOURS OF THE NASO-PHARYNX; THEIR INFLUENCE ON HEARING, RESPIRATION, AND PHONATION ; AND THEIR TREATMENT.

By Dr. B. LÖWENBERG, Paris,

Translated by H. Macnaughton Jones, M.D., &c., Professor Queen's University, Ireland.

*(Concluded from page 445.)*

### *The Annular Knife.*

M. Meyer reccommends operation by means of a little oval ring with a sharp interior and anterior edge.

This little instrument consists of a thin flat blade, only 2 millimètres in breadth, it is one centimètre in its transverse axis, and seven millimètres in the axis perpendicular. The ring is fixed at a slight curve with a strong metal handle, 11 centimètres long, at the extremity of which is an ebony stem of the same length.

The instrument is used in the following manner : We introduce it with the right hand, by the nares, on which ever side enables us most easily to reach the morbid growths, till it is passed into the pharynx ; then the left index finger is introduced by the mouth, in order to fix the morbid growths, and to press them against the sharp edges of the knife.

The results of this operation are the same as those which we have explained in treating of the use of the curette.

As regards the value of this instrument we must confess that we have often found it useless, sometimes because we found it impossible to pass it by the nasal fossa, or that it would cause too much pain to the patient, at other times because, on account of the situation of the tumours they could not be reached by the knife, the space in the interior of the nose being restricted to allow of free manipulation of the instrument. (We must add that the regretted Wendt has, in two cases, seen the use of this annular knife followed by acute purulent otitis with perforation of the membrana tympani.)

### The Author's Method of Operating.

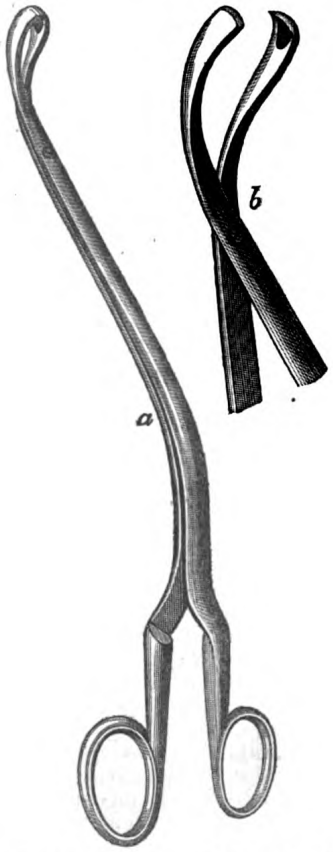
Amongst the various operative methods that we have employed, the use of the curette appears to us the easiest and most efficient, but nevertheless it is not without its drawbacks. The introduction of this instrument with sharp edges, may indeed becomes dangerous in cases where the patients are restive or unmanageable, even when we take the precautions we have explained (see above). Moreover, when it is introduced into the naso-pharynx, the curette may make an incision so deep as to extend below the limits of the tumour which is to be removed.

We have thus been induced to substitute, for the instruments already known another of our own invention, which we believe to be as efficient as these, and at the same time, more sure in manipulation, and less distressing to the patient. (See accompanying figure.)

It is a forceps, the extremities of which are two sharp blades, the cutting edges being applied against one another, when the instrument is closed. It, like the curette and caustic holder, is formed in a double curve, somewhat resembling an S. The joint is placed near the bit so as to secure a considerable length of the handles, this gives a powerful leverage, and enables us to cut easily. The blades cut by approaching one another. They are slightly curved and concave on the interior surface.

We use the instrument in the following manner :

Guided by the rhinoscopic mirror, or by the index finger of the left hand, we introduce the forceps closed ; we then open it and cut the growths as closely as possible to their base. A thin pedicle, or a sessile growth of small size, may be cut through by one stroke of the instrument, while it will naturally require several to remove a large tumour. True pharyngeal polypus can be operated on in a similar manner by means of our instrument.



*a* Two-fifths the natural size. *b* The extremity two-thirds natural size.

When the morbid growths are divided we withdraw the closed forceps, and generally with it also the tumours that we have just removed.

Having frequently employed our forceps with complete success, we can recommend its use to those who find it necessary to operate on adenoid tumours or polypi of the pharynx.

### *The Galvano Cautery.*

Adenoid tumours may be also destroyed by a platinum wire rendered incandescent by the continuous current. We cut through the pedunculated growths with the sharp handle, and destroy the sessile ones with the galvano-cautery.

We have not yet tried the thermo-cautery in these special cases. When it is employed we should suggest to cover the instrument, except that portion with which we cauterise the tumours, with some material which does not radiate heat, and is at the same time a bad conductor. We propose the same means for the galvano-cautery, with the intention of protecting the healthy parts ; we could, for instance, cover thus the circumference of the shank for the platinum wire. We offer this suggestion to any surgeon who may find it necessary to attempt this operation in the interior of a cavity whose walls should be protected against the enormous radiating heat of the platinum, which conveys the current from the battery.

### Treatment of Concomitant and Consecutive Affections.

The following pages do not profess to enumerate every

method of treatment employed in contending against the affections above described. Moreover, we can easily obtain this information in special works. We wish only to explain here the methods which, by long personal experience, we have found useful in the concomitant affections of adenoid tumours of the pharynx.

We have seen that chronic inflammation of the mucous lining of the pharynx and the cavities adjacent to it, coexists in a great number of cases with adenoid tumours of the posterior cavities of the nasal fossa ; we have always found pharyngitis, and very often rhinitis.

It is necessary to treat these different groups or disorders, independently of the measures to be taken with regard to the adenoid tumours themselves. We will now give the means which we have employed in the treatment of these numerous symptoms.

When the affection has attacked the *nose or the naso-buccal pharynx*, we employ *alum*, an excellent astringent, by means of gargles and the naso-pharyngeal douche.

The *gargle* is used, as we have explained above, with a solution of alum at the temperature of the surrounding atmosphere.

*Naso-pharyngeal Injection.*—We must take important special precautions to insure the success of this excellent method. We must avoid the use of pure water without the addition of some salt ; for simply cleansing injections, we use water containing chloride of sodium, 1 to 3 parts in 100. We also add salt to the astringent solutions, for without sea-salt the water is very irritating to the pituitary membrane, probably on account of a too violent osmotic process ; while table-salt, possessing a very slight osmotic action, the presence of which limits that of certain other salts, prevents the exaggerated interchange and consequent irritation, which would take place between the fluid injected and the elements of the Schneiderian membrane. (*a*)

Alum is used in the nasal douche, in the proportion of 1 to 3 parts in 100 of water.

All medicated fluids should be warm, so as to avoid irritation of the nasal mucous membrane.

The astringent solution may be used also in powder, but we then lose the cleansing effect of the current of water, which is indispensable in carrying away the secreted products, which are often so abundant, compact, and adherent, that without the aid of Weber's douche, all the efforts of the patient cannot succeed in expelling them.

If alum, or other astringents, as, for instance, tannin, are not sufficient to effect a complete cure, we may increase their action by local cauterisation ; we must have recourse to this where pharyngeal granulations exist, or actual swellings of the pituitary, such as we have often noticed. We very frequently use the galvano-cautery for these cauterisations.

*Measures to be taken with regard to Respiration by the Mouth and its consequences.*

It is evident that we cannot hope to re-establish respiration by the nose until after all the adenoid tumours which interfere with this normal function have been removed. But as we have already seen, operative measures are not sufficient to accomplish this successful result in the greater number of cases ; even after a pathological condition of the nasal fossa, which to a greater extent interferes with the permeability of these channels has been cured, the habit of the young patients of breathing by the mouth, often remains still unconquered. On the other hand, the re-establishment of the normal method of respiration is all the more desirable, as the simple fact of the passage of air through the nasal fossa, would, in its turn, materially assist in restoring their physiological condition.

In what manner should we act in these cases ? When the passage is sufficiently free we begin by advising those who are in charge of the child to check his old habit by constantly reminding him to close his mouth. It is all the better if the child finds this surveillance annoying. He will then attempt to render it unnecessary by remembering of his own accord to breathe by the nose.

M. Guye, of Amsterdam (*a*) proceeding more energetically, proposes simply to close the child's mouth by means of an apparatus, somewhat similar to the respirator of the English, but differing in this respect, that the "anti-respirator" of our Dutch colleague and friend is completely impermeable to air.

But this apparatus will not be efficient unless it is applied so closely that it adds to the little patient's annoyance by preventing him from speaking. Moreover, it may happen in these cases that the nose, particularly if the mucous membrane has not completely regained its normal condition, is temporarily closed, and how can the child who has been strictly forbidden to remove the apparatus then breathe ? And how can he expel the pharyngeal secretion, which is generally so abundant, or even the saliva ? These questions are all the more important, since, instead of losing time which should be utilised, we ought to begin the supplementary treatment as soon as there is the least possibility of breathing by the nose.

We have devised a more gentle means which has already been serviceable in some cases. It is the use of a simple chin-piece, but we replace the end which passes round the scalp by two bands, making between them almost a right angle, so as to bind the head firmly. There is a slit in the inferior portion for the reception of the chin. This chin-piece brings the two jaw-bones with their dental arches in contact with one another, thus preventing respiration by the mouth. In cases where a small opening still exists, it is only because there are spaces between the teeth of the same row, or that some of the molar teeth are removed at the back ; not only are these spaces insufficient to serve for regular prolonged respiration, but, if availed of, it would be also very troublesome, as it would necessitate the patient keeping his lips separated, while the chin-piece tends to close them by pressing the inferior against the superior maxillary bones. But this mode of breathing may be used for a short time if the nose is temporarily closed. This system has, moreover, the advantage of permitting the patient to speak, if not well, at least sufficiently for anything that is absolutely necessary. We, therefore, propose its use, and beg of others to try it in appropriate cases, as our invention being of recent date, cannot be brought into general use until it has been tested in a greater number of cases than those in which we have hitherto had an opportunity of trying it. It would be important, for instance, to study its effect in cases where the jaw-bones, with their dental arches, are differently shaped, and in the numerous varieties of dental formations. All that we have seen up to the present appears to prove that our device may with gentleness teach a child to breathe by the nose without imposing on him a restraint beyond his age.

Where *snoring* does not disappear spontaneously, as soon as the naso-pharyngeal passages have recovered their normal permeability, the chin-piece should be still used, but only during the night.

*Defective pronunciation* should be conquered by reading aloud, an exercise which is also very useful for the whole extent of the respiratory tract, as it stimulates and regulates the mechanism of respiration.

As to the *thoracic deformity*, suitable gymnastics should be tried under the supervision of a doctor especially familiar with orthopædic surgery, and its anatomical and physiological basis. The earlier it is used the greater will be the chance of a successful result. Electricity may be used with advantage in the treatment of the deformity.

### Therapeutics of Aural Affections.

The affections of the ear caused by adenoid tumours of the pharynx, require different treatment according to their nature and intensity. Two groups are to be

(*a*) Graham, in "Philosophical Transactions," 1865. Part i. "On the Diffusion of Liquids."

(*a*) International Congress of Medical Science. Brussels. 187.

specially distinguished, simple catarrh and purulent otitis (we shall find specimens of these two groups in the cases related above). In both of them removal of the growths is the first essential condition of all efficient treatment. This being accomplished, each group requires special cares, which we shall briefly explain. We may say at once that it is necessary to begin the treatment as soon as possible.

### Treatment of Catarrhal Inflammation of the Middle Ear.

The most frequent cases of aural troubles arising in the course of an adenoid affection, are those of simple chronic inflammation of a catarrhal character. We advise that it should be dealt with in the following manner: by means of the catheter we insufflate air into the Eustachian tube and cavity of the tympanum. We prolong the beneficial effect of the air-douche by substituting for the ordinary atmosphere hydrogen, or air which has been inspired and expired alternately four or five times, according to the methods proposed by us in our treatise, "De l'Echange des Gaz, &c." (*a*)

We can also insufflate air or other gases, and even vapours, into the middle ear by means of the method of M. Politzer, of Vienna. This method of our Austrian colleague is practised in the following manner:—We introduce a tube into one nares (see our modification, page 57), which communicates with a caoutchouc bag, and we hermetically close all communication between the interior of the nasal cavities and the surrounding atmosphere, by closing the patient's nose. The end of the tube should not extend at the most farther than one centimètre into the nares. We then compress the bag, and thus inject its gaseous contents, at the same time making the patient perform the movement of deglutition. This facilitates the operation in two ways: 1st. It raises the soft palate and thus closes the naso-pharynx from the buccal-pharynx. 2nd. It diminishes the resistance of the Eustachian tube, and renders the access to the cavity of the tympanum more easy.

In an immense number of cases this excellent method may replace catheterisation, an operation which is naturally more annoying to the patient; but M. Politzer's method is especially indispensable in the case of little children where catheterisation is impossible.

We have lately proposed some modifications of this method, which consist in obtaining the elevation of the soft palate by means of the pronunciation of certain letters, rather than by the act of deglutition. But we should not forget that these modifications do not imply, as deglutition does, the freeing of the passage through the Eustachian tubes, a condition not less important for the success of the operation than the elevation of the soft palate. Nevertheless, when we are dealing with little children, we employ this method, which consists in making the patient pronounce a prolonged *a*. It is indeed easier to practise insufflation during the emission of this vowel than to seize the moment of deglutition, as children will not swallow at the instant they are desired.

For a similar reason we reject the use of another plan, which consists in saying "hack" or "huck." We may sustain a vowel for a considerable time, and thus keep the soft palate raised for so long a period that the surgeon is enabled to choose the moment at which to inject the air, while the pronunciation of the consonant *k* only lasts an instant, and we must seize exactly that moment, or else the operation fails.

Besides, it very often suffices with little children to introduce the tube of the bag into the entrance of one nares, to close the nose and blow the air forcibly into the cavity of the tympanum, simple pressure being generally sufficient at this period of life to overcome the resistance of the Eustachian tube.

Finally, in certain very rare cases, even with adults, we succeed more easily in performing the operation by making them pronounce some words rather than by deglutition. The causes of this peculiarity are as yet unknown to us.

We shall conclude with some practical advice which a long experience has suggested to us. It is often difficult, even with adults, to perform insufflation at the exact moment when the Eustachian tube is open during deglutition. We recommend the surgeon in these cases to watch the patient's neck, and to compress the ball at the moment when the larynx is seen to ascend. In this manner we succeed more certainly.

In those cases in which the insufflation of air does not give a satisfactory result we inject astringent solutions through the catheter, for instance, sulphate of zinc (1 to 2 grammes to 100 of water). In cases of very great swelling of the mucous membrane of the tube, it may be often necessary to use a whalebone bougie; but only very skilful surgeons should venture to employ this instrument, even they must at the same time take the precaution of using the otoscope (an elastic tube which puts the surgeon's acoustic ear in communication with that of the patient); the aid of the rhinoscope is also necessary in very difficult cases. The proof that these precautions are not superfluous is, that the least imprudence in handling this instrument may produce false channels in the tissues of the pharynx or Eustachian tubes, and that if we persist in attempting to practise insufflation we shall produce emphysema, which may affect the pharynx, the soft palate, the uvula, the face, and the neck, and descend even to the sternum, the arms, and between the shoulders. According to Triquet (*a*) this emphysema may even reach the larynx and stifle the patient.

### Treatment of Purulent Otitis Media.

This form of otitis accompanies the adenoid affection more rarely than simple chronic catarrh. We advise the following manner of treating it. If the membrana tympani resists the pressure from within outwards of the liquid accumulated in the cavity in acute otitis, and that it is impossible to open a natural exit for the pus, by freeing the Eustachian tube, we must without delay perforate this membranous barrier (the membrane), and relieve the walls of the cavity from a pressure which is so painful to the patient. It is principally in these cases that we may advantageously employ the myringotome, which has been, and still is, often used in so culpable a manner.

When once the acute stage is passed, leaving perforation of the membrane, whether caused by artificial means, or by the internal pressure which has ruptured it, we use the catheter, or Politzer's method. At the same time we treat the external meatus, and the cavity of the tympanum, by means of daily injections of warm water, followed by astringent instillations. Since the year 1868 we have used *absolute alcohol*, with or without the addition of tannin in solution. We use it at first mixed with four or five times its volume of water. Gradually we increase the strength, and with many patients we finally apply absolute alcohol (alcohol called "absolute" in the pharmacopœia still contains two to five per cent. of water, but this is of no importance).

In a certain number of cases the insufflation of powdered alum has also given very satisfactory results.

We take this opportunity to remark, *en passant*, on two facts, the knowledge of which should be spread as widely as possible, though every day brings us fresh proofs of how little they are generally known.

1. A prolonged discharge from the ear does not, 99 times out of 100, proceed from the auditory meatus, but from the cavity of the tympanum, and is naturally complicated with perforation of the membrana tympani, a pathological condition which must be treated without delay.

2. Contrary to the almost universal opinion, perforations of the membrana tympani of recent date, may be cured, so to speak, with the most simple treatment, pro-

(*a*) *Loc. cit.*

(*a*) "Legons Cliniques sur Maladies de l'Oreille," p. 150. 1863

vided it is employed in time; it is also very often possible to lead to complete cicatrisation even of old perforations, and at the same time to dry up the discharge which accompanies them in nine cases out of ten, we need hardly say that this result is extremely advantageous to the patient.

If we have devoted so much attention to this study of adenoid tumours of the naso-pharynx, and have published it with so many details, it is because the considerable number of cases that we have observed, confirms us in our belief in the very great frequency of the affection in general. Indeed, many of our colleagues to whom we have explained the results of our studies, have been struck with the pathological group of symptoms, which we attribute to the presence of adenoid tumours, and each could remember having frequently met with similar cases in his own practice amongst his young patients.

We venture then to hope this publication may prove useful to those of our colleagues who are not as yet familiar with its results, but which, nevertheless, may be contended against with the greatest success, if we adhere to a treatment established on the principles which we have here laid down.

## ROYAL MEDICAL BENEVOLENT COLLEGE AND CHARITY VOTING.

### DECISION OF GOVERNORS.

[Owing to great pressure of matter we were able last week to give but a very brief outline of the proceedings at the Annual Meeting of the Royal Medical Benevolent College. The subjects discussed, however, were of such an important character, and the meeting one of the largest and most influential ever held, that we now present our readers with a verbatim report, from our own reporter.]

The Annual Meeting of the Governors of this institution was held on the 29th ult., at the offices in Soho Square, Dr. Jonson presiding, when a decisive vote was taken in regard to the system by which the recipients of the charity are elected. In the preliminary business the scrutineers' report was presented, giving the result of the election, and expressing sympathy with the unsuccessful and congratulating the successful candidates. The Annual Report of the Council was then read, and it stated that the Council had delegated to a committee the task of inquiring into and reporting upon the system of electing by votes the recipients of the charity. The committee, in their report, which was signed by Mr. Erasmus Wilson, opposed the abolition of the voting system as tending to the injury of the charity. The fairness of election in the institution had never been questioned, while the alternative mode would leave the choice in the hands of a committee. Besides, the funds would be likely to suffer, as, under a new system, the friends of a candidate would think it would be no use to subscribe, while, under the present system, every new candidate brought new subscribers, some of whom continued, and the fresh additions kept the list of subscriptions to the average. The Report referred to the circular issued by the Committee for the Abolition of Charity voting as Jabez Hogg's.

The Chairman, in moving the adoption of the Report, spoke in the highest terms of satisfaction of the educational standard attained by the Epsom College scholars, and moved that the Report be adopted and entered upon the minutes.

Mr. Jabez Hogg.—I beg, Sir, to take exception to one part of the Report—that part which speaks of "a paper issued by Jabez Hogg." The paper alluded to was not issued by me individually, but was issued by an influential committee, of which I am the honorary secretary. I beg to say that the Report should be corrected in this particular. I shall not now go into the merits of the Report read. I have individually no complaint to make against the Council in reference to the slip issued with the voting papers, and which casts a reflection on me. The view therein expressed has had a contrary effect to that which the Council anticipated, inasmuch as, since it was issued I have received nearly two hundred communications from Governors asking me to add their names to the requisition for the abolition of the voting system. (Cheers.) I would now simply remark that we are asked to meet here in a formal manner to ratify the acts of the Council, who virtually select the members of their own body, but refuse to act as a selective body when it concerns the interests of the beneficiaries of the institution. Have not the Council always acted as a selective body in putting forth the names of gentlemen for the vacant seats in Council, and who are called upon to discharge most important functions, and who frame our laws? With regard to the voting at these annual gatherings, it does appear also to me that the bye-laws on some points require altering, particularly as regards the voting of country members on questions of importance as that which will come before this annual meeting, since Governors, as Dr. Bartolomé, of Sheffield, and ladies especially, are virtually disfranchised. The votes of country Governors should be taken by proxy, and the Council should at once alter the bye-law and enfranchise those who are disfranchised by reason of their living too far from London.

The Chairman.—In reply to the first observation of Mr. Jabez Hogg, allow me to say that nothing invidious was intended by speaking of the paper referred to as his. In speaking of the paper issued by the committee of which he is honorary secretary as that "issued by Mr. Jabez Hogg" we spoke of him as representing the Committee.

Mr. Jabez Hogg.—I shall be quite content if you say in the Report "the paper emanating from the Committee, of which Mr. Jabez Hogg was secretary." (Hear, hear.)

The Chairman.—That shall be done.

Mr. Mason.—There is another point. We have with the Report of the Council, an important report from a Committee, and before we are called upon to vote upon this as an adopted Report, I should like to know our position. There is much in the Report from which I differ. (Hear, hear.) It was carefully read, but we have not had time to consider it. It ought, I think, to have been issued with the balloting papers. (Hear.) I am not about to enter upon this subject of the system of voting, but I may say this—as far as the report goes, I think I am in the right in declaring that one candidate at least of those elected on this occasion has friends who could have supported him, and we have had an example of this before. I trust that the Governors, in the interest of the poor candidates themselves will look into the question, and see how the system operates. (Cheers.)

Mr. Mocatta.—I venture to ask one question before we proceed to adopt the Report. I rejoice to see the brilliant position occupied by the College, but I should like to know how far we shall be endorsing the views of the Council on the voting system by adopting the Report? We must, I think, pause before we adopt the Report.

The Chairman.—It is usual to adopt the Report and enter it on the minutes.

Mr. Ernest Hart.—The best plan will be to let the Report be received and entered on the minutes.

The Chairman accepted this, and the Report was "received," and ordered to be entered on the minutes. The Chairman then remarked that the meeting of Governors had no power to alter the bye-laws, but could recommend the Council to do so.

Dr. Hare then rose and moved

"That the Council be requested to alter the bye-laws to the effect that a committee of investigation be appointed, the duty of which shall be to examine carefully into the claims of the several candidates, and to recommend for election a number of the candidates corresponding with the number of vacancies in the Colleges; that the names of such recommended candidates shall be sent with the voting papers, which should also furnish, as at present, the names, &c., of all candidates to every Governor of the College.

"That the Council, with each ballotting paper made out as at present—and, of course, leaving to every Governor the absolute right of voting for any candidate as he or she may please—do inclose a slip of paper, on which shall be printed the following words, or words to the following effect: 'The Committee of Examination recommend the following cases as being in their opinion the most urgent,' after which shall be printed the names of the candidates for pensionerships and foundation scholarships selected as above by the Committee of Examination."

He said: I rise with a deep sense of the responsibility

which attaches to me, owing to the importance of the task which I have been requested to take upon myself. I wish very much indeed that the matter had been entrusted to some one who was better able to deal with it than myself. Indeed, were it not for the illness of a very distinguished and learned nobleman—one whose life has been spent in philanthropy—Lord Lichfield, I should not occupy my present position. He would much more ably than I can state what I have now to state. By-and-by you will hear a letter read from him, going fully into this matter, and expressing his deep regret that illness alone has prevented him being here. But, Sir, if I feel the responsibility of my position; I also feel that I have a great and good cause in hand. It is a cause in which somehow or other I have been brought to the front, I scarcely know how; but so long as I have life and health left I promise you I shall be wanting in no exertion until the subject is finally and absolutely settled in the way which we require. There is one thing of which I am sure—viz., that on this occasion, I, unlike others on former occasions, shall be allowed to have my say. This time two years ago, and once before, we had scant courtesy shown, and it was only by insisting on our rights as Governors, that we were allowed to speak at all on the subject. In your hands I am sure this will not be the case. I remember, amongst other things, we were taunted with the fact that only some 500 or 600 had expressed a desire not to be canvassed. What did we do? We explained this to the Governors, and 1,160 names were added to the list. I am sure you will believe me when I say we do not undervalue in the slightest degree all that the Council has done for the good of the institution. Their Report I have listened to with very great pleasure indeed. It has been a great satisfaction to me to hear of the results which have been effected by an institution founded by our esteemed and valued friend, Mr. Propert. At any rate, it has been a source of unmingled satisfaction to know that students have distinguished themselves so well, and that so much good has been done by this institution. But while we give you every praise for this, there is a point on which we think you, as representatives of the College, require to be "educated," and it is the question of "charity voting" We have done our best to come to a knowledge of what the Governors wish, and we have learned that 366 wish the present system to go on, while 3,775 are for its abolition. In other words, nearly 8 to 1 are in favour of our view of the question, as near as I can tell. But it is not a question of 8 to 1, it is the question that we have an absolute majority of Governors who say we will have the thing altered, and therefore we come to you in that distinct and definite way. We do not ask you to change it, but request you to change it. Every one of these forms contain a distinct and definite request from Governors, that you will change the manner of election. As to the charter and the provisions of our bye-laws which have been alluded to, I may say that I never knew a more conservative charter, or more one-sided bye-laws in my life. It results in this, that we, the Governors, cannot enact bye-laws. You will observe that the resolution which has been placed there has been very carefully worded. We ask only that you, the Council, should propose that the bye-laws should be altered. We are precluded from this. We have no power whatever, and all the Governors together could not change them. But what we intend to carry is a distinct request to the Council that you alter the bye-laws in accordance with the wish of the Governors at large. In most institutions an appeal can be made from the voting which takes place in a small room—such as this, in fact, where all the governors of an institution could not possibly be present—but we have no opportunity of the kind. Whatever is carried in this room must be taken to be the will of 5,000 Governors of the College, who can have no chance of being present to express their views. If 3,775 Governors on the one side, and 366 Governors on the other, do not show a very strong feeling, I am indeed mistaken in my estimate of the views of the Governors. You have said that if this were carried into execution, you feared a considerable falling off in the subscriptions. Let me tell you there is a great fear of falling off in the other direction. It would be a poor kind of charity which would give its guinea, or its donation, simply that it might have the power of exercising more influence in the election of candidates. No! I do not believe British charity is of that grovelling kind. There are a number of institutions which flourish without any adventitious aids of the kind, and I believe that our profession, even the more conservative among them, will not retire merely because the mode of election is made more easy to the deserving. But supposing a few subscriptions dropped off, would that necessarily mean that our College would produce a less amount of good? It is not by the number of guineas subscribed that we can measure the good an institution can do. It is only by the amount of good it confers upon those for whom the institution was instituted. I think there are 60 candidates on this occasion. We have been told that no less a sum than £100 has been spent in the election of a single child. I shall merely put it as £15. This is much under the mark, and gives £900 simply wasted on advertisements, on bills, on canvassing, not to speak of the health and strength, which is of more consequence, wasted; £900 annually are wasted to do that which 900 pence would do just as thoroughly. Therefore, if our subscriptions should fall off, which I prophecy they will not, still the amount of good done by the abolition of this system would not be lessened by this diminution of receipts. It would be more than that sum gained to the institution. What do the people themselves say? One individual says (and she went through it last year): "I believe the plan to be cruel and bad." That was a mother speaking, who had toiled to bring her child into the institution. "Those who get their sons elected are the most wealthy. I think this ought not to be. Surely this excellent charity was intended for the most poor and helpless orphans! I was five years in accomplishing my desire, because I had no relative to help me." What do the Governors say? We have not asked the opinion of a single individual on any matter connected with the College, but we have had a great number volunteered to us. I will read a line or two. One thought "the last election was simply an imposture"—(Mr. Gadd, of Rugby). Mr. Campbell, of Worcester: "It is the most clamorous who succeeded." Mr. Barker (Gravesend) said the abuse had changed his ideas with regard to the charity voting. One said an election had cost a widow £100. One had withdrawn because of the abuses. Another thinks so badly of the system that he promises to raise his subscription to two guineas if it is abolished. Mr. Stephens, of Manchester, wrote the present system was an "abominable nuisance." Another withdraws his subscription until the reform is carried. Another says he has saved £50, which he intended devoting to the institution, but if the reform be not agreed to he will give it to some other charity. I appeal to the gentlemen of the Committee of the Council to alter their views. I appeal to you to give way to a majority of the Governors, at least when the majority is so large, and when you can do it without discomfort to yourselves. Will you or will you not? That is the question. If you will—right and good. If you do not you shall have no peace. So long as I have life and health left, time after time, we will come before you, and we will carry our point come, what will. We will carry our point because we have justice on our side; because we speak for the widow and the fatherless, and because we have the Governors at our back.

Mr. Ernest Hart.—I am requested by the Committee to second this motion, but to save time I propose with your permission, to withhold any observations for the present in the hope that some members of the Council will, perhaps, now rise and express the views of the Council, and thus, perhaps, save me from going over unnecessary ground. I therefore at present merely formally second the motion.

Mr. Hird said: I can only express the regret I feel that Dr. Hare should, at the conclusion of his observations, have imported into his speech anything in the shape of passion or threat. I am quite sure I do not ask more than justice for the Council when I say they are put into their position as the executive body to administer the laws of the College, such as they are. The Council have not made the laws nor framed the Act of Parliament; but they are bound so long as the laws exist to administer them in conformity with those laws, and if they, from the responsibility of their position hesitate, it is only because they feel that the law would not enable them to do what they are asked to do. I do not refer only to the present revolution, but to former ones which had been moved, and which I hoped had been forgotten, because the law could not have been altered without altering the Act of Parliament. (No.) I speak advisedly. The Council had no power to do what they were asked to do. The general body of the Governors had no

power to do it without altering the Act of Parliament. We must have had a new charter modifying certain conditions of it. The Council did not feel themselves called upon to recommend so radical a change as that. I am sure I can say on the part of the Council that whatever their opinions collectively or individually may be, whenever there is an expression from the Governors of the College, when the Governors of the College know exactly the case in point, and are in full knowledge of it, I am sure there is not one in that Council who would fail to carry it out. And if the Council do not appear to have fallen into the views which had been given expression to on this and on other occasions, it is not in a spirit of opposition, nor in a spirit of resisting that which would be a benefit for the poor people who are admitted as candidates to our charity. I ask for as much consideration on this point as any Governor. Does anyone suppose that any of the Council would give the amount of energy, or subscribe so munificently, as many who have brought thousands by their personal exertions to the charity, would hesitate at once to join with the Governors in doing that which would be a permanent advantage to the College? I am sure there is not a Governor here who would insinuate anything of the kind. But the Council first act upon their own individual knowledge of the institution they administer. There are a number—our Chairman I may say for one—who have been connected with the institution from its foundation, and who have laboured for it year by year, and who have subscribed, as I have said, thousands of pounds towards its fund through their influence. Sir, I would take the example of yourself. You take an active interest in another institution connected with our profession—the Medical Benevolent Fund. Now that is a fund of an entirely different kind from our own institution. It is a fund to give immediate relief for present emergencies. The action that it does must be a rapid action. There is no time for canvassing. They ask for relief, and at the monthly meetings they can have the vote of a small sum for their immediate necessities. There are in addition some pensioners on the establishment. But what is the difference between placing a pensioner on that institution, or giving a small contribution, and doing what our Governors have to do? Anyone admitted into our College either as a scholar or a pensioner receives what can be estimated at a money value of between £300 and £400. Now this is an amount of patronage of a very large extent. On this occasion there would have been so many scholars receiving each £300 or £400. The pensioner would also receive a money value varying according to the age of recipients. Who really are the parties who have this great patronage? Is it the patronage that is to be awarded by the whole of the Governors individually, or is it to be put into the hands of a small select body or committee—in fact, some six Governors, either members of the Council or not—and are they to tell the something like 5,000 Governors "these are the proper people for you to give your votes to?" Now the Council, from their experience, feel that most of the Governors wish that they should be able to give their vote as to who they think fit for the benefits. Now what is to be the practical effect of adopting this resolution? The Council are of opinion that such a list would practically amount to this, that the names mentioned by the committee would be the names elected. Now we wish to mention what our experience is, what we have learnt from other institutions. I take it that most of the large institutions in the country have their elections upon the same lines as we ourselves have. There are some others who do not have canvassing or even voting. But there are some that have been started upon the principle of not canvassing and of having no selected list, and the institutions have simply drifted into inanition; their funds have diminished, there was no vitality in the institution, and the good done for the parties who it is intended to benefit was comparatively small. One of these was the Royal Benevolent Institution, which was started many years ago upon the principle of not canvassing, and not having a selected list. After a few years they found that it began to diminish in interest, the subscriptions fell off very considerably, and after a number of years they felt something must be done or the charity would die. They altered the plan—returned to the principle of not sending a printed list out to the Governors. The Council have not been influenced by any doggedness or spirit of resistance to what is proposed; but they have before them an amount of facts that they believe they are justified in the course they pursue. I am sure the few alterations, which were made, were made with the spirit to meet the demands that were made on them, and we are only glad to see the Governors of the College take the interest to come here and favour other Governors of the Institution with their particular views. Instead of the Council resisting them, the Council are very glad to listen to them. But it has been stated, and Dr. Hare has said, that you come to demand these measures because you find seven out of every eight favourable to your views. I am sure Dr. Hare will pardon me if I do not accept this as strictly correct. I have no doubt he is correct in saying he got eight replies to the papers he sent, against one not in favour. But I take it that that might be interpreted in a different way to the way Dr. Hare has intepreted it. I take it that a lot of people did not consider themselves called upon to send any reply at all. The College has been formed on certain lines. It has been conducted successfully on these lines; it never was in a more flourishing condition than at present; it never did more good than at present it is doing. Now, supposing the subscriptions did fall off. Here we are with a very large and expensive institution, a large building, a large number of expensive masters, and we do not save a shilling; we have no surplus fund, we have no profits from the school portion of the institution. Those who are not upon the foundation simply pay what it costs. Supposing the subscriptions fall off we must at once diminish the number of those who are on the foundation. Instead of having fifty perhaps we should fall off to twenty-five. Instead of having all the pensioners we have we might have only half that number; and I am sure therefore that the Council feel that they could not accede to this request unless they have a more special request from the majority of the Governors.

Mr. Ernest Hart.—The Council have had practically two speeches, the Report, and the courteous one from the gentleman who has just resumed his seat. I venture to differ with him, especially on the question of the fulness of the knowledge which the Governors have on this question. I believe there is no question of which they have a fuller knowledge, as it has been brought before them frequently during the last few years, and it has been brought before them by circulars, resolutions, reports of Council, and discussions in the public press. Therefore, I believe the Governors have given this vote with a deliberate knowledge of all that can be said against the view they have taken. I am sure the Governors agree with me as to the value of the services rendered to the institution by the Council. Nevertheless, I venture to say on this particular question the whole of the profession are against the Council. Nothing in the way of argument has been brought forward against the views which the Governors take on the subject. We all respect the conservative instincts which make the Council pause ere they take a leap in the dark, and I think the motives which induce them to adopt this course are worthy of respect. But when we hear all that can be said by them, I think Mr. Hird spoke as a man who knew that he was talking in a lost cause. I admire the constancy and courtesy with which he brought forward that which took the place of argument. As to having a majority of Governors "knowing the facts," a majority has been gained after a consideration of the facts for the last three years. Knowing this stale argument, that a certain amount of money would be lost by persons who wish to buy charity, they gave this deliberately written opinion. Not obscure, or men of a hasty judgment, but such men as Sir William Gull, Sir Thomas Watson, Sir Rutherford Alcock, and almost every eminent man in the profession, have spoken strongly in our favour, and they have taken the trouble (against the weight of authority) to join their names to the majority of the Governors, and signed a special resolution issued by outsiders calling on the Council to make this change. I hope there will be no hesitation in complying with it. Mr. Hird has said that the Council cannot make laws, but they can make bye-laws, and they can make the one we ask them.

Mr. Hird—I did not refer to the present resolution; it is perfectly legal.

Mr. Hart—As to the falling off in the subscriptions, that is the responsibility of the Governors now; and of the 2,775 persons who have called on the Council to make their bye-law, one or two instances were quoted where certain institutions were said to have dwindled away from certain causes. But it will not be right to accept these as cases in point until we are able to decide whether the absence of charity voting was

really the cause of the bankruptcy, or whether it resulted in the presence of certain officials, or their absence from the working of the institution. I trust we shall be able to proceed at once to vote. I believe the Governors have had a very full opportunity of making up their minds on the subject. I hope, whatever the result may be, it will be accepted in the fullest way possible, as a proof of the views held by those most interested in the institution.

Mr. FRANCE, a Member of Council, said his opinion was that this meeting was very far from representing the great majority of those supporting the institution.

Mr. MOCATTA thought there was a very strong feeling among people acquainted with the working of charitable institutions on this subject. He had had great experience in charities, and was aware of the demoralisation and suffering caused by the canvassing system. That day he had received a card from a respectable tradesman saying, "I hope you will send me some money, because I am in great difficulty, and before I can get admitted into an institution I shall have to spend a great deal of money; and what am I to do with my poor children?" Mr. Mocatta referred to the gross injustice and hardship inflicted upon the poor by the Surgical Aid Society, and said he believed there was a loss of money to charities by the present system, because there were a number of people like himself who were willing to support charities, but not voting societies.

Mr. MANBY said he had spoken on this subject several years ago, and he had come up from Norfolk to support the resolution. The present system merely had the effect of crushing out the most and most deserving indigent amongst the candidates, and therefore he should hold up both hands for it.

On the motion being put to the meeting it was declared to be carried by a very large majority.

The usual vote of thanks to the Chairman brought the meeting to a close.

# Department of Lunacy.

## PSYCHOLOGICAL LITERATURE.—I.

IT is our intention to devote a series of articles to the general consideration of psychological literature. We propose in the first place to discuss the periodical journals, and reports of the various asylums which we have received. The first to which we shall allude is the *Journal of Psychological Medicine*, edited by Dr. L. Forbes Winslow. This is Part I., of Volume 5, of the new series. The *Journal* is the oldest of all those devoted to the consideration of psychological subjects. It first made its appearance in the year 1848, and in consequence of the interesting tone of its articles, it was read by the public as well as by the profession. We are glad to say that the present editor has kept up the style and reputation of the *Journal*. In the current number we find many interesting as well as instructive articles, which will be read with general interest. Mr. Paget, who for fifteen years has discharged the duties of police magistrate, gives us a very comprehensive and instructive article on "Constance Kent and the Road Murder." He is of opinion that the mystery of the murder still remains unsolved, as opposed to the statement of Dr. Bucknill. Mr. Paget in an able way argues the case, and arrives at the conclusion that the supposed confession of Constance Kent was a delusion, emanating from an insane imagination. In coming to this conclusion, Mr. Paget compares the story she told to Dr. Bucknill five years after the event—"and after two years seclusion from the world, under the spiritual guidance of the Rev. Mr. Wagner, her memory, full of the horrors of that fatal night, and her soul oppressed by the dark cloud of suspicion which she knew was hanging over herself and every one that was dear to her—with the simple and plain tale she told under the sanction of a judicial inquiry, and subject to the test of hostile cross-examination by a skilful and experienced counsel. Let it be asked, which bears most strongly the indications of truth? Is it strange that her reason should have given way, and that she should have fancied that she had been an actor in scenes which had impressed themselves so vividly on her memory and her imagination?"

Mr. Paget concludes his able article with a *resumé* of the leading authorities, on the weight generally to be given to confessions which are self-criminating; and illustrations are given to prove that very little credence must be attached to such. The opinion that Constance Kent is innocent, and that her confession only emanated from an insane imagination, is entertained by the majority of psychologists who have considered the question, and also by a vast number of the general public. The article is well written, and is worthy the careful perusal of all interested in the question of insane confessions.

Dr. Winn comes again to the front as an uncompromising advocate of the independence of the human mind, in an article on "Mind and Living Particles." With reference to the hypotheses of some modern physiologists he observes: "Modern neurologists are guilty of a serious and culpable error in their attempt to explain mental phenomena by a hasty generalisation from the very few facts that are known respecting the nature and properties of the ganglionic cells, so extensively diffused throughout the cortical substance of the brain. Their hasty and illogical conclusions would have mattered comparatively but little, if the question at issue had reference only to physical science; but when their haphazard speculations tend to shake a belief in the independence of the human mind—a belief that has been upheld by the greatest philosophers both of ancient and modern times—they might surely have paused before enunciating doctrines which, if true, would make man an irresponsible agent, and sap the foundations of morality and religion."

In "Mad Poets" we welcome a series of most brilliantly written essays on the insanity of several of our poets. We have no difficulty in recognising in these the able pen of Dr. W. A. F. Browne, of Dumfries. The article is a very long one, but most interesting. It is the second of a series on the subject, and doubtless will be published as a separate work. The article is headed:—

> "This wretched brain gave way,
> And I became a wreck at random driven,
> Without one glimpse of reason or of Heaven."

It alludes to the madness of Robert Ferguson, Hoffman, Charles Lamb, Nathaniel Lee, Charles Lloyd, James Gates Percival, Edgar Allan Poe, Riddell, Rousseau, Savage, Schiller, Smart, Jonathan Swift, Tannahill, and Torquato Tasso. As each of these is brought forward as an illustration of a vast mind "fallen from its high estate," it will be read with melancholy interest by many. Dr. Bateman, Physician to the Norfolk and Norwich Hospital, gives us his address which he delivered before the annual meeting of the Eastern Counties Asylum on "Idiocy." Dr. Bateman makes some valuable remarks upon the histology and pathology of idiocy, and asserts as a positive fact that it is the result of "defective physical organisation." The paper is a valuable addition to the literature of the subject. Dr. Semple gives the fifth of his articles "On Pathology and Treatment of Cerebral Disease," which will be read with much interest, as from its high scientific value it deserves careful perusal. The editor republishes a paper which appeared in our journal on the "Psychology of Hamlet." He considers that there is conclusive proof of mental aberration followed by restoration to health previous to the termination of the play. The *Journal* contains articles on the "Pathology of Nightmare," "Localisation of Cerebral Disease," and "Criminal Lunatics." We have great pleasure in recommending the present number of the *Journal of Psychological Medicine* to the profession as well as to the general public.

The April number of the *Journal of Mental Science* is remarkably good. The articles are all of an essentially practical character, and many of its readers will be pleased

to notice the freedom from that irreligious tone which was for a long time so conspicuous in its pages.

*Brain*, for April, contains a valuable article by Dr. Crichton Browne, "On the Weight of the Brain and its Important Parts in the Insane," and there are excellent contributions by Drs. Sharpey, Althaus, Hughlings-Jackson, and Gowers. We think Dr. Bucknill's disquisitions on the "Physiology of Hume," by Prof. Huxley, are quite out of place in a journal devoted to the study of the pathology and physiology of the nervous system, and their strong materialistic character must prove offensive to many. We consider four editors for one journal an anomaly. If we may be excused for using a very homely phrase, "too many cooks are apt to spoil the broth."

*The Report of the St. Andrew's Hospital for Mental Diseases.*—This first-rate institution for the care and treatment of the middle and upper class of patients with limited means was, until the commencement of the year, called the Northampton General Lunatic Asylum. The average number of cases during the year has been 282, and 112 have been admitted, and 84 discharged; 22 deaths have occurred, and the number remaining on January 1, 1879, was 288, the same as the average resident during the year. The number of admissions was 15 less than during the year 1877. This was caused by the inability to admit a large number of cases, in consequence of the fulness of the wards. Out of 84 patients discharged, 55 are stated to have recovered, and the percentage of recoveries to admissions during the past year has been 40 males and 56 females. Considering the fact that nearly 400 cases have been under treatment during the past year, and many of them with strong homicidal and suicidal tendencies, no accident has happened to either patients or attendants. This speaks volumes as to the management and general supervision of the inmates. Dr. Bayley, the able superintendent, gives us some interesting and valuable statistical records, and the Report concludes with the general rules for the admission and visitation of the patients. It may be of interest to our readers to know that patients can be received into this most excellently managed hospital from £1 5s. and upwards, according to the requirements of the cases and the accommodation provided. This hospital, without doubt, may be regarded as the first asylum in England for the reception of middle-class patients on very low terms.

---

Peculiar Lunacy Case.—On the 27th May, medical and other evidence was led at great length before Sheriff Bell, at Coupar, in reference to the state of mind of George Aberdein, farmer, Pitkinney, who had been incarcerated in the Fife and Kinross Lunatic Asylum, at the instance of the fiscal authorities, as a person of unsound mind, and as being dangerous to the lieges. Aberdein, it seems, had lost several cases at law, and imagined that the Lords of Session and several Sheriffs had conspired to withhold justice from him. He forwarded a petition to the House of Lords, and several letters to the Home Secretary, and when these were not attended to in the manner he desired, he threatened to go to London and waylay Mr. Cross in the street. Two doctors deposed that he was sane, and two that he was insane. The trial was adjourned.

---

The rates of mortality in the principal foreign cities according to the most recent weekly returns, were—Calcutta 30, Madras 28; Paris 27; Geneva 22; Brussels 34; Amsterdam 27, Rotterdam 26; The Hague 25; Copenhagen 25; Stockholm 23; St. Petersburgh 47; Berlin 26, Hamburg 31, Dresden 28, Breslau 35, Vienna 32, Buda-Pesth 51, Rome 24, Naples 33, Turin 30, Venice 26, Alexandria 36; New York 24 per 1,000. Small-pox caused 31 deaths in Paris, 29 in St. Petersburgh, and Buda-Pesth.

'SALUS POPULI SUPREMA LEX.'

WEDNESDAY, JUNE 11, 1879.

## PROGRESS OF MEDICAL LEGISLATION.

It is now about six weeks since we last touched upon that everlasting topic, Medical Reform. If we have not very recently said anything about the subject it was out of fear that the patience of our readers was almost, by this time, exhausted with waiting for news which gave some prospects of the labours of medical reformers coming to a speedy and satisfactory end. At the same time it must be admitted that until quite lately the business which has been transacted during the last few months has been one of progress, and had it not been for the great outcry for the immediate reconstruction of the General Medical Council, the Government Bill would, in all probability, have been by this time law, and a Conjoint Board for each division of the United Kingdom in process of organisation. We say one of progress, because every fresh alteration that has taken place in the attempt made by the Government to meet the wishes of the profession has been an improvement upon the one preceding it. At first, the great flaw in their Bill was that it was merely a permissive one, and left the Scotch Examining Bodies to do as they liked. Then came the compulsory clauses, as well as the amendments which threw the onus of regulating the examinations upon the Medical Council, and made provision for a uniformity of fees and of examinations. There still remained that great stumbling-block, the present and unpopular constitution of the Medical Council; but when the Government decided upon submitting the

question of the reconstruction of that body to a Select Committee, upon whose report the Bill might be amended before it became law, it seemed as if we had arrived at the last act of this eventful drama.

We quite agree with the Council of the Irish Medical Association, that a more direct representation of the profession in the Council is advisable, but more than eighteen months ago we expressed an opinion that the effect of medical reformers insisting upon its immediate reconstruction might be an indefinite postponement of the whole question of medical reform, as well as the loss of the opportunity we then had of obtaining all the other objects which it was, in the interests of the public and the profession, so desirable to secure. It would seem now as if our prediction was likely to come true, for not only has the agitation with regard to the Medical Council led to this question being delegated to the consideration of a Select Committee of the House of Commons, but the new move on the part of the Government has led the whole question of Medical Reform, and of the respective merits of the various Bills on the subject, to be submitted to the same Select Committee. We do not, however, wish to imply that this important step is necessarily either a retrograde or an obstructive one. But as much of the ground, over which the Medical Council and medical reformers have alike laboriously trodden, will have to be gone over again, as some considerable time must elapse before the Committee can examine witnesses, collect evidence, and send in their report, it follows that another year must elapse before any further progress can be made with regard to settling the great questions at issue.

The Select Committee consists of Mr. William Edward Forster, Dr. Lush, Dr. Cameron, Dr. Lyon Playfair, Mr. Mitchell Henry, Mr. Arthur Mills, Mr. Serjeant Simon, Lord George Hamilton, Sir Trevor Lawrence, Mr. Errington, Mr. Goldney, Mr. Heygate, Mr. Wheelhouse, and Mr. David Plunkett.

Now what, it will be asked, may this Select Committee be expected to do beyond what has been already proposed or accomplished? Will their decisions lead to medical reform being more thoroughly carried out than it otherwise would have been? Will they satisfy the aspirations of those ultra-medical reformers who wish to make a clean sweep of all existing institutions, and of that other party who see very little necessity for any reform at all, or will they adopt the policy which Lord Beaconsfield adopted on a recent occasion, and agree to a "compromise" on the subject? As is usual when there is a great move of any kind, each faction may hope or think his own side will come off best. It is curious to observe that the two extreme parties above-mentioned are equally rejoicing over the appointment of this Select Committee. He, who in his seat at the General Medical Council is the great champion of the Scotch corporations, who has been throughout the consistent and eloquent opponent of medical reform, was the very first to propose that the whole question should be submitted to the consideration of a Parliamentary committee. On the other hand, this "great concession of the Government" has been received with unmeasured praise by that organ of medical opinion which has gone as far as any one in agitating for a total revolution in all existing institutions, and a radical change in the present system of medical examinations. How plausibly Dr. Wood spoke at the last session of the General Medical Council in favour of the appointment of this committee, how strongly and on what grounds it was opposed by the great majority of the Council, must be fresh in the memory of our readers. No doubt Dr. Wood thought that, were his advice taken, the settling of the question would be indefinitely postponed, that further obstruction might be thrown in the way of those reforms to which he was so hostile, and that, as he intimated in his speech, the Government Committee might find that the existing state of things and the present condition of medical education, &c., both in this country and in Scotland, was not after all so defective as they had been represented, and that, consequently, very little change was desirable. It must be confessed that those who share Dr. Wood's opinion have, in this new phase of the question, something to hope for, while we, on the other hand, are not without some misgivings. One of the members of the Select Committee, Dr. Lyon Playfair, is a strong and influential opponent of medical reform. The witnesses examined may be, for the most part, persons who are interested in maintaining the present order of things; while those who represent the Scotch Corporations will lose no opportunity of holding up the merits of their system of medical education, and indeed the condition of the profession generally, to the admiration of the Committee. Nor are we very sanguine about the constitution of the Medical Council being so changed as to make that body much more efficient than it is at present. Much will depend upon the number and character of the witnesses examined. If these honestly represent all sides of the question, and not merely the opinions and vested interests of the corporations which have hitherto had the chief voice in the matter, then we may expect to have a Government Bill that will give universal satisfaction. It is impossible to say at present what will be done, and when anything will be done. Perhaps we shall be like the dog in the fable, and find that while we imagine we are in reach of a substantial modicum of reform, we are but grasping at a shadow, and losing a good deal of the advantage already obtained. At all events it may be doubtful whether we shall gain much by allowing this great question of medical reform to drift into the hands of a Parliamentary Committee. There, however, it is at present, and all we can do is to hope for the best.

## DUBLIN SANITATION.

Our Dublin contemporary, the *Irish Times*, takes us to task for "the bitterness, hostility, and the personal character of" our strictures on the sanitary administration of Dublin, complains that we do not explain "wherein lies the job" which we cried out against, and "who is to be benefited thereby." We can say with truth that we would greatly prefer to treat the subject without the use of strong language, especially as the emphasis of our remarks necessarily includes within its scope the medical officers of the Public Health Committee, for both of whom, as gentlemen and men of science, we have the greatest respect. But to describe in tender terms the proceedings of the Public

Health Committee since the passing of the Public Health Act in 1874, and ever since the passing of the Act of 1866, when they were first constituted, during the progress of the existing epidemic of small-pox, and in presence of the appalling death-rate of the city, would be to mis-describe, and would fail to convey to our readers what we, in common with all sanitarians, feel upon the matter. We have not ceased, during many months past, to remonstrate and complain against the faults of omission and of commission perpetrated by the Public Health Committee, giving on each occasion facts and proofs to justify our censures. It is not reasonable for the *Irish Times* to require us to re-traverse the same ground, nor is it truthful for any newspaper having omitted to look back to what we have said, to suggest that we have accused without evidence, or abused without cause.

We cannot now do more than re-state our indictment against the Public Health Committee, and refer the public back to our columns, to the repeated reports of the Sanitary Association, and to the Parliamentary returns on the working of the Irish Public Health Act, for evidence to sustain the indictment.

We accuse the Public Health Committee—

*a.* That they, being entrusted with the sanitary organisation of the city under the Act of 1874, did so arrange as to discourage the sanitary medical officers in searching out the causes of disease, did, habitually and persistently, ignore the reports sent in by those officers, and give those officers to understand that their activity was disapproved of by the Committee.

*b.* That they, having been driven by the public outcry to take notice of the excessive death-rate of the city, did, at length, require reports from their sanitary medical officers, and finding that those reports, in many instances, pointed out very emphatically that the excessive mortality was the result of neglected sanitation, did suppress those reports, snub the writers, and take no action therein.

*c.* That they did not institute any adequate inquiry as to the true causes of the excessive mortality, but, on the contrary, discouraged and resisted every proposal for the holding of such an inquiry by Government.

*d.* That they permitted, and still permit, the sanitary inspection of the city by their superior officers to be almost wholly neglected, that they have not taken, and do not propose to take, any steps towards an honest or sufficient inspection of the city, that they tolerate and, we might almost say, protect the frequent and most abominable neglect of sanitation by tenement-farmers, and refrain, usually, from acting upon the reports of such neglect made to them by their officers.

*e.* That they have, for years, paid salaries to their medical officers, superior and subordinate, whilst the duties attaching to such salaries were not even pretended to be performed, and that, to escape the necessity for compelling their superior sanitary officer to fulfil his function or else resign, they have proposed to pension him off, or to provide him with a sinecure office at the cost of the citizens, making no promise worth speaking of, for the medical superintendence of the organisation.

Finally, *f.* That in the presence of an excessive and constantly increasing mortality amongst the citizens, they have, though armed with the fullest powers and every necessary authority to enforce sanitation, remained for the last five years inactive; that their policy has constantly been to deceive the public by representing that the recorded mortality was only apparent, or was inevitable, and therefore, needing no active intervention, and that their attitude has been, and still is, one of discouragement towards those who are disposed to act energetically towards a remedy for that mortality.

All these charges we profess ourselves ready to prove by documentary evidence if, indeed, any proof were needed. We invite the *Irish Times* to give our indictment as much publicity as it has given to the charge of personal hostility made against us, and we ask the public to say that, assuming our accusations to be proved, we have not spoken one whit too strongly, when we have characterised the sanitary organisation of Dublin as a "sham," and the most recent move of the Public Health Committee as a "job."

## ARMY MEDICAL REPORT FOR THE YEAR 1877.

At the risk of taxing the attention of the reader with the dry statistics of the Army Medical Department, we venture to briefly notice a few interesting points referred to in the Report last issued.

The average annual strength of the troops serving at home and abroad in 1877 was 174,884 non-commissioned officers and men, of which force the admissions into hospital were 165,371, and the deaths 1,723. This represents a ratio of 946 per 1,000 for admissions, and 9·55 per 1,000 for deaths. In glancing at the death-rate among the troops at the different stations for the year 1877, we find that it compares very favourably with that among the troops for the ten years 1867 to 1876. Thus the annual death ratio per 1,000 men in the United Kingdom was 7·20 as against 9·00 for 1867-76; at Malta 8·28 as against 12·20; in the Dominion of Canada 5·87 as against 9·04; Bermuda 4·79 as against 13·33; India 13·75 as against 21·85. With regard to the other stations the difference between the death-rate for the year 1877, and the average rate for the preceding ten years, was not so marked; but in not one instance was the former much higher than the latter. With respect to the United Kingdom, the death-rate of the non-commissioned officers and men was 7·20 per 1,000 of the strength. The "general diseases," which gave rise to most admissions into hospital, and to the greatest number of deaths, appear to have been continued fevers, rheumatism, syphilis, scrofula, and phthisis; while among the "local diseases" those of the respiratory system, the digestive organs, the urinary organs, and the skin, were the most prevalent, and those of the nervous system, and of the heart and lungs, the most fatal. Rheumatism is a common affection in the army, as we also found it to be in the navy; and the rate of admission was much higher than usual in the Western District, and somewhat higher for the Southern, Chatham, South-Eastern, Home, Aldershot, and other districts.

As respects *syphilis*, the rate of admissions for all districts is ·8 per 1,000 lower than in the preceding year. With regard to the operation of the Contagious Diseases Acts, the report is very favourable. Thus while the ratio per 1,000 admitted for primary venereal sores was, for

the 14 stations under the Acts, only 35, it was for the stations not under the Acts as high as 91. While, moreover, the ratio at many of the former stations was remarkably low, the ratio at many of the latter stations was as remarkably high. While the ratios of admissions for Cork, Dover, Winchester, Aldershot, and Woolwich, were only 16, 19, 18, 46, and 29 respectively, the ratios for London, Manchester, and Dublin were 166, 131, and 103 respectively. The adage that "prevention is better than cure," was never better illustrated than by an examination of the figures before us. The high ratios just mentioned are for those towns which are not only not under the Acts, but in which the facilities for contracting syphilis are very great. On the other hand, where, owing to restrictions afforded by the Acts, or to the comparative isolation of the troops, the facilities for contracting this disease are very few, the ratio is remarkably small, however great may be the strength of the force. Thus, of 3,979 men quartered in London, the admissions for primary venereal sores were 660, or more than the number (657) that were admitted at Aldershot out of a force of 14,416; the ratio per 1,000 being in the former case 166, in the latter only 46. We even find, what we failed to do in respect of the navy, a great difference in the prevalence of gonorrhœa in the protected and unprotected stations, although this difference is not so marked as is the case of syphilis. The ratio per 1,000 of the strength admitted for gonorrhœa for 14 stations under the Acts was 68, that for 14 stations not under the Acts, 117. In two or three stations, however, this difference was very remarkable, while at Aldershot, out of the large force above mentioned, the ratio was only 68; for London, where the force only numbered 3,979 men, the ratio was as high as 150. Again, Director-General W. M. Muir observes that for the four years (1860-63) preceding that in which the first Contagious Diseases Act was passed, the average rate of prevalence of primary venereal sores at a group of stations each of which was successively placed under the Acts, is 130, and that for gonorrhœa is 135 per 1,000 of the strength. But in the period 1870-77, during which the Act was in full force in the subjected group, "the average rate of prevalence of the disease fell to 44 per 1,000, and to 97 per 1,000 at the unsubjected group. The rate of prevalence of gonorrhœa in the first years of the application of the Act did not materially differ in the two groups of stations; in the last year, however, the results are favourable for the subjected group, the ratio of which, in 1877, *is more than a third* lower than that of the unsubjected one." We are fully aware that statistical evidence is sometimes vitiated by fallacies that may much weaken or even upset the truth of the inferences drawn from it. It should also be remembered that syphilis, generally, is neither such a prevalent nor such a virulent disease as it was formerly; but making all due allowance for these admissions, we do not see how the facts we have just mentioned can be well explained away by those who contend that the Contagious Diseases Acts have failed to attain the object for which they were passed. At all events we have thought it advisable to draw attention to this part of the Report, especially as the Government will shortly appoint a Commission to inquire into the working of these Acts.

Passing on to quite another subject, that of *vaccination*, we notice that out of 23,508 recruits found fit of service, only 868 (equal to a ratio of 36·9 per 1,000) had neither marks of vaccination nor of small-pox. It also appears that of 7,105 men vaccinated with fresh lymph, the ratio per 1,000 of failures, was only 150, while of those vaccinated with preserved lymph, the ratio was 353·3. With regard to these *recruits*, there are a few points worth mentioning. It is somewhat remarkable that the highest ratio per 1,000 of rejected recruits (314·47) occurs among that class whose occupations are not unfavourable to physical development (as smiths, carpenters, masons, &c.) Next comes shopmen and clerks (300·66), next, manufacturing artisans (299·98), next, labourers, servants, husbandmen, &c. (290·49), next, those engaged in professional occupations, students, &c. (265·77), and, lastly, boys under 17 years (89·05). So that certain mechanics and shopmen, and clerks, show the highest, and boys the lowest ratio of rejections. With regard, moreover, to the causes of rejection, syphilis, muscular tenuity and debility, defective vision, disease of the heart, diseases of the veins, hernia, varicocele, and malformations of the chest and spine, are those which hold the most prominent place. Of a total of 9,998 rejections, no less than 1,519 were rejected for muscular tenuity and debility, and 1,669 for defective vision.

# Notes on Current Topics.

## The Fleming Testimonial.

No one, in this country, has, single-handed, done so much to advance the science of veterinary medicine, or to compel respect for the profession to which he belongs, as Mr. George Fleming. We therefore take great pleasure in congratulating him on the handsome and substantial testimonial which he has just received from his professional brethren. At the late annual dinner of the Royal College of Veterinary Surgeons, he was presented with a handsome timepiece, which was engraved with a suitable inscription, and accompanied by a purse containing three hundred sovereigns. Had the testimonial been ten times more valuable, it would not have been more than Mr. Fleming deserved. When, a quarter of a century ago, this surgeon first began to devote all his time and energies to the study and advancement of veterinary medicine, he found that science, likewise the profession generally, in a very different state to what it is in at present. In those days men studied and practised the veterinary art in a most perfunctory manner. The treatment of the diseases of animals was in the hands of ignorant and uneducated practitioners, many of whom had not so much as dissected a dog. Literature, there was none; so that "with the largest empire in the world, and an almost incomprehensible wealth in animals, in the way of veterinary science and literature we were far behind the smallest Continental State." To remedy this Mr. Fleming has sacrificed days and nights of labour, which other men give to pleasure or to sleep. To teach himself to speak, write, or read six or seven languages, to make laborious translations, to write on various subjects books which have long become classical and standard works—this was but a part of the Herculean

task which Mr. Fleming set himself to accomplish. Truly, there are greater reputations that have been earned on much easier terms. As Mr. Greaves justly remarked, he has proved himself a man gifted with talents of no mean order, and what is more, he has laid out those talents well. Wherever a life-long devotion to a work that has but few rewards is duly honoured, wherever science is cultivated, and the lower animals properly cared for, there Mr. Fleming will be considered to have deserved by fair, honest, and independent means, the perpetual esteem and remembrance of his fellow men.

## Pharmaceutical Society of Great Britain.

PROFESSOR TYNDALL'S speech at the late annual dinner of the Pharmaceutical Society was delivered in a very complimentary manner to that body. He addressed the members of the Society more as medical practitioners than as chemists, and confined his remarks almost entirely to the proficiency and progress of medical science. He justly remarked that "a strong conservative force prevailed in all corporations, and it was natural for a great profession not to be wafted about by every wind of new doctrine; hence it was that new views in medicine were criticised with severity, and even looked upon with dislike. This conservative tendency had prevented the propagation of many a weed, and sent many a quack nostrum to the wall; but when new views were true views it was in the highest degree interesting to observe how they made headway." "The prosperity of the Pharmaceutical Society" was a toast in which most medical men can heartily join, for the Society has done good work in educating chemists up to such a standard as to claim the confidence and respect of both the profession and the public. The Master of the Apothecaries Society said that both this and the Pharmaceutical Society were actuated by the desire of suppressing unqualified practitioners. That is no doubt true, and therefore it is to be hoped the Society will continue to discourage, as much as possible, among its members that "prescribing over the counter," to which so many objections have not unreasonably been made.

## The Death-Rate of Dublin.

THE mortality of Dublin in the week ending May 31, reached the astounding figure of 51·1 per 1,000. In London the death-rate was 20·6 in every 1,000 of the estimated population; in Glasgow, 22·7; and in Edinburgh, 24·8. The Registrar-General hastens to explain that "this unusual death-rate is owing to the circumstance that 137 deaths of persons interred in the several Dublin cemeteries during the first four months of this year were not registered until last week. These deaths, which form 44 per cent. of the total deaths registered during the week, came to the knowledge of the district registrars by means of the returns of burials which are now obtained under the provisions of the "Public Health (Ireland) Act, 1878," sec. 191. The information acquired through these returns may cause an apparently high death-rate for a few weeks to come, but henceforth the returns will be furnished monthly, and they cannot fail to tend to the completeness of the Registration of deaths in Dublin."

This explanation is no doubt satisfactory as regards the present week, but if so, it is obvious that the sanitation of Dublin must be really much worse than the Registrar-General's returns have hitherto represented it to be. These deaths, it would seem, should have been registered from week to week during the last four months. That they were not so registered proves that many deaths within the city have hitherto been unrecorded, and that the death-rate has actually been considerably understated.

We congratulate the Public Health Committee on the excuse thus offered for their shortcoming, which, however, seems to us to make their inefficiency more obvious than before.

## The Sanitary Institute.

THE annual meeting was held last week, Dr. B. W. Richardson in the chair. The report showed that four examinations have been held under the direction of the council for local surveyors and inspectors of nuisances. Twenty-six candidates had presented themselves, of whom 12 wished to obtain certificates of competence as local surveyors, and 14 certificates as inspectors of nuisances. Five surveyors and 13 inspectors of nuisances had gained certificates, and 7 surveyors and 1 inspector of nuisances had failed to satisfy the examiners. Sixteen candidates had expressed an intention to present themselves for the next examination in June. On the motion of Dr. Lory Marsh, who was supported by Dr. Russell, of Edinburgh, and Captain Douglas Galton, a resolution was carried suggesting that the council should proceed with as little delay as possible to carry out that part of the basis of constitution which related to the establishment of a school and classes for the technical teaching of sanitary science.

## Drug Adulteration.

A GROCER was lately charged at Stockton, England, with selling adulterated spirits of nitre and cream of tartar. The County Analyst certified the former to contain 25 per cent. more water than genuine nitre contained. The cream of tartar contained an excess of tartrate of lime—tartrate of lime 8·5 per cent., sand 1·2 per cent., sulphate of baryta 17 per cent. The defence was that although the nitre was of inferior quality it was a commercial article, and of the quality usually sold. The first quality of nitre was seldom produced, the second was usually sold in town, and the third was generally sold in the country for cattle. The purchaser paid for an inferior article, and he was entitled to no better quality than he got. Mere inferiority was no ground on which to convict a man under the Act, and he therefore asked the bench to dismiss his client. The bench fined the defendant 1s. and costs in each case.

CREMATION, having been pronounced a measure of "salutary progress" by the Committee of the Municipal Council of Paris, appointed to consider the question, is about to be introduced into Père Lachaise Cemetery. It has been decided to set up an apparatus on Siemens' principle, and a Columbarium.

## The Health of Great Cities.

APPROPRIATELY to our observations upon the excessive death-rate of Dublin, we may quote from the *Union Médicale* an analysis of the death-rate of large cities in Great Britain for the last five years. "The mortality during that period," it says, "in 23 large English towns was 24·4 per 1,000 of the population, slightly under the mean, which was 24·8. The following towns exceeded that mean: Newcastle 24·9, Birmingham 25·2, Leeds 25·3, Oldham 26·1, Glasgow 26·9, Salford 27·1, Dublin 27·3, Liverpool 28·6, and Manchester 29·0. Liverpool has made great efforts to improve its sanitary condition during recent years, and is now reaping the fruit of such activity. Its mortality for two years (1865-66) was 40·2. For the four years 1875-78 it had fallen to 27·8. The mortality in large towns should not exceed 20·0 per 1,000, and we find that Dover is permanently below that ratio. In other towns it ranges from 23·0 to 28·1, 29·7, and even 30·8 per 1,000. Most of these towns *must* be in a deplorably insanitary condition, and their public health department incurs a terrible responsibility. Above 20·0 per 1,000, all deaths must be laid at their door."

## Superannuation of Irish Prison Surgeons.

THE attention of the Attorney and Solicitor-Generals for Ireland has been drawn by Dr. Brunker, Secretary of the Association of Infirmary Surgeons, to one very serious effect which would follow the scheme attempted by the Prisons Board, and which would effect *all*—both the infirmary surgeons and regular gaol surgeons. Under the Superannuation Act, 36 & 37 Vic., ch. 51, they would be entitled to retire after *twenty* years' service on two-thirds of the salary; but should they have to submit to *re*-appointment, it is understood that the law as it stands at present is, that to obtain the pension, the time would *begin* from the date of the *re*-appointment, and thus they would lose *all* the previous years of service. It is needless to obterve that this is one of the most unjust things that could occur.

## A Catholic Medical Journal.

ACCORDING to a notice in *El Restaurado Farmacéutico* (of Barcelona), a new medical journal has been started in that city, under the title *El Sentido Católico en las Ciencias médicas* (=The Catholic Sense in the Medical Sciences), which is issued "under the censure and approbation of the ecclesiastical authority!"

The *Boletin del Colegio de Farmacéuticos de Barcelona* says that "it inaugurates its existence with the Papal benediction, and that it will not insert any article without previous ecclesiastical approval."

## Surgeons for Zululand.

THE following medical officers have received orders to prepare for service in Zululand:—Surgeon-Majors Burnett, Jackson, Kerr, Murphy, and Skew, and Surgeons Bushe, Donovan, Filvey, Geoghegan, Jennings, Leake, Lloyd, Martin, Parkinson, King, Saunders, Stokes, Usher, Ward, and Wood. This reinforcement will bring the medical forces in South Africa to about ninety, exclusive of Civil surgeons on service there.

## The Parkes Museum of Hygiene.

WE are glad to hear that this museum, of which we some time ago gave a full description, will soon be opened to the public. This event will take place on July 1st; but there will be an inaugural ceremony on Saturday, June 28th, under the presidency of Mr. Cross, the Home Secretary. Considering that the museum already contains a large and varied collection of objects and apparatus relating to every branch of sanitary science, we must regard it as both a novel and a very promising means of affording popular information on various subjects connected with the preservation of health. We trust, however, that the museum will not only "be open to the public," but that the public will be induced by occasional advertisements in the daily papers, lectures, &c., to avail themselves of the opportunity now offered to them of instructing themselves on some of the practical details of those sanitary constructions without which neither a house nor its surroundings can be called perfectly healthy.

## Charitable Bequests.

BY the will of the late Mrs. Mary Dummett, of 25 Upper Buckingham Street, Dublin, amongst others are the following bequests: The Belfast General Hospital, £200, the Lying-in-Hospital, Rutland Square, Dublin, £200, the Hospital for Incurables, Donnybrook, £100, the Adelaide Hospital, Dublin, £100, the Whitworth Hospital, Drumcondra, £100, and to the Provost, Fellows, and Scholars of Trinity College, Dublin, to found a scholarship to be called the Ekenhead Scholarship, to be competed for by students from the co. Antrim, and to be held for three years, £1,000.

## Gratuitous Lessons on Swimming.

WE have on more than one occasion drawn attention to the advisability of doing everything to encourage among the people a taste for this useful and healthy art. It is therefore very satisfactory to hear that the London Swimming Club is now projecting a scheme to add no less than eight additional plunge baths to the now scanty list, at which gratuitous tuition will be afforded to all comers. Its members give displays of swimming to schools or other institutions desirous of inculcating a love of this art amongst pupils and *protegés*, advice in the choice of professional teachers, and otherwise endeavour to forward the movement.

## Arsenical Wall-Papers.

THE subject of arsenical poisoning, by means of wall-papers, paint, articles of furniture, and wearing apparel, is being investigated by a Committe of the Medical Society of London. Any information likely to elucidate the subject will be gladly received by Mr. Malcolm Morris, 63 Montagu Square, W.

IN stating the names of the Select Committee on the Medical Bills, as proposed by Lord George Hamilton, we inadvertently set down Mr. Mills and Sir Trevor Lawrence as Scotch instead of English representatives, and Mr. Dalrymple as an English instead of a Scotch member.

## Our Bank Holidays.

A LETTER which has just appeared in the *Times* reminds us of an article on this subject which we contributed to these columns nearly two years ago. At that time we ventured to remind the public that their bank-holiday cannot be regarded without unmixed feelings of satisfaction "It may be doubted," we said, "whether this is the best way of recruiting the health and strength of the hard-worked citizens of this great city. It is all very well for people to go to church or to war *en masse*, but we are not so sure it is good for them to take their pleasure *en masse*." In the very sensible letter which "A City Tradesman" has sent to our contemporary, he draws attention to the many inconveniences and evils attending these holidays. "The institution, he remarks, "of bank-holidays has now had a fair trial, and, I venture to affirm, has not proved the boon it was intended to confer. So many people having a day at their disposal at the same time causes, as a natural consequence, every exhibition and place of amusement to be overcrowded to such an extent that discomfort, and in many cases danger, instead of pleasure, are the result." He then alludes to the crowded state of the hotels and railway stations, the lateness of the hour at which the "weary children and parents" get home, and the great amount of drunkenness which prevails on these occasions. "A City Tradesman" has not exaggerated the disadvantages attending this system of public recreation. It should be borne in mind that this British carnival—this sudden and simultaneous exodus of the working classes—is only for the day. At night you will see them all flocking home—train after train, penned in like so many sheep, with scarcely any room to breathe, and, if nothing worse, somewhat exhausted with the day's outing. The hygienic surroundings of these holiday folk can be more easily imagined than described. Re-breathed air, the exhalations inseparable from a crowd on a hot summer's day, drinking and smoking, the fatigue incidental to sight-seeing, and travelling by rail—all this must be a heavy discount upon the pleasure and salutary effect experienced by the excursionist. On the occasion to which we refer we suggested that it would be more to the advantage of the public if they could take their holiday piecemeal instead of the wholesale manner at present practised. "There are few great firms and few tradesmen who could not, two or three times a year, allow their *employés* a day's holiday, and even find that the latter did, in the long run, all the more work for their little more play." We are glad to see that we are right in that supposition. "A City Tradesman" says—"As one who employs a great number of hands, I would most willingly arrange with my *employés* to give them the same number of holidays at various times, and I am of opinion that nine-tenths of the traders would be glad to adopt the same course, for not only do we now lose an entire day's trade, but it is unfortunately the case that the week preceding and the week following every bank holiday is a period when business is thoroughly disorganised. I desire neither to curtail the relaxation of the employed, nor to disparage the benevolent intentions of Sir John Lubbock's Acts; but, writing under the conviction that bank holidays have proved a mistake, I think it would be for the welfare of all concerned if, while giving equal privileges to the employed, instead of releasing all at once, the same number of holidays were conceded at different times, so that such days might be spent pleasurably either in the country or in visiting the many interesting exhibitions with which the metropolis abounds, free from the discomfort and overcrowding which seem to increase on every succeeding bank holiday, I venture to say this would prove most beneficial to everyone."

This excellent suggestion requires no further comment, and we feel certain it will be approved of by every medical man who considers the subject from a sanitary point of view.

## The Seaman's Hospital, Greenwich.

IT appears from the report just issued that this excellent institution is still doing good work. The total number of applicants for medical and surgical relief during 1878—the ninth year of the Seaman's Hospital as an institution on shore—was 4,553. Of these 1,549 were received into the wards, and 3,004 were treated as out-patients. During the first and last quarters of the year 833 patients were admitted, and during the spring and summer months 716 patients, The highest number of admissions for one month was 196 in January, and the lowest number 84 in November. Of the total number of in-patients, 793 were passed into the medical wards, and 756 into the surgical wards. The average daily number of sick inmates is estimated as being about 156, showing a marked decrease when compared with that of the past year.

## Arsenic in the Nursery.

A CORRESPONDENT of the *Daily Telegraph* has done well in drawing attention to an exceedingly dangerous use of arsenic. In a box of Kindergarten toys were some cardboard slips for making letters. One side of these slips was covered with bright green paper, which he analysed, and found that the green pigment consists of emerald or Scheele's green, which is well known to be a compound of arsenic and copper. The colour is, moreover, readily removed by moistening with saliva, which is of the more importance as young children are in the habit of putting such things in their mouths.

## Hospital Sunday Collections in Liverpool.

THE Liverpool Hospital Sunday Committee have divided £8,600 among sixteen of the charities of the town. The Royal Infirmary received £2,580, the Southern Hospital £1,396, the Northern Hospital £1,204, the Dispensaries £860, and the others in proportion.

INSPECTOR-GENERAL of Hospitals, A. Anderson M.D., C.B., half-pay, late of the Army Medical Department, has had a distinguished service reward conferred on him.

NOTICE has been given that an examination of candidates for commissions in the Medical Service of the Royal Navy will be held at the University of London, in August next, the precise date of which will be duly announced.

Professor Cameron, of Dublin, one of the foreign editors of the Paris *Revue d'Hygiene, et le Police Sanitaire*, has been elected an Honorary Corresponding Member of the Society of Public Medicine and Hygiene of France.

The Duchess of Edinburgh has consented to open a bazaar and sale of fancy work, to be held at the Cannon Street Hotel on the 1st and 2nd of July, in aid of the funds for furnishing the new in-patient wards of the North-Eastern Hospital for Children, Hackney.

The death-rate from the seven principal zymotic diseases averaged 2·6 per 1,000 in the large towns last week. Scarlet fever showed the largest proportional fatality in Dublin, Sunderland, and Leeds; measles in Newcastle-upon-Tyne and Bradford; and whooping-cough in Sheffield and Birmingham. The deaths from fever, principally enteric, were unusually few, except in Dublin. Three deaths were referred to diphtheria in Bradford, and 2 in Brighton. Small-pox caused 8 more deaths in London, 13 in Dublin, but not one in any of the other large towns.

The rates of mortality per 1,000 last week in the principal large towns were—Brighton 15, Plymouth 15, Leicester 16, Portsmouth 16, Bristol 17, Sheffield 17, Wolverhampton 17, Leeds 18, Birmingham 19, Salford 19, London 21, Nottingham 22, Glasgow 23, Liverpool 23, Norwich 23, Sunderland 23, Bradford 23, Hull 24, Manchester 24, Oldham 25, Edinburgh 25, Newcastle-upon-Tyne 28, and Dublin 51. It should be mentioned that what appears to be an exceedingly high epidemic rate in Dublin is in reality only the addition of arrears of statistics under the new Public Health (Ireland) Act. More than 40 per cent. of the deaths in this computation occurred before the beginning of May.

# Correspondence.

## DIPTHERIA AND CROUP.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—Notwithstanding the great amount of discussion which has lately taken place on the "croup and diphtheria" question, I must still beg to offer a few remarks, partly of a personal, partly of a general nature, in further elucidation of the subject.

In the first place, I maintain that the issue involved is as yet only partially understood, and with regard to myself, my opinions have been misinterpreted, in spite of the distinctness (as I believe) with which they have been expressed on repeated occasions. When I read, for instance, that "Dr. Semple, Sir William Jenner, Dr. Johnson, Dr. Dickinson, and others are convinced of the identity of croup and diphtheria," I must state, *in limine*, that I for one am convinced of nothing of the kind, and that I have never expressed any such conviction. The distinguished gentlemen with whom I am thus casually but flatteringly associated by the writer, are, of course, fully able to answer for themselves, and although I fully believe that their opinions are in accordance with my own, they have no doubt arrived at their conclusions by independent means of investigation, as I have done myself.

I deny, then, that I have ever said that I am convinced of the identity of croup and diphtheria, and I appeal to my published writings, papers, and speeches, in support of this denial. What I have stated over and over again, and with a reiteration which I have sometimes feared was tedious, is that the form of diphtheria which attacks the larynx and trachea (or laryngo-tracheal diphtheria), is the same disease as that form of croup which is attended with the formation of a false membrane (membranous croup). I have also shown by abundant evidence that the word "croup" is used by most British systematic writers to designate at least three totally different diseases, namely, laryngo-tracheal diphtheria, infantile laryngitis, and laryngismus stridulus; and I am of course aware that diphtheria in a great many cases (indeed, perhaps the majority) never attacks the wind-pipe at all. Unless, then, I am believed to be totally ignorant of the literary and clinical aspects of the question, I cannot conceive why I should be deemed guilty of uttering or defending any such absurdity as that diphtheria, a membranous disease, which is a general one attacking many parts of the body, is the same affection as the so-called croup, which, whatever be its supposed nature, attacks only the larynx and trachea; and which, moreover, is sometimes a purely spasmodic affection, passing away with the causes which produced it.

Having thus emphatically denied that I am convinced, or ever was convinced, of the identity of the so-called "croup" and diphtheria, I maintain with equal emphasis that the *laryngo-tracheal form* of diphtheria is identical with *that form* of croup which is characterised by the presence of a false membrane in the larynx and trachea. It is not very long since that the identity of typhoid fever and the fever described by Cullen and other systematic writers was vehemently denied; and no doubt there are many persons in the present day who do not yet recognise that identity, and who perhaps insist that the fevers of the present day are totally different from those described by our immediate ancestors, and that over and above the fevers now designated respectively typhus, typhoid, febricula, and relapsing, there are the synocha, synochus, and typhus of Cullen. It seems to me that this is the very class of writers and thinkers who now deny the identity of laryngo-tracheal diphtheria and membranous croup. They have been educated, as I was myself, in the doctrines of Home and Cheyne, and they still firmly believe in the correctness of those doctrines, whereas, if they had examined the question historically and clinically, they would have been convinced, as I now am, that those authors, although perfectly honest as to facts, were quite mistaken as to the conclusions which they drew.

"Laryngo-tracheal diphtheria is identical with membranous croup." That is my contention, and there I take my stand. The paper I wrote in 1875 for the Royal Medical and Chirurgical Society maintained and defended that proposition, which has been invalidated by nothing which has subsequently transpired. All the arguments supposed to controvert the proposition have merely tended to show that ordinary infantile laryngitis is totally different from diphtheria, a fact which I never denied, and which, indeed, I have always maintained. There is, therefore, no opposition to my views, for I maintain as strenuously as any one can do that croup and diphtheria represent two distinct ideas, croup being a generic term including several different affections, and diphtheria a specific disease attacking various parts of the body, but always characterised by the presence of a false membrane.

My opponents, if I have any such, must show, not that croup and diphtheria are different, which I do not deny, but that "laryngo-tracheal" diphtheria is different from "membranous" croup. It has been proved that the so-called membranous croup has propagated diphtheria, and *vice versâ* that faucial diphtheria has propagated membranous croup; but still it is maintained that the diseases are essentially distinct, a logical sequence which to me is utterly obscure, and in fact seems to be a *non sequitur*.

Many years ago, when I first wrote on the subject, and held the same opinions as I now hold, I undoubtedly encountered opposition from many quarters. Some opponents, then as now, contented themselves with the conventional expression, "Croup and diphtheria are totally different diseases;" but without condescending to examine the question I proposed. Others, however, who kindly pointed out to me my supposed mistakes, declared that the false membrane in laryngo-tracheal diphtheria was totally different, chemically and microscopically, from that of membranous croup. Others, again, recommended me to study the writings of the German school, who would prove me to be in error. Others pointed out the different situations respectively occupied by the two affections, and their supposed anatomical differences. Now I had examined all these points for myself, and although I appreciated the kindness with which the advice and information were offered, I deemed it superfluous.

But when the question which I had raised was brought, by the appointment of a Committee of the Medical and Chirurgical Society, before the whole profession, I was rejoiced that the matter would now be thoroughly investigated, and that my opponents would have the opportunity of showing the grounds of their opposition. But to my surprise and amusement, I found that those who had formerly most vigorously denounced my conclusions, were now totally silent, most of them not even replying to the printed questions addressed to them by the Committee, while the majority of those who did answer contented themselves with the repetition of the stereotyped formula, "croup and diphtheria are totally different diseases."

As I have before stated, I admit this distinction, but I ask, in conclusion, "what is the difference between laryngo-tracheal diphtheria and membranous croup?" If any of your numerous correspondents will kindly answer this question, not only I, but the whole profession, will be enlightened; for it is perfectly true that the Report of the Membranous Croup and Diphtheria Committee has not answered it. There is almost a touch of humour in the regret expressed by some of the speakers in the late debate, that no definite distinctions had been drawn in the Report between laryngo-tracheal diphtheria and membranous croup. Certainly no such distinctions have been drawn, and, as I conceive for the best of all reasons, as I have myself repeatedly declared, namely, *because there are none.* There is a theorem in Euclid which shows that if two figures have their sides equal and their angles equal, they are equal to one another, and such is the case with laryngo-tracheal diphtheria and membranous croup. The Report wisely refrains from asserting that no such distinctions will ever be found, for with his limited capacities, a mortal man can no more declare dogmatically that the features of a disease *may* not change than that some new constellation may not some day be discovered in the heavens.

I remain, sir, yours, &c.,

ROBERT HUNTER SEMPLE, M.D.,
F.R.C.P. Lond.

8 Torrington Square, London,
May 29, 1879.

P.S.—Since the above was in type, I have read in the last number of the *Medical Press* an interesting letter on "Croup and Diphtheria," by Dr. Prosser James. The writer's views are for the most part in accordance with my own, but on some matters of fact I confess that I do not understand him. He states, for instance, that the Academy of Medicine in Florence in 1874 "pronounced in favour of dualism," meaning, I presume, the distinct nature of membranous croup and laryngo-tracheal diphtheria. Now, unless there are two Academies of Medicine in Florence, which have arrived at diametrically opposite conclusions in reference to the same question, I think that Dr. Prosser James must have fallen into an error. I had all the records of the Florentine epidemic of diphtheria sent to me in the original Italian, and also the Report of the Academy of Medicine in Florence on the subject, and the Academy came to the unanimous conclusion that laryngo-tracheal diphtheria and pseudo-membranous croup were identical. The Italian words are—"La forma crouposa e la forma difterica si consociano e si succedono in maniera da apparire come fasi e modalità in ragione di tempo e di sede *d'uno stesso processo morboso.*" It is true the Academy admit, as Dr. James states, that a true primitive croup (namely, one limited to the trachea) does exist, but they add that this is *very rare;* and I may observe that this limited and localised form of diphtheria is perfectly well understood by the French writers, and is called "*croup d'emblée.*" But, as I have hinted, perhaps Dr. James refers to some other epidemic, or some other Report; and, if so, I should like to know where I can find the particulars, for I have searched for them in vain in the Italian medical journals.

## MEDICAL TITLES.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—In answer to a question put by a correspondent in your issue of May 21st, you say "On the strength of your diploma from the College of Physicians of Edinburgh, you can assume the title of 'Dr.' and use it on your door-plate." In referring to the case of Addison (June 4th), you deny that a licentiate of a college of physicians has any more right to style himself or to be styled "physician" "than the boy who carried out his medicines." Why can a man call himself "Dr." when he is not a doctor? If a L.R.C.S. is a surgeon, why in the name of common sense is not a L.R.C.P. a physician? I do not see what else he can be called. He may be called simply surgeon, as is usual in England, but that is a relic of ancient times when a man only possessed one diploma, and when the London College of Physicians would not allow a surgeon to hold its diploma. To style himself "general practitioner" would be to get himself put down as an oddity or a quack. I am aware that some amongst the public, in England especially, take the word physician as signifying a consultant or "pene." So it probably did years ago, when men only took one qualification. But now, when everyone is doubly qualified, it seems absurd that the plain meaning of words should be ignored in deference to the old-world notions of the public. If Fellows of a College of Physicians are afraid that they will be confounded with general practitioners, let them call themselves consulting or pene physicians. That some of them are so confounded is due to themselves. Are there not Fellows who visit patients for less than a guinea? I have heard that some give two or three visits for that fee. I believe that in Germany the physician is an inferior practitioner. I have the L.R.C.P. Ed., and would be much obliged if you could enlighten me on the above points, as I am anxious to know what I *can* call myself.

Yours &c.,

PERPLEXED.

June 4th, 1879.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—Under the heading "Charge of Murder against a Physician," page 453, of your issue of the 4th instant, you say—"It is scarcely advisable for people to believe, &c., &c., that every practitioner is a physician who puts 'Physician and Surgeon' on his door-plate, or who may have received from some College of Physicians a licence to practise medicine."

It surely must be ever advisable to write and believe the truth; if so, how is a man to characterise himself who is a Licentiate, or Member, or Fellow of a College of Physicians, or Surgeons, but as a physician or surgeon? His being what you characterise as "simply a general practitioner engaged in general practice," and "who had no more right to call himself, or to be called, a physician than the boy who carried out his medicine," will be received as a "fallacy" by all who know, and have no interest in trying to evade, the truth.

The division of labour is a very good thing, and the receipt of large fees a very pleasant one, but do all those who profess *purity* of practice act up to their professions? Let the recent revelations in the *Brit. Med. Journal* on "Physicians and their Fees" answer the question.

The only real distinction betwixt men is that of gift and culture, and the history of the profession smells sweet of men who, being "general practitioners," yet have given the brightest, the noblest, and the best discoveries, and have added the brightest and the noblest names to the roll alike of science and the medical profession.

I am *not* a "general practitioner," and a sense of the injustice you endeavour to do such members of our craft alone tempts me to take exception to what you write and your manner of doing it. I ask you in common fairness to insert this letter.

Your obedient servant,

June 6th, 1879. M.D.

[WE should be the last to say anything to disparage the position which the general practitioner holds in his profession, and are surprised that any of our correspondents should have put such a construction upon the remarks we made last week. We thought then, as we still think, that it was a mistake of the lay journals to represent men of the stamp of Adam Addison as a "physician," and we still maintain that it is not advisable for the press to foster this belief that every medical man is a physician who puts on his door-plate "Physician and Surgeon," or who has received a *licence to practice medicine* from a college of physicians. The generally accepted distinction between "physician," "surgeon," and

"general practitioners," is a good one, especially as it represents three distinct modes of practice, but it is one that can have no standpoint if a practitioner is entitled to call himself a physician, although he is neither a *member* of a college of physicians, nor *practises* as a physican. As we received the above letters shortly before going to press, there is no time to enter into further details, but we promise our correspondents to take the earliest opportunity of doing so.—Ed. M. P. & C.]

## PROFESSIONAL COMMUNICATIONS TO LAY PAPERS.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—I take the liberty of occupying a little of your valuable space in making the following explanation with reference to the publication of an article by me in one of our local papers. The article in question was published by me in the *Lancet*, May 17th last, and not, as you are led to infer, primarily in the local lay newspaper in question. When I learned that it was to be published in the latter as it appeared in the former, I made every effort to prevent it, but unfortunately, owing to one side of the newspaper being printed one day before the other, was too late, the editor having sent it in at once, believing that as it appeared in one paper it could be published in another.

You will thus perceive that it was only a blunder; however, I deem it due to my professional brethren and myself to make the above explanation.

Your obedient servant,

T. O'N. Russell,
Limerick Union, June 6, 1879. Res. Med. Off.

[We are pleased to elicit the foregoing repudiation, which is quite satisfactory as regards the writer, but we retain our opinion that an editor has a limited knowledge of his duty to his readers or to any one else if he, as in this instance, transfers without acknowledgment an article from another paper the subject of which was of a strictly professional nature, and of very indelicate detail, especially when the author of the communication is within stone's throw, and might be consulted as to the propriety of republication.—Ed. M. P. & C.]

# Literature.

### Short Notices.

(1). "Experiments with Living Human Beings." By George M. Beard, M.D.

(2). "The Quarterly Journal of Inebriety." Lockwood and Co. Hartford, Connecticut. London: Baillière and Cox. March, 1879.

(3). "Fifth Annual Report of the Rural and Urban Sanitary Authorities of the Halifax Union." By Thomas Britton, M.D.

(4). "Hydropathy." By E. Martlett Body, F.R.C.S. London: Baillière, Tindall, and Cox. 1879.

(1). Dr. Beard, in this pamphlet reprinted from the "Popular Science Monthly," points out some of the many sources of error to be avoided in dealing with disease in the human subject, and especially in experiments, such as those made by Charcot and his coadjutors, with metalloscopy and metal-therapeutics. It is almost a matter of regret that we should require such a paper. There can be no doubt the author is justified, even at the present day, in insisting on the necessity of careful experimentation, and is not a bit too severe in his remarks at page 2. The great name of Charcot (and we are undoubtedly indebted to him for contributions of the highest value, as the columns of the *Medical Press and Circular* have so frequently testified), is not even a protection against imposture. It would be well if our experimenters bore in mind the possible sources of error, so well-pointed out by Dr. Beard in this short essay.

(2). We are glad to notice that this American Journal not only maintains it character, but is even improving. It is not sufficient to point out the evils of intemperance, or to lament over the misery caused by the use and abuse of alcoholic drinks, or to pile up weekly accounts, of the dreadful incidents and crimes committed under the influence of alcohol. We are emerging into a healthy period in reference to the drink question—a period of action. In the first place, we are truly grappling with the evil, by counteracting the temptations of the public house, by providing coffee houses and amusements; and in the second place, by endeavouring to cure inebriates. We have passed the age of controversy.

Thousands and thousands of pounds have been spent on the *Alliance News*; we hope now thousands and thousands of pounds will be spent in the direction we have pointed out above.

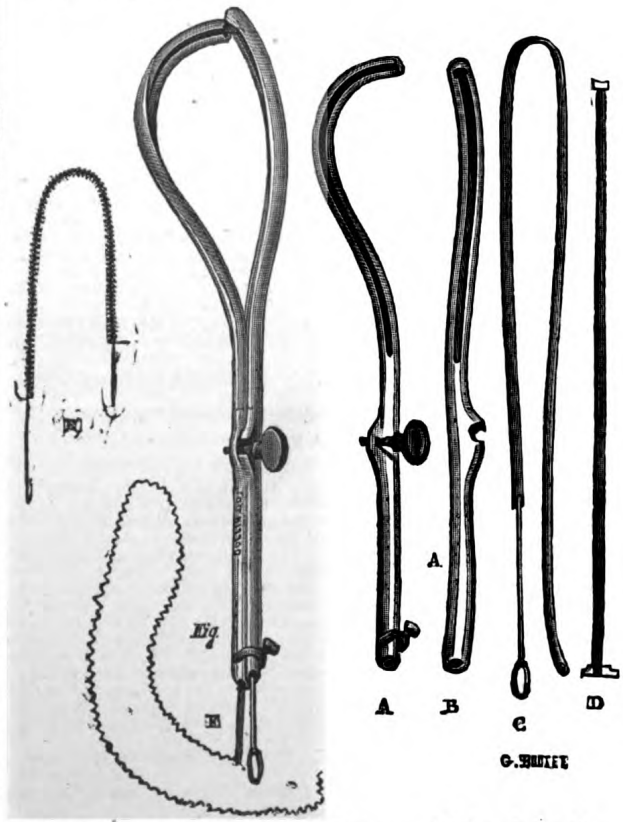
(3). We have received the fifth Annual Report of this sanitary authority, which is of the usual interesting character, showing that good practical work has been done.

(4). Mr. Boddy has republished in pamphlet form, his papers, which are already familiar to the readers of the *Medical Press and Circular*, so that we need hardly make any comment upon them. Hydropathy is a neglected branch of medical science. In a small compass, some useful facts in connection with it are here explained.

# Novelties.

## AN INTRA-UTERINE SAW.

M. Tarnier has recently presented to the Surgical Society of Paris, in the name of M. Pierre Thomas, instruments which are intended for the intra-uterine decollation of the fœtus. The description of these instruments is given in the *Progrès Médical*, of April 5, and they are illustrated in the accompanying sketch.



At A is depicted the crochet of Braun, modified and armed with the chain saw. Its use is to pass the chain saw round the neck. B is a new instrument for protecting the vagina whilst it is traversed by the saw. In use the instrument will engage the neck of the fœtus in the loop of the saw, as it is shown above the protector. The operator then seizes the handles, and by rapid to-and-fro movements, severs the neck in a few seconds. C is a hook for passing the saw quickly through the protector. The instrument is made by Collin, of Paris.

# NOTICES TO CORRESPONDENTS.

Dr. Birkbeck Nevin's letter is again held over for want of space. Correspondents should remember that our columns are not made of india-rubber. We have already reduced Dr. Nevin's letter about one-third its original length, and it still makes four columns of type.

Dr. Lauder Brunton, F.R.S.—"On Pulsation in the Jugular Vein" received.

Society for Relief of Widows and Orphans.—Members are reminded that the next quarterly court will be held on July 9th. The names of candidates to be balloted for must be sent to the Secretary at 53 Berner's Street, London, W., on or before the 17th inst.

An Inquirer.—The gentleman referred to is now practising as a consulting physician at Nice.

Mr. T. Wilson.—Sorry we can give you no information; the preparation has been but recently brought under our notice, and we have not yet had sufficient time to test it practically.

## POOR-LAW PROFESSIONAL AMENITIES.

*To the Editor of the* Medical Press and Circular.

Sir,—An election for medical officer to a certain dispensary district resulted on two occasions in another gentleman and myself receiving an equal number of votes. On the third occasion he was elected by a majority of one. After being elected, he requested me to continue to act for him for a week (I had been acting *pro tem.*), and I at once consented. He then asked me, in presence of the chairman of the dispensary committee, what I would charge him. I said, don't mind now, we will arrange it at another time. He replied, in presence of several persons, "You may afterwards claim £6 6s., and we had better arrange now." I then said, I am sorry to have promised you to act. Still, as I have done so, I will keep my word. I will charge you £2 2s. for a week.

I was receiving £3 3s. a week from the guardians, and it was my intention at the time to have done duty for him gratis.

He now refuses to pay me the £2 2s., and I am anxious to have your opinion. *Would it be unprofessional to process to quarter sessions?* By the way, this gentleman or his friends acted very ungentlemanly towards me during the election. They got bills printed and posted through the district, saying my father had quenched more fires *than Bridge*, &c., which undoubtedly had a very injurious effect on me.

Faithfully yours,
Professional Honour.

[If the facts be as stated, our correspondent certainly has good cause for disgust and anger in regard to the conduct of his professional neighbour, which, if truly represented, was simply disgraceful. Nevertheless, we deprecate a resort to law. It would, probably, dirty our correspondent as much as the defendant, and it is better to leave a person capable of such conduct to public opinion and his own conscience.—Ed.]

Mr. Cripps Lawrence.—"On Intermittent Broncho-Pneumonia" received.

Dr. Ringrose Atkins.—"On Othæmatoma" received.

Dr. Tuckey.—"Experiences of a Poor-law Medical Officer received.

The subjoined brace of advertisements appear in juxtaposition in the *Belfast News Letter*:—

*A Card.*—Doctor Henry O'Neill, late Senior Resident Surgeon, Belfast Royal Hospital, begs to inform his friends that he has removed to 5 College Square East, where he can be consulted from 9 to 10 o'clock in the morning, 2 to 3 o'clock in the afternoon, 7 to 8 o'clock in the evening.—May 9, 1879.

*A Card.*—Mr. and Mrs. Burn, Resident Chiropodists, 2 Murray's Terrace (off College Square), Belfast. Terms and hours as formerly. Reference to patients in Belfast.

Mr. Spencer Watson, F.R.C.S.—"On Double Lachrymal Fistula" received.

Dr. T. Morton.—"On the Diphtheria Outbreak" received.

## A FACT.

*To the Editor of the* Medical Press and Circular.

Sir,—Ruminating over affairs in general this gloomy weather, the thought struck me that I should like to communicate to you a "fact" on the comparative value of two businesses over a period of time—viz., a chemist's and a publican's. In this neighbourhood stands two corner houses, exactly facing each other, and of the same size and appearance—one a chemist, the other a public-house. Over a period of twenty-five years each of these houses has changed hands three times, and at the last change the purchase-money of the chemist's business was £1,000. The public-house business was sold for £14,300. This is a fact! But it must certainly be discouraging to the noble band of temperance reformers in our profession who are striving so earnestly to put down alcohol. If I commenced life again with my present knowledge, and was given a choice by my paternal relative for a living—a "medical shop" or a "public shop," I should be almost inclined to say with Shakespeare, "throw phys to the dogs, I will have none on't" give me a "public" bar.

You truly,
A Philosopher.

London, W., June 7, 1879.

N.B.—The proprietor of the "public" drives his curricle and pair; the medicine man uses a shank's pony.

Medical Bills.—A short time since we drew attention to the fact that, owing to the lax principle of general practitioners not sending in their bills every three, or at the outside six months, an enormous aggregate in fees was lost annually to the profession. The *Louisville Medical Journal*, following up this subject, says: "Doctors are almost alone in the custom of giving long credits, and they should get out of it, in justice to themselves and to their patients. Many a bill is lost because it was not presented promptly. It is painful for any one to pay for a thing which is well-nigh forgotten; and besides, when an account runs a long time it may have grown to such an extent as to put it beyond the ability of the debtor to discharge it, while in broken doses it might have been easily managed. It is all nonsense to be mealy-mouthed about matters of this sort. No patient whose patronage is worth having can take offence at the doctor for taking care of himself and family, even as the patient does himself in matters monetary."

A Novel Method of Controlling Vicious Horses.—That excellent publication, the *Veterinary Journal*, has in its issue for June drawn attention to the power electricity has in subduing vicious horses. At a recent *séance* of the National Society of Agriculture, M. Bella gave some interesting details of the subject. By the process adopted, intractable animals given to biting, rearing, kicking, &c., are rendered inoffensive, and submit peaceably to be groomed and harnessed. To obtain this result a weak current of electricity is passed into the mouth of the horse each time it becomes restive, the will of the animal seems almost annihilated. The current is produced by a small induction machine, the wires of which communicate with the bit of the bridle. In the case of resistance by the horse, the driver has merely to push a button, when a current passes immediately, and the animal becomes docile. The employment of electricity is said to produce a sort of uneasiness or torpor, rather than pain, and is much less barbarous than many taming methods hitherto adopted, such as those which depend on weakening by deprivation of food, on fatigue, &c.

## VACANCIES.

Beckett Hospital, Barnsley.—House Surgeon. Salary, £150. Applications to the Hon. Sec.

Bristol General Hospital.—Physician's Assistant. Salary, £50, with board. Applications to the Secretary before June 21.

Enniscorthy Union, Oulart Dispensary.—Medical Officer. Salary, £100, with fees, and £15 as Medical Officer of Health. Election, June 24.

London School of Medicine for Women.—Lectureship on Materia Medica. Applications to the Dean before June 12. (See Advt.)

Manchester, Owens College.—Demonstrator and Assistant Lecturer on Anatomy. Salary, £150. Applications before June 13. (See Advt.)

Maynooth College, co. Kildare.—Medical Attendant. Election, June 24.

Middlesex Hospital.—Physician and Surgeon on the Honorary Staff.

Naas Union, Blessington Dispensary.—Medical Officer. Salary, £125, with fees, and £15, as Medical Officer of Health. Election, June 23.

Naas Union, Clane Dispensary.—Medical Officer. Salary, £125, with fees, and £15 as Medical Officer of Health. Election, June 17.

Samaritan Free Hospital for Women.—Physician to the Out-patient's Department. Applications to the Secretary on or before June 24.

Surrey Dispensary.—Medical Officer. Full particulars of the Secretary, Great Dover Street, Southwark, S.E.

## APPOINTMENTS.

Best, G. P., M.B., M.R.C.S.E., Resident Surgeon to the Aston Branch of the Birmingham General Dispensary.

Brown, W., L.R.C.P.Ed., M.R.C.S.E., Medical Officer for the Caldewgate District of the Carlisle Union.

Burnside, G. S., L.R.C.S.I., Certifying Factory Surgeon for the District of Clondalkin, co. Dublin.

Coghlan, P. F., L.R.C.S.I., Medical Officer to the Ulid Dispensary, Waterford Union.

Duigenan, J. J., L.R.C.S.I., L. & L.M.K.Q.C.P.I., Medical Officer to the Edenderry Workhouse, and Consulting Sanitary Officer.

Elliott, H., M.R.C.S., House Surgeon to the Westminster Hospital.

Fallon, J. S., Resident Obstetric Assistant to the Westminster Hospital.

Gorst, H., M.R.C.S.E., L.R.C.P.L., House Surgeon to the Liverpool Lying-in Hospital.

Hassall, J., M.B., C.M., M.R.C.S.E., House Surgeon to the Stockton Hospital and Stockton Dispensary.

James, W. C., M.D., Physician to the Westminster General Dispensary.

Kelly, Dr. T. J., Medical Officer, Medical Officer of Health, &c., for the Enniscorthy No. 1 Division of the Enniscorthy Dispensary District.

McCall, Mr. J., House Surgeon *pro tem.* to the Dental Hospital of London.

Shea, J., M.D., M.R.C.S., Physician to the Royal Berkshire Hospital.

# Marriages.

Pearsall—Stack.—On June 4, at St. Colomb's Church, Omagh, co Tyrone, William Booth Pearsall, F.R.C.S.I., to Marguerite Emily, eldest daughter of George Hall Stack, Esq., Mullaghmore Omagh.

Powell—Farrow.—On June 5, at Mundham, A. E. Powell, M.R.C.S., L.R.C.P., of Holme Dale, to Mary, only child of J. Farrow, Esq. of Mundham House, Norwich.

Waddell—Gilbert.—On June 5, at St. Mathews, Thorpe, Norwich, J. C. Waddell, M.D., of Norwich, to Caroline, only daughter of the late Robert Gilbert, J.P., of Ashby, Norfolk.

# Deaths.

Barker.—On June 5, at 18 Bayview Avenue, Dublin, after a protracted illness, James Barker, F.R.C.S.I.

Biddle.—On May 17, at Yately, Thomas James Biddle, M.R.C.S.E., aged 45.

Dunn.—On May 29, at Birmingham, George Peat Dunn, M.R.C.S.E., of Halesowen.

Heginbotham.—On June 2, at Bruton, Somerset, Edmond Heginbotham, M.D., aged 44

Hooper.—On May 28, at Jersey, George Symes Hooper, M.D., aged 79.

Kitching.—On May 26, at Milnthorpe, John Kitching, M.R.C.S.E., aged 83.

Medd.—On May 30, at Shrewsbury, John Medd, M.D.

M'Ilroy.—On June 5, at 16 Royal Terrace, Kingstown, John M'Ilroy, M.D., R.N.

Oakes.—On May 31, at Waterside, Derry, Frederick Ashton Oakes, M.R.C.S.E., Surgeon-Major, Army Medical Department, aged 51.

Stuart.—On June 3, at Reading, Surgeon-Major John Stuart, late of the Royal Engineers, aged 50.

Walsh.—At Littevant, co. Cork, Patrick Lynch Walsh, M.D., aged

# IRISH POOR-LAW INTELLIGENCE.

## MEDICAL OFFICERS OF HEALTH FOR IRELAND.

THE Council of the Irish Medical Association, having taken an opinion of counsel relative to the duties and remuneration of the medical officers of health, have addressed the following communication to the Local Governmont Board:

TO THE SECRETARY TO THE LOCAL GOVERNMENT BOARD.

Irish Medical Association,
Royal College of Surgeons, Dublin.
9th May, 1879.

SIR,—With reference to the recent correspondence between the Council of the Irish Medical Association and the Local Government Board relative to the position, duties, and remuneration of the Medical Officers of Health under the Public Health (Ireland) Act, 1878, and more immediately to the contents of your letter (No. 6,850—79, Miscellaneous) bearing date the 2nd April last, I am directed by the Council to state that, as their views regarding the effects of the repeal of the Public Health Act, 1874, and the requirements of the new Act, were so widely different from those entertained by the Local Government Board, and as the points at issue had reference to the correctness of the interpretations to be put upon the law, the Council have had prepared for the opinion of counsel a case which embraced the correspondence on the subject up to 8th April, 1879.

The case was submitted to Mr. Purcell, Q.C. (a copy of whose opinion I herewith forward, together with the questions put to him), and it will be observed the views of the Council are, in every parti ular, supported by his opinion.

I am therefore directed by the Council, in the event of such opinion being concurred in, to express a hope that the Local Government Board will now see the expediency of assigning to the Medical Officers of Health their proper duties and functions under the Public Health Act, 1878, and also of informing the several sanitary authorities throughout Ireland that it is their duty to fix anew the salaries of those officers without having regard to the amount of the salary paid to the Medical Sanitary officers under the Act of 1874, or to any scale whatsoever; and, furthermore, to determine the amount of such salary (subject to the approval of the Local Government Board) as they may deem equitable remuneration for the duties to be performed.

I am to request that the Local Government Board will have the goodness to inform the Council, at their earliest convenience, as to their intention, or otherwise, to adopt the view of the law as expressed by Mr. Purcell, as the Council are desirous of having the question finally dealt with in whatever manner may be found necessary, and as considerable time has already elapsed since the passing of the new Act. Indeed, this delay has caused great dissatisfaction to the Medical Officers of Health, who are in a state of uncertainty as to their duties, and also as to whether their services will be adequately requited.

In conclusion, I am directed to repeat that, unless the Medical Officers of Health be fairly remunerated for their services, the intentions of the Legislature with regard to sanitation in Ireland, as expressed in the new Act, must prove as great a failure as did the Public Health Act of 1874, which, however, was alleged to be but a "tentative" measure.

I am, Sir, your obedient servant,
JOHN WILLIAM MOORE, M.D.
Hon. Sec. to the Council.

The questions put to Mr. Purcell, Q.C., and his opinions thereon will be found in the Supplement to the MEDICAL PRESS of May 21, 1879.

The following reply has been received:—

No. 12,573—1879. Miscellaneous.

Local Government Board, Dublin.
7th June, 1879.

SIR,—Referring to your letter of the 9th ult., relative to the position, duties, and remuneration of the Medical Officers of Health under the Public Health (Ireland) Act, 1878, the Local Government Board for Ireland desire to state that, having found it necessary to obtain the advice of counsel on several questions arising under the 11th section of that Act, they have been advised that it is desirable to issue new orders in relation to the duties and salaries of the Medical Officers of Health. The subject of the suggested orders is now under consideration.

By order of the Board,
B. BANKS, Secretary.

To John William Moore, Esq., M.D.,
Hon. Sec. to the Council, Irish
Medical Association.

We cannot refrain from reference to the proceedings of the Local Government Board in this matter, and to the excuse pleaded by them in the foregoing reply. Here is a great public department fully cognisant that questions had been raised in Parliament with reference to an amendment of the law which they themselves were charged to administer. Being perfectly well aware that these amendments were pressed with a view of changing the state of affairs as affecting their own officers, and that Parliament had decreed these changes with deliberate intention, the Local Government Board takes upon itself to ignore the orders of the Legislature and to obstruct its wishes; and, instead of loyally and actively carrying out the terms of the Act of Parliament, as it was bound to do,

it takes not the least notice of the change of law for nearly twelve months, and even refuses to carry that change into effect when its nature was forced upon their consideration from outside. It appears from the reply of the L.G.B. that, "having found it necessary to obtain the advice of counsel on several questions arising out of the 11th section, they are advised that it is *desirable* to issue new orders." Being perfectly conversant with the terms of the Act, we fail to understand that any legal opinion was necessary, or could have altered the law. But if there existed any ambiguity it seems strange that the Local Government Board should not have taken steps to remove such ambiguity when the clause became law, or should have delayed for twelve months before taking advice thereon. It being at length satisfied that it is "desirable" to issue the new orders, we hope that no further jogging of the official memory will be needful. We trust we are not too sanguine in anticipating a change in this method of doing business under the *regimé* of the new vice-president.

## MOUNTMELLICK UNION.

### LUNACY CERTIFICATES.

Mr. Phillips said, in the *Leinster Express* he found the following words given as expressed by Mr. Cullen: "He recollected a great number of years ago a guardian came in and voted for a certain medical man, but he afterwards went to Mr. Cobbe and made an act of contrition, and said he knew he had done wrong, but that when he was ill the medical gentleman had raised him out of a bed of sickness. Well, the answer to that was that he should have paid his doctor fully for his services. It was often the case that it was the gratitude they owed to their family doctors which induced the magistrates to grant the maximum amount allowed by law in lunacy cases." He wished to know if Mr. Cullen had used these expressions.

Mr. Cullen said that some of the report gave exactly what he meant to say.

After some discussion the following resolution was passed:—"That this Board ask the Local Government Board in cases in which the magistrates order £2 to a doctor for a certificate in a case of lunacy, is it the law that any guardian voting against it could be brought by *mandamus* before the Queen's Bench; and, if so, that they will mention the Act and section where it is to be found?"

## WESTPORT GUARDIANS.

The Chairman drew attention to the claim of Dr. Johnson, under the Sanitary Act, for a guinea, his fee for the certificate of the burial of a person who died of infectious disease; and he then read from the *Freeman* the announcement that Government were about bringing in a Bill to double the vaccination fees payable to doctors, and also proposing compulsory power authorising medical officers to take lymph from children against the wish of parents, and a penalty of £2 is proposed in every case of refusal. The following notice was then read:—

"That having seen in the newspapers a report that a Bill is now before Parliament, one of the objects of which is to double the fees, and that the Government is favouring the proposition, which is brought forward solely in the interest of the medical officers and not of the public, we desire to express our strong disapproval of this large unnecessary addition to the already too heavy local taxation of Ireland. We think that in the present time of unprecedented agricultural depression, there should be a pause in the system of yearly adding to the local burdens by increasing existing payments, and by special fees to the medical officers and others for work which should be considered part of their ordinary duties. Our county members are requested to oppose the proposition to the utmost."

Mr. Louden—If you would add—that the county members be called on to obstruct this measure. I apprehend they would have a heavy bill to pay for certificates of burial. Infectious disease meant almost every disease the people die of.

## IRISH MEDICAL ASSOCIATION.

The Annual General Meeting of the Association took place on Monday, June 2, at the Royal College of Surgeons. The chair having been taken by the President, Dr. Robert MacDonnell, F.R.S., and the minutes having been signed, the Report of Council, of which the following is an abstract, was read by the Hon. Secretary, Dr. Chapman:—

The Public Health (Ireland) Act, 1878, received the Royal Assent on the 8th of August last year, and your Council consider it a subject for congratulation that it has become law.

Your Council throughout the various stages of the Bill have never ceased to advocate that efficient supervision by properly qualified medical inspectors under the Local Government Board should be provided, feeling assured that such provision is as necessary for the protection of the medical officers of health, who perform their duties in an independent and efficient manner, as it is to compel negligent sanitary authorities, or officers, to discharge faithfully the duties imposed upon them. Your Council are still of opinion that independent supervision is essential to give a thorough effect to the valuable provisions of the Act; nay, more, that unless such be provided, the public will not derive all the advantages intended by the Legislature to be conferred upon them, with regard to sanitation in Ireland. Even to the very last stage of the Bill in the House of Lords, your Council persistently advocated the necessity for providing independent supervision, and although no attempt was made at any time to refute the justice of this demand, the invariable reply to it was to the effect that the Local Government Board had power to make such provision if deemed necessary or advisable.

Your Council have availed themselves of the opportunity now afforded by the introduction of a Bill to amend "The Public Health (Ireland) Act of 1878," of bringing this very important provision, upon which the success of the measure chiefly depends, again before Parliament, and have, through the kindness of Mr. Meldon, M.P., been enabled to do so—he having undertaken to move the desired amendment.

Your Council, bearing in mind the very unsatisfactory manner in which the duties of the then medical "sanitary officers" under the Public Health (Ireland) Act of 1874 were defined, took an early opportunity of directing the attention of the Local Government Board to this subject, and requested that in assigning to the medical officers of health their duties, under the new Act, they should be specially defined, and be made consistent with the functions of professional gentlemen, without in the least degree depriving the public of any of the advantages derivable from their services. Your Council, from their reading of the new Act, consider that the Local Government Board is bound to regard the medical officers of health as new officers, whose duties as such should be specially defined, and whose remuneration should be fixed anew without regard to the maximal scale fixed by the old Act, that Act having been repealed *in extenso*; but the Local Government held a directly contrary view on all these points. Your Council instructed Mr. Clifford Lloyd, Solicitor to the Association, to submit the question at once to Mr. Purcell, Q.C., whose opinion is that the views of the Local Government Board are altogether erroneous, and that those

of your Council are correct in every particular. This opinion has been forwarded to the Local Government Board, and your Council expect soon to hear that it is adopted as the true reading of the new Act, as the assurances of Government before this measure became law could not reasonably lead your Council to arrive at any other conclusion. Thus it may be seen that an attempt has been made to override the Act of Parliament which your Council have not been slow to call in question, and which but for their vigilance would have been successful. The questions which were put to Counsel, and his replies thereto, were published in the *Medical Press and Circular* of the 21st of May.

Under the 258th section of the new Act the medical officers of health are entitled to remuneration for attending and giving evidence at sanitary prosecutions; but your Council regret that very recently a medical officer of health who claimed such remuneration was informed by the sanitary authority that if he persisted in his demand they (the Sanitary Authority) would take into consideration the reduction of his salary! So gross an attempt to stifle the provisions of the law it is to be hoped will be properly dealt with by the Local Government Board. In this case the Sanitary Authority informed the medical officer of health that he should apply for such fees to the magistrates before whom the prosecutions were heard, though the Act of Parliament directs that he "shall be entitled to remuneration *from the Sanitary Authority.*"

An instance has lately come under the notice of your Council in which the remuneration of a "consulting sanitary officer," hitherto paid by salary, has, at the request of the Sanitary Authority, and with the approval of the Local Government Board, been changed to payment by fees whenever he shall be consulted! and as it probably appeared likely to the gentleman who held the office that he would never be consulted, he resigned his appointment; it now remains to be seen whether a successor will be appointed, and if so, whether he will ever be called upon to act. Such an arrangement as to payment, tending as it undoubtedly does to make the office of consulting sanitary officer a *merely nominal* one, is highly disapproved by your Council, and is by them regarded as an act which in effect would encourage the local sanitary authority to neglect carrying out the provisions of the Public Health Act; and if this surmise be correct, it will afford another proof of the necessity for independent supervision.

### Bills to Amend "The Medical Act, 1858."

Your Council have recommended that any legislative measures which might be enacted should provide for—

1. A revision of the constitution of the General Medical Council—
   - (*a*) By a more equitable distribution of seats amongst the licensing authorities.
   - (*b*) By widening the constituencies which elect the representatives of several of those bodies.
   - (*c*) By a more direct representation of the general body of the profession.
2. The grant to the Medical Council of complete control over the education and examination of candidates for admission to the profession.
3. The compulsory establishment of a single conjoint examination for each division of the United Kingdom, which examination should be essential for admission to the licence or degrees of any of the medical authorities.
4. The enforcement of absolute uniformity in standard of examination, extent of curriculum, and amount of fees payable, required by each and all of the conjoint examining bodies.

All the bills now before Parliament to amend the Medical Act of 1858 have been referred to a Select Committee of the House of Commons, with power to take evidence, and your Council have expressed their readiness, through a representative, to give evidence. It is hoped that the Select Committee may be able to complete its labours in sufficient time to enable the desired legislation to be effected during the present session of Parliament, and your Council trust that a thoroughly satisfactory measure may soon be enacted which will secure to the public and to the profession all the desired advantages.

### Bill to amend the Vaccination Acts.

This measure contains many of the clauses of the Bill drawn up by this Association; but, unfortunately, several of the most important clauses contained in the latter have not been inserted in the Government Bill, which has already passed the second reading, and will soon again come before the Committee of the House of Commons.

Your Council have during the past three years repeatedly called the attention of the Government and of the authorities to the necessity which exists for amendment of the vaccination laws of Ireland, and are pleased to find that at length this important subject is receiving consideration in Parliament.

Mr. Meldon, M.P., and Mr. Mitchell Henry, M.P., have kindly promised to propose the other amendments which your Council consider essential to make the measure a thoroughly satisfactory one.

The two Bills drawn up by this Association suggested that the results of the operation of vaccination should be subjected to systematic inspection by competent inspectors to be appointed by the Local Government Board, as this is the only way in which universal efficiency of the operation can be obtained. The allowance of awards for special excellence of results was also suggested. This system of inspection and awards—which is provided for by law in England—is admitted by Parliament and the authorities, as well as by all official persons competent to form an opinion with regard to it, as not only highly beneficial to the interests of the State, but actually essential to ensure the best results being attained; your Council, therefore, hope that a similar provision may be extended to Ireland for the same reasons.

The new Bill proposes to allow to the Irish public vaccinators two shillings for each successful vaccination. In England the remuneration allowed for this service averages two shillings and six pence for each case; and your Council, failing to see any reason for such discrepancy, claim that the Irish vaccinators are entitled to, at least, similar remuneration to that given to the English vaccinators for the performance of precisely similar duties. As the justice of this demand cannot be denied, it is hoped it will be conceded; and as the Irish vaccinators have hitherto received the utterly inadequate remuneration of *only one shilling*, it appears to be only reasonable that their services should now be liberally requited.

With regard to the question of attendance at prosecutions and the remuneration therefor, your Council have had during the past year a long correspondence with the Local Government Board, which was ultimately forwarded to the Government, quoting the opinion of Mr. Gerald Fitzgibbon, Q.C. (now Lord Justice of Appeal), supported by another eminent Queen's Council, which stated that it is not part of the duty of a dispensary medical officer to give evidence at vaccination prosecutions, and that the Acts at present in force entitle him to remuneration for such services; notwithstanding which the medical officers have been generally required to attend and give evidence, without receiving even the amount of their actual expenses, much less a fee. This system of injustice has been the result of a circular, bearing date 31st August, 1876, which was issued by the "Executive," to the magistrates throughout Ireland, the evil effects of which were brought under the notice of the Lord Lieutenant, when your Council were informed that "the circular of 31st August, 1876, was intended to assist the medical officers in their applications to the justices for the allowance of some more reasonable compensation than the amount of their actual expenses!' Although the circular in question appeared very distinctly to forbid the allowance of

any remuneration, it is to be regretted that the justices forfeited their independence, and also the discretionary power conferred upon them by the law with regard to this matter, by adopting the course which appeared to them to be indicated by that circular, the injustice of which they have recognised.

### Registration of Births and Deaths Bill.

Your Council regret to have to report that although they have taken every step which to them appeared advisable with a view to securing the re-introduction in Parliament during the present session, of the Bill drawn up by this Association for amending the very defective "Registration of Births and Deaths (Ireland) Act," they have not succeeded in attaining their object.

### Dispensaries (Ireland) Bill.

"A Bill to give facilities for providing dispensary houses and dwelling-houses for medical officers of dispensary districts in certain parts of Ireland," has been prepared and brought in by Mr. Bruen and other members of Parliament, and has just been passed. Your Council have given attention to this Bill, the principles of which are to erect suitable houses as dispensaries, and suitable houses as residences for dispensary medical officers, in those districts only which at present do not afford such accommodation conveniently situated.

With regard to the erection of suitable houses for dispensaries, your Council need only observe that as many of the premises now in use for that purpose are quite unfit for it, it is to be hoped that suitable houses may soon be provided.

The words of the Bill appear to be clear and intelligible; the residences will only be erected in districts which require them, and it may therefore be assumed that the medical officer will gladly avail himself of the opportunity of occupying a suitable and convenient house at a reasonable rent, to be deducted from his salary. The Bill very properly does not provide that occupation of such houses shall be compulsory on the medical officer, and if he does not reside in the house no reduction can be made from his salary as rent for it. This admits of the medical officer declining to occupy the house if the rent asked for it appears to him to be not reasonable.

### Disqualification by Medical Relief Bill.

This Bill, which was avowedly introduced for the purpose of checking the spread of infectious diseases by removing the disqualification from exercise of the franchise by persons so suffering who have received in hospital medical relief, passed the House of Commons without the insertion of the amendment suggested by this Association, which was as follows, viz.:—"Provided always that such person or persons shall have paid to such (hospital) authority such reasonable charges for maintenance, medicines, medical attendance, and nursing, as may be made by such authority with the approval of the Local Government Board." The general and unnecessarily pauperising tendency of this measure is much to be deplored.

This Bill has passed the House of Lords, where it has been amended in accordance with the views of your Council.

### Medical Witnesses at Coroners' Inquests.

In the last annual report the members of this Association were informed that certain illegal practices, with regard to the employment at coroners' inquests of medical witnesses who were not, as directed by the statute, "in actual practice at or near the place where the death occurred," were brought under the notice of the Lord Lieutenant, and your Council have pleasure in reporting that His Grace's reply was to the effect that the suggestion of the Council would be carried out.

The attention of your Council having been directed to the fact that the medical officers of Irish prisons have frequently been called upon gratuitously to give evidence and make post-mortem examinations upon the bodies of prisoners, as to the causes of death, on whom inquests were held, your Council have published a letter addressed to those officers stating that they are entitled to the fees allowed by the Act of Parliament to other practitioners, and quoting a judgment given in 1861 by the late Mr. Justice Ball, whose decision was that, as it was not part of the prescribed duty of a prison medical officer to give such evidence gratuitously, the fee must be paid.

Under the existing law the medical officer of any public hospital or infirmary or of any building or place belonging thereto, or used for the reception of the patients thereof, or of any county or other lunatic asylum, or of any public infirmary or other public medical institution, whether the same be supported by endowments or by voluntary subscriptions, whose duty it may have been to attend the deceased person, upon whose body an inquest shall be holden, is not entitled to any fee or remuneration for his evidence, or for making a post-mortem examination. Your Council trust that the contemplated legislation to amend the law of coroners' inquests may put an end to the manifest injustice of compelling medical men, especially those whose services are given gratuitously to public institutions, to give to the State such extra services without fee or reward.

### Prisons Medical Officers, their Duties under the New Prisons Act—Compounding.

There are two classes of prisons medical officers in Ireland, viz.: those directly appointed, and the infirmary surgeons, to whose office the duty of acting as medical officer of a prison without remuneration was attached. The new Prisons (Ireland) Act does not provide for the appointment of apothecaries or compounders of medicines, and the General Prisons Board having attempted to force upon the medical officers the new duty of compounding the medicines they prescribed, which was by them declined as an indignity to their office, a duty with which they were not acquainted, and one which was directly at variance to their position, your Council submitted a case for the opinion of counsel, and were advised that the position taken by the prisons medical officers was supported by the law.

The General Prisons Board finding that they could not compel the prisons medical officers to compound medicines, have intimated to the infirmary surgeons, who as such are also medical attendants to prisons, and who have declined to accept the degradation sought to be imposed upon them, that their services are no longer required, and that they are not recognised by the Board as entitled to hold office under the new Act. In the opinion of counsel above referred to, your Council are advised that the General Prisons' Board can only dismiss a prison medical officer for incompetency or neglect. The order of the General Prisons Board, it appears, has been withheld with a view to obtaining further advice as to its legality, and beyond this point the subject has not advanced.

[Continuation of above Report, as well as report of the "Royal Medical Benevolent Fund Society for Ireland," will appear in our next issue.]

## TO READERS.

The Editor will feel especially obliged by receiving copies of newspapers which contain any Poor-law or other intelligence of medical interest, in order that he may, if fit, republish it for the benefit of the readers of the *Medical Press*. Although twenty-one of the leading Irish newspapers are received at the Irish office, many things may escape notice which are deserving of attention. Newspapers should be marked, and addressed to Dr. Jacob, at the Dublin offices of this paper.

### REMARKS ON THE ROUTINE USE OF THE OPHTHALMOSCOPE IN CEREBRAL DISEASE.

By J. HUGHLINGS JACKSON, M.D., F.R.S.,

Physician to the Hospital for the Epileptic and Paralysed, and to the London Hospital.

(*Continued from page* 461.)

It is not at all uncommon for patients to recover from optic neuritis. I do not say recover from amaurosis (although they may recover when sight is gravely affected, if treated soon after the failure), for I now speak only of cases of optic neuritis in which there *is no defect of sight.* I give one illustration: In a case I recorded (*Med. Times and Gaz.*, Dec. 7, 1872), the patient was attending on me for convulsive seizures, when one day, May, 1871, he complained of his sight. I had examined his eyes at his first visit, Feb. 9, 1871 (the discs were then normal), but I had neglected to examine them at intervening visits (April 14 and 29), thus breaking a rule I have tried to enforce.

On May 9 I made this note: "There was nothing wrong observable about his sight, judging from his manner, but he said he could not read for many minutes together, and that he saw badly across the road. I therefore looked at his discs, and, finding neuritis, tested his vision. When near the window he could read with each eye No. 1 of Jäger. He read slowly and made one or two mistakes, but corrected them when they were pointed out to him. The discs were much swollen; the edges were lost. The veins were large and tortuous; there were irregular white patches and several recent hæmorrhages. How long these appearances had existed I could not tell. The discs were normal at his first visit on February 9.

May 16th.—He could still read No. 1 of Jäger and No. 1½ of Snellen. He read slowly and made four mistakes in about four lines, *e.g.*, he said "space" for "spade," which, however, he corrected himself. Still he complained of his sight. He said, "it comes over like a cloud now and then," and that when he looked at the newspapers "it comes over like a mist." His sight never failed altogether. He had occasionally specks in the left eye. There were no "colours." He recognised the colours in the coloured types of Snellen very well. His field of vision was normal. The left optic disc was much swollen, the veins large and knuckling over the edge of the disc. The arteries were obscured. There were very small shapeless white patches and scattered blotches of blood. The right optic disc was in about the same condition. There were no changes at the yellow spot. There was no albuminuria. He had had a slightly giddy seizure. I gave him large doses of iodide of potassium.

The discs gradually cleared up; indeed, by June 26, the appearances would have seemed normal to a careless observer, but the edge of the disc was slightly indistinct; the arteries were traceable, and the veins were not tortuous. By direct examination, streaks were seen along some of the vessels. There was "silvery-looking" matter near the entrance of the vessels in small quantity; there was also a little streaking of the adjacent retina.

1874.—He keeps well. The ophthalmoscopical changes to ordinary indirect examination are *nil*, and to direct examination they are very slight.

*At every visit the patient could read the smallest test-types.* I tried him with Jäger's, Snellen's, Dixon's, and Williams's types, so that he did not read assisted by memory.

In all the cases I have seen of recovery from optic neuritis the patients had taken large doses of iodide of potassium. Whether they would have recovered if left alone, that is, whether sight would have failed, I cannot tell. My belief is, however, that the iodide of potassium administered in the earliest stage of optic neuritis would save many from blindness. It can, of course, do no good for the tumour (unless it be syphilitic), but it does, I think, for the inflammation of the optic nerves. When I say I have known optic neuritis appear and disappear, I can speak of cases in which, in a subsequent illness, the patients have died. The ophthalmologist never sees the pathological condition until sight is damaged. But the

physician will, if he looks, often see it when there are no other permanent symptoms than headache, with or without vomiting.

Patients sometimes die suddenly, as the case of cerebellar abscess illustrates, from intra-cranial adventitious products. In the following case, reported *Lancet*, June 21, 1873, there was no autopsy, and thus we can only say that the patient died suddenly after showing symptoms of chronic cerebral disease of some kind. But the case shows strikingly the importance of the *routine* use of the ophthalmoscope. It might easily have been mistaken for one of hysteria, or, by careless persons, for some affection of the liver. The woman always looked well. But such mistakes could not possibly have been made in this case after the use of the ophthalmoscope ; optic neuritis is always a serious matter. At the very first the patient's husband was told that she was very dangerously ill. The only reason for giving this opinion was, there was optic neuritis.

A woman, æt. 28, attended first on October 26, 1872, for severe pain in the head, coming on in paroxysms, and for vomiting. The history she gave was obscure. It seemed probable that about a year before she had had double vision. She would occasionally fall down, and she had fits of some kind beginning in the left leg ; no clear account of them was obtainable. Because she had *pain in the head* an ophthalmoscopic examination was made. Being a very nervous woman she seemed slightly alarmed at this procedure, and said excitedly, "There's nothing the matter with my eyes." She did read 1½ of Snellen with each eye very easily, and, indeed, appeared to see quite well. Nevertheless, she had double optic neuritis well marked. Under iodide of potassium in large doses she got well, or, rather, to feel well, for the neuritis had not passed off when she ceased to attend. Her sight was tested at each visit, and found to be normal.

She came again for the same kind of symptoms, February 3, 1873, and for attacks of giddiness, in which she would fall. At this time some swelling of the discs remained, *but she could still see well ;* she easily read out No. 1½ of Snellen as before. The patient was again improving when, on March 23, she died suddenly. The evening before she had been out marketing with her husband. In the night she said she was not so well, got up, walked about, said she felt better, returned to bed, again said she felt not so well, and died immediately.

At her last visit she seemed to be a fine healthy woman, except for nervousness and an air of simple weariness. There was an inquest, but no autopsy.

I find I have not given the most recent of Gowers's conclusions in stating what he has observed as to optic neuritis. I am indebted to him for the following letter :—

50 Queen Anne Street, Cavendish Square, W.
June 6th, 1879.

Dear Dr. Jackson,—Later microscopic investigation has led me to modify considerably the opinion of the rarity of descending neuritis expressed in the statement you have quoted in the *Medical Press and Circular* for the 4th inst. The opinion was founded on the slightness of the indications of inflammation commonly presented by the trunks of the optic nerves in cases of intra-ocular neuritis from cerebral disease. But I have since found in several cases that equally slight changes may connect an intense neuritis behind the optic foramen, with an intense neuritis within the eye ; and I am led to the belief that these slight changes have far more weight than has commonly been attributed to them ; and that descending inflammation, instead of being rare, is a very common mode in which neuritis is produced in intra-cranial tumour. I have described the facts on which this opinion is founded in my Manual of "Medical Ophthalmoscopy."

Believe me,

Very truly yours,

W. R. Gowers.

Dr. Hughlings Jackson.

## PSOAS ABSCESS, WITH DISEASE OF ONE OF THE LUMBAR VERTEBRÆ.

By JOSIAH ADAMS,
Formerly Medical Officer, Tullyvin Dispensary.

E. W., æt. 25, came under my care in April, 1877. She was treated in England for some time after she became ill, for rheumatism. She had been afterwards in two hospitals there, in one of which she was told "she would never get well." Looking at the case with all its dark surroundings, and having obtained the opinion of Mr. O'Grady, of Mercer's Hospital, the outlook was anything but pleasing.

There was a large abscess in the right lumbar region, extending down under the crest of the ilium, also in the upper and inner part of thigh, but not large in that situation ; one of the lumbar vertebræ projected more than half an inch. She was thin, but looked cheerful, pulse 80, suffered great pain at times in hip, down the thigh, and to the ankle—the ankle often the worst ; pain not so great on the opposite side. Gave her cit. ferri et quinæ, and ordered eggs and milk. My first object was to cure the diseased vertebra, and this I succeeded in doing by repeated small blisters on each side of the affected bone. As the abscess enlarged her head got pained, and she could not sleep well. Pulse got up to 100, I therefore determined to give exit to the matter, which I did by the abscess-lancet on the 24th May. I then gave her a sedative mixture and wine.

The next day pulse fell to 80, she was cool and slept some time.

May 27th.—Some hectic symptoms appeared.

28th.—She was hot and perspired.

29th.—She slept well, not much hectic. Gave cit. ferri et quinæ. Eats well, wishes to get up.

June 1st.—Pulse up to 100, but came down after a discharge from abscess.

4th.—Abscess continues to discharge, and I encouraged it, as it keeps down the pulse.

5th.—Gave sulph. quinæ. She continued to improve, and gained flesh till the 29th July, when a redness appeared about the origin of the glutæus medius. I then got the opening healed in the lumber region, in order to force the abscess to break where the redness appeared, as I should then have a better exit for the matter. It burst on September 6th.

Sept. 14th.—I dressed it with lint to the bottom. Pulse 100, and she lost flesh a little.

24th.—Ordered her to sit up in another room.

In October sent her to friends for a change.

April 1st, 1878.—Sore about half the size and depth. She said a small piece of bone came away while on her visit. Ordered sulph. quinæ et tinct. mur. ferri.

May 5th.—Sore quite healed, and she felt quite well.

Some time after the sore got irritable and discharged matter for a few weeks, and then healed. Afterwards, a small tumour appeared below the trochanter major. As she wished to go to her brother and sister in England I gave her leave. The quinine and iron strengthened her much, and I then ordered cod-liver oil. The little abscess broke some time after going to England, healed soon, and she was rid of all her trouble. She is now in a situation earning good wages.

I would remark three things in the treatment to which I think it well to draw attention.

1st. I believe the application of blisters several times when the surface is well healed to be in every way preferable to issues.

2nd. Keeping the abscess discharging every day or second day, instead of healing and opening again.

3rd. Permitting the patient to be up and in good air as much as possible.

I may remark also that had the patient been examined sooner, and blisters applied, she might have been saved all her trouble. I am positive had I put off opening the abscess much longer I might have left her to die ; and had I another case I would open it even at an earlier period.

# UTERINE INFLAMMATION AT THE CHANGE OF LIFE.

By EDWARD JOHN TILT, M.D.,
Past President of the Obstetrical Society of London.

In the present paper I limit my remarks to uterine inflammation as it occurs from the beginning of menstrual irregularities until cessation. I begin by pointing out that, from the 35th year to the 45th year, when cessation occurs in most women, sexual life is less intense, the married have fewer children, and the unmarried think less of marriage. Perhaps this diminution of sexual energy accounts for a corresponding decrease in the number and in the intensity of inflammatory uterine affections. Many women, nevertheless, begin the change of life with uterine diseases that have been undetected or imperfectly cured, and all such diseases are sure to be aggravated and brought to light by "the dodging time," for the ovaries still draw the blood to the womb every month, and the blood, finding an insufficient outlet, or none at all, from the internal uterine surface, congests whatever organic disease may be present in the sexual apparatus. Beyond an aggravation of habitual symptoms, I have noted nothing peculiar to this epoch, in the march of diseases of the neck of the womb. Subacute cervical inflammation may wake up its usual troublesome symptoms. Failing general health, there is the usual tendency of the cervical mucous membrane to exfoliate, when the subjacent uterine tissues are more or less caco-plastic. Ulceration in and around the cervical canal may cause a purulent or a muco-purulent discharge. All such cases should be treated on their own merits, for they will be made more difficult to cure by the dodging time, and by cessation.

To explain what may occur to the body of the womb during the dodging time, I must remind the reader, that in my Handbook of Uterine Therapeutics, I insisted on defective *puerperal* involution as a little-known, though frequent cause of uterine disease. I represented it, as less a disease than as the enlargement of the area in which may spread whatever disease is inclined to arise—congestion, inflammation, papillary development into a roughened or mamimillated surface or polypoid growths. Now, *puerperal* involution proceeds at a slower rate, and is oftener defective in women confined during the last decade of reproductive life ; and I believe, that not unfrequently, a womb that has not been able to effect *puerperal* involution, is called upon to work out the ultimate uterine involution of the change of life. I am convinced that "the dodging time" is sometimes protracted to unusual length by the fact of the womb having thus remained considerably too large after the last pregnancy, and without other disease than hyperæmia of its internal surface, and not always that. I have been led to this conviction by being sometimes puzzled to understand the protraction of the dodging time to great length in patients I had occasionally attended, and in whom I had found the cervix to be healthy and smaller than usual. These patients were so healthy, that I could not suspect the body of the womb to be diseased, and so fat, that there was no other way to measure the size of the womb except by the sound or bougie. I have often, in such cases, passed from 4 to 5 inches of a wax bougie into the womb, even when the cervix was shorter than usual. There was little pain, no loss of blood in some cases, but in others, a moderate loss of blood, as in one of the following cases :—

During the last twenty years I have occasionally attended a lady, now 55, for cervical inflammation after confinements. When 46, she had her last child ; she was supposed to have had a miscarriage when 48, and a few weeks afterwards there was considerable flooding from an enlarged womb, which confined her to the house for three months. When 49, menstruation began to be irregular, and there were pelvic pains and cervical congestion. They were more marked after the last menstrual period in December, 1878, but the cervix was healthy, and smaller than hitherto found. The abdominal walls were so fat that I could not feel the womb, and, on passing a wax bougie, it measured four inches and a-half. It gave little pain, and there was no subsequent loss of blood. In this case there is simple enlargement of a womb that never properly retracted after the miscarriage, and the enlargement being free from disease may be explained by the fact that the patient is a singularly healthy woman. This uterine enlargement has nevertheless delayed cessation for six years, and I am trying to reduce the womb, by giving twice a day, 3 grains of ergotine and half-a-grain of extract of nux vomica.

I have attended, off and on, for the last ten years, a lady respecting whose case I shall only now say, that I explained singularly severe attacks of epigastric neuralgia, with extreme prostration, to depend on chronic inflammation of a much enlarged womb. These attacks have occasionally returned at menstrual periods, and have indicated a relapse of uterine disease. Early in 1873, seven years after cessation had been thought imminent, menstruation came at intervals of three, four, six, and thirteen months. After this last protracted interval, the menstrual flow returned on the 3rd of November, 1878, being moderate, and lasting three days. This was followed by a very bad attack of neuralgia. I found that the cervix was healthy and smaller and shorter than hitherto ; nevertheless pelvic pains pointed out the womb as the centre of pathological disturbance, and, as the abdomen was so coated with fat as to render impossible any other mode of measuring the womb, I introduced a wax bougie, and, to my surprise, it went in to a depth of four inches and a-half. There followed a little pain and a few drops of blood, but the following day blood flow set in moderately, and continued so for ten days, accompanied and followed by a succession of the customary epigastric attacks. In addition to the womb being morbidly large, as in the previous case, there was in this case an irritable hyperæmic lining of the womb, and this pathological condition has occasionally brought back the attack, and has already delayed cessation for five years in a woman aged 55.

In other women, in whom the womb is in a state of defective involution, at the beginning of the dodging time, flooding is the frequent symptom of more acute hyperæmia, or of internal metritis, brought on, or aggravated, by the stoppage of an habitual outlet to pelvic congestion. This is not all : inflammation is just as much a bar to the ultimate involution of the womb at the change of life, as it is to the right progress of *puerperal* involution of the same organ ; and when, at the dodging time, an enlarged womb becomes inflamed, there is little chance of its size decreasing till after cessation. This enlargement of the womb, as a not uncommon condition at this epoch, explains why some women have an outflow of serum, or muco-pus, at some stage of the intermenstrual period—generally inodorous, but I have known it to be offensive, and greatly to distress a patient. Half-a-teacupful of pus, or bloody pus, may be also suddenly evacuated, and give the idea of an abscess, whereas the occurrence clearly points to internal metritis.

I have known patients to repeatedly pass matter instead of blood at monthly periods, and with considerable pain, and in one instance this was repeated at six successive menstrual periods. In all such cases there are symptoms of uterine metritis, and this imperfect menstruation is attended by considerable pain, on account of a progressive narrowing of the cervical canal, the result of the setting in of an attempt at cervical involution. It is evident such cases cannot be cured while pelvic circulation is in a state of disturbance, and our best efforts should be directed to the diminishing uterine congestion or inflammation, and to the maintaining of a free passage through the cervix for uterine secretions. By so doing we shall give such cases a fair prospect of being cured after cessation, as shall be explained in a another paper, in which I will treat of uterine inflammation after the menopause.

Seymour Street, Portman Square.

## ON DIPHTHERITIC PARALYSES. (a)

By Professor HARDY.

Translated from the *Annales des Maladies de l'Oreille, du Larynx et des Organes connexes.*

By W. DOUGLAS HEMMING, M.R.C.S.,
Assistant Surgeon, Central London Throat and Ear Hospital, Surgeon to the Notting Hill Dispensary, &c.

Gentlemen,—We have just examined together in the Saint Anne Ward, a woman, æt. 58, whose history is very instructive. She has told you at length how three weeks ago the affection commenced which brought her here, and if you have seen me insist on her telling you in detail the origin and course of the affections she suffered from, it is because amongst the conditions under which these affections show themselves we must not be indifferent to one which can throw light on the nature of this angina, which was cured and almost forgotten when they appeared.

The following are the conditions: this woman, working by the day, lives in a room adjacent to a small apartment occupied by a young household composed of the parents and two children of six and four years old. These children, received in a motherly way into our patient's room, passed several hours there daily. They began to suffer about five weeks since (remember the date, it is of importance, as you will see in time); "they complained of the throat, they threw up small pieces of skin by the mouth, were feverish, and soon became so ill that they were taken to Sainte-Eugénie, where they both died."

A few days only after the departure of the children for the hospital, our patient complained of her throat and head, had some difficulty in swallowing, felt generally ill, was feverish and obliged to take to her bed. Nearly a week passed before she was seen by any doctor; when he came the sore-throat was on its way to its cure. Whatever were the objective characters presented by this sore-throat, whatever was its extent and its nature, we may at least suppose that it was accompanied by somewhat severe fever, and by a grave general condition, since the patient remained in bed twelve days. It was at this time that the complications appeared from which the patient still suffers; visual trouble, feebleness of the lower limbs, stuffiness of the voice, great difficulty in swallowing solids or liquids. This morning you have been able to judge for yourselves the nature and intensity of the complications: you have heard this dull and nasal voice, which only allows the patient to make herself understood by speaking slowly and with effort, which she can only do at the expense of great fatigue; you have witnessed the great difficulty with which deglutition is accomplished, as it is only after a series of efforts that bread or meat, even after long mastication and insalivation, can be swallowed, the bolus of food, as the patient says stopping in the throat; this sensation of the arrest of the bolus of food is perfectly real, the last efforts at swallowing being made slowly and with difficulty, owing to want of action of the muscles of the pharynx. The swallowing of liquids is scarcely more easy as they mostly return by the nostrils.

The examination which you have made of the throat of our patient has shown that when we make her utter a continuous Ah, the falling velum was struck by the column of expired air; you have seen that there was an absence of all tension in the membranous velum; you have seen besides that the patient found it quite impossible to blow out a candle; you have seen, lastly, that the sensibility of the whole pharyngeal mucous membrane was singularly blunted, for the deep introduction of a tongue depressor, the introduction of the whole handle of a spoon caused neither movements of deglutition, nor those efforts at expectoration which generally render complete and prolonged examination of the throat so difficult.

But this is not all—the lower limbs are weakened; it is the same with the upper limbs, which are so enfeebled that the least work is painful and fatiguing. We find now nothing abnormal in the orbital muscles, in the iris, nor in the sphincters, which, besides, appear never to have been affected. Tactile and sensorial sensibility have undergone no alteration; the same holds good with respect to the intelligence and the general functions.

That, gentlemen, is the history of the patient and the condition in which you find her to-day.

With what affection now have we to do? why, and how have these symptoms appeared?

Could this be the affection first described by Duchenne, of Boulogne, under the name labio-glosso-laryngeal paralysis?

The slightly stupefied air of the patient, the slow, veiled, dull voice, the impossibility of blowing out a candle, of swallowing, and of drinking should not deceive us, it means nothing; besides, in Duchenne's disease the mode of origin and the progress of the complications are different, functional troubles are the chief, especially in the tongue and the orbicularis oris, which in this case were absolutely unaffected, their movements maintaining all their facility, extent, and rapidity. We have to do with a paralysis of the velum palati and the pharynx, which has this peculiarity, that it was developed at the close of a sore-throat which we did not see, but the nature of which could not be mistaken from the precise descriptions given by the patient; I shall, therefore, take this opportunity of speaking to you in detail of the affection of which this woman offers so good an example.

It is only about twenty years since the attention of physicians was drawn to the sequelæ of some forms of sore-throat which led to paralytic troubles affecting the velum palati with greater frequency and intensity than other parts. It must not be supposed from this that paralysis in connection with sore-throat is anything novel; you will find it mentioned by some authors of the last century; for instance, Ghisi of Cremona has left us a very good description of a paralysis of the velum in his own son, which he had seen to supervene on a severe sore-throat; a similar case was observed in New York, in 1771, in a child two years old, by Samuel Baar, in the course of a very fatal epidemic of sore-throat. Similar cases were observed by Orillard in the course of a severe epidemic at Poitiers, in 1836.

These cases and many others analogous, little attracted the attention of physicians, until M. Maingault brought them forward in a remarkable thesis published in 1854. This possible sequela and complication of sore-throat had completely escaped the sagacity of Bretonneau, who does not mention it in his celebrated works on diphtheria; in fact, it was only on the solicitations of Trousseau, a witness of some cases of post-anginous paralysis, who questioned on this point the experience of his master, that Bretonneau recalled many cases in his practice, and repeated at the same time—making use his own words—the observation of Professor Herpin, of Tours, with whom he was in company in the spring of 1843: "fifteen days after the development of a diphtheritic sore-throat, inoculated in a child, there appeared disturbances of vision, paralysis of the velum, with loss of sensation, and regurgitation of food and drink by the nose; a very difficult and very slow walk, above all painful feebleness when he attempted to go upstairs." A few years later, M. Maingault published some new clinical researches on the causes, nature, and treatment of diphtheritic paralysis; to these labours must be added those of Gubler, Roger, G. Sée, and Trousseau. From that time attention was drawn to the relationship of cause to effect connecting sore-throat with paralytic complications, which without being very common are so frequent that a year does not pass without one or two cases being observed in the hospitals.

(a) A Clinical Lecture delivered at La Charité, Paris.

These paralyses deserve separate study, and constitute a perfectly definite morbid species in the same way as the saturnine or hysterical paralyses, since, like this latter, they affect in their cause, in their commencement, in their progress, in their narrow limits, or in their generality, a condition of existence which we must now recognise. With regard to the origin of these paralyses, we must first know what forms of sore-throat will give rise to them. According to most physicians, paralysis has appeared only after diphtheritic sore-throat; this opinion has been ably defended by Maingault, who considers the paralysis as the result of the impregnation of the nervous system with the diphtheritic poisons; this was, besides, the opinion of Trousseau, who regarded it as a contamination of the whole economy by the diphtheritic virus. But considerable as is the part played by diphtheria in the production of paralyses after membranous sore-throat of a serious kind, it is perhaps not so exclusive as was thought until the last few years. Some facts would seem to prove that various forms of sore-throat, not diphtheritic, may be followed by paralysis; in a case of M. Gubler's, which seems very convincing, it was caused by a herpetic sore-throat; in a case of M. Sée, the paralysis appeared after a simple common angina; in another case of Professor Sée, the paralytic complications were seen in a man who had had merely a simple tonsillitis.

To these well observed facts I can add one from my own family, in a child whom I treated for a common sore-throat, who kept her room scarcely three days; I saw after fifteen days (when nobody was thinking any more about the throat trouble), there supervened pain in swallowing, affection of the sight, general debility, then complete paralysis of the soft palate, to which was soon added a paresis of the lower limbs, sufficiently severe to prevent the child from walking.

These facts show you that, if, as a rule, paralyses are connected with diphtheria, they may also be consecutive to a simple common sore-throat, and I would add that they may appear when the sore-throat has not been more than usually acute or intense; in proof of what I say I would only recall the cases of M. G. Sée and my own.

These facts would seem to prove that the sore-throat, that is to say the seat of the affection, always first shows its nature; it is never wanting, and always precedes the appearance of the paralytic phenomena.

The patient would appear to be more exposed to paralytic consequences in the case of pharyngeal, palatine, or tonsillar affection, than where the general diphtheritic affection has determined the localisation of the angina. We shall besides endeavour to call these paralyses *anginous paralyses*, more than diphtheritic, since it is established that if diphtheria does not constantly and necessarily exist, angina is never absent. I know well that in opposition to this view very rare cases are cited of paralysis in which the diphtheria remained cutaneous. To this objection I would reply that it is not impossible that in the patients in question there was a slight pharyngeal localisation, which passed unperceived owing to its very small local and general reaction.

At what period do these paralyses commence?

There is in their mode of appearance something striking and peculiar; it is not when the angina appears, nor immediately after its disappearance that one sees paralysis supervene; but a fortnight, three weeks, or a month after, when everything seems to presage a complete cure. Remember what our patient said, that a fortnight after the sore-throat, the pain in swallowing appeared, and then the complete paralysis of the soft palate. With respect to the mode of beginning of the paralysis, there are two things to remember; that the paralytic troubles do not appear all at once, one day or the next; there is feebleness, paresis, and difficulty of movement before there is complete paralysis; I would add also that paralysis is scarcely ever absolute, for difficult, painful, obstructed and slow as movements are, the patient almost always manages to execute them.

The most important peculiarity in the history of these paralyses is that they always begin, save in very rare exceptions, in the soft palate; this is so true, that in a case where the diagnosis was doubtful in the face of paralytic troubles otherwise abnormal and uncertain, the fact that a paralysis of the velum of the palate had preceded the general affection would almost suffice to affirm the nature of the paralysis.

The paralysis begins, then, in the soft palate where it shows itself by signs similar to those you have just witnessed; at the same time sensation is affected in the pharyngeal mucous membrane, so that one can titillate the uvula and depress the base of the tongue without causing the distress which is generally set up by exploration of the throat. Sometimes things go on further. Difficulty in swallowing, instead of being limited to the pharynx, is felt lower down; the bolus of food is stopped at the beginning of the œsophagus, and after a meal a sensation of stifling which does not cease until the patients have thrown up the food. In some, liquids and even solids get into the larynx. In this case there is, added to the paralysis of the velum, some paralysis of the laryngeal muscles.

But the affection is not limited here; if in certain patients things do not go any further, in others the paralysis progresses and becomes more general. In these cases there is first noticed some alteration of the sight, myopia, presbyobia, or amblyopia supervening. The patients have a sort of mist before the eyes, they distinguish objects badly. These phenomena are most usually the result of a defect of accommodation; in some patients also there have been observed troubles in the region of the third nerve, the paralysis either being complete or being limited simply to the branch to the levator palati and causing only ptosis.

Still later other phenomena appear, the patients complain of numbness and heaviness of the lower limbs, which prevents them from attending to their occupations and compels them to sit down frequently; they have pain in walking, their legs bend beneath the weight of their body, the phenomena of paralysis become more intense, and may even come to complete paralysis.

With respect to sensation: this is generally perfectly preserved. Patients almost always feel when they are pricked or pinched. There are, however, some severe cases in which both movement and sensation were lost. In some patients, lastly, the paralysis attacks the upper limbs; and, which is a difficult thing to explain, physiologically and anatomically, this paralysis supervenes most commonly after paralysis of the inferior extremities. Here loss of power is proclaimed by numbness, heaviness, and later on muscular weakness, which may be positively appreciated by the dynamometer, as you have seen in our patient.

*(To be continued.)*

# Special.

## HYDROPHOBIA IN LANCASHIRE.

ALMOST a panic has been created in the neighbourhood of Preston and Blackburn by the terrible ravages of a mastiff, said to be suffering from incipient rabies. We have made inquiries, and through the kindness of the Rev. George G. Pughe, Vicar of Mellor, the owner of the dog, we are enabled to give the following particulars: He informs us that his mastiff, the gift of a friend, was of pure breed, with a long pedigree, and if it had lived would have been a year old. It was a bitch. This dog, named "Varna," had never been habitually chained up. It was very quiet, and a friend's child, two years old, could ride on its back. His own little boy, aged seven, could play with it, and used to handle it by its legs like one would a wheelbarrow. It was docile, intelligent, and never showed any signs of bad temper,

On the 8th April he noticed the dog was a little peculiar, and he accordingly tied her up. Believing that the animal was suffering from sexual excitement, he wrote to Colonel Fielding's agent to send one of his dogs to Wilton. Varna was kept tied up and taken out for exercise regularly.

On the 14th April the bitch was taken to Wilton by the sexton in order to be allowed to copulate.

The bitch would not have anything to do with the dogs, and it appears snapped at the animals belonging to Colonel Fielding. The dog somehow escaped from its new home and returned to the Vicarage, and on Wednesday morning the vicar was called out from his study and told that Varna had come back without chain or collar, and that there was something wrong about her, as she was very excited.

He went into the kitchen and patted her. His little boy even then whipped her with a small top-whip, and his daughter put a chain round her neck. He noticed that the bitch was either puffed or swollen round the neck, but so little did he think of rabies that, at his request, his daughter took her into the coachhouse. The dog followed her quietly for a little way. The brave girl had a very narrow escape, for the dog became restive, jumped at her, and would probably have bitten her but for a fox terrier that attracted the animal's attention. It expended its fury on the terrier, and shook it like a rat. It again snapped at the young lady. The vicar was called to, and asked to shoot the bitch. He immediately hurried up stairs, loaded his gun, and on coming out he saw the dog lying in a peculiar position, with its head on its paws, at the corner of the coachhouse. He fired, the animal jumped up, giving a howl. He fired again, and hit the dog, though not mortally. The animal got away, and the vicar, after obtaining some more cartridges, searched the country for thirty miles in pursuit of the dog, in company with a gamekeeper. He did not meet with it.

The narrative becomes now more tragic. The animal seems to have run in the direction of Preston. It attacked a sheep on its way, tearing off half its face. It is said to have been seen running up London Road, Preston, and to have bitten several persons at Walton-le-Dale.

It first bit a donkey in Preston, and was now pursued by a crowd. Running through St. Paul's Road, it bit a little girl named Watson, very severely, on cheek, and in Fish Street it seized a boy named Milner, aged six, tearing away a large portion of his cheek, and another boy, named Wellacy was similarly injured by the animal. In its course it bit several other dogs, also a man named William Dickenson, badly bitten on hand and face, and a boy, named East, on the arm. It found its way to Frenchwood Hall, where it was killed by one of the owner's servants. It is positively known that it has bitten three donkeys, ten dogs, five children, and two men.

Two of the donkeys have been destroyed, the owner of the third refusing to accede to the wish of all that the animal should be killed; the ten dogs were immediately destroyed; the mastiffs belonging to Colonel Fielding have also been destroyed.

The police of the district have taken active measures to control the dogs in the town, and stringent orders have been issued not to allow dogs to run loose. The results up to the present have been most disastrous—two children have died.

An inquest was held on April 30th by Mr. W. Gilbertson, Coroner, on the children, Watson and Milner. We need not give the general evidence, as that of the medical attendants, Drs. Rigby and Holden, is alone interesting.

Dr. Rigby said: I was called in on the 16th April. I saw the deceased Watson; she had a very extensive and deeply lacerated wound on the right cheek, which extended to the right corner of her mouth, and formed a large flap that could be lifted up. I was informed that she had been bitten by a dog. The wound seemed to do fairly well. After the first week of treatment, the process of healing was rather rapid. I continued to see her. I was sent for again on Sunday evening last. The father came down to my house and stated that the little girl had not been quite so well. *I gave him some medicine*, and I saw her early in the morning.

She was manifesting symptoms that led me to infer that hydrophobia was coming on. She had laryngeal spasm, and had very much difficulty in swallowing. There was a remarkable over-sensitiveness of the surface of the skin, especially all over the face, to the extent of the waving of the hand or a little puff of the breath.

By a puff of the breath she was sent into a violent paroxysm of spasms. I did what I could under the circumstances. It was impossible to administer medicine by the mouth. The case went on in the ordinary course. There was a little alleviation of the symptoms; the child got rest for a few hours occasionally, and then the symptoms returned. I last saw her alive on Wednesday evening; she was rather excited. I did not anticipate her recovery from the condition of her pulse. She died from exhaustion between eleven and twelve the same night. I have not the slightest doubt but that she died from hydrophobia, caused by the bite of a dog.

Necessarily, from this evidence, we cannot learn anything as to what the treatment was, nor do we know whether a post-mortem examination was made. We trust Dr. Rigby will report the case in full, with exact details, as pointed out in our Reports on "Rabies or Hydrophobia."

The evidence of Dr. Holden in the second case (John Milner, aged 14) is more meagre.

Dr. Holden said: I saw deceased on Monday last, about one o'clock; he was in a state of restless excitement, and seemed to be wandering about for a nameless purpose. He attempted to get through a window; he seemed scarcely conscious; he had symptoms peculiar to hydrophobia. I did not see him again. I did not see him in a paroxysm, because when I called again he had gone to Garstang. I don't know how many medical men saw the youth. The wound was dressed when I was there. I was sent for between one and two o'clock on Wednesday morning. *I sent one of my assistants*, and he injected morphia to allay the symptoms.

We cannot extract much from the foregoing. Who attended this lad? Evidently not the medical man who gave evidence at the inquest. We must defer criticism. We presume a qualified assistant was sent to inject the morphia? We must also presume some line of treatment was adopted?

There are many points of interest in connection with this sad history—

1st. It is highly important to have the disease in "Varna" traced. Was "Varna" bitten by Colonel Fielding's dogs? Was "Varna" bitten by any other dog? Was the disease of spontaneous origin; in other words, of *de novo* origin?

2nd. The rapid supervention of death in the children is worthy of notice. The bites were evidently of a serious nature—on the face, a most exposed part.

3rd. We should like to hear of the treatment, as regards cauterisation, &c., &c.

Five other persons have been bitten, and these survive. We should like it to be known (and we trust our contemporaries, the *Preston Herald* and *Blackburn Standard*, will assist us in this) that at the present time a large number of investigators are studying hydrophobia, and that by telegraph, one or two of them can be summoned to attend, give advice, and assist in treatment, at almost trifling cost, and *even gratuitously*. It is no use in having 20 or 100 medical men calling to see cases of this nature. No good is done to the patient or to science by this method. What is wanted is the advice of men experienced in this disease, who will treat it scientifically; and, as we have proved hydrophobia has been cured, it must follow it can be cured again.

Drs. Lauder Brunton, Burdon Sanderson, Mr. Callender, and Mr. Hart are at the service of the profession for any case of hydrophobia. As announced repeatedly, they will be glad to assist in treatment. Though there have been numerous cases of hydrophobia reported in England, since the first issue of the announcement that their valuable services would be gratuitously at the disposal of the profession, yet we have noticed that it has not been taken advantage of. It cannot be that a false jealousy prevents practitioners from telegraphing for them?

In the interests of humanity, and in the true interest of science, we trust, that on the first appearance of symptoms of hydrophobia in any fresh case in Lancashire one of the above-named gentlemen may be communicated with.

Our suggestion that hydrophobia should be treated by a medical officer of the Privy Council, seems to us the only really feasible manner of arriving at a satisfactory settlement of the value of treatment. At present, we have treatment of some kind, or no treatment, according to the views of the local practitioner. By our method, we could test the most approved systems, and, still more, we should obtain a staff of medical men fully acquainted with hydrophobia in all its symptoms and details, and who would, in consequence of this experience, be able to distinguish the true from the false.

At present, it is a matter of chance whether a practitioner may have ever seen a case of hydrophobia. When one comes under his notice he is not prepared for it; and before he has arrived at a satisfactory conclusion as to what he had better do, his patient is *in articulo*.

The general practitioner and the public at large should read and digest the Reports published in this journal in 1878.

## PROFESSOR HUTCHINSON AT THE ROYAL COLLEGE OF SURGEONS.

### NEURO-PATHOGENESIS.

On Wednesday, the 11th inst., was delivered the first of a series of six lectures, by Professor Jonathan Hutchinson, F.R.C.S., Senior Surgeon to the London Hospital, &c., at the lecture hall of the Royal College of Surgeons. The subject of the course is "Neuropathogenesis, chiefly with reference to Diseases of the Skin, Eye, and Joints." Mr. Hutchinson, after a few introductory remarks, explained that he would occupy the attention of his auditors by describing the phenomena exhibited by diseases produced through the nervous system, and though it is a seemingly easy matter to differentiate these from actual disease of the nerve-tissues, it is really a question of great nicety, and a most difficult matter so to do. He instanced the important influence exerted on the progress of patients by troublesome bed-sores, and the dependence of these on the nervous state, a fact only demonstrated after many suggested correlatives with other systematic disturbances had been advanced to explain them. It is only in recent times that this explanation has obtained general favour, the view having been first put forward by Dr. Bright, and advocated after him by Charcot and other eminent authorities.

Mr. Hutchinson, adverting very briefly to the historical aspect of his subject, quoted a paper contributed thirty-seven years ago, by Sir James Paget, to the "Medico-Chirurgical Transactions," as the earliest exposition of the *symmetry* of skin affections, and referred also to an essay on the matter by Budd, of Bristol, in the same volume of the "Transactions." He then proceeded to classify the morbid processes under discussion thus;—

1. Those developed in and by the tissues affected.
2. Those developed by something circulating in the blood.
3. Those developed through the influence of the nervous system.

The first group includes diseases that are *local*, that persist, are non-symmetrical, or only accidentally otherwise. In order to their production the tissue is predisposed to affection, and an exciting cause then develops the special phenomena, *e.g.*, the malignant group, lupus, &c. These show no disposition to spontaneous cure, or only at a very late period, and exhibit a tendency to serpiginous spreading.

The second class of diseases due to the blood are markedly symmetrical, a fact probably explicable on the ground of the "elective affinity" exercised by the tissue on the circulating fluid (morbid). This being equally distributed to both sides of the body, each participates in the receipt of its contained morbific elements, and to this is to be attributed the peculiar dual appearance in syphilis, rheumatism, gout, &c., Sir James Paget first having drawn attention to these phenomena in syphilitic eruptions The diseases included under the second head are either transitory or augmentative, these conditions following on a rapid re-formation, or a transference, or other equally potent cause.

Diseases of the third order are due to the nervous system. To them is applied the term "Neuropathogenesis," and the impossibility of applying any common laws of diagnosis to them arises from the complex variety of the nerves primarily implicated.

The racemose arrangement of vesicular eruptions, Mr. Hutchinson continued, follows from the disposition of the nerve twigs, and a marked characteristic of them is their ready spontaneity of cure. The secretion is non-contagious, thus prominently differing from that of eczema and allied disorders. The lecturer referred to a case related by Mr. Hilton, in which the tongue of the patient was *unilaterally* furred, and in explanation of which the observer adduced the irritation of tooth-ache from which the patient was suffering on the affected side. In opposition to this view, Mr. Hutchinson instanced a case from his practice, that of a lady whose tongue, similarly furred on only one side, was brought to this state through the non-employment by the patient of the teeth of that side during mastication. Originally equally coated on all parts of its surface, the organ became denuded of its covering only on the portion employed during the meal-time. From this instance it was urged, the greatest caution should always be employed in arriving at any conclusion as to the neurotic influence exerted over symptoms of disease, and the whole bearings of each case be carefully inquired into, since it is inherently probable that a definite non-symmetry can invariably be associated with a purely local causation.

It was shortly pointed out that all symmetry is not necessarily due to hæmial agency, that exanthemata, for instance, may have some share of neurotic influence, the nerve-centres being, alike with other parts, subject to changes brought about by changed conditions of the blood. Having shortly adverted to the question of intra-uterine influences on the fœtus, and the bearing of this on congenital disease, Mr. Hutchinson entered at some length on an exceedingly interesting discussion of the effect on nutrition of the various systems of nerves, motor, sensory, and vaso-motor, and concluded his discourse with a consideration of the doctrine of trophic nerves, tending to the opinion that no sufficient grounds for accepting these as a distinct system are adducible as yet.

## THE SELECT COMMITTEE ON THE MEDICAL ACTS AMENDMENT BILL.

THE first meeting of this Committee was held on Monday last, and the whole sitting was occupied by the examination of Dr. Acland, who had not completed his evidence on the conclusion of the session.

Dr. ACLAND described himself as the President of the General Medical Council, of which he proceeded to give some account, explaining the origin, constitution, and duties of the Corporation. The members were shown to be distributed thus: to England eleven, Scotland six, Ireland six, the President being at the present time an Englishman also. Of the total number on the Council eight represent universities, while nine are corporation members, the various licensing bodies being duly represented.

### THE DUTIES OF THE COUNCIL.

1. Publication of a Register of duly qualified persons, this being required by the terms of the Act of 1858 in order to remove the anomaly caused by the issue of a number of different registers, which were due to the action of the licensing bodies then in existence; but prior to this no authentic register had been published.

2. Publication of an authoritative Pharmacopœia, there having been previously several in use.

3. *The Superintendence of Examinations.*—This, as the chief duty of the Council, was that which most occupied its attention, and it was said later by Dr. Acland that the very considerable time given of late to public questions in the Council, to the comparative exclusion of the educational subject, had led a number of gentlemen whose services might be of incalculable value on the board, to contemplate a total withdrawal therefrom, because of the alienation of its deliberative counsels from their legitimate direction. The method of visitation and suggestion by which the General Medical Council have striven to improve the working of the various licensing bodies, occupied some time of the Committee, and much valuable information was given on the subject. The question arose in cross-examination whether it would be the object of the Conjoint Board to elevate the standard, to which candidates must attain to deserve qualification, in connection with an expression elicited at this stage of the inquiry to the effect that a varying degree of knowledge was necessary to success under the different bodies granting diplomas. To this inquiry no satisfactory reply could be gleaned; but it was sufficiently clear the President of the Council would be no enemy to a change which would have the effect of increasing the actual requirements of the common school.

### THE DOUBLE QUALIFICATION.

This union was shown to have taken place in Scotland on a humble scale. In England a scheme has been proposed, but no definite action had ensued. Neither in Ireland had anything conclusive been effected in this direction. Out of the nineteen examining bodies, but three accord a double qualification, Oxford not being in the number because, Dr. Acland ingeniously averred, the authorities of that University thought it to be a public duty incumbent on them not to add one to the already multitudinous qualifications already in use. Needless to say, this is a vague reply to those who think Oxford should not be behind-hand with Cambridge in affording a degree in surgery to her alumni. Dr. Acland did not explain to the Committee how the degree, Ch.M., or its equivalent, that would be naturally adopted, would so disastrously add to the terror of numbers, and he will probably be asked to explain the point more clearly. The Chairman of Committee, Mr. Forster, requested to be supplied with a table of the bodies conferring qualifications in medicine and surgery together, those conferring them singly, and those conferring special qualifications. The combinations effected in Scotland, the witness continued are between the Colleges of Surgeons and Physicians, &c., while in Ireland a scheme for the combined action of T.C.D., the R.C.S.I., &c., has been proposed, but not carried through. The proposal to combine in England is of some long standing, and opinion is gradually tending in favour of the plan. All the licensing bodies in consultation being agreed on the necessity of the arrangement to secure a purity and uniformity of examination. It was elicited in further evidence that on two divisions in the Council on this question, 1870—78, the minority have been Irish and Scotch representatives, and it is unquestionably a fact that the keenest opposition against the scheme exists in these two countries. The perfect scheme was promised to be submitted to the members of committee at the next sitting by Dr. Acland. He declared that there was no detail in this remaining unsettled which a slight consideration might not dispense, but in this relation Dr. Lyon Playfair pertinently demanded if the three months' midwifery teaching provided for by the scheme could be considered sufficient, reading in support of the contrary view a letter from his brother, Professor Playfair, of King's College. On this Dr. Acland said he felt sure that any question of the kind would meet with the earnest attention of the Council, and be duly remedied, if need be.

A considerable amount of information as to the bearing and influence exerted by the Council through its *recommendations*, &c., was given, and also an account of its exercise of judicial functions.

### DIRECTION OF THE COUNCIL'S EFFORTS.

A matter in which the Council has been referred to, proceeded the witness, has been the proceedings of foreign and colonial governments in respect of practitioners holding British qualifications, and this and allied functions were those it deemed itself rightly called on to perform, but it has never interfered with the purely *personal* or individual rights of those over whom it held control. Political questions, or those involving grave external responsibilities, such as Vaccination, the Contagious Diseases Acts, and similar subjects, were apart from the scope of the Council's labours. It dealt with the student, and the student's education, and the later conduct of the practitioner, but this only in so far as professional procedure is involved. After some further evidence on the working of the Council came a consideration of

### THE CONSTITUTION OF THE COUNCIL.

There is a general union of three separate Councils, Ireland and Scotland each possessing a local Council which can act independently, but the acts of which carry no authority of the *General* Council. There is further, an *Executive Committee* made up of representatives from the three kingdoms, and to this is entrusted such business as can be decided without a general meeting of the whole body of the Council, which, costing £400 per diem, as against £80 incurred by the Executive Committee renders it desirable that the business should be transacted by the smaller body when possible. In answer to a question whether the Council worked satisfactorily, Dr. Acland said he did not know otherwise, since men so eminent as former presidents and members had given the weight of their counsel to the deliberations of the assembly. He could not say either how it was to be improved, and in connection with this he discussed the question of

### DIRECT REPRESENTATION.

He said that he considered it a good plan for the Crown to hold the appointment of some members, and did not see that there was likely to be a lack of eminent men from whom such nominations should be made after the other electing bodies had made their choice. He could not see that the addition of six members, or, indeed, any number to the ranks of the Council, would materially assist the efficiency of that body, and the objections to the plan proposed by which these representatives should be elected he deemed very considerable. The system whereby some 22,000 voters would be constantly called on to exercise their privileges he thought a very grave objection, while the introduction of the ferment of perpetual elections into the Council was by no means a desirable change. He could not think that more importance would attach to the elections merely because they were made by so many voters; and pointing to the past history of the Council, declared his conviction that no men more eminently qualified than had been elected, would, under the proposed plan, have been chosen to represent the various bodies.

Dr. PLAYFAIR wished to know if witness considered it fair that the Scotch licensing bodies, who last year qualified 210 candidates, should have only two representatives in the Council, while Oxford and Cambridge, which gave only 44 licentiates in the same time, should send *four*.

To this Dr. ACLAND replied that no representative goes as the exponent of the interests solely of his constituancy, but of the national good; and he felt sure that this must be a feeling common to every member of the Council, and also to those who send them there. Being further asked if he considered the general practitioner fairly represented on the Council, he emphasised the conviction that every member of it has earnestly at heart the interests alike of the student and the practitioner.

Dr. PLAYFAIR could not see how, with the one hundred examiners, who under the new scheme would be required,

any uniformity in examination would be possible; but this Dr. Acland declared, would follow from the position and hearty co-operation of the examiners.

Some further questions were put to the witness by other members of the Committee, which was then adjourned to Friday next, when Dr. Acland will conclude his evidence. Mr. Simon will be the next witness.

WEDNESDAY, JUNE 18, 1879.

## BEARING OF PRELIMINARY EXAMINATIONS UPON THE SOCIAL STATUS OF THE PROFESSION.—No. I.

THE importance of providing a sufficiently stringent test of the general education of the student has two aspects. It may be regarded on the one hand as influencing the social rank of the profession in its contact with the world; and on the other as influencing the capacity of the individual to acquire professional knowledge, and to succeed in life as an astute physician or a cultivated surgeon.

From either of these points of view it is difficult to fix the limit of education which we should require from the student in medicine. To set out what amount of mental culture is necessary to make a gentleman, or a man of science, is obviously impossible; and, as in the assessment of professional education, we are obliged to content ourselves with the minimum extent of attainments which will satisfy the public necessities; so with reference to the general education and culture of the medical man, we are obliged to content ourselves with that modicum of erudition which will entitle the practitioner to take his place in society as a gentleman, and enable him to pursue his profession successfully.

We must not even hope to raise the practitioner to the highest ranks of cultured society; for as it is our duty simply to construct a practitioner suitable for his public uses, so we can demand no more than a general education suitable to the rank from which he comes, and in which he is to pursue his avocations.

Considering that the numerical strength of the medical profession throughout the United Kingdom amounts to nearly 20,000, and that the ranks of medicine are supposed to be recruited from the upper stratum of the middle classes, it must be a subject for wonder, as well as regret, how little public influence it possesses. Neither the bar, the church, nor the military service are numerically equal to the medical profession, and yet their opinions receive much higher consideration from the public, and their interests are much better cared for than those of medical men. From whatever cause arising, this state of things cannot be other than calamitous in its results towards our profession; and the proofs that it is so are to be found in each year's legislative work. Of the 658 members of the House of Commons but eight are even nominally members of the medical profession, and of these one is a practising surgeon—a poor legislative representation, truly, of the 20,000 medical men in the United Kingdom.

Nor is the indirect influence of the profession of much weight in any constituency, or worthy of being seriously considered by legislators, and, in consequence, medical affairs receive but little consideration when they come before the House of Commons. It has been of recent years a usual course pursued—for example in the case of the Lunacy (Ireland) Amendment Act, and the Adulteration of Food and Drugs Act—to impose new duties upon medical men, to be discharged by them *without fee or reward*. And, in the lately-passed Prisons (Ireland) Act, the infirmary surgeons attached to those Institutions were placed absolutely at the mercy of the Prisons Board. These things could not be if medical men held their proper position in the community, and the absence of their advice and influence has been observable in almost every piece of legislation in which medical affairs were directly or indirectly involved.

This inferiority by no means extends to all ranks of the profession, for in London and Dublin the very highest social position is occupied by medical men, and their advice is freely asked and accepted with reference to all great questions. It exists also to a much less extent in all ranks of the profession in Ireland than in the English and Scottish provinces, and in many parts of Ireland the dispensary medical officer, if a man of culture and address, is in a position of perfect equality with the neighbouring gentry.

The fact of the social inferiority of the profession being thus admitted, the cause will be readily found in two undeniable facts. Firstly, that education of a medical practitioner has not hitherto been such as would ensure his being a gentleman. Secondly, that the intimate connection of medicine and surgery with drug-selling has made general practice a calling unsuitable for a person of refined mind.

That the essential general education of a practitioner has not hitherto been such as would ensure his being a gentleman will hardly be denied. It has been and is neither of an extent or character equivalent to that required for the other learned professions; and even the

limited requirements which have been recognised as sufficient, have, in consequence of the looseness of the regulations, been habitually disregarded by licensing bodies. The recommendations of the General Medical Council on this point are as follow :—

That no person be allowed to be registered as a medical student unless he shall have previously passed a preliminary examination in the subjects of general education as hereinafter provided.

The Executive Committee to prepare annually a list of examining bodies whose preliminary examinations are recognised.

That it be recommended to the licensing boards not to accept the certificate of proficiency in general (preliminary) education from any of the bodies, the names of which are contained in the list annually circulated, unless such certificate testify that the student to whom it has been granted has been examined in the following subjects :—

1. English language :—including grammar and composition. The General Medical Council will not consider any examination in English sufficient that does not fully test the ability of the candidate :—(1) To write a few sentences in correct English on a given theme, attention being paid to spelling and punctuation as well as to composition ;—(2) to write a portion of an English author to dictation ;—(3) to explain the grammatical construction of one or two sentences ; (4) to point out the grammatical errors in a sentence ungrammatically composed, and to explain their nature ; and (5) to give the derivation and definition of a few English words in common use. Provided always that an examination may be accepted as satisfactory that secures, on the part of the candidate passing it, a sufficient grammatical knowledge of English.
2. Arithmetic :—including vulgar and decimal fractions ; algebra :—including simple equations.
3. Geometry :—First two Books of Euclid, or the subject thereof.
4. Latin :—including translation and grammar.
5. And in one of the following optional subjects :—
   Greek ; French ; German ; elementary mechanics of solids and fluids, meaning thereby mechanics, hydrostatics, pneumatics, and hydraulics.

No medical student shall be registered until he has passed a preliminary examination, as required by the General Medical Council, and has produced evidence that he has commenced medical study.

But inadequate as are those recommendations to enforce a suitable general education of practitioners, it is notorious that they are habitually disregarded, and that students are frequently transformed into practitioners without having, in any fair sense, complied with them. And so well is the low class of education required for the medical profession understood, that the parents of students are wont to stop their son's school education as soon as it has been decided that they are to be put to the study of our art.

How different is the standard of education considered essential for a medical man on the Continent, may be judged by the following report of the Medical Council made by Drs. Beigel and Bruce some years ago :—

The State provides that every child shall receive a certain amount of elementary education, and every parent is bound either to supply this himself, or to send his child to one of the elementary schools (*elementarschule*), which are under direct governmental inspection.

At the age of nine, the lad may be admitted into a college (gymnasium), provided he possesses an elementary knowledge of German, Latin, arithmetic, and history. These colleges are scattered over the whole country, there being several hundred in Prussia alone. The mode of teaching is uniform in all. Each college has eight classes ; the sixth (sexta) being the lowest, the second and first being divided into two sub-divisions (secunda and ober-secunda, prima and ober-prima). The session of each class lasts twelve months, the two sub-divisions of the first and second being considered as separate classes. Promotion from one class to another takes place only once a year, and is determined solely by examination, in which at least a medium knowledge of every subject is required. The same system of teaching runs through all classes from the lowest to the highest, and thus each class is preparatory to the one immediately above it. The course is completed in about eight years, the youth having at this time completed his seventeenth year, and he is now required to pass an examination if he desires to enter a university.

## EPHRAIM McDOWELL.

In a comparatively obscure town in a distant land, an event has recently occurred which cannot fail to interest every member of the surgical profession, and indeed all who know how much that profession has done towards relieving the physical miseries of human life. Far away in the heart of Kentucky, in what was only a few years ago the backwoods of America, a small group of men lately assembled to do honour to one who may be justly ranked among the benefactors of his species. And yet we speak not of one whose name Fame has already carried to the four corners of the earth. He was no great general, nor statesman, nor philosopher, nor poet. He was simply Ephraim McDowell, who was little known beyond his own circle of acquaintance, and of whom probably even the professional reader has never heard. Like another benefactor of mankind, the immortal Jenner, he was only a country doctor, who in the year 1798 settled down to practise in an obscure village in the wilds of Kentucky. And what did Ephraim McDowell do ? Read the inscription on that monument which has just been dedicated to his memory :—"Beneath this shaft rest the remains of Ephraim McDowell, M.D., the Father of Ovariotomy. By Originating a Great Surgical Operation he became a Benefactor of his Race, known and honoured throughout the Civilised World. Born in Rockbridge, Co. Virginia, 1771 ; attended the University of Edinburgh, 1793 ; Located at Danville, Kentucky, 1795 ; Performed the First Ovariotomy, 1809 ; Died 1830. Erected by the Kentucky State Medical Society, 1879." An immense concourse of people assembled within the walls of the building where the dedicatory "exercises" were held. The greatest of living surgeons in America, Prof. Gross, came upon a pilgrimage of a thousand miles to deliver a long and eloquent oration. Dr. Sayre, as the newly elected President of the American Medical Association, made also an appropriate speech. Letters were read from Mr. Spencer Wells, and several other gentlemen who had been invited to be present on the occasion, and the ceremony was closed by presenting Dr. Gross with a slight memento of him whom they had all assembled to honour.

It may be that we are over-estimating the claims which Ephraim McDowell has upon the memory of his fellow-men. But the genius, or the skill, or the courage which

has enabled any one to do well and successfully what has never been done before, has always had for us an irresistible charm; and we often think that men too readily forget those who have been the first pioneers in any new sphere of action or of thought. Therefore, let us take, as no doubt many others will take, the opportunity of placing in imagination a wreath of *immortelles* upon McDowell's grave, and indulge in a few pleasing reflections on his life and on his work.

It was while practising as a general practitioner in the village of Danville—now a small town—that McDowell performed for the first time an operation which, after being long denounced as a murderous innovation, now ranks among the grandest and best established operations in surgery, which in its aggregate results in the hands of different surgeons, "has already added upwards of forty thousand years to womans' life," and which is destined, as years roll on, to rescue thousands upon thousands of women from an untimely grave.

For a long time it was doubted whether McDowell was the first to perform this great surgical exploit. It has been ascribed to L'Ammorrier, of Rouen, who, it is said, had performed it in 1776; while more recently this honour has been given to Dr. Houston, of Dublin, whose name appears in connection with an operation on the ovary as early as 1771. In these cases, however, the contents of the cyst were merely evacuated by an incision through the abdomen, the cyst itself being left behind. Indeed, what little doubt there was about the matter has been completely set at rest by the painstaking investigations of Professor Gross, who, in 1852, showed that the honour of being the first to successfully extirpate an ovarian tumour from the body of a living woman is undoubtedly to be ascribed to Ephraim McDowell. And when we take into consideration the circumstances under which that first operation of ovariotomy was performed, far away from the haunts of civilised man, before chloroform or any other anæsthetic had been discovered, and without those improved methods of procedure, antiseptic measures, and skilled nursing that are now available on every occasion on which ovariotomy is performed, we scarcely know which to admire most, the confidence and skill of the man who performed, or the courage of the woman who submitted, to, that untried operation. To her, too, we would say with Prof. Gross, let a monument be erected not by this or that society or corporation, but by those women who, with her example before them, have profited by her heroism. Nor can we be surprised that the performance and success of that operation were received with incredulity on this side of the Atlantic. No wonder that the then editor of the first medical journal in the world could not imagine it to be possible, and that in reference to the recovery of McDowell's patient, he exclained, *Credat Judæus, non ego!* No wonder, again, that some considerable time elapsed before this enterprising surgeon found any imitators; for it was not till 1821 that Nathan Smith, of New Haven, had the courage to follow in his footsteps. In 1823 the operation was performed by Alban J. Smith, a partner of McDowell, and again in 1829 by Dr. David L. Rogers, of New York. All these cases terminated favourably. McDowell himself operated thirteen times, with the result of eight cures, four deaths, and one failure, a degree of success which, considering the disadvantages under which he laboured, was highly creditable to his skill and judgment. Coming to our own country, we find that the first attempt at ovariotomy in Great Britain occurred in the practice of Mr. John Lizars, of Edinburgh, whose attention had been drawn to the subject by reading a description of McDowell's operations. In 1825 that surgeon published an account of four cases in which he had operated, with two recoveries, one death, and one an utter failure, due to an erroneous diagnosis, both ovaries being perfectly sound. Nothing more, however, was done, either at home or abroad until 1842, when the operation experienced a revival in the hands of Dr. Charles Clay, of Manchester, followed shortly afterwards by Dr. Frederick Bird, of London, and the two brothers John and Washington Atlee, of Pennsylvania, the first case of the former having occurred in 1843, and of the latter in 1844. Still the operation made but little way. It met with the strongest opposition, and was denounced in most unmeasured terms, both in this country and in America. "I was represented," says an early ovariotomist, "as a dangerous man, even as a murderer, and a celebrated professor and popular teacher publicly invoked the law, to arrest me in the performance of the operation." What a change has taken place in the opinion of the profession! While, as late as 1850, Lawrence asked whether ovariotomy could be encouraged and continued without danger to the character of the profession, Sir James Paget said, in 1877, that the great success of this operation had led to an extension of the whole domain of peritoneal surgery, and that its influence for good extended through every part of operative surgery. The good results, indeed, which have recently followed the performance of ovariotomy have been greater than its most sanguine supporters could have anticipated, while the large number of cases that have been operated upon show the appalling frequency of ovarian disease, and consequently the number of women, who, but for this operation, would have been doomed to an early grave. Dr. Clay, writing in 1874, states that he had operated upon 276 cases, while those of Dr. Atlee, at the time of his death amounted to 387. Mr. T. Spencer Wells, whose brilliant career as an ovariotomist began in 1858, says, in a letter to Prof. Gross, dated April 29th, 1879, that he had just had his 938th case. "I began," he adds, "the year 1878 with the 888th case, by adopting the antiseptic system of Lister, and have kept it up ever since, the result of forty-five cases being forty recoveries and five deaths." As Dr. Druitt has justly observed, ovariotomy need not fear to be judged by such results as these, which are far more favourable than those after the larger amputations, and after herniotomy and lithotomy in the adult.

Judging from all accounts that have reached us, it is evident that Ephraim McDowell was no ordinary man. He was in advance of his time and of his profession; and had ambition or accident placed him in a different position to that in which he lived and died, there can be no doubt he would have been ranked during his lifetime among the most eminent European surgeons of his age. He was known to be a bold surgeon, a man of elevated understanding, capable of taking a comprehensive view of anything that was presented to him. He had not been

home long from his foreign residence before patients began to flock to him from all parts of the Southern States of America, and he found himself immersed in a large surgical practice, demanding the performance not only of the more common, but also of many of the more difficult and severe operations. He was an excellent anatomist, and he seldom performed any serious operation without previously recalling to his mind the structures involved in it. He had the most scrupulous regard for the welfare of his patients. He never operated for the sake of operating, and for the mere mechanical surgeon he had a supreme contempt. Speaking of ovariotomy, he once said, "It is my most ardent wish that this operation may remain to the mechanical operator for ever incomprehensible." But the circumstances under which he performed his first operation are alone an incontestable proof of his genius and his skill. No little persuasion, and no little confidence in the possible success of his undertaking, must have been required to have induced his patient to be the first to submit herself to so formidable and so perilous an operation—an amount of persuasion and of confidence that could only have been brought into play by one who was far above the professional prejudices and preconceived opinions of his day, and who had that reliance in the reparative powers of Nature, which have seldom disappointed those great surgeons whose skill and judgment have been equal to their zeal in arresting the progress of disease. Fain would we also speak of his excellent private character, his many domestic virtues, but the limited space at our disposal reminds us that we must draw these remarks to a close.

It was not given to McDowell to see the fruit of his labours beyond the limits of his own country. The seed which he sowed fell at first upon uncongenial soil. Nor did he receive any of those honours and distinctions which it is customary to lavish upon less deserving men. In 1807, the Medical Society of Philadelphia sent him its diplomas of membership; and in 1825, the University of Maryland conferred upon him the degree of Doctor of Medicine; that is all. But there are distinctions which no society, no university, can bestow. There is the reputation of having done something that "posterity will not willingly let die." There is the honour of having originated and performed an operation, which ere long will have been the means of saving thousands of our fellow countrywomen from a premature and miserable death. There is the name, Ephraim McDowell, which, in conjunction with those of Atlee, of Pennsylvania, Clay, of Manchester, and Spencer Wells, of London, will live in the memory of future generations as long as surgery is studied as a science, and practised as an art. Give to them an honourable place in the history of medicine! let them be inscribed in our text-books! that every student may see that in whatever position it has pleased Providence to place him, it is still possible for him to make his life—

. . . . . sublime;
And when departing, leave behind *him*
Foot-prints in the sands of time.

# Notes on Current Topics.

## Hospital Sunday.

On Sunday last, the fifth of what we may now consider a well-established Hospital Sunday, sermons were preached in all the more important churches and chapels throughout the metropolitan district, on behalf of our unendowed hospitals and dispensaries. The Lord Mayor and Sheriffs attended the service at St. Paul's in the morning, and the afternoon at Westminster Abbey. The weather was once more of an unfavourable character, and must have considerably diminished the congregations, especially at the morning services; St. Paul's Cathedral, accommodating as it does, an enormous congregation, never comes up to what might have been anticipated and expected, and yesterday there was an additional falling off in the sum collected, from the Dean taking away the evening service collection, and devoting it to an alien Society of a totally different character. The collection amounted to only £112; whilst that of the Abbey was more than double, £255. At the Temple, Dr. Vaughan delivered an eloquent address, and the sum collected was £186; at the Metropolitan Tabernacle by Mr. Spurgeon, the total reached £186; at Dr. Parker's City Temple, £109; at the small Chapel Royal, Savoy, sermon preached by the Rev. Henry White, the collection amounted to nearly £50; at the Chapel Royal, St. James's, £47; and at the several Synagogues the collections of Saturday amounted to over £1,000, a sum somewhat less than that of last year. On the whole it is expected that the final result will certainly not be less than that of last year.

## A Poisonous Caterpillar.

A remarkable account is given in the *Journal* of the Royal Microscopical Society for June, of a poisonous caterpillar lately discovered in Brazil. Mr. E. D. Jones, a corr. member of the Literary and Philosophical Society of Liverpool, relates that he was induced to experiment upon himself, and found it very venomous. He does not particularise the species, but he describes the caterpillar as being one-and-a-half inches long, thick in proportion to its length; the body being covered with long reddish-brown hairs growing in tufts arising from the centre of each segment of its body, and at the base of each hair is concealed a venomous spine. The body is soft and fleshy, and of a paler colour than the hairs that cover it. The head is small, and whilst the creature is feeding nearly covered over by a fleshy mantle. Believing that it was, as described, a venomous species, he nevertheless determined to make an experiment upon himself. "At 11 a.m. he applied the back of the caterpillar to the back of his left hand with sufficient pressure to feel the pricking of the spines. In ten minutes he had evident pain in the hand and the place of contact had swollen up into a white lump surrounded by a deep red inflamed patch. A few minutes later and violent pain commenced under the arm-pit. At 11.30 a red rash appeared on the inside of the elbow, and this gradually extended to the shoulder, along the biceps, and down the arm to the place of injection. The rash was slight excepting just at the elbow. Soon after 12 there was a sensible weakness

of the hand and arm, either in consequence of the extreme pain or a distinct effect of the poison. At 12.15 the rash began to disappear, and the pain under the arm much diminished. The affected part of the hand began to perspire considerably, but the pain about the infected spot was as violent as ever, burning horribly like a scald. At 1 p.m. the arm-pit pain had nearly ceased, and the rash disappeared, but the pain in the hand itself could scarcely be borne. Boring a hole with a red-hot iron came nearest to the pain experienced. At 5, 6, 8.30, and 10 there was a gradual diminution of pain, though at 1.30 a.m. Mr. Jones awoke and still felt it. Next day it had entirely vanished, but the soreness did not subside till the day after. The marks of the points of thirty-six spines were still visible a fortnight afterwards." From the drawing which accompanies the description, it would appear to belong to a species not hitherto described.

## The Dublin Pathological Society

BEING in a very languid condition, has undergone another revolution. It will be recollected that in years past, the exhibition of recent specimens was the only business of the Society, no discussion being permitted, and the students being admitted as audience. It is, indeed, not very long since the attendance of students at its meetings was recognised as equivalent to a course of lectures on practice of medicine.

Two years since a reform was instituted and a proposal was carried that communications to the Society should be open to debate, and that students should be no longer admitted. After two years' trial the Society has reverted to its old method.

At a special general meeting of the Society, held on Saturday, May 17, in the anatomical theatre of the School of Physic, Trinity College, William Moore, M.D., President, in the chair, the following resolutions were adopted as bye-laws :—" 1. That in future students be admitted to meetings of the Society. 2. That members not in arrear with their subscriptions shall receive at the beginning of the session thirty-eight tickets for distribution to students at the rate of not more than two tickets for each meeting of the Society. 3. That discussion be permitted at the meetings of the Society. 4. That the hour of meeting be five o'clock in the afternoon. 5. That an essay on a subject in general or special pathology, accompanied or not with specimens, may be laid before the Society. A week's notice must in such case be given in writing to the secretary ; and that such notice be communicated to the members by circular."

It is hardly to be expected that these resolutions will regenerate the Society. It languishes really because the profession takes no interest in it, for its meetings are held at four o'clock in the afternoon, and nothing is heard beforehand of the subjects to be brought under notice, or for months afterwards of the communications which have been made. The Society is, in fact, a hole-and-corner affair, and necessarily has interest only for those within the limited circle of its members.

## Regulation of Cow Sheds and Dairies.

VERY salutary instructions have been recently issued by the Executive Committee under the Contagious Diseases (Animals) Act, 1878, with regard to the regulation and inspection of cow sheds and dairies. Among these instructions we may mention the following :— No cow-shed or dairy to have any water-closet, privy, cesspool, or urinal within its walls, or in direct communication with it ; no one occupying a cow-shed or dairy to allow any person suffering from infectious disease, or living in a house where such disease is known to exist, to enter the dairy or cow-shed, &c. ; every place used as a dairy to be thoroughly ventilated and paved with non-absorbent materials, and have no drain within its walls communicating with a public sewer. Moreover, all vessels for the reception, storage, or delivery of milk are to be made of non-absorbent materials ; the occupier must cause them to be at all times thoroughly cleansed and purified, and all milk is to be removed as quickly as possible from the cow-sheds to the dairy. The dairy must also be provided with pure water for the purpose of cleansing the vessels, flushing the floors, &c. Full instructions are given for the construction of new cow-sheds and dairies for which licenses may hereafter be applied. Any person applying for sanction to establish a new dairy must send in a plan of the projected premises, showing the provision made for the drainage, lighting, ventilation and water supply of the same ; and furnish, moreover, a plan of the locality showing the buildings and streets within 100 yards of the premises.

## Pharmaceutical Society of Ireland.

THE following reports were adopted by the Council :—

The Committee appointed to consider the Pharmacy Act for Ireland, and to report whether any, and if so what, changes should be made therein, having carefully considered the matter, and also having had before them the opinion given by Mr. Purcell, Q.C., on the questions submitted to him, are of opinion that it would be judicious for the Council at an early date to have the Act amended, in order to give power to them as follows :—

1st. The Council of this Society having decided to have but the one grade for the compounding of prescriptions, viz., that of pharmaceutical chemist, this Committee are of opinion that clauses 15 and 18 should be repealed, and all other clauses relating to the title of chemists and druggists be altered to agree therewith.

. . . . . .

3rd. To allow all persons at present actually engaged in the sale of poisons, or poisonous drugs, on making a declaration to that effect, and giving reasonable proof thereof, to be registered on payment of a fee not exceeding £3 3s., and that such persons shall be styled " registered druggists."

4th. That the Council shall have power to institute an examination for those wishing to sell poisons and poisonous drugs, and a fee, not to exceed £3 3s., to be charged therefor, and that the names of the persons so examined shall be placed on the list of registered druggists.

. . . . . .

6th. That it shall be illegal for any person to sell poisons or poisonous drugs, or to style himself a " druggist," except he shall be so registered, save and except he be a qualified medical practitioner, or duly registered by the Pharmaceutical Society of Ireland, or otherwise exempt by the Pharmacy Act.

7th. That it shall be unlawful for any registered druggist to keep open shop for retailing, dispensing, or compounding medical prescriptions.

Resolved :—

"That the amendments to the Pharmacy Act, adopted by the Council, be drawn up in the form of an Act, to be submitted for consideration to the Society at the annual meeting to be held in October next, a copy being previously sent to each member."

## How Small-Pox is Spread.

In the last report of the health of Kensington, Dr. T. Orme Dudfield, Medical Officer of Health, refers to a patient who had escaped from his house in a state of delirium, and was under the observation of a large crowd of people, attracted by his insane behaviour. It transpired that the poor man took a cab and drove some distance to Devonshire Terrace to call upon a friend, being then full of his delusions. After a few minutes' stay the people of the house persuaded him to go to the workhouse opposite, from whence he was removed to the hospital. Shortly afterwards the wife of the person in Devonshire Terrace, on whom the man called, was taken to the hospital suffering from the same disease; and one of his own children had been removed on the previous day. The history of the case is that a man, whom the deceased employed, called upon him about thirteen days prior to the commencement of the illness, and in explanation of his absence from business, stated that he had been ill of small-pox. In fact, he was ill at the time, and infected the deceased. Dr. Dudfield remarks that if the facts could be proved the man ought to be prosecuted under sec. 38 of the Sanitary Act, 1866.

## The Health of Hastings and St. Leonards.

Hastings may now claim the proud distinction of the premier health resort in the United Kingdom. There may be smaller and less known sea-side towns, which could show as low or even a lower death-rate, but there is certainly no town of equal magnitude that can boast of such a bill of health as 15 per 1,000 in a population of about 40,000 souls. This, when we take into account the number of patients sent there, oft times in the last stages of phthisis, is satisfactory news to the profession; and the medical officer of health is to be congratulated, in conjunction with the local authorities, for carrying out those sanitary measures which must have materially tended towards this result. Not very many years since we felt bound in the public interest to severely condemn the *laissez faire* system of insanitariness which seemed to have taken possession of the local authorities; now all this is changed, and Hastings and St. Leonards have again become what they were before they increased so rapidly in size and population—a real health resort.

## The Fear of being Buried Alive.

The will of a benefactor to medical charities was proved a few days ago in the London Probate Court, in which, after leaving a handsome legacy to hospitals, the fear of being "buried alive" was shown to be ever prominent in the testator's mind. Some of our readers may remember the litigation as to the validity of the will of Mr. Philip James Ashton, who died on May 5, 1878, on board his yacht, the *Dauntless*, at Dover; the personal estate of this gentlemen has now been proved under £160,000. In it he devised that £20,000 be divided by his trustees among such of the hospitals of the counties of Chester and Lancaster as they shall consider most in need and most deserving of pecuniary assistance; and testator further directs the medical man in attendance on him, or some other medical man, should, after his death, open an artery in his arm, and his burial was not to take place until this direction had been faithfully carried out.

## A New Method of Professional Decoration.

We learn from a Dublin paper that a local music master in an English country town "has composed an exceedingly effective march, which he has dedicated to Dr. J. G. Beaney, the eminent Australian surgeon. There is introduced the famous post-prandial ditty, 'He's a Jolly Good Fellow,' which the author, in a preface, says is identical with the familiar French chanson, *Malbrouck se va-t'en guerre.*"

## Royal College of Surgeons in Ireland.

At a meeting of the President and Council, held on 5th June, 1879, the following resolution was unanimously passed, viz. :—

"That, in the opinion of this Council, the proposal of the General Prisons Board, to the effect that the surgeons attached to prisons should be required to compound medicines without offering them an option, unless at a sacrifice of salary, is highly objectionable.

"That the Council considers that the recent notification of the Prisons Board, that the infirmary surgeons attached to prisons have ceased to hold office, and are liable to re-election on such terms as the Board sees fit to impose, is, if not absolutely illegal, at least most unjust to officers who have for many years performed their duties with undoubted efficiency; and this Council therefore trusts that the General Board will withdraw such notification, and that if retained, it will not receive the sanction of the Lord Lieutenant.—Signed, E. D. Mapother, President; J. Stannus Hughes, Secretary."

Dr. Wilks, F.R.S., physician to Guy's Hospital, has been selected to deliver the annual Harveian Oration at the London College of Physicians, on Thursday, June 26, at 5 p.m.

It is not often medical journalists are able to chronicle the fact of a member of the profession leaving a fortune behind him; such however, is the case with the late Dr. Murchison, whose will was proved last week under £50,000 personalty.

Dr. Saunders, the Medical Officer of Health for the City of London, in his report, presented last week, at a meeting of the Commission of Sewers, states that during the past fourteen days the inspector had seized upwards of fifty-three tons of meat unfit for human food, the value of which had been estimated at £10,000.

Invitations have been issued for the annual *conversazione* of the Royal College of Physicians of London, on Wednesday evening at 9 o'clock. This reception is one of the features of the London season, and provincial members of the profession who anticipate being in the metropolis at the time should endeavour to procure a card of admission.

On Saturday a deputation of the Temperance Leagues waited upon the Home Secretary, for the purpose of urging upon the Government the expediency of taking over the water companies of the metropolis, in order to secure a purer and more constant supply of water.

The Right Hon. W. E. Forster has been elected Chairman of the Committee of the House of Commons appointed to consider the Duke of Richmond's Medical Act Amendment Bill; and Mr. Salt, the Financial Secretary of the Local Government Board, has been made Chairman of the Committee on the Scotch Poor-law Removal Bill.

The death-rate from the seven principal zymotic diseases averaged 2·6 per 1,000 in the large towns last week. Measles showed the largest proportional fatality in Salford and Leicester; scarlet fever in Oldham and Newcastle-upon-Tyne; and whooping-cough in Birmingham. Small-pox caused 12 more deaths in London and its Outer Ring of suburban districts, 18 in Dublin, but not one in any of the other large towns.

The rates of mortality in the principal foreign cities according to the most recent weekly returns, were—Calcutta 28, Madras 36; Paris 26; Geneva 28; Brussels 32; Amsterdam 24, Rotterdam 27; The Hague 24; Copenhagen 28; Stockholm 24; St. Petersburgh 44; Berlin 25, Hamburg 32, Dresden 25, Breslau 38, Vienna 33, Buda-Pesth 34, Rome 21, Turin 34, Venice 23, Alexandria 33; New York 24 per 1,000 of the populations.

The rates of mortality per 1,000 last week in the principal large towns were—Portsmouth 12, Plymouth 15, Brighton 16, Hull 17, Sheffield 17, Wolverhampton 17, Edinburgh 18, Sunderland 18, Salford 18, London 19, Nottingham 20, Bristol 20, Norwich 20, Newcastle-upon-Tyne 21, Liverpool 21, Leeds 21, Birmingham 21, Glasgow 21, Leicester 22, Manchester 22, Bradford 23, Oldham 23, Dublin 40, of which number nearly one-third of the deaths occurred in the first four months of the year.

Surgeon-General J. T. Carter Ross, C.I.E., who has recently retired from the Indian service, after a distinguished career, has accepted the post of Chief Commissioner for the Stafford House South African Aid Committee for Aid to the Sick and Wounded, and has proceeded to Natal. He takes with him Dr. George Stoker, who was similarly engaged in the Russo-Turkish war, as Assistant Commissioner; also some trained nurses, whose services will no doubt be immediately called into requisition.

# Scotland.

(FROM OUR NORTHERN CORRESPONDENT.)

Morison Lectures on Insanity. — Professor W. T. Gairdner, of Glasgow, delivered the first of six Morison lectures on insanity in the Hall of the Royal College of Physicians of Edinburgh on the 4th inst. Dr. Peddie, President of the College, occupied the chair, and there was a large attendance of medical, legal, and other gentlemen.

The Working of the Contagious Diseases (Animals) Act.—A quarterly meeting of the members of the Edinburgh Veterinary Association was held in the London Hotel, St. Andrew's Square, on the 5th inst., Professor Rutherford, of the Royal Veterinary College, Edinburgh, occupied the chair. Professor Walley submitted a number of specimens of remarkable cases of disease which had come under his notice, some of which created considerable discussion. Mr. Leith, V.S., Leith, stated that he had now been an inspector under the Contagious Diseases (Animals) Act at Leith for nine years, and during the whole of that time pleuro-pneumonia had existed in the burgh till November, but he was glad to say that, as he believed through the operation of the recent order of the Privy Council, they had been fifty-six days clear of the disease. Professor Walley also testified to the good which had resulted from the Order. Mr. Robertson, V.S., afterwards read a concluding paper on "Arthritic or Joint Disease in Young Animals."

School of Dental Surgery.—The first of a series of lectures to dental students was delivered on the 3rd inst., in Anderson's College. The event was one of much interest to the profession, being the inauguration of the first School of Dental Surgery in Scotland. The arrangements for the course of lectures are as follow: Dental Surgery and Pathology, by Dr. J. R. Brownlie; Dental Anatomy and Physiology, by Dr. C. Crooks Morrison; and Dental Mechanics and Metallurgy, by Dr. W. S. Woodburn. Dr. Brownlie delivered the introductory lecture, and in addition to a good number of students, there were present Dr. McKinlay, Dr. Charteris, Dr. Dunlop, Dr. Scott Orr, Mr. Grieve, Dr. Muirhead, Dr. James Morton, Dr. Kelly, Mr. Kidston, secretary of the College, Mr. David Sandeman, Dr. Crooks Morrison, and Dr. W. S. Woodburn. Dr. McKinlay, in the absence of Mr. Jamieson, was called on to preside, and introduced the lecturer.

Greenock.—Prosecution under the Public Health Act.—A cabman, named William MacCartney, was brought before Sheriff Smith, Greenock, on the 5th inst., at the instance of Mr. George Mackay, sanitary inspector, charged with infringing the Public Health Act by conveying a man to the infirmary in his cab who was suffering from typhoid fever, and with having failed to disinfect his cab afterwards. It was shown by the evidence that the woman who went for the cab first asked a cabman named Sidey, who refused when told what the man was suffering from, but the accused took the hire, and he now said he was not aware the man was in fever. After hearing the evidence, including that of Dr. Douglas, who saw the man and gave the order for his removal, the Sheriff found the charge not proven. Michael Graham was also likewise charged with removing his brother from East Shaw Street to the Infirmary without taking any precautions, although he was suffering from typhoid fever, and also failing to report the affair to the Sanitary Department. The Sheriff gave orders that where certificates were granted by medical men for the admission of patients to the hospital suffering from fever it should be made a point to inform the parties that it was necessary that the patients should be sent to the infirmary in the vehicle provided by the sanitary authorities.

The Health of Edinburgh and Leith. — The health of Edinburgh is again reported satisfactory. The rate of mortality last week was again reduced to what is recognised as the summer standard—17 per 1,000 per annum, In Leith the death-rate was only 12.

Death-Rate of Glasgow.—Deaths in Glasgow during the week ending June 7th, were at the rate of 21 per 1,000,

against 23 in the preceding week, and 26, 26 and 28 in the corresponding periods of 1876, 1877, and 1878.

THE BUTE ROBERTSON-STEWART HOSPITAL.—This hospital has been enlarged to admit of cases other than infectious, at a cost of over £6,000, which has been defrayed entirely by Mr. A. B. Stewart, the liberal proprietor of Ascog Hall.

ILLNESS OF SIR WYVILLE THOMSON, F.R.S.—On Sunday Professor Sir Wyville Thomson was seized with a shock, which, though not paralysis, is so serious that he has remained in a state of unconsciousness for about a day. Negotiations have been opened with Professor Alleyne Nicholson, of St. Andrews, to conduct temporarily Professor Thomson's class in the Edinburgh University.

GOVAN DEATH-RATE.—Dr. Aitken, the medical officer for Govan reports that the total number of deaths registered in the burgh during the month of May was 87, being at the rate of 22·21 per 1,000 per annum to a population of 47,000. There were 13 deaths from consumption, 10 from inflammation of the lungs, 8 from bronchitis, 8 from measles, 3 from whooping-cough, one from diarrhœa. The deaths were spread over the burgh as follows—No. 1 Ward 17, No. 2 Ward 19, No. 3 Ward 9, and No. 4 Ward 40.

REGISTRAR-GENERAL'S RETURNS.—During the month of May there were registered in the eight principal towns in Scotland, the births of 3,873 children of whom 1,955 were males and 1,918 females. 474 marriages were registered in the eight towns during May. Although this number is above that recorded during May of last year, yet for a period of ten years it is 68 below the average. The deaths of 2,451 persons were registered in the eight principal towns during the month, of whom 1,203 were males and 1,248 females. Allowing for increase of the population this number is 401 below the May average of the last ten years. Seventy deaths resulted from violent causes of whom 3 were suicides, 3 deaths were caused by delirium tremens, and 9 by the direct effects of intemperance.

# Correspondence.

## THE CONTAGIOUS DISEASES ACTS.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—As Dr. Thompson has laid before your readers his view of the sanitary features of the Contagious Diseases Acts, I know I need only appeal to your sense of fairness for space in which to express the views held by those who disapprove of such legislation. Without taking your correspondent's cue of irrelevant and unfounded accusation, in the use of such expressions as "advocates of free trade in prostitution," "ignorant," and the like, I will confine myself strictly to the sanitary question; premising that the opponents of these and similar acts do not seek to abolish them because they are sanitary failures, but because of their unconstitutional and immoral character which has not the excuse of sanitary success to redeem it.

Firstly, let me quote a few lines from the Report of the Royal Commission of 1871, the office of which was to investigate the effects of the laws in question: "There is no distinct evidence that any diminution of disease among the men of the Army and Navy which may have taken place, is attributable to a diminution of disease contingent upon the system of periodical examinations among the women with whom they have consorted" (sec. 37). The Commission "thinks it right, however, to observe that there appears to be a general impression on the part of medical officers that the Acts have operated beneficially on the health of the men, though the results of the statistics must be inconclusive" (sec. 38). "We recommended that the periodical examinations be discontinued" (sec. 66). Further experience to 1877, the date of the latest Army and Navy Reports, confirms the views which the Commission had thus expressed.

The Acts were passed "for the better prevention of contagious diseases at certain military and naval stations" and "the term 'contagious disease' means venereal disease, including gonorrhœa;" so if these measures have hygienically succeeded they must have reduced constitutional and primary syphilis as well as gonorrhœa. The following statistics (which relate to the whole Army, for there are no means of comparing the amount of secondary syphilis in the subjected and the unsubjected stations) show how far this result has been attained:—

ARMY.—*Secondary Syphilis—Before the Acts.*—The ratio *fell* from 32·68 per 1,000 to 24·73 per 1,000, or *one-fourth of its amount*, in 5 years. *Since the Acts.*—The fall in the disease stopped the year the Act was passed, and the amount of secondary disease has been higher by one-eleventh on the average of the whole period since, than it was the year the Acts were first put in force. The yearly ratios have been 28·1, 31·6, 25·4, 20·3, 24·3, 23·7, 24·5, 28·7, 27·4, the latest ratios being higher than when the Act was passed.

*Primary Venereal Sores—Before the Acts.*—The *fall* in these sores was 6 *per cent. yearly*, calculated upon the amount of disease in 1860, the year the Army Reports began to be published regularly. *Since the Acts.*—The *fall* has been *only* 4·6 per cent. yearly, calculated upon the mount left in 1866, when the Acts were put in force.

*Gonorrhœa—Before the Acts.*—*Fell* from 111·66 per 1,000 in 1861, to 98·43 per 1,000 in 1866, or one-eighth. *Since the Acts.*—It has fluctuated exceedingly both in the stations under the Acts and those not under them. *It has been higher in the stations under the Acts than in those not under them*, by the acknowledgment of every Army Report since the Acts, until concealment of disease invalidated the returns, In 1873 a new Army Order was issued which invalidates all the statistics of venereal disease from that date.—*See* "Army Report," 1873, p. 13, last line. "Army Report," 1874, p. 11, "Syphilis." Ditto, 1875, p. 14. Ditto, 1876, p. 12. Ditto, 1877, p. 16.

*Loss of Time and consequent* LOSS OF EFFICIENCY.—*Before the Acts.*—The number of men constantly in hospital, from venereal diseases of all kinds (secondary, primary, and gonorrhœa) in 1860 was 23·73 per 1,000 men. The ratios fell year by year (omitting decimals) to 24, 22, 20, 19, 18, to 16 in 1866, when the Act was passed. It had fallen one-third in six years without the Acts (Min. of Evid. R. Com. p. 815). *Since the Acts.*—The Army Report now gives no return of the number of men constantly in hospital from secondary syphilis, or from gonorrhœa, nor of the duration of these cases. We have therefore no means of ascertaining the loss of efficiency to the services caused by these forms of disease—the real question to be considered. As the average amount of secondary syphilis has risen in the army, though slightly, and the average duration of each case of gonorrhœa in the navy has gradually risen from 18 days in 1866, to 27 days in 1876, the omission of these two forms of disease, from the tables relating to the constantly sick, is a very serious one in estimating the influence of the Contagious Diseases Acts on the efficiency of the Army.

NAVY (Home).—*Secondary Syphilis—Before the Acts.*—The Navy Reports do not give the returns on this head, on which account it cannot be compared with the amount *since the Acts.*

*Primary Syphilis—Before the Acts.*—The same remark applies as that used about secondary syphilis above.

*Primary and Secondary Syphilis combined—Before the Acts.*—The *fall* in these combined diseases was at a rate of 11·2 *per cent. yearly* on the amount of disease when the Navy Reports began to be published regularly. *Since the Acts.*—The *fall* has *only been* 3·7 *per cent. yearly* on the amount of disease remaining when the Acts were put in force.

*Gonorrhœa—Before the Acts* the average ratio for 6 years was 29·0 per 1,000. The ratio fell from a maximum of 34·8 per 1,000 in 1862, to 20·4 per 1,000 in 1866. *Since the Acts.—Gonorrhœa has risen* steadily year by year from 20·4 per 1,000 in 1866, to 48·4 per 1,000 in 1876. It has more than doubled.

The severity of the cases has increased. The average duration of each case was 18 days in 1866. It has risen to 19, 21, 21, 22, 25, 27, 26, 27, days in 1876, the last Navy Report published.

Sir Alexander Armstrong's evidence before the Royal Commission: "The Returns of Dr. Armstrong (navy) of cases of gonorrhœa are remarkable—they would seem to

show that since the introduction of the system in 1864, the more serious form of disease has diminished, whilst the other form (gonorrhœa) has increased."—Royal Commissioners' Report, sec. 31. For the reduction in primary and secondary syphilis, see above.

If any medical man believes that the increase of gonorrhœa in the navy is only apparent (as Dr. Thompson asserts), and that it arises simply in recording trifling cases now which were omitted formerly, I beg him to notice that the *number of recorded cases* has risen yearly from 20 to 48 per 1,000; *the average duration of each case* has steadily risen from 18 to 27 days and the *loss of time* by men constantly in hospital has risen from an average of 53 to 99 men per 1,000. These changes have occurred since the Act. Is it anything short of an absurdity to ascribe them to a mere nominal matter?

*Loss of time and consequent* Loss of Efficiency *from all forms of Venereal Disease.*—This was improving in the navy at the rate of 8 *per cent. yearly before the Acts.* It has only improved at the rate of 1·4 per cent. yearly since the Acts.

Comparison between five ports under the Contagious Diseases Acts, and five ports not under the Contagious Diseases Acts. Special Admiralty Report for the House of Commons, 4th July, 1877.—*Venereal Diseases*, of all kinds, *have risen* in the five ports under the Acts during the last 5 years of their most complete operation by 31·23 per 1,000, which amounts to an increase of 346 men laid up in hospital yearly in these 5 ports, in excess of the number during the previous equal period of 5 years when the Acts were not in full force.

Navy (Mediterranean).—Malta, Gibraltar, and the Piræus—the most important stations of the Navy—have been for many years under Contagious Diseases Acts, and nearly all the garrison towns on the Mediterranean at which ships of the navy are stationed, are under government regulations of prostitution, more or less, closely resembling the Contagious Diseases Acts:—

Secondary syphilis is not recorded previous to 1866. In that year it was 10·1 per 1,000. It fluctuated from 9·3 to 10·2 per 1,000 until 1873 when it rose to 13·7 and in 1876 it it had risen to 17·0 per 1,000.

*Primary Venereal Sores—Since the Acts.—Have risen* from 24·0 per 1,000 in 1866, to 63·0 per 1,000 in 1875—nearly trebled.

*Gonorrhœa—Since the Acts.*—Has risen from 14·8 per 1,000 in 1866, to 50·6 per 1,000 in 1875—more than trebled.

*Loss of Time.*—This has increased from 5·5 "ratio of days sickness per 1,000 men" in 1866, to 10·7 in 1875. The loss of time has more than doubled.

*Prostitutes Registered under the Acts.*—Venereal disease has been higher by 19·7 per cent. on the average of the whole period that the Acts have been in force than it was the year they came into operation. ("Annual ratio per cent. of cases of disease calculated on the average number of women on the Register").

Capt. Harris's Report, 1877, p. 5, col. 31.

| | | | | | | | |
|---|---|---|---|---|---|---|---|
| 1866 | ... | ... | 121·6 | 1872 | ... | ... | 146 9 |
| 1867 | ... | ... | 140·7 | 1873 | ... | ... | 141·7 |
| 1868 | ... | ... | 202·7 | 1874 | ... | ... | 137·3 |
| 1869 | ... | ... | 194·7 | 1875 | ... | ... | 127·0 |
| 1870 | ... | ... | 148·2 | 1876 | ... | ... | 129·5 |
| 1871 | ... | ... | 135·4 | 1877 | ... | ... | 148·5 |

*Deaths.*—These have more than doubled since 1865, the year before the Acts—they have risen year by year as follows:—

Deaths per 1,000 registered prostitutes.

| | | | | | | | |
|---|---|---|---|---|---|---|---|
| 1865 | ... | ... | 9·8 | 1870 | ... | ... | 16·8 |
| 1866 | ... | ... | 15·5 | 1871 | ... | ... | 20·6 |
| 1867 | ... | ... | 10·4 | 1872 | ... | ... | 21·6 |
| 1868 | ... | ... | 10·4 | 1873 | .. | ... | 16·4 |
| 1869 | ... | ... | 16·7 | 1874 | ... | ... | 23·0 |

Capt. Harris's Report.

At this time the increase of deaths attracted great attention, and was quoted extensively as showing the fatal influence of the system upon the life of the registered prostitutes; and coincidently with these unfavourable comments on the result of the Acts, the deaths became fewer very rapidly and suddenly, viz.: 1875, 15 per 1,000; 1876, 10·5 per 1,000; 1877, 12·3 per 1,000. By removing prostitutes from the register when in danger of death, the mortality will naturally fall.

*Civil Population* (*Wives and Children in subjected Place*)—*Wives.*—There are no published data from which any information is to be obtained as to the influence of the Contagious Diseases Acts upon the amount of disease among the married women in places under the Acts.

*Children—Disease*—The only data upon this subject with which we are acquainted are the hospital returns from children's infirmaries. Ten children's infirmaries in England, Ireland, and Scotland, 266,846 patients—average of syphilis 1·4 per 100 patients.

Devonport Children's Infirmary (1875) 5·3 per 100 patients.

Note.—Devonport has been under the Contagious Diseases Acts longer than any other station, and is generally referred to as specially representing their beneficial operation.

*Deaths.*—Mr. Humphrey, of the Registrar-General's Office, published a report in the *British Medical Journal* for July 8th, 1876, which stated that there had been no reduction in the mortality from congenital syphilis in the subjected towns since the Act had been in force.

*Difference in Primary Venereal Sores between Fourteen Stations under the Acts, and Fourteen Stations not under the Acts.*—It is upon the difference between these two sets of stations that Dr. Thompson and the advocates of the Acts claim to have discerned such a sanitary success. Finding all other statistics against them, they state triumphantly that "the ratio of primary venereal sores in the subjected stations is only half of what it is in the unsubjected stations;" but a study of the following facts will show that computations based upon individual stations, or small groups of stations, are fallacious. In 1875 there were *no cases* of primary venereal sores in thirteen stations *not* under the Act; in 1876 the same was true of fourteen similar stations; and in 1877, of 37 (Army Rep., pp. 17, 13 and 17 of respective years). I must here refer to the objection that we have taken from the very first—viz., that there is no common ground upon which the set of fourteen stations under the Acts can be grouped together as affording a fair sanitary comparison with the other set of fourteen not under them. The only principle on which it is even professed to group them is that the one set is under the Acts and the other is not. Stations like Aldershot and the Curragh, under the Acts, have not a single feature in common with Manchester and Dublin, not under them; and the absurdity of making a comparison between London, not under the Acts, and Maidstone or Canterbury, under them, needs, one would think, only to be mentioned to be appreciated.

The army contains about 120 regiments, and the Acts have been in force for 13 *years;* and Dr. Thompson cites as conclusive proofs in his favour, *three* instances in which a regiment removing for a few months from a subjected to an unsubjected station, or *vice versâ*, experienced a change in the amount of venereal disease. It would be wearisome to your readers to reply to such an allegation in detail, and it is sufficient to say that these instances have no weight, since they refer to only a few hundred men removed for a few months; whereas there is no point on which Dr. Balfour insisted so strongly before the Royal Commission as the necessity of taking large numbers of men (thousands), and long periods of time (years), in forming an opinion as to the effect of such Acts as those in question. Much stress is also laid upon the importance of this caution by Inspector-General Lawson, who informed the Medico-Chirurgical Society that he had found greater differences in the amount of venereal disease in adjoining regiments at the same time in the camp at Aldershot than have been put forward between subjected and unsubjected stations in this controversy: the ratio per thousand varied from 23 to 59 and 114, all at the same time and place.

Had I not now so far encroached upon your generous allottment of space, I should like to refer to some other points in Dr. Thompson's communication. Enough has, however, been here set forth to show that (without taking as granted things that are not granted, or picking out special instances, as your learned correspondent has done) it is easy to prove on grounds of the simplest computation that there is no evidence of any reduction in venereal disease having been effected in Great Britain by the Contagious Diseases Acts, either in the army, the navy, or the prostitutes.

I am Sir, yours faithfully,

J. Birkbeck Nevins, M.D. Lond.,

Liverpool, May 22nd, 1879.

## CROUP AND DIPHTHERIA.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—It was, I am sorry to say, with mingled feelings of pleasure and disappointment, that I have read Dr. Semple's letter in the last number of your journal—*pleasure*, when he boldly proclaimed himself, as I thought, a dualist in these words:—"I deny that I have ever said that I am convinced of the identity of croup and diphtheria"—*disappointment*, where he declared, almost in the same breath, "what I have stated over and over again, and with a reiteration which I have sometimes feared was tedious, that the form of diphtheria which attacks the larynx and trachea (or laryngo-tracheal diphtheria) is the same disease as that form of croup which is attended with the formation of a false membrane (membranous croup)." And, although he devotes over two columns of closely printed matter in your excellent journal to the subject of his communication, he does not advance, so far as I can see, a single fact or argument to substantiate his thesis. He finally concludes by asking, "what is the difference between laryngo-tracheal diphtheria and membranous croup?" To which I would reply (as the question plainly involves an ingenious and nicely-couched sophism), that there is no difference in one sense, and yet there is in another. Every medical man, whether unicist or dualist, admits that diphtheria when it attacks, as it sometimes does *secondarily*, the larynx, trachea, and bronchial tubes, is croup; but they invariably designate it, by way of qualification, diphtheritic, in order to distinguish it from the acute, inflammatory, idiopathic form which *primarily* invades the organs in question. But, while conceding this, which no one possessing the most rudimentary knowledge of disease will for a moment deny, they are obliged to recognise a form of croup, accompanied sometimes by false membrane, sometimes not, which has no connection either remotely or proximately with diphtheria; which is sudden in its onset, rapid in its course, terminating in recovery or death in two or three days, according as it is actively and judiciously treated, or simply left to the unaided resources of Nature. The membrane exuded in this variety (true croup) is entirely different to that of the diphtheritic form, both in its mode of origin, and its physical and histological characters. In true croup the membrane is uniform in consistence (*membrane tabulée*), whitish, brittle, inodorous, evenly moulded to the air passages, from which it is easily detached either by operation, or by the expulsive efforts of coughing or vomiting. Here, purgatives, emetics, and other depressants, and as a *dernier ressort*, tracheotomy, are imperatively required. Indeed, the little victim not unfrequently appeals for the operation in a manner more eloquent than any language, by throwing his head backwards and tugging piteously at the skin in front of the larynx. The membrane here, I may add, is non-vascular, and contains neither pus nor blood corpuscles in its substance. The pellicle of diphtheria, on the other hand, is uneven, eroded, raised in parts, depressed in others, greyish or gangrenous in appearance, elastic, and firmly adherent to the contiguous structures, from which it is with great difficulty separated even by caustics and escharotics, not to mention emetics and other mechanical means, and gives vent to a sanious discharge highly offensive in odour. Here tonics, astringents, and antiseptics, are clearly indicated; whereas purgatives and emetics (even the vitriolic kind) are most mischievous, and only tend to give additional force and energy to the virulence of the disease. The one (true croup) is sthenic and inflammatory, and destroys life mechanically by obstructing the air passages, and preventing the due oxygenation of the blood; the other (diphtheritic) is asthenic and constitutional, and proves fatal not so much by impeding the respiration, as by tainting the system in general. Hence the cyanosis and other symptoms of strangulation, which invariably precede death in the one case, and the putrid and typhoid phenomena (delirium, coma, &c.), which usher in a similar catastrophe in the other. The one (true croup) is as harmless to the nurse, medical attendant, and others, in its immediate vicinity, as is a pleurisy or a pneumonia; the other is as contagious as typhus, scarlatina or small-pox.

I fully agree with Dr. Semple when he says that "the issue involved is as yet only partially understood," for the very good reason that medical men will persist in confounding two pathological conditions, which, although, bearing a remote resemblance to each other in some general or special features, are yet as distinct as are measles and scarlatina. But the analogy, I hold, is far less intimate than that which obtains between measles and scarlatina, and yet how many of us would venture to assert that these diseases are only the shades, the fine gradations, so to speak, of one and the same affection?

In conclusion, I would say that we have three diseases which, in a pathological no less than a therapeutical point of view, we should ever carefully distinguish, viz., true croup, whether accompanied or not, by false membrane; diphtheritic croup, and false or spasmodic croup (laryngismus stridulus), which is of all the most innocuous, being simply a neurosis.

I am, &c.,

BERNARD KELLY, M.D.

Rotherhithe, S.E., June 12th, 1879.

## "PROFESSIONAL COMMUNICATIONS TO LAY NEWSPAPERS."

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—My attention has been called to a letter under the above heading, and over the signature of "T. O'N. Russell, Resident Medical Officer, Limerick Union," also to your editorial comment thereon. I cannot, of course, in the least, find fault with your remarks, which would, as you state, be "quite satisfactory as regards the writer" assuming his representation of the matter to be true. But what are the facts? On the 20th of May, Dr. Russell sent me a copy of the *Lancet*, containing "the article in question," with a request that I would copy it into the *Chronicle*. Next day (our publishing day) he called, when I informed him that it could not appear that post, owing to pressure on our space arising out of the then contested election, but that we could insert it in our next. With this he appeared perfectly satisfied, adding that "that would do very well."

Accordingly, on the 21st, I passed it direct into the printing department to be set up, not thinking for a moment that Dr. Russell who, of course, was aware of the contents and nature of the article, would ask me to transfer it to our columns if it were at all unfit for publication in a "Lay Newspaper." Being so very much occupied with the election, I hastily glanced through the first of the two articles, and, without passing it through editorial hands, took it for granted that the second was of a like nature; unfortunately, however, the latter is the one open to objection. On the following day, Dr. R. again called on me, expressing a wish that it would not appear, when I informed him, as he admits, that "owing to one side of the newspaper being already printed, it was too late," and, therefore, it could not now be withdrawn. Most certainly the articles in question would never have appeared in the *Limerick Chronicle* only for the special request made by Dr. Russell, and even then, though willing to oblige him, would certainly have been refused insertion had I been fully aware of their entire contents.

As you have published Dr. Russell's version of the story, I shall feel obliged by your kindly giving insertion to the foregoing, which is a true statement of the facts.

I am, Sir,

Your obedient servant,

WILLIAM HOSFORD,
Proprietor *Limerick Chronicle*.

June 14th, 1879.

# Obituary.

## DR. JOHN COATS, OF GLASGOW.

THIS well-known medical man died at his residence in Newton Place, Glasgow, on the 7th June. Dr. Coats was well known as a medical practitioner in Glasgow for well-nigh half a century. He practised for many years in the Argyle Street district of the city in connection with his surgery in that street. Dr. Coats may be said to have gone through all the grades of a city practice, and in all of them won by his integrity of character and the variety of his experience the respect due to conscientious application and devotion to his profession. For fifteen years Dr.

Coats held the position of treasurer to the Faculty of Physicians and Surgeons, and was for some time a member of the Court of Examiners in the University of Glasgow. It is said that for forty years Dr. Coats never knew what it was to be ill, and the illness, Bright's disease, which terminated fatally, we understand was not of long duration.

## DR. JOHN PAXTON, LATE OF KILMARNOCK.

The death is announced at Sutton, of Dr. Paxton, lately of Kilmarnock, at the age of 67. Dr. Paxton was long and honourably known as the leading medical practitioner in Ayrshire. A native of Kilmarnock, where his father was a well-known brewer, Dr. Paxton received his medical education both in Edinburgh and Glasgow. His general education and information were of an exceptionally high order. After graduating, Dr. Paxton acted for some time as house-physician to the Glasgow Royal Infirmary, and subsequently pursued his studies in Paris at the Hôtel Dieu, with his intimate and attached friend, the late Dr. Sloan, of Ayr, both made a tour through Northern Italy on leaving Paris, and thence to Trieste and Vienna. Travelling in those days through the beautiful country between these towns was not such an easy matter as now, and the writer has often listened to Dr. Paxton's genial reminiscences of the adventures of himself and "Sloan" on this journey. After a short sojourn at Vienna, Dr. Paxton returned to his native town, in which he practised until about four years ago, when owing to failing health and family considerations he took up his residence in Sutton. For several years past the deceased gentleman was troubled with nephritic disease, to which he ultimately succumbed. Dr. Paxton possessed the strange peculiarity of dilating the iris at will, and a paper was written in the *Glasgow Medical Journal* on this subject a good many years ago by Dr. Allen Thomson. A man of genial heart, and warm sympathies, a thorough hater of humbug and charlatanism, fond of a good professional story, and in every respect a gentleman, in the death of Dr. Paxton, the medical profession has lost one, whom to know, was to have honoured. Dr. Paxton is survived by one son and two daughters.

## THE CURATORSHIP OF THE IRISH COLLEGE OF SURGEONS.

The Council of the College elected on Thursday last Mr. Abraham, Curator of St. Bartholomew's Hospital, to the charge of the College Museum, recently held by the late Dr. John Barker. We congratulate the College on having secured an exceptionally competent custodian of its valuable collection, for Mr. Abraham is a gentleman of very unusual attainments and talents. He achieved the unprecedented honour of being granted the Mastership in Arts of the University of Dublin, *honoris causa*, and without payment of any fee, he being nothing more than a student, but having recommended himself to the University authorities by unequalled answering at his degree examination. He at that time obtained the First Senior Moderatorship and large Gold Medal in Natural Science, and the First Silver Medal in Experimental Science. He is also a B.Sc. of the University of London, where he graduated with the First Honours in Zoology and Comparative Anatomy. More recently he was Natural Science Exhibitor, and the first scholar of his year at St. Bartholomew's Hospital.

He has done a great deal of work in museums, his experience having been acquired in the Museum of Trinity College, Dublin, in the Natural History Department of the British Museum, at the Winchester City Museum, and in the Museum of St. Bartholomew's Hospital Medical School; and during the last two and a-half years he has been working in the laboratories of Drs. Burdon Sanderson, Lauder Brunton, and Klein.

## THE O'CONOR DON'S IRISH UNIVERSITY BILL.

In referring to this measure a fortnight since we stated our opinion that there was not the least probability of its becoming law this or next year, but that, if it should pass, it would be an unmitigated evil in respect to its bearing on Irish medical education, because it was neither necessary or at all expedient to add to the number of licensing bodies in Ireland, or to resort to a system of wholesale bribery to attract students to any university. The Irish College of Physicians has taken a very proper step towards arriving at an understanding between the Irish licensing bodies on this subject, and has organised a conference of delegates from the University of Dublin and the Irish College of Surgeons to meet the representatives of the College of Physicians on the subject.

The Vice-Provost and Professor Haughton will act for the University of Dublin, Drs. Lyons and Grimshaw for the College of Physicians, and Drs. MacDonnell and Jacob for the College of Surgeons. We are pleased to understand that the O'Conor Don is disposed to strike the medical clauses out of his Bill, which intention, if it exists, would relieve the profession in Ireland of its apprehensions, and the Bill of one of its most dangerous features.

## THE SURGEONCY TO THE MEATH HOSPITAL, DUBLIN.

We believe that the vacancy in the surgeoncy of the Meath Hospital and co. Dublin Infirmary, which has occurred by the death of Dr. Robert Persse White, will, probably, be filled on the first Tuesday in July.

# Medico-Parliamentary.

### HOUSE OF COMMONS.—Wednesday, June 11th.

#### CONTAGIOUS DISEASES.

On the motion of Colonel Stanley, a select committee was appointed to inquire into the Contagious Diseases Acts (1866-9), their administration, operation, and effect; and the following members were appointed to serve on the committee:—Mr. Cavendish Bentinck, Mr. Stansfeld, Colonel Alexander, Sir Harcourt Johnstone, Viscount Crichton, Mr. Shaw Lefevre, General Shute, Mr. Burt, Mr. Bulwer, Mr. O'Shaughnessy, together with five members to be nominated by the committee of selection.

# Medical News.

**Royal College of Surgeons of England.**—The following candidates, having passed the required examinations, were admitted to the Fellowship, at a meeting of the Council held on Thursday, June 12th:—

Andrews, William Stratford, Castle Street, Dover.
Cathcart, Charles Walker, M.A., M.B., C.M. Edin., Carlton Terrace, Edinburgh.
Cheyne, William Watson, M.B. Edin., Old Cavendish Street.
Clarke, William Bruce, M.B. Oxon., North Wootton, Lynn, Norfolk.
Footner, John Bulkley, Romsey, Hants.
Juler, Henry Edward, L.S.A., St. Mary's Hospital.
Lang, William, Exeter.
Morgan, John, L.R.C.P. Lond., Hereford Road, Bayswater.
Wherry, George Edward, B.A., M.B., Cantab., Trumpington Street, Cambridge.

**International Congress of Medical Science.**—The *Lyon Médicale* informs us that the Sixth Congress is to be held at Amsterdam from September 7 to 13 inclusive. Prof. Donders is the President of the Committee of Organisation, and Dr. Guye, of Amsterdam (to whom all communications respecting the Congress are to be addressed), is the Secretary. The French language is to be employed at the general meetings of the Congress, and either French or German at the meetings of sections; but members will be allowed to use other languages and their addresses may then be translated into French.

**The French Association for the Advancement of Science**—The Association will hold its eighth session at Montpellier, commencing on August 28, and continuing for eight days. The President is M. Bardoux, Deputy for Puy-de-Dôme, and late Minister of Public Instruction, and Prof. Gariel is Secretary to the Council. Applications are to be addressed to 76 Rue de Rennes, Paris.

## NOTICES TO CORRESPONDENTS.

DR. GRIFFITH.—If you will send the communication you wish inserted first, we will mark it to appear before the one in hand.

DR. WHITE.—A translation of Charcot's celebrated work on "Diseases of the Kidneys" has just appeared in this country, we do not know the price. We have it in hand for review and are much pleased with it.

### THE VALUE OF HYOSCIAMINE.

*To the Editor of the* MEDICAL PRESS AND CIRCULAR.

SIR,—Can you, or will any of your correspondents, kindly give me any experience of hyosciamine, given either internally or hypodermically?

What dose was given, and what strength was the solution used for injection?

Yours truly,

June 16, 1879. ALFRED JAS. POWELL, M.D.

STATISTICAL SOCIETY OF LONDON.—The next meeting of the present session will be held on Tuesday, the 17th inst., at 7.45, when a paper will be read "On Tabular Analysis," by Dr. Guy, F.R.S. Also, if time permits, extracts from a paper on "The Influence of Famine on Growth of Population," by Dr. Cornish, F.R.C.S., Sanitary Commissioner of Madras.

### THE REMNANTS OF AN ARMY: JELLABABAD, JANUARY 13TH, 1843.

*To the Editor of the* MEDICAL PRESS AND CIRCULAR.

SIR,—One of the great attractions in pictures at the Royal Academy Exhibition this year is, "The Escape and Return of Dr. Brydon from the Massacre of our Troops in 1842 in one of those mountain passes leading to Cabul." The painting is a gem of art at the hands of Elizabeth Butler, *née* Thompson. I should like to see this painting of a gallant military medical officer pass into the possession of either our Royal College of Surgeons or Physicians. If you can ascertain the picture can be bought I propose that a subscription be asked from the profession to possess the same. I am willing to put down my guinea at once towards it. I have great regard and respect for the military medical service, hard knocks we have, nevertheless.

Yours truly,

J. MCGRIGOR CROFT, M.D., M.R.C.P.,
Late Staff Surgeon to Her Majesty's Army and Commandant of Artillery.

Mandarin Hall, London, N.W.,
June 13th, 1879.

MR. R. H. NEWETT—Letter, with editorial reply, will appear in our next.

P. R. (Freemantle).—You cannot hold either a Poor-law or an Army or Navy appointment without double qualifications.

COMMUNICATIONS, Enclosures, &c., have been received from—Mr. Prescott Hewett, London. Dr. John Harley, London. Mr. Critchett, London. Dr. E. Sergeant, Bolton. Dr. F. N. Otis, New York. Barnes, Westminster Hospital. Mr. Malley, Westminster. Dr. Kerr, Preston. Mr. W. Hosford, Limerick, &c., &c.

### VACANCIES.

Armagh Union, Keady Dispensary.—Medical Officer. Salary, £120, with fees, and £20 as Sanitary Officer. Election, July 2.

Birmingham Queen's College.—Professor of Chemistry. Full particulars of the emolumentt, duties, &c., of the Secretary, 21 Paradise Street, Birmingham.

Bristol General Hospital.—Physician's Assistant. Salary, £50, with board. Applications to the Secretary before June 21.

Kinsale Union, Courceys Dispensary.—Medical Officer. Salary, £100, with fees. Election, June 24.

Newport Infirmary.—Resident Medical Officer. Salary, £100, with board. Applications to the Chairman on or before June 23.

Oldcastle Union, Crossakiel Dispensary.—Medical Officer. Salary, £120, with fees, and £15 as Sanitary Officer. Election, July 4.

Sligo District Lunatic Asylum.—Assistant to the Resident Medical Superintendent. Salary, £100, with allowances. Election, July 2.

Tunbridge Union, Kent.—Medical Officer for the First District. Salary, £130, exclusive of fees. Applications to the Clerk of the Board before June 25.

Westminster Hospital.—Medical Registrar. Salary, £43. Applications to the House Committee on or before June 24.

Women's Hospital, Soho Square.—Assistant Physician. Applications to the Secretary on or before July 8.

### APPOINTMENTS.

MCLAUGHLIN, T. J., L.R.C.S.Edin., L.R.C.P.Edin., Medical Officer to the Clara Dispensary, Tullamore Union.

O'REILLY, F. J., L.R.C.P.Ed., L.R.C.S.Ed., Certifying Factory Surgeon for the District of Trim, co. Meath.

RECKITT, E. B., L.R.C.P.Ed., L.R.C.S.Ed., Medical Officer and Public Vaccinator for the Boston Union District and Workhouse.

RENNIE, S. J., M.R.C.S.E., L.R.C.P.Ed., & L.M., House Surgeon to the Ashton-under-Lyne District Infirmary.

SHORTER, H. G., Medical Officer to the Hastings Free Dispensary.

SPURGIN, T., L.R.C.P.Ed., M.R.C.S.E., Medical Officer for Nos. 1 and 2 Districts of the Ongar Union, Essex.

SYMONDS, C. J., M.D., Surgical Registrar to Guy's Hospital.

TURLE, J., M.D., Medical Officer of Health for the Finchley Urban Sanitary District.

## Births.

BUZZARD.—On June 13, at 56 Grosvenor Street, London, W., the wife of Thos. Buzzard, M.D., of a son.

COLLINS.—On June 8, at East Grinstead, the wife of C. E. Collins, L.R.C.P., M.R.C.S., of a daughter.

ROBERTS.—On June 12, at 42 Upper Rathmines, the wife of Browne Roberts, L.R.C.S.I., of a daughter.

## Marriages.

BIRD—CORNISH.—On June 12, at Dartmouth, G. Gwynne Bird, M.R.C.S., of 72 Berners Street, London, to Eve, daughter of the late R. N. Cornish, of Sherford.

MACARTNEY—KELLY.—On June 3, at the Church of St. Andrew, Westland Row, Dublin, James Macartney, M.D., Surgeon-Major, A.M.D., to Mary Josephine, eldest daughter of John C. Kelly, J.P., 37 Fitzwilliam Square West Dublin.

## Deaths.

ANDREWS.—On June 7, at Willowbank, Titchfield, John Andrews, M.D., Fleet Surgeon (retired), aged 61.

BEAUMONT.—On June 4, at Knaresborough, Thomas Mills Beaumont, F.R.C.S E., aged 67.

BENNIE.—On June 2, at Bloomfield, Currie, James Bennie, M.D., aged 27.

COATS.—On June 8, at 25, Newton Place, Glasgow, John Coat's, M.D.

CRAWFORD.—On June 13, in Montague Street, Russell Square, London, Adair Crawford, M.D., aged 88.

HEMSTED.—On June 12, at Bath, Hy. Hemsted, F.R.C.S., late of Speenhamland, Berks, aged 72.

LEITH.—On June 3, at Comrie, Perthshire, George Leith, M.D.

MANSELL.—On June 11, at Grange Road, Bermondsey, T. L. Mansell, A.B., M.D., Imat of the Royal Court of Guernsey, aged 70.

PAXTON.—On June 6, at Oakleigh, Sutton, John Paxton, M.D., late of Kilmarnock, aged 67.

WEST.—On June 8, at Maida Hill, London, Jane Frances, widow of Milburne West, M.D., late of Newbury, Berks, aged 83.

WILKS.—On June 3, at Ashford, Kent, George F. Wilks, Esq. M.R.C.S., L.S.A.L., in the 69th year of his age.

# IRISH POOR-LAW INTELLIGENCE.

## IRISH MEDICAL OFFICERS OF HEALTH AND THEIR DUTIES.

We have frequently felt it necessary to notice the unpleasant position medical officers of health are placed in by the conscientious discharge of their duties. If they have the manure-heap and stagnant cesspool removed from the cabin door, the horse or the ass from the interior, or the pig from under the bed, they are too apt to be made a mark as to how they can be annoyed in their dispensary duties, while the landlord of the premises, in the form of the cottier tenant farmer or petty shopkeeper, is apt to take equal offence, and employ another medical attendant for themselves and family, or if on the committee, retaliate by the red ticket. A case involving annoyance of another character, occurred recently. An outbreak of diphtheria taking place at Robertstown, co. Kildare, Constabulary Barracks, and some of the cases of a malignant form, as there was no other case in the neighbourhood whereby infection could possibly be the means of origin, Dr. Sale, the medical attendant, sought for the cause; this he was satisfied he discovered in certain structural faults of the sewerage. Dr. Sale, in his capacity of medical officer of health, fully reported these defects, recommending such remedies as seemed necessary. The Naas Board of Guardians forwarded his report to the Board of Works, who, it seems, are lessees of the Barracks. In acknowledging this report, the Board of Works stated that, "although grave cause exists for doubting whether any case of diphtheria occurred at all," they were carrying out the recommendations of the medical officer of health. Dr. Sale felt called on by the doubt thus thrown on his official report to demand the authority of the Board of Works for making such a serious statement, reminding them that they were not qualified to give an opinion upon patients whom they had never even seen during their illness, and that his opinion was corroborated by another medical officer of health. The Board gave a very evasive answer to this application, stating that they thought it right to convey the substance of the report they had received from their own officer (a clerk of works) who fully inquired into the case. Dr. Sale, being aware that they acted on what may be termed old women's gossip, demanded that the Board forthwith repudiate their statement and apologise for it, or he should feel obliged to take more serious measures. The Board now recognised their position, and unreservedly stated their regret that the statement had been made, that it was entirely beyond the province of the department, and they would order its withdrawal. Thus, was cancelled the very improper and very serious reflection by a public Board on the character of the medical officer of health; and, so far, Dr. Sale has succeeded, by the determined course which he pursued, in completely re-establishing his professional position. But the matter is of interest, as illustrating the entire insufficiency of the Public-health Law of Ireland to provide for honest sanitary inspection. When the Act was under consideration as a Bill we, in common with all who had any knowledge of the subject or any real desire for effective sanitation in Ireland, insisted with all vehemence that the measure would prove futile and farcical if the medical officer of health were not made, as far as possible, independent in the discharge of his duties. This suggestion, the Irish Local Government Board—being, as afterwards appeared desirous of burking sanitary effort in Ireland—would not approve, and, as a consequence, the sanitary officer was, is, and will be in such a position of subordination to the nuisance-proprietors of his district, that he cannot possibly be expected to do his duty as it ought to be done.

## IRISH MEDICAL ASSOCIATION.

### REPORT OF COUNCIL—*(continued)*.

ABUSE OF DISPENSARY MEDICAL RELIEF.

During the past year your Council addressed a letter to the Local Government Board, calling attention to the frequent irregularities in the issue of tickets for dispensary medical relief which occur throughout Ireland, and to the fact that a very large proportion of the persons for attendance on whom such tickets are issued are not "poor persons," but are well able to pay for medical advice and medicines. In response to this communication, the Local Government Board promptly issued a circular directing the attention of the authorised ticket-issuers to the complaints made, and requesting that greater care should be taken in future to prevent abuse of the system.

The abuse, however, still exists, and it is indisputable that it encourages improvidence amongst the lower classes of society. Your Council consider that the attention of Parliament must be directed to this abuse, and that new legislation should be sought for as the only possible means of checking it. It certainly was never intended by the Legislature that improvidence should be encouraged, or

that persons who could afford to pay for medical attendance and medicines should be gratuitously supplied with both at the expense of the ratepayers and the detriment of the medical profession. A resolution on this subject will be submitted to this meeting.

### Superannuation of Medical Officers.

This very important question has for many years been the subject of frequent communications made to this Association, and your Council are deeply impressed with its importance, not only from a public but also from a professional point of view. Whilst, on the one hand, it is essential in the public interest that the sick poor should have the services only of medical officers who are capable of discharging their duties efficiently, it is, on the other hand, but reasonable and fair that the services of medical officers, whose health and years have been almost exhausted in faithful and efficient service to the public, should be adequately recognised. Under the present state of the law the Boards of Guardians have a discretionary power to grant superannuation allowance to any medical officer who has become incapable of discharging his duties with efficiency—by reason of permanent infirmity of mind or body, or of old age, upon his resigning or otherwise ceasing to hold his office—in amount not exceeding two-thirds of the emoluments of his office. Your Council observe with gratification that the Boards of Guardians are more considerate now than heretofore in dealing with the question of superannuating worn-out medical officers; but they regret that owing to the fact that superannuation allowance is at present only permissive, there are too many instances of medical officers utterly worn out and incompetent to discharge efficiently their duties to the sick poor, who, being solely dependent upon the salary and emoluments of their office, and who, being unable to calculate upon obtaining the required approval of their Boards of Guardians to the granting of a retiring allowance, are compelled to hold their appointments rather than run the risk of having to be supported by charity.

It is deplorable to think that any such instances can be found; but, nevertheless, there are several medical officers in such a condition, who are absolutely without means of suppott unless superannuated, and this state of things is not the result of improvidence on their part, but of inability through lack of opportunity during their career, to make provision for themselves and their families in their old age.

Your Council are of opinion that the State should contribute to the superannuation allowances in the same proportion as it contributes to the salaries of the medical officers; and that superannuation allowance should be obtainable as a matter of right by those who, by reason of age, illness, or infirmity, have become unable to discharge their duties efficiently, as well as by those who have served over twenty years, and that the permissive system at present in force should be confined to cases which would not come under those heads; and your Council are confident that, if such were the case, the result would be much more satisfactory to the public than the present system.

### Leave of Absence to Medical Officers.

Under the existing regulations a Poor-law medical officer is not entitled to "leave of absence" unless incapacitated by illness or other cause from discharging his duties, in which case he is required to nominate a fit and proper person to undertake his duties, usually at his own expense.

Your Council believe that this state of affairs is not conducive to the well-being of the Poor-law medical service, and are convinced that it would tend to the efficiency of that service, and not materially increase the expenses thereof, if workhouse and dispensary medical officers were entitled to a reasonable period of leave of absence in each year at the public expense. By such an arrangement the medical officers would be afforded an opportunity not only of recruiting their health, but also of acquiring information and extending their knowledge, which would in turn be advantageous to their patients, and tend to diminish the number of instances of incapacitation by illness. In the various departments of the Civil service this system exists, and your Council cannot see any reason why it should not be extended to the medical officers of the Poor-law service, who certainly do not less require it.

The report concluded with a statement of accounts.

## LIST OF ENTRIES IN THE REGISTER OF THE BRANCH MEDICAL COUNCIL (IRELAND) FOR THE MONTH OF MAY, 1879.

May 8th.—Davis, James, Joseph; Trim, Co. Meath; Lic. R. Coll. Surg. Irel. 1878.

16th.—Ashe, St. George; 4 Leeson Park, Dublin; Lic. R. Coll. Surg. Irel. 1877.

16th.—Mulvany, Peter; Navan, co. Meath; Lic. R. Coll. Phys. Edin. 1879, Lic. R. Coll. Surg. Edin. 1879, Lic. Apoth. Hall, Dub. 1879.

22nd.—Butcher, Charles; 19 Windsor Street, Liverpool; Lic. Apoth. Hall. Dub. 1879.

26th.—Bond, Joseph Henry; Victoria Villa, Rathgar, co. Dublin; Lic. R. Coll. Surg. Irel. 1879.

June 27th, 1876.—MacDonnell, Mark, Antony; Orchard, Hey, Walton-on-the-Hill, Liverpool; M.D. 1876, Mast. Surg. 1876 Q. Univ. Irel. [Restored per order of the 23rd May, 1879.]

## ALLEGED NEGLECT OF DUTY BY A MEDICAL OFFICER.

### INQUIRY AT BLESSINGTON.

Dr. M'Cabe, L. G. Inspector, recently held an inquiry on oath, relative to charges brought against Dr. Leslie Maturin, M. O. of the Dispensary District. The circumstances which led to the inquiry have been detailed in a previous issue.

The Rev. Mr. Rowan entered at the outset a protest against the inquiry, on the ground that the Local Government Board had already decided on the complaint he had preferred against the medical officer, and that they had issued instructions to the dispensary committee to call for his resignation in a letter to the committee of management in April last. They had, therefore, believed that the facts were established; and there was no need for an inquiry to ascertain what had already been conceded. The rev. gentleman stated that it was strange that after such a decision had been arrived at, the matter should be opened again. There was nothing to justify such conduct, which was manifestly unjust to him as a clergyman, and he desired to enter his protest against it.

Dr. M'Cabe reminded the Rev. Mr. Rowan that the Local Government Board did not call directly on Dr. Maturin to send in his resignation; but they directed the honorary secretary to the dispensary committee to summon an extraordinary meeting of the committee, for the purpose of receiving his resignation; and the committee thus summoned, after carefully investigating all the circumstances of the case, declined to act upon the recommendation, or rather the suggestion, of the Local Government Board. The inspector added that, so far as he was aware, the Local Government Board possessed no legal power to compel a dispensary committee to act in accordance with their suggestion.

The Rev. Mr. Rowan deposed that he preferred a complaint against Dr. Maturin for neglecting to attend a patient named P. Merrigan on a red ticket, and the patient died two days after it had been presented. The deceased man suffered from retention of the urine, and it was his belief that he died from want of medical treatment and relief.

Mr. P. Quinn deposed that he is a local guardian, and issued the red ticket to procure medical attendance for

the deceased, who was a relative of witness. He thought he was a fit subject for relief under the Medical Charities Act. He was aware that previous to his issuing the ticket a nephew of the deceased man had offered a fee of one pound to Dr. Maturin, who declined to attend under two pounds.

Mr. Toomey asked the witness if he considered that a man, on whose behalf a fee of one pound was offered, was a fit subject for relief under the Medical Charities Act.

The witness said he could not answer that question. He knew, or was told, that Dr. Maturin would not go on a fee of £1, but that if a red ticket was issued he would have to go, and he then issued the ticket.

The Inspector here pointed out that no matter under what circumstances the red ticket was issued it was Dr. Maturin's duty to have attended upon it. If it was found to have been illegally issued the doctor had his remedy afterwards.

To Dr. Maturin—You do not deny that you got the red ticket, and did not attend upon it.

Dr. Maturin—I did not.

In reply to other questions, Mr. Quinn stated that he was a poor-law guardian. *He did not know the law of the Medical Charities Act.*

Mr. Samuel Panton, the honorary secretary of the dispensary committee, deposed that he received a letter from the Local Government Board on the 12th of April, requesting him to summon an extraordinary meeting of the committee, for the purpose of receiving the doctor's resignation. The committee at their meeting in the March previous censured Dr. Maturin for not attending in another case on a red ticket. They stated that fact in their reply to the Local Government Board when answering their communication in April, adding that they were disposed to dispense with any further action, inasmuch as a certain amount of pressure seemed to have been put on the doctor, by at first offering him a fee of £1, and when he declined to take it, and go under £2, then issuing a ticket.

In answer to Mr. Toomey, witness said that it was the impression of the majority of the committee that the red ticket had been issued out of spite, because the doctor would not take the £1, and not as medical relief. They thought the man could afford to pay the fee required.

The Inspector asked from what source they had derived that impression.

Witness said from what two members of the committee stated when the matter was discussed. They did not examine any witnesses as to the man's circumstances.

The Rev. Mr. Rowan here observed that the circumstances of the man were these—he was a poor labourer, and he fell ill at his nephew's on the way home. He had no means whatever. The fact of his nephew being well to do had nothing to say to his right of relief.

Mr. Toomey asked if the brother of the deceased was not a large farmer.

The Inspector thought that question was irrevelant.

The Rev. Mr. Rowan said that Mr. Toomey appeared anxious to make out that the deceased man might have paid a fee because he had rich relatives. As a matter of fact, it was the nephew of the deceased who offered the fee of £1 to Dr. Maturin out of kindness towards his uncle.

Dr. P. Meliea deposed that he was a member of the dispensary committee.

Witness, in reply to Mr. Toomey, bore testimony to Dr. Maturin's general care and diligence, and to his successful treatment of some cases.

Mr. Panton also spoke in similar terms of the doctor's care and efficiency.

Mr. William Owen, J.P., sworn, deposed that he made a statement before the committee that the deceased man was a member of a very well-to-do family. In reply to Mr. Toomey, Mr. Owen said that it was miles nearer for Merrigan to send for the doctor of Seven Churches than to have sent to Blessington for Dr. Maturin.

Inspector to Mr. Owen—Are you not as a magistrate and a member of the dispensary committee, aware that if the man lived next door to the medical officer of an adjoining district, and still was not living within his district that he had no claim upon that medical officer for a ticket?

Mr. Owen said he was aware that in such a case he would have no legal call.

The second branch of the inquiry with respect to the charge that he neglected to attend the dispensary regularly at the stated times was then proceeded with.

In substance this charge was to the effect that Dr. Maturin got a visiting ticket to attend a man. The doctor visited him on his way back from the dispensary and told the parties to send to him for the medicine, which he prescribed before four o'clock that evening to Blessington. The messenger did not call, however, until eight o'clock the next morning, when Dr. Maturin refused to give the medicine, and no medicine was got until the following dispensary day, which was two days afterwards.

The statements to the above effect were not substantially denied by Dr. Maturin, who was then examined at some length as to the circumstances of the whole case. He admitted that he did not attend the deceased man Merrigan, believing that when a fee was offered, and he refused to take it, the ticket was then issued in order to coerce him to attend. Had he known at the time the man's dangerous condition he would have gone instantly to visit him, without fee or ticket. He was painfully aware since that he should have gone to see him.

Regarding Bern's case,

Dr. Maturin said it was his custom not to give medicine except on dispensary days, unless there was urgent necessity for it. He denied that he was irregular in his attendance at the Ballymore-Eustace Dispensary, inasmuch as he always put in the full number of hours each day. In further explanation of his refusal to attend in Merrigan's case Dr. Maturin said the patient lived nearly twelve miles away from him, and a party offered him a fee of £1 if he went, whereas they could easily have procured for that fee another doctor, who lived within two miles, if they wished to do so.

Captain Pratt, J.P., and other gentlemen were then examined, and gave Dr. Maturin a very high character as a professional gentleman.

At the conclusion of the inquiry Dr. M'Cabe said he would in due course submit the evidence and his report to the L. G. B. Since then the L. G. B. has called upon Dr. Maturin to resign, which he has done; and the Dispensary is now vacant.

## THE ROYAL MEDICAL BENEVOLENT FUND SOCIETY FOR IRELAND.

REPORT OF THE PROCEEDINGS OF THE SOCIETY FOR THE PAST YEAR, PRESENTED AT THE ANNUAL GENERAL MEETING—(*Abstract*).

THE history of our Society during the past year has been unmarked by any events of special importance. No great acquisitions to our funds have to be reported; and no losses or deficiencies of any moment have to be deplored. Death, indeed, has deprived us of some old friends, but we have gained in their place some new ones. Thus the Society has pursued the even tenor of its way during the thirty-seventh year of its existence, and the Central Committee who were charged with the management of its affairs now render up the account of their stewardship for the past twelve months.

The auxiliary branches, of which there is one or two in each county, and one in each Indian Presidency, are all in working condition. Some changes in their honorary officers have taken place.

In India the Afghan war and the anticipation of a Birmese war, have, as might be expected, interfered con-

siderably with the success of the local branches. To this cause, as well as to the diminished value of the rupee—now about 23 per cent. below what was its value some years ago—are attributed the falling-off in the amounts received from these auxiliaries. Dr. King continues to work zealously for us at Madras, and has remitted this year £20 as a first instalment, with the hope of being able to forward another.

Surgeon-Major Chesnaye, Honorary Secretary and Treasurer of the Bengal Branch, also shows unabated energy in the cause of the Society. His connection with one of the armies invading Afghanistan, viz., that of the Peshawur Valley, necessarily checked, but did not paralyse, his exertions on our behalf.

Surgeon-Major Joynt continues to labour, with untiring zeal, for the Society in the Bombay Presidency, and remits subscriptions to the amount of £43, adding, "small as is the amount, it is better than I expected." He reports the death of Surgeon-Major Rogers, of the Bombay Establishment, "who for several years was not only a subscriber but a zealous and successful collector for this Branch."

*Funds.*—It may be well to remind the members of a resolution passed at the General Meeting of 1878, which comes into operation for the first time at the present distribution. This resolution empowered the Central Committee to add such portion of *future* donations and legacies, as they thought fit, to the grants for the current year, instead of *wholly* funding them, as was the previous practice, unless expressly forbidden by the testator or donor.

During the past year donations and bequests to the amount of £255 have been received, viz., Mr. Robert Hudson, of Chester (per Dr. Hudson), £100; Dr. Philip Smyly, £50; Dr. Robert M'Donnell, £25; Dr. J. M'Donnell, £5; the late Surgeon Henry M. Johnston, of Belfast, a bequest of £55; Mrs. Elliott, of Upper Norwood, London, £10.

The donations of Dr. Smyly, and of Mrs. Elliott, are by their request included in the awards of the present year. Mrs. Elliott, it is right to mention, is widow of the late Dr. Gilbert Elliott, formerly of Castleknock, and in her letter she states that she gives the above sum to our Society in accordance with a wish expressed by her husband. The remainder of the donations and bequests, viz., £195, the Committee purpose funding. Thus a small increment is made to the corpus of the fund, in aid of future beneficiaries, whilst those of present year derive immediate benefit from the generosity of contemporary donors.

The money voted in awards this year is £1,344, being a little over that of last annual distribution.

The Committee have much pleasure in directing special attention to the fact, that a sum of £28 and upwards has been subscribed to the Fund this year by medical students alone, in Dublin, Galway, and Cork. Bearing in mind how limited the pecuniary resources of these young men generally are, it is not to say too much that this contribution reflects most honourably on those who gave it; and their example should stimulate to a like generosity the many medical practitioners who still treat the Society as the Levite and Priest of old treated the man who fell among thieves on the road from Jerusalem to Jericho; but, be it remembered, the sufferers by this apathy are the poor medical brother, his desolate widow, or his destitute orphans.

*Applications.*—Since the last distribution, *seventeen* applications for assistance—*six* from Dublin, and *eleven* from the provinces—were sent in at *irregular* times. To *nine* of these, grants, altogether amounting to £144, were awarded, in anticipation of this distribution.

The case of one of these applicants is worthy of mention, as showing the peculiar value of this Society, and well illustrating the maxim, *qui cito dat, bis dat.* A lady, comparatively a stranger in Dublin, was left, by the sudden death of her husband (a surgeon), homeless and penniless, with three young children, and a fourth expected. In her extremity she applied to the Society for aid, and received an immediate grant of £30; and so much sympathy was awakened for her, that this grant was supplemented by a considerable collection, which enabled her to return to her family in Bermuda.

The total number of claimants this year is 99, *fourteen* of which are new cases, including *two* medical men. The 99 cases consist of 80 widows, 11 orphans, and 8 medical men. The total number applying through the provincial branches is 51, and through the central branch, 48. In *six* instances grants were refused, the applicants being ineligible, undeserving, or their statements not properly authenticated.

Two of the medical men obtaining grants this year got £80 a-piece, but for which they would be in a state of absolute destitution. One of these gentlemen is over 80 years of age, and very ailing; the other, though much less advanced in life, is utterly helpless, from complete hemiplegia, and suffers great annoyance from an enormous scrotal hernia, which no truss can keep up.

In concluding their Report, the Central Committee earnestly and emphatically call on their medical brethren to rally round this Society, and to give it their hearty, cordial, generous support. Its claims on every man amongst them are of the highest kind: on the rich, on account of the abundance which God has given him; and on the poor, as seeing that his widow or orphans may yet be suppliants to the Society.

The soundness of the principles on which the Society is based have been tested by the experience of thirty-seven years, and the amount of good it has done, and is doing, is incalculable. It has now become one of the recognised medical institutions of this country, and, in regard of its objects and operations, though not of its resources, it well deserves the honour of such association. Let each practitioner in Ireland give but 5s. a-year to its funds, and this financial blot will be removed. That charity should begin at home is an acknowledged Christian obligation, and if true, in the case of indiduals, why not in that of professions?

## CLARA DISPENSARY.

A SPECIAL meeting of the Committee was held for the purpose of electing a successor to Dr. Brady, whose resignation was recorded last week.

There were four candidates in attendance to compete for the appointment, namely, Dr. Thomas J. McLaughlin, Dr. Ingham, Dr. Fox, and Dr. Mulvany.

All the candidates, in accordance with the desire of the committee, agreed, if elected, to give a month's notice when contemplating resignation, or forfeit a month's salary.

As Dr. McLaughlin had a clear majority of the votes of the entire meeting he was declared elected.

He refused to adopt the suggestion recently made by the Local Government Board that a dispensary doctor should take a smaller fee than one pound, and stated that rather than do so he would attend for nothing.

## TO READERS.

THE Editor will feel especially obliged by receiving copies of newspapers which contain any Poor-law or other intelligence of medical interest, in order that he may, if fit, republish it for the benefit of the readers of the *Medical Press.* Although twenty-one of the leading Irish newspapers are received at the Irish office, many things may escape notice which are deserving of attention. Newspapers should be marked, and addressed to Dr. JACOB, at the Dublin offices of this paper.

### ON NERVOUS AFFECTIONS OF THE SKIN AND ITS APPENDAGES, WITH REMARKS ON TREATMENT.

By T. STRETCH DOWSE, M.D., F.R.C.P.Ed.,

Physician to the Hospital for Epilepsy and Paralysis; formerly Medical Superintendent of the Central London Sick Asylum.

*Trophoneuroses.*

In dealing with this class of disease we are of opinion that if their nature were clearly understood we should find less difficulty in applying to them methods of treatment more decisive and more certainly curative. Modern investigation has conclusively proved that a large proportion of skin disease is due to an exalted or depressed condition of the nerves governing circulation, secretion, and nutrition, and at the present time it is admitted that defective treatment is often due to a want of knowledge of the important part played by the nutritive nerves in these almost universal and troublesome complaints.

M. Charcot says, there is nothing better established in pathology than the existence of troubles of nutrition consequent on derangements of the nervous centres or of the nerves (Charcot "On Diseases of the Nervous System," New Sydenham Society, 1877, p. 7). Again, page 12 of the same work, he says: "If diseases whose consequence is the abolition or suspension of the action of the nervous system are unable to produce in distant parts other disorders of nutrition than those attributable to prolonged inaction, *it is not thus as regards disorders which determine either in the nerves or nervous centres an exaltation of their properties, an irritation, or an inflammation.*"

The late M. Mougeot has given this subject considerable attention, and to him we are indebted for much valuable information (B. A. Mougeot, "Récherches sur quelques troubles de nutrition consecutives aux Affections des Nerfs," Paris, 1867).

In Guy's Hospital Reports for 1867, p. 316, Sir Wm. Gull brought forward a paper of special interest, which shows that the slightest irritation upon the skin of some persons will produce a form of nettle-rash by partly paralysing for a time the nerves which control the circulation. He says: "This susceptibility of the skin is common in a greater or less degree to all persons, and can be termed morbid only when extreme. In the first patient in whom I noticed it, it was the source of great inconvenience, for if the skin was handled roughly, as in wiping the face with a towel, or in putting on the socks, it would quickly become swollen and stiff with weals, which are principally due to contractions of the skin."

The course of events in a case of this kind seems owing to (1) sensory nerve disorders, (2) contraction of cutaneous muscular fibres owing to irritation of their motor nerves, (3) paralysis of cutaneous nerves controlling the circulation.

The most practical way of considering this matter is to refer to those skin eruptions which are more or less immediately associated with injuries to nerves, and it is to Dr. Weir Mitchell (*a*) and Sir James Paget that we are indebted for much that we know about it. The former says, "At some time in the history of a nerve injury it is common to see certain forms of eruptions which form bladders (herpes vesicles or bullæ). In our own practice we saw numbers of eruptions which, as a rule, were most sure to be met with in the cases of greatest irritation, and which usually assumed the appearance of small vesicles."

Sir James Paget, in speaking of such cases (*b*) says: "Glossy fingers appear to be a sign of peculiarly impaired nutrition and circulation due to the injuries of nerves. They are not observed in all cases of injured nerves, and I cannot tell what are the peculiar conditions of the cases in which they are found, but they are a very notable sign, and are always associated, I think, with distressing and hardly manageable pain and weakness. In well-marked cases, the fingers which are affected (for this appearance may be confined to one or two of them) are usually taper-

(*a*) "Injuries of Nerves," p. 153.
(*b*) Paget, *Med. Times and Gaz.*, March 26, 1864.

ing, smooth, and hairless, almost void of wrinkles, glossy, pink and ruddy, or blotched, as if with permanent chilblains. They are commonly also very painful, especially on motion, and the pain often extends up the arm.

"In most cases this condition of the fingers is attended with very distinct neuralgia both in them and in the whole arm, and its relation to disturbances of the nervous condition of the part is moreover indicated by its occasional occurrence in cases where neuralgia continues after an attack of shingles affecting the arm."

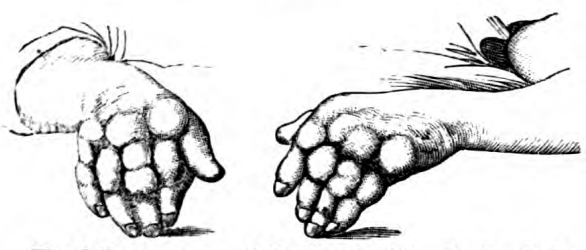
These observations on the nervous origin of skin affections both from peripheral as well as central irritation are sufficient evidence to guide us to the conclusion that defective action on the part of the nutritive nerves ought to teach a lesson of paramount importance and significance relative, not only to changes, which are seen and realised during life, but to many of those obscure forms of diseased changes which are rarely made evident until after death.

Dr. Laycock, in some very interesting lectures on Nerves of Nutrition in the *Med Times and Gaz.*, March 18, 1871, (*a*) says: "Before we consider special tissue changes as trophesies (nutritive changes) let us clearly understand what we mean when we speak of *loss of tone*, of *nervous debility*, and of *defective innervation*."

It is clear these phrases may refer either to defective vital energy in general or to defective regulative nerve energy especially. The following case of gangrenous stomatitis is a typical instance of want of due nerve force to excite and regulate nutrition. It is one of many, although rare, which I saw in the year 1877.

Agnes D., æt. 20 months, came under my care in September 29, 1877. Previous to my seeing her she had measles, from which she never fairly recovered, and shortly after it was noticed that there was considerable thickening of the upper lip, the breath was highly offensive, saliva was dribbling from the mouth, and the submaxillary glands were enlarged. When the upper lip was freely exposed the disease was seen to be limited to its anterior surface, and to the gums in connection with the front teeth. Here the soft parts were in a state of gangrene, and the incisor teeth of the upper jaw were quite loose. But in addition to this, the soft parts around the lips were regularly and symmetrically de-vitalised and carbonaceous. Notwithstanding, the child's general vitality was fairly good. She was placed under the influence of chloroform, and the loosened teeth were removed, as well as the neighbouring dead tissues. This being done, strong sulphurous acid was carefully applied, a generous diet of milk, brandy, and egg was given every quarter of an hour, and a mixture was ordered of quinine, strychnia, opium, and chlorate of potash to be taken every two hours. By this active treatment the disease was arrested, and although the child's condition was extremely critical for some days, she ultimately recovered.

FIG. 1.



The following case of dysidrosis (Fig. 1) is of signal interest, and as far as I can see the disease is governed by precisely the same nervous laws of nutrition as the former. The patient was over 50, suffered from gout and chronic kidney disease, and the chief points of interest are these :—

1. A marked gouty history. His eldest son, like himself, was a martyr to gout. He said, that instead of having skin disease he ought to have had an attack of gout, for he felt the same as he always did when the gout was coming on.

2. Upon the Good Friday before I saw him, his skin became exceedingly irritable, the hands and feet burning and tingling, and in the course of a few hous they were covered with a shotty eruption, which, in some places, formed into bladders.

3. When he came under my care he was noted as a man of strong physique, fair complexion, with well-marked gouty characteristics; the ears were large, the under lobe thickened with gouty concretions, and the fingers and hands were deformed from gouty joint changes. He was extremely feeble; there was great mental depression, and the movements of the upper limbs were accompanied with tremor.

The skin eruption was variable and symmetrical in character, the forehead, alæ of the nose and mental fossa were bespattered with eczematous encrustations. The arms, which were at first almost devoid of sensation, were now extremely sensitive, swollen, painful, and covered with a lichenous rash. The hands, but especially the fingers on the inner side were partially covered with large blebs. The joints seemed to be the chosen seats of these, they made their appearance with astonishing rapidity, and a few hours were sufficient to admit of their rising to a large size. The feet and toes were affected in the same manner. The tongue was clean and moist, and the appetite fairly good. Now, in this case I have little doubt but that the condition of impaired nutrition was essentially due to a paralysis of those nerves governing the circulation and nutritive processes of the skin.

I will now refer to an enlargement (hypertrophic) of the terminal ends of the fingers and toes, with which we are all so familiar in consumption and in other chronic diseases of the heart and great vessels of the chest, and is usually known to us as clubbing. I would say that in my experience these deviations from the slightest normal growth to the strongest characteristic enlargements are the most striking manifestations of defective nervous power in immediate relation with the thoracic circulation with which we are acquainted. They are, too, of the greatest possible value to the practical physician in making a correct diagnosis, for they are not only intimately associated with advancing organic disease of the chest, but they are frequently the precursors of the gravest maladies.

There can be little question that these abnormal changes of nutrition are more or less immediately connected with similar changes in the spinal sensory-motor-sympathetic- and vaso-motor-ganglia of the thorax.

Dr. Weir Mitchell, in speaking of alterations of appendages of the skin consequent upon nerve wounds, makes the following note: "After the total section of a nerve the nails are apt to become clubbed, and in rare cases to suffer from painless whitlow." He further remarks: "I am unable to say whether or not nail-growth is for a time arrested immediately after the section of the nerve, but in most of the cases it is found at a later stage to be slower than that of the corresponding healthy parts, although in no instance have I met with a total cessation of growth. In lower nerve wounds ulceration around the nails is common, and often very painful; but in connection with the glossy skin of certain neural lesions we observed striking peculiarities of nails. They suffer only in the fingers, the neural supply of which has been interfered with, so that the nails in the median distribution may be contorted, and those in the little finger be unaffected. When the nails of the toes have been attacked, and they are very rarely so, the curving is less marked, but a distressing ulceration is apt to occur at the angles. The nails seen in the illustrations are the most typical of the kind I have ever seen (Figs. 2 & 3). They are photographed from a lady of 60 years of age (but it must be remembered that age has little to do with their production). She was quite well, and had enjoyed excellent health until she was 57 years of age, when she caught a severe cold from sleeping

(*a*) "Lectures on Diseases of Organs and Tissues as Influenced by the Nervous System."

in a damp bed, and was completely prostrated with gouty and rheumatic swellings in the joints. As this condition passed off it was succeeded by cough, spitting of blood, night sweats, and highly offensive expectoration. At this time she also complained of intense coldness and numbness in the toes and fingers, which alternated with burnings, prickings, and tingling, accompanied by darting neuralgic pains, so that her attention was almost constantly directed to them. There were well-marked chalky changes about the finger joints. The urine was high coloured, and, for the most part, loaded with lithates,

FIG. 2.

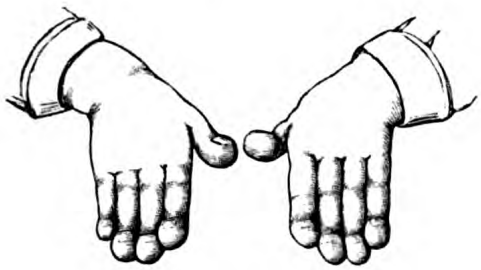


FIG. 3.

but free from albumen. The pulse was usually full and tense, the tongue coated, the cheeks flushed and more or less blue; both lungs were undergoing disintegration at their bases. Here, then, we had a clear case of disturbance of nutrition from gouty inflammatory action in the lungs and vessels of the chest, associated with this peculiarly interesting and typical change in the extremities of the fingers and toes. Notwithstanding the severity of the symptoms, she progressed favourably under the influence of increasing doses of atropia. This drug appearing to have an especial curative influence over those cases which are essentially due, in the first instance, to defective action of the vaso-motor nerves.

*Baldness.*—At one time dermatologists endeavoured to prove that disease of the hair follicles through parasitic influence was of all things the most common. But recent investigations have shown with some amount of certainty that, even where the parasite had become fully developed, its germination and propagation was really due in the first instance to defective nutritive nerve influence. We now know full well (and this is the most important point for our patients) that the administration of such drugs as opium, atropine, arsenic, quinine, phosphorus, bichloride of mercury, strychnine, and cod-liver oil, with an especial nutritive diet, and a weak galvanic current to the skin, do more to effect a cure than pounds of ointment and gallons of washes.

This statement applies to, and is borne out by the facts of treatment not only in cases where the most primitive forms of fungi exist, but also in those cases where the more highly developed parasite finds a fair field for increasing its species.

*Itching.*—There is another troublesome condition of the skin generally, and of the hairy parts underneath the arms, and between the thighs. Pruritis, prurigo, mitis-formicans, senilis, where the patients feel a creeping, itching, burning sensation like the creeping of innumerable insects over the skin, but all kinds of sensations are not unfrequently experienced. Now these are invariably due to a faulty condition of the nervous system. They may be associated with living organisms, and they may lead on to more definite, and in some instances aggravated forms of skin disease by scratching, but the powers of nutrition are essentially at fault. Sedative emollient applications will relieve for the time, but utterly fail to cure the disease. A discontinuance of soaps and other irritant remedies, with the administration of bromide of potassium, colchicum, aconite, and bicarbonate of soda, using warm bran baths, and observing perfect cleanliness, the condition invariably subsides rapidly and completely.

I can scarcely recall to mind a more instructive instance of inactivity of the vaso-motor and nutritive nerves (assimilative processes), than in the following case. It shows how essentially such a state is due to an impaired tone of the nervous system, and how readily it yields to a correct form of treatment.

A stout, fair, well-nourished woman, æt. 27, came into hospital under my care without any special family history of gout or nerve derangement. She was born in Cambridgeshire, and had suffered from ague. Her statement was this. That whilst in good robust health, during the last week of Easter, she first observed on the extensor surfaces of the knees and elbows small, flat, slightly-raised red patches, which were extremely irritable, soon became pale, and died off in large scaly flakes (psoriasis). They then made their appearance around the waist, and in a short time covered the whole of the body (except the face), the hands were the last to become affected, and the last to get well.

From this period up to the time of my seeing her she had been trying a number of remedies with no good result; in fact, the disease had progressively increased, and she became so prostrate that she was scarcely able to stand. There was an amount of mental depression in equal ratio with the physical prostration. The urine was free from albumen, and the catameniæ were normal. She had daily attacks which in some way resembled ague and gave distinct evidence of the nervous origin of the disease. For instance, she would be seized with tremor, beginning in the left foot, taking the same half of the trunk and left arm up to the occiput; then leaving the face it would pass over to the *right half* of the trunk, take the right arm, and finally attack the right leg and foot. She said the sensation was similar to that produced by a galvanic battery. It was usually attended by a sense of coldness, succeeded by great heat and profuse sweating.

The entire body was covered by a mass of scales which were produced and shed with astonishing rapidity. On account of the great irritation she slept but little.

Tuesday, July 15th.—Was put in a blanket bath for six hours (the bed was covered with a large piece of india-rubber sheeting, and upon this was placed a blanket wrung out of hot water, in which the patient was firmly packed, and other blankets were then laid over her), and allowed to drink iced water in small quantity. The respiration and circulation were never affected. When she was taken out of the blankets all the scales had disappeared, leaving the body of a lobster redness. She was then enveloped in india-rubber sheeting, which was bandaged close to the body. In a day or two the scales reappeared, but not to the same extent. On the 23rd the bath was repeated with similar good results. From this time the disease was manifestly checked, and by the 1st of August the skin was perfectly healthy, and she never felt better in her life.

If we consider the aggravated nature of the disease, and the rapid way in which it yielded to this purely resolvent mode of treatment, we have every reason to be satisfied with the result.

There are many other skin diseases and changes in the skin which are due to defective action of the nutritive nerves, which might be referred to, but I have presented these examples to give interest to the subject.

The following is a remark of Erasmus Wilson in his oration on the Progress of Cutaneous Medicine, delivered before the Medical Society of London, in May, 1876:—"I may say for myself that although experience has given me a thorough trust in the remedies which I employ, I am nevertheless bound to admit that there is still very much to be accomplished in this department to raise our practice to the level of our theory—to render it if possible a science rather than an art."

## EXPERIENCES OF AN IRISH POOR-LAW MEDICAL OFFICER.

By THOMAS TUCKEY, A.B., M.B., & M.Ch. Univ. Dub.
Medical Officer Ballyhooly Dispensary, Fermoy Union.

IN requesting you to give publicity to the following account of my Experiences as a Poor-law Medical Officer, I do not know whether I may not be trespassing too much on both your space and your readers' forbearance. Though written somewhat in the form of a story, it is intended to be a guide, and in many respects a warning, to young practitioners about to enter on the arduous career of an Irish dispensary doctor. They will see, I hope, the trials, the heart-breakings, and the petty annoyances which they must in many cases expect to meet with. I hope to show them some of the difficulties which will surround their practice, and some of the causes which will prevent their successfully treating cases among the poor. Every character is drawn from life, every incident is true. I hope the profession will not think me hard on Mr. Jerry O'Rorke (*a*), whom we shall several times have to meet professionally. *The man is alive to this day*, and quite ready to demolish any number of reputations. If, therefore, sir, you will condescend to publish in your journal my communication, which approaches to a narrative form, having written the preface, I have only to perform another duty of an author, and dedicate it to you, sir, who have always been the Irish dispensary doctor's best friend.

## THE HISTORY OF A DISPENSARY DOCTOR.

(WRITTEN BY HIMSELF).

### CHAPTER I.—DR. SCALPEL.

*In which the Author gives some account of his Election, and how he sped on his first Red Ticket.*

The former doctor of the Blossomtown Dispensary having unfortunately taken to drink, and having unenviably distinguished himself by numerous instances of mala-praxis and neglect, and having finally extinguished himself by mistaking a compound fracture of the thigh for morbus coxæ, was very properly called upon by the Local Government Board to resign. Having resigned of necessity, the dispensary district became vacant, and I among others determined to stand for the post. At last the day arrived when the election was to take place, and the committee assembled above stairs, while we, the candidates, assembled below stairs, each with his diplomas under his arm, and glanced at each other, while the committee were deliberating. Being each called up separately, and admonished as to our duty, and the responsibility of neglecting a red ticket being duly dwelt upon, we were dismissed, when we came down again, and wriggled on our chairs, in expectancy; or sat still in gloomy despair, as we calculated our chances. At last a voice, stentorian in sound, and Hibernian in accent, resounded down the stairs, and requested that Dr. Scalpel—your very humble author, reader—would step up. Having stepped up, I was informed that an enlightened and discriminating committee had elected me by a majority of one. I bowed, returned thanks, and found myself installed, subject to the approval of the Local Government Board, as Medical Officer of the Blossomtown Dispensary District, at the salary of £100 per annum, exclusive of £10 as sanitary officer, with the usual vaccination and registration fees. Elated with my success, I immediately invested in a horse warranted sound, but which, unfortunately for me, had imbibed somewhat of its former owner's habit of praying, a practice admirable in a man, but anything but desirable in a quadruped, tending as it does to tumble its owner in the dirt. Riding to the post one morning, my steed practising what my groom called "playing marvels" (*Anglicé* marbles) along the road, I found at the office a communication stating that I was appointed medical officer. Riding home, I was accosted by a gentleman in a very ragged coat, and no hat worth talking about, who spoke to me as if he were conscious of owning a part of me, and presented me with my first red ticket. Pocketing the then to me literary curiosity, I made further inquiries, and was informed that Mrs. Mary O'Shaughnessy was then in the pangs of labour some four miles off, at some place which began with a K, pronounced by my friend "Konock," and which requires a twist of the tongue, and a knock of that organ against the soft palate, which, having been brought up in France, I have never yet been able to master. After a journey partly on the high road, partly up one "boreen," and down another, varied by splashing through a bog, and through gaps fenced by stones, which my guide obligingly knocked down (it is extraordinary how free men are with other persons' property!), we arrived at his cabin, a wretched tenement built of mud and thatched with heather; the chimney ingeniously constructed of loose boards, held together by a "sougawn" (*Anglicé* straw rope). Consigning my steed to the husband's care, I entered, not without difficulty, my hat being knocked over my eyes by the hen roost. Recovering my eyesight, and getting accustomed to the darkness, I found I was in a room which constituted the sole apartment of the cabin. That part of it which was not occupied by the settle bed (an admirable piece of furniture, which is covered over by a wooden semi-circular frame, and seemingly built on purpose to give the doctor who examines a fever patient the disease), I found taken up by some dozen women, keeping up a babel of talk, each relating to her neighbour her experiences of the trying situation their friend was then in; and filled up as the conversation was of floodings, instrumental deliveries and mishaps, eminently calculated to reassure her mind and make her lively and cheerful. It was with some difficulty I discovered the patient, placed as she was on her knees in an attitude of devotion, while the midwife on the occasion occupied the position of a back-stop at cricket, ready for any emergency. Having put out her mother and friends, the former of whom set up a howl as if my presence was the forerunner of certain death to her daughter, I made inquiries of the nurse, who went over to the fireplace and lit a short "dudeen," possibly for the better clearing of her brain. I could get nothing out of this learned woman, except that the child was *caught underneath the frame.*

She had, indeed, she said, employed various efforts to bring the case to a successful issue, her medicinal remedies consisted of starvation as regards food, and plenty of whisky punch as drink, but she was unable to accomplish her desire, and having seen Mrs. O'Callaghan—"God be betw'n us and harm!"—die under the same circumstances, she had sent for me, though, indeed, in Mrs. O'C.'s case, the medical gentleman could do nothing. With these words, pleasant both to patient and myself, she became silent, and sucked diligently at the dudeen, taking it now and then from her lips to utter a peculiar sound, which I can only render on paper as "chuck!" "chuck!" a method of giving vent to their feelings, much in vogue

(*a*) The practitioner from whom I have taken the character of Mr. Jerry O'Rorke has since died. I have purposely made his appearance as unlike the original as possible.

among midwives of that class. Seeing that the case would not terminate for some time, I went outside, being, truth to say, half-stifled with bad tobacco-smoke, and that noisome stuffiness which exists in most Irish cabins, the natural result of overcrowding, uncleanliness, and want of ventilation. While waiting outside I had the pleasure of making the acquaintance of one I am proud to call my friend, the then Catholic curate of the parish, the very type of a good priest. Conscientious, believing in his religion, patient, hard-working, sparing no labour where his duty was concerned, charitable beyond his means, polite, not overbearing, and believing that those points in which he agreed with Protestants were much more important than those in which he differed from them; and yet a thorough Irishman, with an eye twinkling with merriment, and a broad Irish mouth racy with fun, telling a story overrunning with humour, now laughing like a sheet of water in the sun, now sombre and even sad as he told of some poor death-bed, reminding one of the same sheet of water darkened by an overhanging cloud. To while away the time we chatted on various subjects, and among other stories he told me the following anecdote of his own experience when a very young man on "his first mission." He was called one night to see a dying man, who lived with an old fellow who went by the *soubriquet* of "Jemmy the Shirt." This hero of the chemise was a very honest fellow, and acquainted the good priest of the fact that the old beggar man had collected a few pounds, and he was anxious that the beggar man should state how much he possessed, in order that he (Jemmy) might not be accused of having stolen any of it. The dying man stated how much he had, and making a verbal will, left the priest three pounds to be expended on masses. The man died in a short time, and the priest heard no more of the matter, until one day he was riding to some "sick call," when he was accosted by an old woman, who asked his pardon for stopping him. "What ails you my good woman?" said the priest. "Such a thing, y'r reverence," said she. "I was asleep last night, when who should appear to me but my brother. 'Affy,' said he, 'I am greatly troubled in my mind.' 'What at?' said I. "Indeed said the ghost, 'at my will that I made leaving all my money to strangers, and none to my own sister, who often gave me a bit and sup when I was in want of it.' So I determined to come to your reverence and tell you about it."—"Did he say anything about my three pounds?" asked the priest. "Yes, your reverence," answered the woman; "that was the only part of the will he said was all right." "Then," said the priest, "if he left my money alone I don't care what he intends doing with the rest of it. Good day;" and away he rode. "You will find," added he, "Doctor, in your dealings with the Irish poor, that as long as they can gain their object, they don't care what becomes of you, that they will endeavour in every way to get you mixed up in a quarrel if they can, and make use of you, not much caring how you come out of it." Not long after this a rider appeared making his way at a good sharp pace over the bog, and presently Dr. Jerry O'Rorke alighted off his horse and stood before me. As frequently happens, the friends of the patient had sent for another physician, without acquainting me of it. I took a short inventory of him as he stood before me, having by a kind of sullen nod acknowledged our presence. Of medium height, with sandy hair and whiskers, with small cunning eyes, and a firm cruel-looking mouth, dressed in tweed, without a tie, his white shirt fastened by bone studs, his hands destitute of gloves, and an oak plant for a whip, he looked withal as curious a specimen of a medical practitioner as I had ever seen. "Where's the patient?" were his first words to me; without introducing himself, or exhibiting even the faintest shade of medical etiquette, he marched into the room, thrust his hand underneath the bed-clothes, examined the woman, and though there was not the least necessity, immediately, without any preliminary consultation, applied the short forceps, plunged his hand into the uterus, extracted the placenta, flung it into a pot, and departed, first having whispered that the woman was left too long. This was my first meeting with Dr. Jerry O'Rooke, a kind of practitioner, let us hope for the honour of the profession, rare in Ireland—a man turned out of some licensing establishment for practising medicine, ignorant, ungentlemanly, forced to raise himself not by real cleverness, but by cunning and depreciating his fellow practitioners. To my cost, it was not the last meeting with him, and for the sake of the profession I hope it has not fallen to the lot of any of my professional brethren to meet such another. Thus I fared on my first red ticket, and it was many a long day before the idea was obliterated from my dispensary patients, which Dr. Jerry O'Rorke impressed on their minds that day of my incompetence and want of skill.

## ON DIPHTHERITIC PARALYSES. (*a*)

By PROFESSOR HARDY.

Translated from the *Annales des Maladies de l'Oreille, du Larynx et des Organes connexes*,

By W. DOUGLAS HEMMING, M.R.C.S.,
Assistant Surgeon, Central London Throat and Ear Hospital, Late Surgeon to the Notting Hill Dispensary, &c.

*(Concluded from page 483.)*

HERE again, just as in the lower limbs, the paralysis is rarely complete. On the other hand if we believe M. See, the stiffness and pricking will exist only from the extremity of the fingers up to the elbow, just as in the lower limbs we shall only notice it in the leg and foot, the thighs and arms never being affected. Here generally anginous paralysis is limited. Nevertheless, we see sometimes a loss of tone in the sphincters of the bladder and anus. There have been cited on this point examples of individuals in whom diarrhœa was established after the administration of a purgative, and who, though able to retain solid matters, involuntarily passed liquids, but these cases are rare, and as a rule the sphincters remain unaffected. In other cases the disease shows still graver characters and examples have been cited of paralysis of the œsophagus which reduced the patients to the sad necessity of being fed by the tube. Still further, there have been observed paralyses of the larynx, of the respiratory muscles, and of the diaphragm; these paralyses cause such disturbance of the mechanism of respiration that the patients are the prey of a true dypsnœa which in a moment may go on to apnœa, and in certain cases to death by asphyxia. Similar disorders may be observed in the heart, whose pulsations are enfeebled, the patients are then liable to lypothymias and syncope, which in some cases have suddenly put an end to the life of patients convalescing from sore throat, and suffering only from some paralytic disorders of the limbs.

With regard to general phenomena, they are usually completely absent; appetite is preserved, sleep is good, the intellect is intact, and no cerebral troubles are observed even when the paralytic phenomena are wide-spead and very marked. Once developed, how does the disease conduct itself? I have already pointed out to you there is an almost regular order in which the phenomena of paralysis supervene when the disease is limited to the soft palate; most usually after one, two, or three weeks amelioration takes place, which is soon followed by complete cure. But sometimes after the paralysis of the soft palate has almost disappeared new complications appear successively, and thus prolong the disease for two or three months.

In the first case the anginous paralysis is a slight affection which is only important because it may be generalised

and invade the œsophagus or respiratory muscles. But even when the upper limbs are affected cure is the rule, and it is rare that this does not take place completely and decisively. Up to the present time no example of relapse has been related.

Is anginous paralysis always cured? Unfortunately no, and death may supervene either quickly, as the result of a complication due to the paralyses themselves, or slowly, from the anæmia or cachexia into which the patient falls, the immobility to which the paralysis condemns him, or the difficulty in deglutition to which it may give rise.

In the first case, of which Professors Tardieu and Peter have each reported one example, it may occur when, as a result of paralysis of the larynx, a bolus of food lodges in the trachea and causes death by asphyxia. In the second case the paralysis of the pharynx and œsophagus does not amend, the patients, no longer able to take nourishment, emaciate, become more and more feeble, and succumb by inanition.

I have been the sad witness of two fatal results supervening in the course of anginous paralyses. The first case occurred in a young boy, æt. 7, who was affected with pultaceous stomatitis with prolongation of inflammation to the tonsils. He had been cured for ten days of his sore throat and stomatitis, when he was seized with paralysis of the soft palate, and soon after obstruction to the respiration, almost producing suffocation. Things were in this condition when the parents, living in the country for the convalescence of their child, brought him to my consulting-room, that I might prescribe some remedy for these new troubles. Whilst the parents were telling me what had happened during the last few days, I had my eyes fixed on the little patient, seated on his mother's knees; all at once I saw him turn pale, the head fell forward on his breast, and he was dead. This was the first case; in it, paralysis having affected both the respiratory muscles and the heart, the child died of syncope. Another case was in 1871, when I was attending, in a family, a child affected with pseudo-membranous sore throat, who succumbed to the croup a few days later. The mother, who had sat up with her child, was attacked in her turn; for a long time the disease persisted as a patch on one of the tonsils, and ended in a cure at the end of three weeks. The patient had been completely cured of her sore throat for ten days, when she was seized with paralysis of the soft palate; after this there supervened amblyopia, then almost complete paraplegia, great weakness in the muscles of the upper limbs, and lastly paralysis of the pharynx and œsophagus. For ten days I sustained the strength of the patient by administering, morning and evening, by means of the œsophageal tube, soup and a glass of wine. I hoped that the disease would stop here, when following the paralysis of the œsophagus there appeared paralysis of the muscles of respiration. From this time the patient was a prey to constant dyspnœa, which increased its attacks without apparent cause. Insufflation of oxygen, the application of the constant current, every means indicated under such circumstances were insufficient, and the patient died in a fit of suffocation.

After having thus spoken to you of the manner of commencement, the progress, and consequences of anginous paralysis, I now come to the study of the nature of the affection; what is the peculiar cause which produces it? In what morbid group shall we class it? Until lately it was thought that anginous paralysis was an essential affection not accompanying any kind of material lesion. Trousseau admitted that it was due to the introduction into the economy of diphtheritic virus, which, after having impregnated the throat, ended by reaching the nervous system, and thus caused paralysis of a dynamic kind without material lesions. M. Gubler thinks also that these paralyses are not accompanied by any anatomical change, and that they are the result of the weakening of the economy which generally follows acute diseases, and admits that these asthenic paralyses may be developed as well after a pneumonia, typhoid fever, peritonitis, in a word after any severe disease which has exhausted the system, as after diphtheritic angina.

But we may object to Professor Gubler that if these paralyses are sometimes developed after certain severe diseases these cases are absolutely exceptional, whilst on the contrary it is common to see them following angina.

Amongst hospital physicians who have attended severe epidemics of eruptive or typhoid fevers, there are very few I am sure who have observed paralyses supervene in variolous or typhoid cases, whilst there is not one among us who has not seen a certain number of paralyses appearing on the decline of angina.

If until our own day anginous paralysis was considered as a paralysis *essential, sine materia*, it is due on the one hand to the difficulties inherent in researches which necessitate examination of the parts; on the other hand, to the unadvanced state in which until the last few years the technical histology of the nervous centres remained. The first positive researches date from 1862, when MM. Charcot and Vulpian published a case of paralysis consecutive to a diphtheritic angina, in which my colleagues observed a lesion of the palatine nerves analogous to that observed in the peripheral end of a divided nerve. Similar researches were made by Lorain and Lepine, and Lionville Pierret in France, and by Rühl and Oertel in Germany, but we may say that the results announced were not always so clear as to bring conviction with them, and to cause uncontested acceptance of the lesion of anginous paralysis. To believe the patient and conscientious researches which have just been made in the laboratory of M. Vulpian on six children who died in the course of circumscribed or extended diphtheritic paralyses, it would appear that these paralyses are dependent upon a lesion of the anterior roots. Indeed, in each of the cases examined by M. Dejerine the change in the anterior roots has always strictly corresponded to the paralytic phenomena observed during life; thus in the case where the paralysis was limited to the upper limbs, the alteration of the roots was not observed lower than the first dorsal pair. The amount of the change in the roots was always in direct ratio to the duration of the paralysis; the longer this latter had lasted the greater were the changes in the nerve tubes.

The interest of this lesion of the anterior roots of an inflammatory nature consists entirely in the fact that it is not primary, but appears secondary or consecutive to a change in the medulla. This medullary change, probably inflammatory in its nature, is situated in the grey matter; it is this which secondarily gives rise to the change in the anterior roots, just as division of a nerve gives rise to inflammation of its periphery.

The details on which I have just entered on the pathological anatomy of the paralyses studied by M. Dejerine, will enable you to comprehend all the importance of his researches, which, if they are confirmed, will remove diphtheritic paralyses from the class, every day more impoverished, of diseases *sine materia*. Not only do these recent studies enable us to comprehend how and why the post-anginous paralyses concentrate or diffuse themselves, since they show us paralytic troubles adequate to the medullary lesions; but they will probably aid us in determining the why and wherefore of their origin,

Why are these paralyses relatively so common after angina?

Why is it, in the immense majority of cases at least, that the paralyses, so limited or so widespread as they may be, commence in the soft palate?

These are problems of which it is at least allowable to attempt the solution; may we not ask whether the irritation which is produced by the simple fact of the angina (whatever besides may be its nature), on the palatine nerves reaching even to their origin, may not cause sufficient excitement to produce in the nerve axis functional and nutritive derangements, which at length will result in this myelitis, and this secondary neuritis, of which I have just spoken? I avow that this view, at least probable, has the advantage of explaining paralyses of the soft palate

following either anginæ of a malignant nature, or anginæ simply inflammatory; that it has the advantage of making comprehensible the generalisation or the concentration of the paralytic phenomena since the medullary lesion may extend, localise, ascend, or descend, and give rise accordingly to the series of paralytic modifications which we have studied, comprising such remarkable manifestations on the respiratory and circulatory centres.

Being given the lesions which I have mentioned to you, we may comprehend very well how they may give rise to a common anginous inflammation, as well as to an inflammation infectious in the highest degree, such as diphtheria. For the origin of the frequence of the paralyses consecutive to diphtheritic anginæ, we must search in the nature of the inflammatory diphtheritic process which must, by its very essence, by the impression which it makes upon the tissues, produce on the pharyngo-palatine nerves very deeply and very commonly, a change extending to the centres; I avow that I comprehend better this mode of production than that which consists in seeing in the impregnation of the medulla by the diphtheria the cause of the lesions of the roots and of the nerves, for then we could scarcely comprehend how a simple angina, lasting only a few days and causing only general reaction, could be followed by a similar paralytic disorder. Excitement, irritation of the nerves by the angina, extension to the medulla, and inflammatory reaction of the latter on the roots and the nerves which arise from it, such is the manner in which I think may be conceived the pathological physiology of anginous paralyses. If I have dwelt somewhat on these new researches, it is because they are full of interest and promise, they make us comprehend also how the anginous motor troubles even lead to paralyses, how these paralyses come, little by little, one after another, and how, lastly, as a rule, they are cured without leaving anything behind them. Indeed, cure is the rule, and the cure generally supervenes of itself, the *rôle* of the physician being to assist it; to do this, you will raise and sustain the strength of your patients by means of iron, quinine, coffee, and nourishing food. In some special cases you will have to interfere, as I have already told you, by the œsophageal tube to assist deglutition when it cannot be made without fatigue or danger by the patient. In cases where the paralysis of the soft palate or of the pharynx does not improve rapidly under the above treatment, have recourse to electricity, in the form of interrupted currents, or still better, under the form of the continuous current, employing remedies which have a special action on the muscular fibre, such as nux vomica; use at the same time sulphurous baths, which you may give several times a week.

This, as a rule, will be the limit of treatment; if your patients remain languid and weak, and are in a position to move, send them to perfect their cure at the warm sulphurous waters—such as Aix, Luchon, Aix-la-Chapelle, or at the saline sulphurous waters such as Bourbonne, Plombières, Ragatz.

# Clinical Records.

## MERCER'S HOSPITAL, DUBLIN.

### Under the care of Mr. E. STAMER O'GRADY.

AMONGST the patients whose cases come to a conclusion during the month of May, were the following:—

*Enucleation of Eye.*—A middle-aged woman, whose left eye had formerly been the seat of disease for years, had some corroding substance of unknown nature thrown into it. There was immediate excessive pain; swelling of the conjunctiva, with sloughing of the cornea, rapidly followed, attended with deep seated pain, which speedily became intense, in the sound eye. Subsequent to the enucleation, there was extreme swelling of the upper lid. This subsided gradually, and the parts healed favourably. An otherwise shapely and movable stump had its adaptability for an artificial eye much impaired by firm adhesions to it, in spots, of the lower lid, where opposing deep surfaces had been destroyed by the caustic agent.

*Excision of Major Part of Tongue.*—Patient, a herd, æt. 66. Well-marked epithelial disease occupied the under surface of the organ on the left side, and also extensively implicated the mucous membrane of the floor of the mouth; the substance of the tongue being infiltrated and indurated for a considerable distance back. It was only three months since the malady, now growing very rapidly, was first noticed; no enlarged glands could be detected. An incision from the chin to the thyroid bone allowed the superficial soft parts to be laterally retracted; with curved scissors the remaining structures were clipped from the concave surface and sides of the lower jaw. The tongue having been drawn well forwards, was transfixed through the cut beneath by a curved needle, the point of which was directed posteriorly. This was withdrawn, leaving in its track a double ligature, each portion of which was used to draw an écraseur chain; one crossing the right, the other the left half of the dorsum of the tongue, were passed out again by the cut beneath, through which the two instruments were worked. The bights of the chains were placed well back, and transfixion by shackle-pins immediately anterior to these, effectively prevented any retraction of the diseased structures. The instruments, slowly worked, severed the included mass with scarcely any bleeding. Two points of carbolised catgut suture considerably approximated the surfaces of the stump. Chloroform was given for the earlier stages of the operation, but the patient (who, become conscious during the arrangement of the écraseurs) seemed to suffer so little that the later portions were conducted without its aid. One quarter of a grain of morphia was given subcutaneously. After being put to bed, the patient at first did nicely; reaction was prompt, and two and a half hours after the operation matters looked well; there had been slight sanguineous oozing through the cut, but it was readily checked by ice, and the patient was positive that he had not swallowed any blood. Soon afterwards a marked change was observed in the man's countenance, which had become livid and shrunken, with blue lips; the pulse was good, unchanged from its previous volume, and the body temperature was normal. The patient was quite conscious, and said he felt nothing amiss. After a time he began to grow duller, then the pulse become weaker. Every effort to induce a rally proved unavailing. The depression steadily increased, and death occurred just ten hours after the operation; no post-mortem could be obtained.

*Fracture of Patella (Two Cases).*

A. Occurred in a painter, æt. 32; the right bone being broken transversely just above its centre, the upper fragment was comminuted. The sulcus of separation was more than 1½ inches. The case was treated by elevation of the limb on a gutter splint. Ice was at first used locally for some days, and subsequently gradually tightened by decussating straps of adhesive plaster. In 38 days a starch bandage was applied, and the patient allowed to go about. When he was discharged a fortnight later there was no appreciable separation of the portion of the fractured bone. As a precautionary measure he was advised to continue the use of a posterior splint.

B. A messenger, an intemperate man, æt. 40, who fell on stone steps. This case was almost identical in character with the preceding one, save that the accident occurred on the left side. The treatment and result were similar, the patient being discharged from hospital by his own request, after 40 days' stay there.

*Presumed Fracture of Skull (Two Cases).*

A. A man, æt. 22, of intemperate habits, was admitted at midnight, in a state of intoxication, after having fallen off an outside car. There was a slight scalp wound, about half an inch in length over the posterior and upper part of the left parietal bone, which, however, it did not ex-

pose. Neither now, nor at the subsequent morning visit, though the patient was carefully examined on each occasion, did aught seem to indicate danger. Shortly before midnight partial insensibility rapidly developed, the right pupil became dilated, the left remaining natural as to size both were insensible to light. Left hand was flexed, both right extremities were in a state of marked rigidity. No spasm nor convulsive movements. The wound on the head was enlarged, but no evidence of injury to the bone could be found on its external surface. The bowels were well acted on by calomel and croton oil, but without any relief. At morning visit, on account of the marked cerebral congestion, 18 ounces of blood were taken from the right arm. For some hours all the symptoms were somewhat relieved, but in the afternoon a rapidly fatal collapse suddenly occurred: death taking place 41 hours after the injury. No autopsy could be got, though anxiously pressed for.

B. Here the patient was a temperate man, a tram-car driver, æt. 33; whilst locking the connections of the pole and bars with the vehicle, he was struck on the left side of the head by the iron knob of the break handle. The break had somehow got loose, and the handle was revolving at a rapid rate when it hit him. When admitted a few minutes after the accident, the patient was in a state of partial collapse, with severe bleeding from the left ear. He was deaf, too, on this side. After a few hours he became quite sensible, and complained of pain and noises in the left side of the head. The bleeding continued constant for more than a day, welling up, filling the meatus, and overflowing. It was replaced by a colourless fluid, which flowed freely at first, but after two days became less in quantity, and subsequently purulent. Six days after the accident, the patient took his discharge, saying he felt quite well. Of the subsequent history of the case nothing is known.

*Noma Pudendi.*—The patient, æt. 5, had the greater portion of the right labium characteristically affected. To the diseased surface, which was about the size of a florin, strong nitric acid was freely applied. Healthy action was at once induced, and repair rapidly progressed, the little patient being discharged from the hospital in nine days, with a simple and healthily-healing ulcer, of less than a shilling in size.

*Osteitis and Necrosis of Tibia, with unusual Elongation of the Bone.*—The right tibia of a lad, æt. 6, measured fully two-and-a-half inches longer than its healthy fellow, and was besides greatly hypertrophied in circumference. Some small portions of necrosed bone were removed, after which the wound slowly healed to a single sinus. During treatment, the circumference of the diseased tibia had much diminished, the relative disproportion of length towards the sound limb remaining unchanged.

*Hare-Lip.*—The deformity was on the left side, and single, but the gap was unusually wide, and with great backward displacement of the nose. The cheek had to be extensively raised to enable the parts to be brought together. The edges of the fissure after being pared by scissors, were united by three hare-lip pins, and one catgut suture on the red border. The centre needle was removed after three, the others after four, days. An excellent result was obtained, and the infant, a female, one year old, was sent home the tenth day after the operation.

# Department of Lunacy.

## NORMANSFIELD ASYLUM FOR IDIOTS, &c.

The ceremony which took place on Saturday at Normansfield Asylum, Hampton Wick, was well-calculated to awaken in the minds of the visitors some curious reflections. With regard to our own impressions, we could scarcely imagine that this large and magnificent establishment,—with its many and well-appointed apartments, its neat and cheerful dormitories, its school-rooms, its gymnasia, its *kindersaal*, its capacious recreation hall and theatre, its pleasure grounds, and its acres of farm land, could have been erected for the accommodation, education,—and the mental and physical improvement of a class of people for whom, not many years ago, any place would have been thought good enough, and who were treated with an amount of neglect, and even brutality, that we can hardly conceive to be possible in a christian country. But times have greatly changed since lunatics were kept in cages like wild beasts, and exhibited at Bethlem as a show at 1d. and 2d. a head. We need scarcely remind the reader how much medical science, medical enterprise, and medical humanitarianism, have done to bring about this happy change. His thoughts will very naturally revert to the admirable reforms introduced by William Tuke at the Society of Friends' "Retreat," at York, by Pinel, at the Bicêtre, Paris, and, at a later date, by Esquirol, and our own countryman, John Conolly. But among the many distinguished names that have been more recently associated with the advancement of psychological medicine, or the improved treatment of the insane, that of the proprietor of Normansfield, Dr. Langdon-Down, must not be omitted, for long has he laboured, and much has he done to improve the social status and welfare of a class of patients formerly thought to be incapable of any improvement.

The ceremony which is now claiming our attention was that of the opening of the New Pavilion Wing and Halls of Normansfield by the Right Hon. the Earl of Devon. It was in every respect, weather excepted, a great success. No trouble or expense was spared to make the visit of the numerous guests who had been invited to be present on the occasion as pleasant as it could possibly be. A special train was placed at their service both in going to, and returning from, Hampton Wick. There were altogether between two and three hundred visitors, many of whom belonged to the *élite* of the profession. We noticed particularly Lord Wrottesley, Sir John Ogilvy, Bart., M.P., Grant Duff, Esq., M.P., General Cavenagh, Dr. James Risdon Bennett, President of the Royal College of Physicians, the President of the Royal College of Surgeons, the Master of the Apothecaries' Company, the Presidents of several learned societies, Dr. Russell Reynolds, Dr. Radcliffe, Dr. Broadbent, Dr. Crichton Browne, Dr. Harrington Tuke, Dr. Bucknill, Dr. Carpenter, Mr. Spencer Wells, Dr. Fothergill, Dr. Semple, and several other gentlemen with whose names the reader would be equally familiar. The opening of the building was the signal for a remarkably good speech from the Earl of Devon, in which his Lordship not only expressed the deep interest he had long taken in the object of the institution, but paid its proprietor some graceful compliments in acknowledgment of the work he had done and the success which had crowned his undertaking. After the ceremony was over the company sat down to a sumptuous repast, which was served in the large Recreation Hall, and where for nearly two hours the visitors were engaged in listening to the appropriate toasts and interesting speeches that were proposed and made on this occasion. In fact, nothing indeed could better show the respect in which Dr. Down and his able and exemplary wife are held by the profession than the cordial and complimentary speeches that were made by the many eminent medical men who had accepted the grateful task of responding to the toasts. After the usual loyal toasts had been given, General Cavenagh in responding for the Army made an able speech in which, referring to the disaster that had occurred at the Cape, and more especially to the sad death of Prince Louis Napoleon, he remarked that it would, perhaps, have been better if some of our officers out there had shown a little more discretion and less dash, and if, moreover, some of them had possessed that talent for organisation which Dr. Down had shown in the establishment and management of his useful institution. Dr. Carpenter, in the course of his remarks, related an anecdote which, while it was very apposite to the occasion

reminded the assembly present of the length of time his name had been associated with the science of physiology. He said that many years ago two students attended his lectures on physiology who particularly attracted his attention for their talent and assiduity, the name of one of these pupils was Robert Brudenell Carter, whose name was so honourably associated with literature and ophthalmic surgery; the name of the other was that of their distinguished host. Dr. Bucknill also made an appropriate speech in which he more especially alluded to the advancement which psychological medicine has made in recent times, and with much taste and justice, observed that one outcome of the progress that had been made in this respect and in the treatment of the insane was the admirable establishment under whose roof they were now assembled.

Dr. Crichton Browne responded for literature, and after several other toasts had been given the guests withdrew to partake of tea and coffee in the *kindersaal*. Most of the visitors returned to town by the special train which left Hampton Wick soon after six, but many lingered behind to walk about the beautiful pleasure grounds by which Normansfield is surrounded.

## PSYCHOLOGICAL LITERATURE.—II.

Insanity and the Lunacy Law.—Dr. Wood has published an interesting brochure on this subject, with suggestions as to the amendment of it. He commences by giving a general definition of what constitutes insanity, with illustrations of cases under his treatment in St. Luke's Hospital. He considers the question of placing patients under private care as opposed to asylum treatment. This, as Dr. Wood states, must vary according to the circumstances of the case. For poor people there is no alternative but to place them, if mentally afflicted, in asylums; but in people of affluence the removal of a patient in the first instance to the care of a medical man is advocated if the case admits of it. Of course, however, there are a large proportion of patients who must be placed in asylums, and on this point Dr. Wood writes:—

"Far too much importance is attached by the friends of patients to the evil results which are supposed to arise from a residence in a home for the insane. Although in every large asylum there will be found a certain proportion of persons suffering from those forms of disease which involve great mental anguish, it will have forcibly struck every acute observer in visiting such institutions, that these are quite the exceptional cases, and that the number is considerably larger of those who present no such distressing symptoms. Quite as many of the patients are joyous as miserable, and the average condition of the whole is such as to create much astonishment. In fact, there is probably less unhappiness among them than would have been found among the same persons when contending with all the worries and anxieties they had, and which most of us experience in ordinary life. Where misery is present, moreover, it is very generally a part of the patient's malady, and it would be quite as bad at home as in the asylum."

Dr. Wood gives some good suggestions for the proposed amendment of the law, and quotes the opinion of the Lunacy Committee on the subject. We cannot, however, accept what Dr. Wood says in connection with Mr. Dodwell, who is here brought forward as an illustration of perversion of reason. Mr. Dodwell laboured under no delusion of an alleged grievance.

*Report of the Chester County Lunatic Asylum.*—We have great pleasure in drawing the attention of our readers to the able Report of Dr. Davidson. It appears that on the first of the year there were 512 patients residing in the asylum, the number of males and females being the same. During the twelve months 58 were discharged recovered, and the percentage of recoveries for the year was 42·2, or 3 per cent. higher than the previous year. The recovery rate at this asylum for the past year is 12 per cent. above the average of county and borough asylums. From a perusal of this Report it would appear that the greatest number of the recoveries took place during the very early stage of the disease. Dr. Davidson draws special attention to the treatment of insanity during the incipient stage. He says, "in no case is deferred treatment more fraught with danger than in the sitophobic, and, therefore, in any case where there is the slightest indication of refusal or aversion to take food, the most judicious course to follow is to have the patient forthwith taken to the asylum." The number of deaths during the year amounts to 50, the chief cause of death being general paralysis. Dr. Davidson says that it is a lamentable, but noteworthy, fact that, in about 29 of the admissions during the year, the exciting cause was clearly traced to intemperance thus confirming the general lunacy statistics, as issued by the Commissioners, in which drink is stated to be the chief assignable cause. The patients have been free from any severe zymotic disorders during the year. The Report concludes with some most valuable and carefully drawn up statistical tables, and the management of the asylum reflects great credit on the able supervision and attention of Dr. Davidson.

Aberdeen Royal Infirmary and Lunatic Asylum.—A quarterly general meeting of the President and Managers of these Institutions was held on the afternoon of the 9th of June in the Infirmary Hall, Lord Provost Jamieson presiding. It was reported that the total number of patients in the Infirmary on the 4th inst. was 171. The Committee of Management, by a majority, recommended (1) that there should be two chaplains—one for the Infirmary and one for the Lunatic Asylum; (2) that the salary of the Infirmary chaplain be £150, and that of the Asylum chaplain £200 per annum; (3) that the chaplain to the Infirmary be a preacher "who has been regularly licensed to preach the gospel according to the rules of the Church of Scotland by law established.

## PROFESSOR HUTCHINSON AT THE ROYAL COLLEGE OF SURGEONS.

### NEURO-PATHOGENESIS.

Lecture II.

In our last we gave a brief abstract of Prof. Hutchinson's first lecture on the above subject, by our Special Reporter. To-day we present our readers with a brief *resumé* of the second. The discussion of the changed nutrition of parts that are deprived of a due nervous stimulus involves a consideration of the complications arising out of the variety of nerves that are everywhere distributed. The sensory and vaso-motor nerve apparatus must be separately investigated in connection with the effects produced by each set on the nutrient processes occurring in the regions wherein they ramify. Also it is necessary carefully to dissociate the consequences following on paralysis and irritation of a nerve. In relating the history of a case illustrating this necessity, Mr. Hutchinson observed that, in his experience, contraction of the pupil does not succeed on paralysis of the vaso-motor of the eye, nor any perceptible lesion of nutrition. Destructive inflammation of the eye, causing paralysis of the fifth, is a not uncommon consequence of gummata in or near the course of the nerve, but such destructive inflammation does not necessarily follow on the presence of gummata in the region of the eye. Experiments, moreover, have shown that division of the fifth nerve need not involve destruction of the eye, provided only that it be guarded from the irritating presence of external bodies, and the

influence of the surrounding media in presence of a protective covering. The result of such experiments, however, is greatly influenced by the state of the general health of the animal submitted to them, a low condition being attended with inflammation in the organ. In one case that Mr. Hutchinson had experience of every precaution was taken to save the eye by covering, &c., but to no purpose, ulcerative inflammation having at length set in. There is an exaggerated notion prevalent with regard to the rapidity with which lesions due to irritation of the fifth nerve occur, but *destructive* inflammatory action does not of necessity succeed to even an ulcerative inflammation.

The question arises—Is paralysis of the fifth when followed by inflammation a *permitted* action? The agent at work in such a case, the cornea being anæsthetic, is merely a passive quiescence, and much difficulty in treatment is thereby experienced. The paralysis of the fifth nerve affects the least vital portion of the eye.

Bed-Sores (Pressure Sores) have been till recently attributed to the effects of pressure. Dr. Bright first drew attention to these sources of clinical trouble, and Charcot has devoted several lectures to a consideration of them, wherein he arrives at the conclusion that pressure is not the chief cause of their production. The rapidity, however, with which gangrene developes in these cases leads us (Professor Hutchinson urges) to suppose that *pressure* is largely to blame for the evil after the buttock *has been paralysed.* In these and allied cases of gangrene (as of the fingers, &c.) the circulation is impeded, the vascular supply being seriously interrupted. It is a difficult matter to determine satisfactorily for what reason the finger tips become sometimes gangrenous. A spasmodic contraction of the small arteries is induced through the vaso-motor system, subsequent to irritation of the ulnar nerve.

The theory of trophic nerves does not suffice to explain lesions of nutrition following injury to the cerebro-spinal system, and it is rather preferable to conclude these lesions are *permitted* rather than *produced* under various influences. The occurrence of inflammation is often hastened by the use of instruments, as by the introduction of a catheter into the bladder where paralysis has followed a blow on the back, &c.

Mutilating Leprosy.—In this disease a large extent of surface is affected; the nerve trunks are peculiarly apt to suffer, and the tubules are compressed by an accumulation of albuminous material which collects in large amount. This enlargement is a peculiarity of leprosy. In this disease it is essential to recognise disorganisation of (1) the skin and (2) the nerve-trunks. In less advanced conditions no great lesions of nutrition occur, this condition being found only in cases of extreme development. A destructive ulceration may be set up in the hand of the leper by excessive heat or cold.

The lecturer at the close of his discourse introduced a patient whose limbs exhibited the peculiar condition he had been describing. The nerves were enlarged in the manner so indicative of the leprous state, and she bore many visible signs of the presence of the disease. She had lived six years in India, and some time since in England.

## THE DISTRIBUTION AND ADMINISTRATION OF THE METROPOLITAN HOSPITALS.

On Friday last a deputation of medical and other gentlemen interested in metropolitan hospitals waited upon the Home Secretary, at the Home Office, to present a memorial setting forth:—1. That the hospital accommodation of London is imperfectly distributed, and in many districts, altogether inadequate. 2. That the want of organisation and co-operation among the medical institutions of the metropolis materially lessens their usefulness. 3. That the present system of indiscriminate relief injuriously affects the independence and self-reliance of those who are able to meet, in some degree at least, the cost of medical and surgical treatment. 4. That the funds at present available either for proper maintenance of nearly all the existing institutions, or for the extension of relief to districts hitherto unprovided for, are very insufficient. The Right Hon. W. E. Forster, in introducing the deputation, said their views had been stated in the memorial handed in, and it was felt that no facts which the deputation could state would have the weight of facts brought out by a Royal Commission.—Sir Rutherford Alcock dwelt upon the necessity of doing something in regard to the distribution of hospitals in the metropolis.—Sir W. Gull, Bart., said that the information which the Government could get by means of an inquiry would be of great help as a guide to the public. People at present were greatly puzzled as a body how they should spend money for good purposes. It was a very curious thing that the charities themselves should now ask for a Royal Commission, for in the year 1836 they resisted all that sort of thing. But they felt that it was now a thing which they might reasonably press upon the Government. He was anxious that his profession should show its sympathy with the movement. The public morals of the country were affected by the question.

The Home Secretary said: I want to ask one question about those hospitals. It always struck me that they are too large?—Sir Wm. Gull: They are.—Mr. Cross: Does not the gathering together of so many people in a hospital generate disease?—Sir Wm. Gull: I do not think so. But I advocate the greater distribution of hospitals, so as to bring help nearer to all.—Mr. Cross: Would not many cases be better treated if they were removed out of London altogether? Sir Wm. Gull: I do not doubt that.—Mr. Stansfeld, as one who had been connected with the administration, wished to express an opinion that although it might be perfectly true, as stated by one of the speakers, that a well-organised system of hospital accommodation in a great city acted very much in the relief of the rates, yet the mal-administration of those hospitals acted as a very great burden to the rates. He, therefore, submitted to the Home Secretary that he should take the opinion of the President of the Local Government Board upon the question.—Mr. Cross, replying very briefly, expressed his regret that the President of the Local Government Board was not present. One result of the interview was that he felt they had a great deal of power among themselves, if they would only use it to remedy the abuses. His strong advice, therefore, was that they should set themselves to the task.

## THE IRISH GRAND JURY BILL.

The Chief Secretary's Bill, which has been so long a-hatching, and has just been issued, is of much importance to the officers of district lunatic asylums, to infirmary surgeons, and to coroners throughout Ireland. Hitherto the granting of funds for county infirmaries has rested with the grand jury, which body will cease to exist for such purpose when the Bill becomes law. The functions of this body will henceforth be vested in a new elective "County Board," which will also have power to elect the board of governors of lunatic asylums, who have hitherto been nominated by the Lord Lieutenant. These "County Boards" will be constituted under the provisions of the Bill, which we epitomise as follows:—

Sec. 4. . . . . The presentment session for every barony . . . . . shall consist of six nominatee, and of six elected members. . . . . .

The nominated members shall be persons nominated by the justices of the peace acting for the county . . . . . and the elected members shall be persons elected in each year by the elected guardians of the poor representing the several electoral divisions in such barony. . . . .

5. For the purpose of selecting the nominated members .

. . . general meetings of all such of the justices of the county as are . . . entitled to any estate for life or any greater estate in any lands situate in the county upon which county cess is assessed, or who are generally the heirs apparent of persons having such property qualification as aforesaid, shall be convened. . . . . .

No person shall be eligible to be nominated a member of any baronial presentment sessions unless he is seized of or entitled to an estate for life . . . . in lands situate in the barony upon which county cess is assessed for the purposes of the barony, or is the heir apparent of some person having such property qualification as aforesaid. . . . .

6. For the purpose of selecting the elected members . . . . . a general meeting of the elected guardians of the poor . . . . . shall be held. . . . . The elected guardians present at such meeting shall, by resolution of the majority of the guardians voting elect six persons to be the elected members of the baronial presentment sessions of the barony. . . . . .

A person shall not be qualified to be an elected member of a baronial presentment sessions unless he is an elected guardian, or a person qualified to be an elected guardian for some electoral division any part of which is locally situate within the barony. . . . . .

7. From . . . the commencement of this Act no presentment sessions shall be held for any county . . . . . and in lieu thereof . . . . . there shall be established in every county a County Board, consisting of an equal number of nominated and of elected members, to be chosen in the manner hereinafter prescribed.

8. In every county in which the number of baronies does not exceed eight, four members . . . . . and in every other county two members shall be returned . . . . to represent the barony at the County Board. Such members shall be chosen in equal proportions by the nominated and the elected members. . . . . .

9. In every barony the nominated members and the elected members of the baronial presentment sessions shall . . . separately proceed to elect from amongst the members of such presentment sessions so many representatives as they may be respectively entitled to elect as members of the County Board to represent such barony under the provisions of this Act. . . . . The nominated members and the elected members shall separately vote for one half the number of representatives entitled to be returned for the barony.

11. The persons elected . . . . . in each year to be members of the County Board shall hold office for one year. . . . . .

12. . . . . All powers, rights, and duties . . . . . exerciseable by or attaching to . . . . . the presentment sessions . . . . in respect to business relating to the county at large, shall be transferred to and vested in such County Board. And, further, there shall be transferred to . . . . such County Board all the powers, rights, and duties . . . . exerciseable by, or attaching to . . . . . the grand jury of such county, in relation to the following purposes, namely :—

(2) In relation to the provision and maintenance of asylums or other accommodation for pauper lunatics.
(3) In relation to any county infirmary.
(6) In relation to inquests, coroners' fees, and allowances to witnesses.
(8) In relation to appointing, removing, and fixing the salaries of public analysts.

16. At any time after the first meeting of the County Board of any county . . . . the Lord Lieutenant may . . . . . dissolve the board of governors of any asylum for the lunatic poor in that county, and by the same order shall fix and determine the number of governors to be thenceforth appointed for such asylum.

The board of governors of each such asylum shall be thenceforth appointed in accordance with the following provisions :

. . . . . two-thirds of the whole number of governors shall be annually appointed by the county board or boards of the contributing counties. . . .

In all cases one-third of the whole number of governors shall be appointed by the Lord Lieutenant . . . . either before or after the appointment of the others.

Of the members to be appointed, whether by the Lord Lieutenant or by any County Board, or grand jury, or town council, one half at least shall be justices of the peace.

The provisions of the Bill with reference to coroners are as follows :—

29. Whenever after the establishment . . . . . of a county board under this Act a vacancy occurs in the office of a coroner for any district of a county, no writ shall issue under the authority of the present law for the election of another person as coroner to fill such vacancy, but a writ shall be directed to the County Board of the county . . . . . requiring such County Board to proceed . . . . . to the appointment of a duly qualified person as coroner to fill such vacancy.

A coroner appointed under this Act shall stand in the same position, and have the same power and privileges, and be subject to the same liabilities, capacities, and incapacities as he would have had and been subject to if this Act had not been passed, and he had been elected instead of being appointed.

After the passing of this Act, no person shall be elected or chosen to any office of coroner in Ireland, unless at the time of being so elected or chosen he, in addition to possessing such statutable qualification as is required at the time of the passing of this Act, is further qualified as follows ; that is to say,

(*a*) Is a barrister-at-law ; or
(*b*) Is on the roll of solicitors in Dublin ; or
(*c*) Is duly qualified to practise medicine or surgery, and registered as so qualified under the Medical Act of 1858, or any Act amending the same.

## THE SELECT COMMITTEE ON THE MEDICAL ACTS AMENDMENT BILL.

[SPECIALLY REPORTED FOR THE "MEDICAL PRESS AND CIRCULAR."]

THE second sitting of the Parliamentary Select Committee appointed to consider the Medical Acts Amendment Bill took place on Friday, the 20th inst., the Right Hon. W. E. Forster, M.P., in the chair. The whole of the day was taken up by the further examination of the President of the General Medical Council, Dr. Acland.

### UNIFORMITY OF EXAMINATION STANDARDS.

Dr. Acland repeated the statement previously made by him, that the continual aim of the Council over which he presided had been to secure an uniform examination standard, and he considered that the amount of proficiency required to be shown by students had been increased in respect of some licensing bodies, while with others it remains but little changed in character. But he could not consider that it was sufficient to say that the educational standard had been slowly elevated, for the whole status of the professional man had been immensely improved of late years, many influences having tended in the direction of improvement. Alluding to the fact, that in Germany an uniform *minimum* standard of proficiency has to be attained to by every aspirant who seeks to enter the medical profession, ere he can be admitted to the examinations of any special licensing corporation, he remarked that a while ago the principle of uniformity would have been eminently distasteful to many who now readily recognised its practical importance. In reply to the inquiry whether the upward tendency of education would not materially suffer under a common standard, Dr. Acland emphatically declared his conviction that the *possibility* even of such a catastrophe is inconceivable. The Conjoint Scheme, he added, does not aim at empowering the General Council to direct its efforts in any line not now within its scope. In every consideration concerning its working, it is essential to dissociate *examination* from *education*. He preferred to give no official answer as to whether it was an ordinary occurrence for students to obtain professional qualification without having previously attended the prescribed courses of lectures. His own belief was that this neglecting the lecture-room does not exist in the present to anything like the extent it formerly did, and he ascribed the change to improved educational measures, as well as to an improved student *morale*. While admitting the desirability of official interference in the matter, he could not agree that the General Medical Council is called on to commence any direct and immediate inspection of the workings of educational establishments, or that it is desirable to include both the examination and education of students within the sphere of its influence.

Much of the evidence adduced was a mere recapitulation of that already recorded, and bore on the mode of procedure adopted by the Council in forwarding the course of education by *recommendations*, which almost invariably receive attention; and the unceasing attempt to secure the desired *uniformity*.

### Clinical Examination.

An important and recent change in the direction of improvement, the general adoption of which by licensing bodies is due to its approval by the Council, consists in the examination of candidates beside the bed, and thus effectually testing their practical knowledge of disease. The Universities of Oxford and London were the first to institute this method; but Dr. Acland thinks the great number of students who present themselves for the test, must necessitate that its introduction as a component part of every professional examination will be only slowly accomplished.

### The Conjoint Scheme.

In Dr. Acland's personal opinion, the Conjoint Scheme should certainly be adopted. In Scotland he said the principle of combination was first admitted and carried out, and it is therefore unfair to conclude the objection to the scheme is *universal* in that country. The opposition made to it he explained to be not so much to the principles involved in it as to matters of detail connected with the extent to which it should be adopted, and the method whereby its provision should be carried out. It having been pointed out to the witness that if the Scotch universities were represented in the same relative proportion to the numbers on the Council, as is the case with the English universities, the numerical influence excited against the Scheme at the meetings of the Council, would be considerably strengthened, he admitted the truth of the conclusions, but could not see anything but unwisdom in the introduction of such a change in representation, or would bring about a result he could not conceive as anything less than undesirable.

Details of the expenditure of the General Medical Council, of the visitations made under its direction, of the recommendations occasionally issued, and the effect of these, having been elicited, a discussion arose as to the liberty of a "registered" practitioner to devote his services to both medicine and surgery, while being qualified in only one branch of the profession. That this occurred was admitted, and was referred to by the witness as being a question rather of a legal nature, and as being outside the legitimate function of the Council to determine.

### The Lost Medical School at Oxford.

The hon. member for Glasgow, Dr. Cameron, submitted Dr. Acland to a lengthy examination on the existence of a medical curriculum at Oxford; no definite answer, however, was accorded by the witness to any of the questions put to him. The inquiry whether any lectures on medicine, or any teaching on the subject, are given at Oxford, he replied to by saying that a veritable answer to these queries had been rendered by himself last year. If the Committee desired, notwithstanding this, to enter on what must be a lengthy consideration of details, he was willing to do so with them. Dr. Cameron said he only wished to know if there is any regular medical school at Oxford at the present time, and was met with the declaration that the answer to be given to this question must depend on the meaning to be attached to a "regular medical school." Dr. Acland then proceeded to indicate the definitions possible to be given of a medical school, so as effectually to mask the original question, and dealt in a similar way with the inquiry addressed to him by Dr. Cameron, as to the number of Professors attached to the Medical Faculty, requesting to be told what the term "Medical Faculty" must be taken to include. He then entered on a history of the Oxford school, from which it appeared that the University presents the most perfect arrangements for enabling young men to become fit to enter a metropolitan dissecting room at the end of some four years' preparatory study of natural history in the admirable museum at Oxford. He declared that he considered the aim of the University should be directed to this end, since no facilities for the wider study of disease and its phases could exist in a small town such as Oxford. He held that a greatly improved class of students proceeded from Oxford to London, and it would be a most unfortunate thing if any steps were taken to enforce a change in the condition of things existent at the University. Being pressed by Dr. Cameron, to say if any professor of anatomy existed at Oxford, Dr. Acland gave only the vaguest reply to the inquiry, asserting that there are two "anatomies," surgical and philosophical, and that it is the aim of the Oxford school to teach anatomy on a sound philosophical basis in the biological portion of its curriculum,—but he gave no direct reply to the question set. Dr. Cameron called for, and was promised, a statement that will be intensely interesting to all who have followed the explanations from time to time afforded about the lost school. It is to include an account of the number of students *at* Oxford *actually registered as medical students;* the number of graduates practising with only an Oxford qualification, &c., &c., and will be calculated to throw much light on a subject that needs a good deal of illumination to be clear.

Dr. Lush inquired if the great eminence of the gentlemen elected to serve on the General Medical Council did not practically dissever them from any association with the body of general practitioners sufficient to maintain a community of interests with them.

Dr. Acland thought not. Neither did he know that the bulk of the profession desired the suggested change in the direction of direct representation. Being asked point blank if he agreed to the principle of direct representation, Dr. Acland replied generally by asserting that such an alteration of the Council would not affect its efficiency. The objections he urged were not against the admission of any *class*, but against the mode of increase in the numbers, *i.e.*, by a *general election*. He was not prepared to give a definite opinion whether the results of the twenty-one years' working of the Council was an adequate equivalent for the expenditure of some £200,000.

Mr. Wheelhouse examined the witness at some length, eliciting that the Conjoint Scheme is approved in England. In Ireland opinion is divided about equally—*i.e.*, that if England and Scotland were in agreement, Ireland would also accord approval. The question of fees was considered, and the fact that great differences in them exist, and the opinion being expressed that the adoption of the Conjoint Scheme would affect the receipt of fees by the separate bodies, Dr. Acland said he thought it unlikely such an event need necessarily ensue. He approved the suggestion that representatives should join the Medical Council from the army and navy, to be chosen by the Crown, and such claims he thought should have equal weight with the direct representation question.

### Herbalists.

Mr. Serjeant Simon wished to know if Dr. Acland was aware that many people in the higher ranks of society were in the habit of consulting *herbalists* rather than duly qualified medical men. He withdrew the phrase, *with advantage*, which he first employed. Dr. Acland said he was aware of the fact, and was not prepared to suggest any interference with the liberty of the subject in this direction; but he would decidedly repress any attempt of the herbalist to wrongly call himself a duly qualified practitioner. He was not prepared to speak without consideration as to the advisability of extending the general clauses of the Act to the sale of medicines.

---

## MONDAY, June 23.

Mr. John Simon, C.B., F.R.S., Pres., R.C.S., and late medical officer to the Privy Council, gave evidence as to the

### History of the Medical Acts.

He declared the Act of 1858 had been mutilated in a very essential part, and had explained the shortcomings of it at the time of its introduction. The original gave the General Medical Council power to *define conditions of qualification*, and to *compel combination*, with the further power of *determining* rather than *recommending*. It would follow that the omission of these important particulars rendered the Bill less productive of good than it might have been if, through it the Council had obtained complete liberty of action, and fixing a *minimum* and universal examination standard. In 1867 and 68, Dr. Parkes drew attention to the fact that many men who presented themselves for the service (army and navy) examinations, being already possessed of a professional qualification, showed themselves grossly ignorant of very essential knowledge. At this time the Council were inspecting examining boards, and making recommendations from time to

time, and June 26, 1878, it appointed an Educational Committee, of which Mr. Syme was chairman. This Committee reported that the *inequality* of the various licenses was the greatest evil of the moment, the easy nature of one or two examinations, depressing all the rest, and so tending to encourage a low standard of proficiency. They strongly advocated the adoption of a Conjoint Scheme, under which the licensing bodies—with the exception of the universities—should enter into combination. This report was the first important step in obtaining the Act of 1870. A letter was addressed by the Council to the Lord President (Lord Ripon) who replied, suggesting a careful consideration of the measures affecting the qualification of general practitioners, these being, in his opinion, defective. This produced a fuller report from the Council, and to this the Lord President replied, suggesting wide and complete legislation. A voluntary association of the lecturers of Metropolitan Schools was formed in 1868, to consider the condition of medical study in this country, and the desirability of securing amended legislation.

### Conjoint Scheme.

The General Medical Council considered the Lord President's proposals which were carried by a majority of seventeen; the motion was proposed by Dr. A. Thompson, and seconded by Dr. Risdon Bennett, that a Conjoint (separate) Board be formed for each of the three Kingdoms. At this time the Scotch and Irish opposition to the scheme was much less than at the present time, three Scotch and four Irish members having sided with the majority on this division.

The 1870 Bill passed the Lords but was not passed in the Commons, owing to the lateness of the session, and the introduction of the question of direct representation. In the present Bill a clause is entirely omitted, which in the earlier measure conceded to the universities the power of reserving the higher degrees in medicine for duly qualified members of the profession.

Objection to the Conjoint Scheme has grown greater and greater, and the Scotch and Irish refusals to accept its provisions is ascribed by Mr. Simon to the loss of Dr. Christison's influence and a forgetfulness of the groundless nature of the fears entertained on behalf of the home corporations.

### Scotch Opposition.

Mr. Simon is of opinion that the great eminence of the officers who will be appointed under the new scheme will be a sufficient guarantee that the dread of the Scotch universities that their prestige will suffer by the adoption of a low examination standard is without foundation. A further guard to these bodies remains, too, in the liberty they will possess of claiming from any candidate seeking the distinctions they can confer an exhibition of such proficiency as they may deem desirable.

A considerable amount of evidence was given by the witness as to the points wherein the present Bill differed from the one of 1870, but it is unnecessary to detail it in this place.

### Colonial and Foreign Practitioners.

Mr. Simon said provision is made in the new Bill for the recognition of duly qualified men as legal practitioners in the United Kingdom without further examination. Clauses 7, 8, 9, of the 1878 Bill provided for the arrangement in the Register of all such practitioners as "Colonial" or "Foreign," and Mr. Simon promised to hand in a report of the propositions of the General Medical Council on this subject.

### Direct Representation.

The witness was of opinion that the Council would be disadvantageously affected by the adoption of a direct representation. He considered the choice of representatives a deliberative act which is not possible with a universal suffrage. Moreover, he could not conceive how the constituency could have that intimate knowledge of the candidates' merits they should possess to enable them to select the best men, and the Council would therefore suffer by the introduction of an intellectually inferior order of members. He advocated the internal reform of institutions now badly managed, and thought that when this had been accomplished many existing grievances will be redressed.

### The Functions of the Council.

A great deal of error on this subject, Mr. Simon said, prevailed. The General Medical Council is not a judicial reformer, nor is it concerned with the consideration of anything outside the education and conduct of the student and practitioner. He did not think it possible any good would accrue from the legal constitution of the Council as a medical parliament with absolute powers. Men of eminence could not give the time that would be necessary to this, and much sacrifice was made by them now to attend on the ten or twelve days each year that the Council meets. He could see no reason why the Council should discuss general, medico-political, or sanitary questions. He believed a voluntary association, to consider the subject of fees, &c., might effect some good.

In reply to Mr. Mitchell Henry, the witness said he considered Ireland and Scotland quite adequately represented on the Council, and that no advantage would be found to follow if the six Crown nominations were equally distributed through the three countries.

### The British Medical Association.

The question of direct representation arose, Mr. Simon said, and is kept continually alive, by the British Medical Association, which was mainly instrumental in preventing the passing of Lord Ripon's Bill in 1870. He thought nothing beneficial would follow the moderate representation, *per se*, of the Association.

Sir Trevor Lawrence, Dr. Dalrymple, and Mr. Wheelhouse, also examined Mr. Simon, but no other important evidence was adduced.

WEDNESDAY, JUNE 25, 1879.

## BEARING OF PRELIMINARY EXAMINATIONS UPON THE SOCIAL STATUS OF THE PROFESSION.—No. II.

The subjects required at the examination, which closes the period of preliminary education under the German medico-educational system, are the following :—

(1) A thorough knowledge of German and Latin, which languages the student is expected to read and write with equal fluency; (2) a sufficient knowledge of Greek to

enable him to read any author in prose or verse without preparation; (3) a general knowledge of history, and a more intimate acquaintance with the history of European nations; (4) French; (5) mathematics—viz., geometry, plane and spherical, algebra, including equations of the third order; (6) elements of natural science, more especially experimental physics and chemistry; (7) the elements of logic. These seven subjects are compulsory, but in addition, a youth may be examined in Hebrew (in case he should desire to study theology), English, Italian, and other modern languages. The examinations are held twice in each year, at Easter and Michaelmas, and are conducted by the professors of the several colleges, and superintended by a Government inspector ("schulrath"), who regulates the entire educational system of a province.

A youth may be prepared at home if his parents desire it, until he is ready to enter the first class, but he must, as a rule, attend this class if he wish to be admitted to the final examination: under exceptional circumstances he may be admitted without doing so ("extra ordinem"). Having passed this examination, the student receives a certificate of maturity ("Maturitats Zeugniss"), which enables the holder to enter upon any branch of study he may desire at any German university, and also gives him the right to serve for one year as a volunteer ("freiwilliger"), instead of being obliged to enter the army for three years, the ordinary period of Prussian military service.

The fee for each class at a gymnasium varies from six to nine shillings for the half-session of six months. The final examination entails no further expense.

The education thus described is, it must be admitted, far superior to that insisted on in our own country. With us the student's general education has ceased when he has passed his preliminary examination, and, as any forward boy can do this when he has reached his 14th year, the result is that he enters life altogether uncultivated in mind, and unfit either for association with men of culture or for the higher duties of his profession.

We have had personal knowledge of the examination of students who, though prepared to translate a Greek author to the satisfaction of the examiner, were not able to name the Greek letters pointed out to them. We have recently perused the written answers of a candidate for his final professional examination who, though duly armed with his certificate of having passed his preliminary examination, had made eleven mistakes in spelling six lines; and a very large experience of the epistolary capabilities of a certain class of medical men oblige us to say that those who can indite a properly spelt, fairly expressed cleanly written letter, are a marked exception to the general rule.

The causes of this state of things are not far to seek. In the first place it is to be recollected that the passing of the student through his "preliminary" is the first step towards entering him as a medical pupil. There is, therefore, a direct interest in the licensing body to make the entrance portal to medical studentship very easy. Moreover, speaking generally, the Irish and Scotch licensing bodies are also the proprietors of schools; and it is well understood that a student passed at the preliminary examination of any qualifying body, will probably enter at once for the courses of study given by that body. Nor is there any supervision of these preliminary examinations analogous to the visitation of professional examinations by the General Medical Council, and consequently there is no active controlling power superior to the examiners.

In view of all these facts, we are strongly of opinion that the general education of the members of our profession never can be placed on a proper level, and that they never can occupy the social position to which they should be entitled, until the preliminary education has been brought within the direct control of the Medical Council. We trust that ere long it will be the duty of that body to frame an examination which will at the least serve to guarantee that the medical man is fit for association with gentlemen, and to see that that examination is applied by the Conjoint Boards with vigorous strictness.

It is not only from the social point of view that the necessity for a fair general education should be viewed. Let us assume that we receive the student from the hands of his schoolmaster capable of reading, writing sense in the English language, spelling correctly, ciphering well, possessed of enough Latin to enable him to read or write a prescription, and sufficiently cultivated in mind to admit of his receiving and comprehending instruction. It is not always that the medical student brings to his professional study this very modest amount of mental culture. Without this much capacity for learning medicine, it is vain to entertain the hope that he can even begin to understand the subjects which must be placed before him, and we believe that there are many students who break down in the early stages of their medical education simply because, in consequence of the undisciplined condition of their minds, the elements of the science are beyond their comprehension, and demands from them a mental effort for which they are not prepared. From this point of view the preliminary schooling of the student assumes additional importance which is not usually attached to it, for it seems to us that not only the career of the boy as a student, but his success as a physician, depend upon the mental training he has undergone to a much greater extent than if he were a divine, a lawyer, or a man of business.

The study of medicine cannot be pursued successfully as a matter solely of seeing, hearing, and remembering. It is not sufficient, as with the law student, to fill our minds with precedents, and to learn off the book a number of axioms. It will not be enough, as with the commercial man, to store in our recollection the facts which influence our business, and then act upon them according to a certain unvarying rule. On the contrary, what we can see and hear in medicine bears but a small proportion to what we deduce from our abstraction of the facts, and he whose mind is not formed for such deduction is devoid of that which makes a physician. The erroneous ideas and practices of the ignorant, and the mistakes of rule-of-thumb general practitioners, are manifest illustrations of the truth of this remark. The uneducated, without exception, fall into the belief that a medicine applicable to a particular symptom in one case is applicable to the same symptom in all other cases, because they are not capable of looking beyond that symptom in the disease, or of deducing from a comparison of less manifest symptoms, and from unseen probabilities, the true state of the patient. It is not alone that the uneducated do not possess the requisite special knowledge to appreciate the circumstances; they do not possess the mind trained to recognise anything more than what their eyes see and their recollection confirms. The same may

be said, and almost to the same extent, of the rule-of-thumb general practitioner.

If he ever possessed the comprehensive mind, he has lost the habit of using it. Being occupied for his whole life in the dull routine of hurriedly prescribing for common everyday ailments, he at length loses the habit of thinking over the symptoms of his patient, and falls into the usage of prescribing off-hand drugs to meet obvious symptoms, instead of applying his mind to a search for the causes.

What is true of the practitioner in his treatment of disease is true of the student in his study of the profession. His very earliest studies—the very first case he sees in hospital—involve his capacity for deducing the truth from half-revealed facts; if he has developed that capacity by his school training, the search for hidden causes of the disease will be interesting to him and valuable to the patient. He will derive from his observation of disease the same gratification which an inventor feels in following up his crude ideas to a practical solution, or which an officer of justice experiences in hunting down a wary criminal, and the zeal which is thus begotten will make him a great and successful physician. But if, to the attempt to discover the secret nature of his patient's disease, he brings an untrained mind, he will see, at his first glance, no more than half what a better disciplined student would have appreciated; will be conscious of a painful effort to arrive at a conclusion, and of dissatisfaction with the conclusion when it has been reached, and will, in many instances, relieve himself of the trouble by ordering *a placebo*.

## NECESSITY OF LATRINE ACCOMMODATION IN LONDON AND OTHER LARGE TOWNS.

Queer, and by no means pleasant, are the subjects which occasionally claim the attention of the medical journalist. In fact, he is, as a rule, omnivorous or nothing, and—if we may be forgiven for paraphrasing on such an occasion a celebrated saying of old—"humani nihil a *se* alienum put*at*." Only last week we were agreeably engaged in sounding the praises of a surgeon whose name will be for ever associated with the early history of a formidable operation. To-day we feel it our duty to descend to the consideration of a very common-place and distasteful question of every day-life.

The necessity of increased latrine accommodation for men and women in this metropolis must be acknowledged by every citizen, but only those who have travelled abroad can know how defective this accommodation is in London, when compared with that which obtains in some of the great cities. The visitor to Paris must have frequently noticed how that beautiful city is disfigured by an unnecessary abundance of open urinals placed along its principal streets and boulevards, and on his return home must have contrasted it with the great dearth of those conveniences in the metropolis of his own country, and that, too, the largest city in the world. We trust, therefore, that the Report which has just been published on the subject by Dr. James Stevenson, the Medical Officer of Health for Paddington, will be the means of drawing general attention to the subject, and of some step being taken to supply a great public want. This Report originated in a letter which the Ladies' Sanitary Association recently addressed to the Vestry of Paddington respecting the provision by the parish of water-closet accommodation for women, and which letter was referred by the Sanitary and Public Health Committees to the Medical Officer of Health for consideration and report.

That further accommodation is necessary we entertain not the least doubt. Well do we remember how, a few years ago our services were required to pass the catheter on a maiden lady who, in consequence of the want of the conveniences of which we are now speaking, had allowed herself to go too long unrelieved, and whose bladder was thus paralysed from over-distension.

It is a well known fact that, as matters now stand, ladies are frequently obliged to resort to pastry-cooks' shops and similar places for the accommodation which, in a great city like this, should be supplied in a proper and systematic manner. Besides, the poorer classes of women—those women who are obliged to peregrinate the streets of London for a living—cannot even do that, and therefore we are not surprised to hear ladies who are interested in the welfare of those below them, stating that poor women have often told them of the agony and shame they have endured in circumstances which it is not here necessary to particularise. Such a want, too, is felt now more than ever it has been, for, as Dr. Stevenson remarks, the facilities of travelling, the creation of new industries, the spread of education, both general and technical, and the increased employment of women, have induced amongst large masses of the population migratory habits unknown to our forefathers.

Nor is the matter to be disregarded from a sanitary point of view. The case we have just mentioned will show this; and if patients in perfect health are liable to suffer so much from the want of proper latrine accommodation in our public thoroughfares, how much the more must this want be felt by those who are suffering from bowel or urinary complaints. Besides, there are "periods and conditions peculiar to the female sex when latrine accommodation would be specially convenient; and as at such times the requirements of Nature are apt to be more urgent and more frequent, women would be spared much unnecessary mental and physical distress were that accommodation provided." Nor does Dr. Stevenson exaggerate the injurious results which may follow that resistance to the calls of Nature which circumstances frequently impose upon both men and women. It is well known that habitual constipation is very often to be attributed to that resistance, whether voluntary or enforced. "Much of the cerebral and cardiac disturbance of the present day --and it is alleged to be on the increase—is probably due to the same cause." Then, again, how many there are who suffer from diarrhœa, or from irritable bladder, and who for the want complained of are obliged to limit their peregrination in the metropolis to very short distances. As we have already intimated, almost every citizen has more than once had occasion to lament the deficient urinal accommodation provided for them in the metropolis; and in this respect Londoners are, as Dr. Stevenson observes, worse off now than they were years ago, for owing to the removal of the conveniences which formerly existed outside

every public-house, there is now-a-days, with a greatly increased demand, a diminished supply. "In the parish of Paddington, with an area of 1,290 acres, with its 44 miles of roads, and with a population of 110,000 inhabitants, which is augmented during the day by the tens of thousands of persons passing to and from no fewer than six railway stations, and in close proximity to others, there are only eight public urinals." It is the more to be regretted that such a want should exist in London, considering that in Glasgow, Nottingham, and some other provincial towns the conveniences in question already exist. Dr. Seaton, the medical officer of health for Nottingham, says: "In speaking of the success of the public closets, I am more especially looking to the very substantial sanitary advantages which have resulted from their establishment. They are generally regarded as a great public boon."

It is, therefore, highly desirable that the several London vestries do all in their power to supply this great public want. Not only would the outlay in the first instance be comparatively insignificant, but, judging from the receipts at some of the stations, the undertaking might be amply remunerative. The closets at the Waterloo Station yield £1,000 a year, and those at Cannon Street and Charing Cross each a still larger sum.

We need scarcely remark that whatever places are erected for these purposes must be built with a due regard to sanitary requirements, and be subject to strict sanitary regulations. That, however, is a question for after consideration. All we have to do now is to thank Dr. Stevenson for his able report on this subject, to give the proposed undertaking our unqualified support, and to hope that ere long not only London, but all other large towns, will be amply provided with conveniences suitable to both sexes and to all classes of society.

# Notes on Current Topics.

## The Title of Physician.

We regret that we have given offence in some quarters by questioning the right of "Licentiates" of a College of Physicians to call themselves "physicians." But a good deal of misconception has arisen from the different interpretation which our correspondents and we have respectively put upon the term "physician." In saying that "it was not advisable for the lay press to foster the idea that every practitioner was a physician, who put on his door-plate 'physician and surgeon,' &c.," we used that term entirely in its popular and generally accepted signification, and taken in that sense, our judgment in the matter is perfectly logical and consistent. In its etymological signification, "physician" means a person who "professes physic," or who "prescribes medicinal remedies for diseases." In that respect, therefore, any licensed medical practitioner is a physician, as even the pure surgeon can scarcely avoid prescribing constitutional remedies for his patients; and with still stronger reason may licentiates of a college of physicians be said to be physicians in so far as they have received a *license* to prescribe medicines for strictly medical diseases. But when we speak of a physician in the popular acceptation of that term, and in that sense which is adopted by the profession at large when they divide themselves into three distinct classes—"physicians," "surgeons," and "general practitioners—" the case is altogether different. If one of the licentiates, of whom we are now speaking (practising, as most licentiates do, as general practitioners), have a patient dangerously ill, the relatives of that patient will probably suggest "a physician" being called in. In doing so they allow that their own medical attendant is qualified to practise physic, but they practically deny that he is a physician in the general acceptation of that term, for their idea of a physician is that of one who does not send out bills, who does not make up his own medicines, who does not practise surgery, and who, moreover, is a doctor in medicine, or a fellow or member of a college of physicians. Viewing the disputed term in this light, the argument to which our correspondents have attached so much importance has very little force, for if we are asked—Why should not a licentiate of a college of physicians have as much right to call himself a physician as a licentiate of a college of surgeons has to call himself a surgeon? we answer because in the former case, by the general consent both of the public and of the profession, a particular meaning or signification is attached to the term "physician" which does not apply to licentiates engaged in general practice, whereas in the latter case, by the same general consent and custom the term surgeon is far more frequently used to designate the position and mode of practice of a general practitioner than of a pure consulting surgeon. In commenting upon Addison's case, in which a conviction followed upon proof of the practice of criminal abortion, our observations were not prompted by any feeling of disrespect for the class of practitioners to which our correspondents belong. The writer of the article to which exception was taken is himself a general practitioner, and therefore no selfish prejudices, no "class bias" have influenced his views on the subject. What was said was entirely in the cause of justice and of truth, and in defence of those practices which we consider to be most conducive to the dignity of the profession and the welfare of the public.

## False Certificates of Death.

That false and illegal death certificates are often made use of to prevent the detection of crime, is a fact of which almost every newspaper reader must be aware. A still more common practice is that of certificates being signed by unqualified men, or by a practitioner who has not seen the deceased for a considerable time before death In order to remedy these evils the solicitors to the Medical Defence and the Medical Alliance Associations have written a letter to the Registrar-General in which they make the following suggestion:—"From our experience," they say, "in cases of prosecution under the Births and Deaths Registration Act, 1874, in cases where certificates of deaths are given by medical men in cases not seen by them, and in cases where certificates are signed in blank and filled up by unqualified persons, we would respectfully suggest that the following method would act effectually as a safeguard and prevention of crime,

and would also assist in pointing out the offender for punishment:—Let all certificates supplied to medical men be numbered in the same way as bankers' cheques, and let the numbers supplied be noted by the district registrar at the time when the certificate book is handed out."

We think the suggestion in many respects a good one, and one which would answer the purpose, whether the signature was that of a person living in the deceased's district and well known to the registrar, or of a person living miles away and quite unknown to that officer. A certificate, for example, is brought to the registrar the signature to which he does not recognise as that of a qualified practitioner; or a death occurs under suspicious circumstances, and it is necessary to see who signed the certificate of death—the registrar at once refers to the number, and finds it to belong to the certificate book in the possession of a qualified medical man, but not signed by him; and on further inquiry he ascertains that it was signed by an unqualified assistant. The additional work, too, thrown upon the district registrar by the adoption of this plan would be very trifling, inasmuch as the signatures of all the qualified practitioners in his neighbourhood are generally well known to him, and only in exceptional cases would he be called upon to make any investigation. Of course we can imagine cases where, notwithstanding this precaution, the ends of justice may be defeated, but nevertheless this plan would be a great improvement upon the system hitherto followed, and we, therefore, hope the Registrar-General will give it his careful consideration.

## Unlicensed Practitioners.

THE charge that was recently preferred, under the provisions of the Medical Act, before Mr. Hannay, is another of those cases to which, unfortunately, we have had so frequently to draw attention. A person, suffering from some complaint, goes to what she may think is the open surgery of a qualified medical man. She sees a young man who, in answer to her inquiries, states that he is the "doctor," and then prescribes for her, makes up some medicine, and takes her fee. It turns out, however, that the supposed doctor is nothing more than an unqualified assistant, who may have received no medical education whatever, and the consequence of whose "professional advice" may be of a most lamentable nature. In the case under consideration it appears that the proprietor of this shop kept two other similar establishments, and as he could not be ubiquitous, was of course constrained, in order to work this thriving trade, to trust the welfare of many of his patients to assistants whose knowledge of medicine may not have gone beyond the knowledge of compounding drugs. It is needless to reiterate what we have so often said with regard to what is not only a great and by no means uncommon imposition upon the public, but also a scandal to the social status and respectability of the profession. We are, however, glad to see that the case has not escaped the attention of a leading daily newspaper which has, in a long article, somesevere but very just animadversions on the great impropriety of such practices, and the disastrous consequences that might result if they are not kept in check by the strong arm of the law. As the *Standard* observes, the enactments against these illegal practices are specially intended for the benefit and protection of the ignorant and the helpless, and it would be well if they were more frequently and more systematically enforced.

## Questionable Economy.

A FEW days ago Mr. Carter, coroner for East Surrey, held an inquiry at the Duke of Clarence Tavern, Penton Place, Newington, into the circumstances attending the death of Lawrence Driscoll, aged forty years, who was found lying dead, in an emaciated condition, in a loft at No. 1 Globe Street, Newington. A witness said he saw the man the day before his death, when he said, "It is no use supplying me with food, I shall not partake of it." The coroner said he had not ordered a medical man to make a post-mortem examination, in order to save the county an expense. After a short consultation, the following verdict was returned by the jury: "That the deceased died from natural decay, caused by his own negligence." This occurrence is noticed by the daily papers under the heading, "A Strange Verdict," but we feel disposed rather to question the propriety of the coroner's parsimony than the verdict of the jury. Surely in all cases of suspected or alleged deaths from starvation, a post-mortem examination of the body should be made. It is seldom that a man starves himself to death, and had there been an examination some internal disease might have been discovered to account for the position in which he was found, and his insurmountable aversion to food. Even in a scientific point of view the examination might have been instructive, for the more data we can get with regard to the post-mortem appearance of people who have died from starvation the better we shall be able to distinguish those deaths which have occurred from this cause from those which have been occasioned by disease.

## Recent Change in the Primary Examination at the Royal College of Surgeons.

THE Council of the Royal College of Surgeons has just determined to make a change in their primary professional examination, which should have the approval of all who are interested in the efficiency of medical education. Instead of anatomy and physiology being comprised under one examination, as heretofore, separate examinations will be given in these subjects respectively, and separate papers will be set for each subject. Physiology is so important a branch of medical knowledge, that it deserved fuller consideration than that of being tacked on to the more popular and practical science, anatomy. Besides, when a student is under the impression that one subject of his studies is put by his examiners in a subordinate position to, and only considered in connection with, another, he is not likely to give to it the attention it deserves, and by such neglect, moreover, runs the risk of being rejected altogether. The only way in which this innovation appears open to objection is, that it might insensibly lead to a too high and too stringent standard of examination. The questions usually put by the examiners on anatomy and physiology are already sufficiently severe for a minimum pass examination. The proposed

change, however, does not necessarily involve any contingency of that kind; and we firmly believe that the decision of the Council is a judicious one, and that the reform will be found to work well.

## Death in an Irish Prison—A Pattern for Inquest Juries.

MR. T. G. POOL, coroner, held last week an inquest in Armagh Gaol, touching the death of a man who died in the prison hospital the previous day. A jury having been empannelled, *six of them being prisoners in the gaol*, returned the following verdict:—"We say that deceased, Patrick Grimes, aged 44 years, a prisoner in Armagh County Prison, and committed on the 17th March last for six months hard labour from county Caxan, on the 13th of June, in this year, at the county prison, Armagh, in the county aforesaid, of inflammation of the lungs, connected with a weak heart, did then and there die, and of no violence whatever. And the jurors upon their oaths do say that it appeared to them that there has been great neglect upon the part of the authorities in Dublin in not replying to the report of the surgeon of the prison, made on the 7th June, regarding the deceased; and they also do say that while the treatment of deceased was humane and proper in Armagh Prison, yet the new scale of diet and attendance to sick in hospital, which has deprived prisoners of the new milk diet, and substituted a food not sufficient for the support of life, and proper attendance, they hereby highly condemn."

## New Surgeon-General for Bengal,

THIS appointment has been conferred, upon the recommendation of the Lieutenant-Governor, Sir Ashley Eden, upon Surgeon-Major Payne, Superintendent of European and Native Insane Asylums at Bhowanipore and Dulbanda, and medical officer in charge of the Lock hospitals for Calcutta and suburbs, both of which he retains. Dr. Payne, who has passed the standard of high proficiency in the native languages, entered the Indian Medical Service the 20th of December, 1848. The appointment is a new one for civil duties only. This fortunate officer passes over the heads of the whole of the Indian deputy surgeons-general. The appointment has caused much soreness in the Indian Medical Department, as against the usages of the service, promotion in which has hitherto been on the lines of seniority, tempered by non-selection, which has always given satisfaction and contentment, and because it is a gratuitous slur upon the many able men his seniors in the administrative ranks.

## Dr. Acland on the Medical Council.

IF Dr. Acland's opinion represents that of the other members of the Council, and if the Select Committee should feel disposed to act upon his recommendation, we shall have reason to fear that the much-desired reconstruction of that body will be placed in great jeopardy. On Friday Dr. Acland told the Committee that, in his opinion, the constitution of the Medical Council "could not be improved, and he believed the thoughtful members of the profession were of opinion that any change in its constitution was very undesirable." We shall wait with no little curiosity and anxiety to hear what Dr. Acland's colleagues have to say on the subject, and whether the more independent and unbiased witnesses examined by the Committee will be wise enough to express a different opinion. At all events, the President of the Council went out of his way in answering for the medical profession in general. As a witness under examination he should have confined his replies to his own views and opinions on the matter, and left it to other members of the profession to answer for themselves.

## Arming of Indian Medical Subordinates.

IN consequence of the frequent attacks upon parties in the Khyber Pass, the Indian Government have, upon the recommendation of the Surgeon-General, British Forces, sanctioned the issue of a revolver with twenty rounds of ammunition to each apothecary, and a sword and belt to the apprentices at the front.

## Testimonial to Mr. N. P. O'Brien.

THE subscription list to the testimonial from the medical officers of the districts which had been in charge of the above gentleman, on the occasion of his resignation of the office held by him under the Local Government (Ireland) Board, will be closed in the course of one week. All intending subscribers had better, therefore, send their subscriptions at once, either to Dr. Jennings, 2 Upper Merrion Street, Dublin, or to Dr. Davys, Swords, by whom they will be duly acknowledged.

## Cinchona Cultivation in India.

DURING last year the cinchona plantations in British Sikkim have been increased 250 acres. There are now 2,242 acres. The increasing use of cinchona febrifuge, it is hoped, will diminish considerably the large expense which the Indian Government is put to annually for the purchase of quinine.

## The Coming Meeting of the General Medical Council

HAS been summoned for the 17th of July, at 2 p.m., and the Executive Committee will meet on the preceding day to arrange the business.

Dr. Acland goes out of office as President, and the election of a new head of the Council will take place on Friday, the 18th July, at 5 o'clock.

## Insolation in a Madras Regiment.

WE regret to hear that during a march along the Malaporan coast, a detachment of the 43rd Regiment suffered severely from this affection. The weather was very close and oppressive at the time.

WE regret to hear that some cases of typhus fever have broken out in the 5th Fusiliers, stationed in India. Some cases of scurvy are also reported.

H.R.H. THE PRINCE OF WALES has consented to lay the foundation stone of the new wing of the Royal Hospital for Incurables, on the 7th prox.

THE annual *conversazione* of the Royal College of Physicians of London, will be held on Wednesday evening, July 2nd, at 9 o'clock.

FRIENDS of the late Drs. Murchison and Tilbury Fox will be glad to know that excellent photographic likenesses of these gentlemen have just been published by Messrs. Barraud and Jerrard, in *carte de visite* size for the album.

A GENERAL meeting of members of the Medical Defence Association for the election of officers for the ensuing twelve months, will be held at the rooms of the Medical Society of London, on Monday next, at half-past 4 o'clock.

LAST week H.R.H. the Prince of Wales, went to Norwich, and laid the foundation stone of the new Norfolk and Norwich Hospital, at Norwich, which is to cost £45,000.

DR. RICHARDSON, F.R.S. and Dr. J. McGrigor Croft, M.R.C.P., were last week elected medical members of the Sanitary Committee of the parish of St. Marylebone vestry, London.

A SCARLET fever epidemic is reported as prevailing in the township of Aspull, near Wigan. Several deaths have occurred, but precautionary measures have been adopted to localise the disease.

DR. CHAPLIN, surgeon to the Kildare County Infirmary, and a Member of the Council of the Royal College of Surgeons in Ireland, has announced that he will seek the Vice-Presidency of the College, at the next election in June, 1880.

THE filling of Parkes Museum of Hygiene, which is to be publicly opened by the Home Secretary on Saturday, is being rapidly pushed on, and by the end of this week it will contain probably the most varied and complete collection of hygienic appliances and literature in the world.

THE rates of mortality in the principal foreign cities according to the most recent weekly returns, were—Calcutta 29, Madras 34; Paris 26; Geneva 31; Brussels 37; Amsterdam 28, Rotterdam 29; The Hague 20; Copenhagen 25; Christiania 19; St. Petersburgh 41; Berlin 26, Hamburg 29, Dresden 27, Breslau 34, Vienna 36, Buda-Pesth 41, Rome 26, Naples 33, Turin 28, Alexandria 39; New York 26 per 1,000 of the populations. Small-pox caused 25 deaths in Paris, 31 in St. Petersburgh, and 13 in Buda-Pesth.

DR. J. J. LOUGH has been presented with a magnificent double-case chronometer and an illuminated address, by his patients and friends in the Ballyjamesduff and Termon Dispensary Districts, on his resignation of his post as medical officer after a term of eight years. Such gifts have in them a value far beyond the market price. They are tokens that a man has done his duty in the first place, and in the second that it has been appreciated. The address and reply will be found in our advertisement columns.

THE rates of mortality per 1,000 last week in the principal large towns of the United Kingdom, were—Hull 12, Bristol 13, Portsmouth 15, Plymouth 15, Leicester 16, Oldham 16, Birmingham 18, Wolverhampton 18, Glasgow 19, Salford 19, Norwich 19, London 19, Sheffield 20, Brighton 21, Bradford 21, Nottingham 22, Sunderland 22, Edinburgh 22, Liverpool 23, Manchester 24, Leeds 19, Newcastle-upon-Tyne 30, Dublin 41, of this number more one-fourth occurred during the first four months of the year.

WE have received Mr. Henry Power's official report to the Local Government Board, on the outbreak of diphtheria at Bleadon. In it, as with everything Mr. Power undertakes, there is evidence of a searching inquiry, an absence of sensation, and an honest admission of his inability to assign a positive cause for the outbreak. He could not trace anything suspicious in the milk; the water supply and the drainage were not perfect, but better than in many little country towns, so that on the whole the outbreak furnishes but another proof of the inconsistency of this troublesome disease.

# Scotland.

(FROM OUR NORTHERN CORRESPONDENT.)

PROPOSED MEMORIAL TO THE LATE DR. MURCHISON.—A meeting was held in the Materia Medica Class Room of the Edinburgh University on the 13th inst., with the object of promoting the proposed memorial to the late Dr. Charles Murchison. Sir Robert Christison occupied the chair, and among other gentlemen present were—Dr. Peddie, President of the Royal College of Physicians, Professors Douglas Maclagan, Grainger Stuart, Turner, Saunders, Dr. T. A. G. Balfour, and Ex-Professor Balfour. The chairman, in explaining the purpose of the meeting, said, it was proposed to commemorate the services of Dr. Murchison on four grounds—first, because of his distinction both as a student and as a graduate of the Edinburgh University; secondly, on account of the services he rendered to medical science and medical literature during his professional life; thirdly, on account of his amiable character; and lastly, and perhaps not least, because of the sympathy they must feel for Dr. Murchison, almost as if he were still with them, on account of the remarkable termination of his life. Some years before his death he was acquainted with the fact that he was labouring under an infallibly mortal disease which could not have him long in this world, and which was likely to terminate his life, as it did suddenly, and without warning. They all knew how he received the intimation of his condition, and continued to discharge the duties of his profession to the very end with all the courage of a man and the resignation of a christian. Prof. Maclagan also paid a warm tribute to Dr. Murchison's life and attainments, and proposed "That this meeting fully approves of the scheme that a memorial of the late Dr. Charles Murchison take the form of a scholarship in clinical medicine, to be awarded alternately by the Universities of Edinburgh and London, and pledges itself to co-operate heartily to promote its success." Dr. Grainger Stewart seconded the motion, which was cordially agreed to. Minor details were then settled. A number of subscriptions having been intimated by

gentlemen present, the meeting terminated with a vote of thanks to the chairman.

How Typhus Fever is Spread.—At the monthly meeting of the Greenock Police Board, held on the 17th inst., the report of Dr. Wallace, Medical Officer of Health for the burgh, was submitted, and contained the following details: How readily Typhus Fever may be Imported and Spread through a Community. Dr. Wallace, after giving in detail the various diseases coming under the cognisance of the department during the month, says, while the result is so far gratifying, it is counterbalanced by the increase of typhus and enteric fever, which, in last report, amounted to 2 of each. As regards typhus, the 24 cases belonged to eleven different households. One of the cases, however, was doubtful, and another had contracted the disease in Paisley. Excluding these, it is important to note the origin and extension of the disease among the remaining 22. In each of the periodical reports since the beginning of the year cases of typhus were recorded. In the most of these, however, no satisfactory explanation could be given of their origin or connection with other cases till the 17th ult., when, in consequence of private information conveyed to the inspector, the existence of typhus fever was discovered in a family residing at 22 Sugarhouse Lane. Inquiry in this case led to further discoveries, which cleared up much of what had been previously obscure, and the first of which may be briefly stated as follows: On the same stair-head with the family referred to (for convenience, say family A) was another (say family B), which included a lodger. This lodger had been regularly visiting a typhus-stricken family at Port Glasgow towards the end of 1878. The consequence was, that the disease was conveyed to two members of the family B, who sickened early in January. Some time afterwards a lodger, who was a mill-worker, became affected, and continued bed-fast for a fortnight, or more. Early in April the disease attacked a child of the adjoining family A, six members of which were in succession struck down before the 17th of May. But this is not all, for the head of the family B kept a menage or money-club, and had in consequence frequent visits from, and intercourse with, parties who were members of the club, the result being that of the other cases registered during May no fewer than 11—viz., 1 in Charles Street, and 2 in Bearhope Street, 4 in Tobago Street, and 4 more in 33 Sugarhouse Lane, caught the disease directly in this way. Of the remaining 2 of the 24, 1 occurred in East Law Street, and the other in Garvel Park House. As regards the former, no direct communication has been traced; but as regards the latter, it is not improbable that the contagion was conveyed from the house in Charles Street by a party who worked at Garvel Park, where the other (a policeman) was regularly on duty. But this does not exhaust the catalogue of ills, for of the 13 cases of typhus ascertained between the 1st January and the 1st May, as many as 7 were traceable to the same source. Indeed, it is to be feared that the whole series of disasters originating in family B has not yet been ascertained, for even during the present week two other cases which had direct contact with family B have been discovered in Sir Michael Street. The patients being children not much attention apparently was paid to them. Neglect of this sort is too common in Greenock.

The Edinburgh Infirmary and Fever Patients.—The question of prospective accommodation for cases of infectious disease was brought under the considcration of the Public Health Committee of the Town Council of Edinburgh on the 17th inst. A Sub-Committee was appointed to confer on the subject with Sub-Committees of the Lord Provost's Committee and of the Infirmary Managers.

Royal Edinburgh Hospital for Sick Children.—At a meeting of the directors of this Hospital, Dr. Underhill was elected an Ordinary Physician in room of the late Dr. James Cumming, and Dr. Carmichael was elected one of the Extra-Physicians.

Health of Glasgow.—Deaths in Glasgow for the week ending 14th June were at the rate of 19 per 1,000 per annum, against 21 in the preceeding week, and 27, 23, and 21 in the corresponding periods of 1876, 1877, 1878. This is the lowest mortality registered in the city for many years.

Health of Edinburgh.—During the week ending June 14th the deaths rose from 71 to 85. The rate of mortality was 20 per 1,000. Forty of the deaths were due to diseases of the chest, and of the 16 deaths above 60, 1 was above 80, and 1 above 90, years of age. There were 13 deaths from zymotic diseases, of these, 3 occurred in the new, and 10 in the old, town.

# Correspondence.

## CROUP AND DIPHTHERIA.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—I am glad to observe that Dr. Bernard Kelly, in a communication with the above heading, has derived pleasure from finding that I entirely deny the identity of infantile laryngitis and laryngo-tracheal diphtheria; and at the same time, I am grieved that he thinks me paradoxical in declaring at the same time that laryngo-tracheal diphtheria is identical with the so-called membranous croup. I think it is a little unfair of Dr. Kelly to blame me for not setting forth at length in my letter the reasons which have led me and others to this conclusion, and I am in some doubt whether your correspondent has followed the course of the inquiries and discussions which have lately taken place upon the subject. Putting aside my own writings and papers, in which the evidence is fully set forth, I question whether Dr. Bernard Kelly has read the Report of the Committee on Membranous Croup and Diphtheria, which is now published, and in which the whole question is elaborately and exhaustively treated—at least, so far as the materials afforded to the Committee allowed. It is to be regretted that he did not contribute his experience while the inquiry was proceeding, because, if he had produced any well-recorded cases which bear out his views as to the distinction between laryngo-tracheal diphtheria and membranous croup, he would have made a valuable and much desired contribution for the guidance of the Committee. I must apologise, or rather excuse myself, for not occupying your valuable space with a detailed analysis of the historical, clinical, microscopical, chemical, and therapeutical evidence which has already been published, and while referring Dr. Kelly to the works I have indicated, I hope he will pardon me for observing that his views as to the difference between the two affections, which I believe to be identical, are merely those which, though held by many eminent members of the profession, have been proved destitute of foundation. There is no difference (I must here write dogmatically, because the matter has now been conclusively settled) between the false membrane of laryngeal diphtheria and that of the so-called croup. And as to the cases where violent inflammatory symptoms have been followed rapidly by the formation of false membrane and by death, I really believe them to be imaginary. At any rate, not one single case of the kind was reported to the Committee, although urgent requests were made to the profession throughout the habitable world to produce any such cases if they existed.

I remain, Sir, yours very truly,

R. H. Semple, M.D., F.R.C.P.L.

Torrington Sq., London, W.C.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—I notice that in a postscript to his letter, Dr. Semple objects to the interpretation I have put on the resolution of the

Florence Academy. Although the tenour of my remarks is in no way affected by the allusion to the opinion expressed by the Academy, I can have no objection to repeat what I thought sufficiently obvious, that my deduction as to dualism upheld by the Academy was founded on the resolution I quoted, viz.:—"That clinical observation is in favour of the existence of true primitive croup, which may be even observed *during an epidemic of diphtheria.*"

The words there italicised seem to me unmeaning, unless intended to convey the idea that the two diseases are distinct, and they seem to justify me in classing the Academy as "in favour of dualism." It is equally true that the Academy voted another resolution containing the expression quoted by Dr. Semple, but the words scarcely seem to support his conclusion. Here is a free rendering of the resolution in question:—"In the impossibility of elevating to a pathognomonic symptom the position of the exudation, whether on the surface or in the substance of the mucous membrane, we can only distinguish true diphtheria by the extension of the process, the infiltration of the connective sub-mucous and periglandular tissues, the specific engorgement of the lymphatic glands accompanied by slight pain and other well-known phenomena of the disease. The majority of the facts, however, in past epidemics, as well as in the existing one, prove that *both croup and diphtheria* may easily accompany or follow each other so as to appear to be due as to time and seat to the same morbid process."

The above is copied from a translation I put down at the time for use in revising the chapter on this subject in my "Sore Throat," and I have not now the original at hand, but as Dr. Semple mentions that he has, he can refer to it. I have no recollection of the vote that "primitive croup is rare," but that could not affect the argument; nor do I remember a definition that it "*is limited to the trachea.*" Perhaps Dr. Semple will give the definition at length if adopted, which would be surprising. He will probably remember that Sir William Jenner stated that he had never seen such a limited disease.

I have said enough to show how I came to apply the words "in favour of dualism" to the Florence Academy, and would beg leave to repeat that the allusion was incidental, and has nothing to do with the position laid down in my article in the *Medical Press and Circular* of June 4th, to which I beg to refer any reader who may desire to know my opinions on the points raised in the recent discussions at the Royal Medical and Chirurgical Society.

I am, Sir, &c,

PROSSER JAMES, M.D., M.R.C.P.L.

3 Dean Street, Park Lane, W.,
June 16th, 1879.

## THE CONTIGUITY OF NEURO-RETINITIS WITH DESCENDING RETINITIS FROM INTRA-CEREBRAL DISEASE.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—In your last impression I find a letter from Dr. Gowers, quoted in Dr. Hughlings Jackson's valuable paper, relating to the above subject of some interest, for the reason that he feels desirous to substantiate a fact which has now long been known to pathologists.

Optic neuritis, without impairment of ordinary visual power, has been known through the researches of ophthalmologists since the introduction of the ophthalmoscope, and it must be vexing to our distinguished neurologist, Dr. Jackson, that it is not in his experience universally admitted. I would, however, suggest that there are tests which might be found, if sought for, by which an optic neuritis may be diagnosed by means of the visual field alone, if comparisons were taken by the use of lenses of highly refracting power and coloured media. A syphilitic growth of the brain with optic neuritis does not of necessity imply a descending neuritis, but it certainly leads to the inference that there is a gross cerebral change corresponding to that seen in the retina, and which unquestionably exists in the course of the optic tract, and which yields to treatment. There can be but small doubt that progressive changes in the brain and the nerves originating in its substance when not due to general vascular disease takes the histological course of the nerve fibres. The form of change may be tumour, hæmorrhage, or embolism. This was well shown through the notes of a case of cerebro-spinal lateral stlerosis, which I brought before the Clinical Society in 1878. Sections were exhibited demonstrating the progressive changes from the pons varolii, ascending in direct continuity with the histological course of the fibres to the internal capsule of the corpus striatum on the *same* side, and descending in the course of the decussating fibres in the anterior pyramids of the medulla oblongata, to the lateral column of the spinal cord on the *opposite* side.

Yours &c.,

T. STRETCH DOWSE.

2 Old Burlington Street,
June 18th, 1879.

## LIQUID EXT. OF RED GUM.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—Red gum is obtained from one of the Eucalypti, and this fluid preparation of it has lately been brought forward in this country by Squire. Although the crude gum has long been well known commercially, it has only within the last year or two been entered on the list of therapeutic agents. The object of this note is to draw the attention of practitioners, more especially of gynæcologists, to the value of this drug as a topical astringent, for which I claim a decided pre-eminence over the sulphate of zinc, alum, and other astringent vaginal injections usually employed. In conditions of vaginal atonicity and relaxation, and in the various chronic forms of leucorrhœa, it is a most valuable remedial application.

Prior to its employment a liberal use of the tepid douche is desirable, so that it may come into immediate contact with the mucous surface. Its chief drawback in my experience is the indelible stain it produces on linen textures, of which patients should be warned. From observation on its action in some two or three hundred cases, it has been repeatedly seen to arrest entirely an intractable leucorrhœal discharge which has defied the usual astringent remedies, in most cases after a single week's use.

It has also been successfully tried in two or three cases of simple diarrhœa, in ten-minim doses, so that its action is probably to some extent constitutional as well as local.

Yours, &c.,

FREDERIC BARNES.

Westminster Hospital, S.W.

## PROPAGATION OF CONTAGIOUS DISEASES.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—The prevalence of scarlatina maligna in this part of the country during the past season has been very unusual, and has left many families in mourning, among others a son of Mr. Secretary Banks, who held the office of medical officer to the Donegal district, having fallen a victim after a few days' illness.

Some years ago there was a similar outbreak of the same disease, which spread throughout the country and decimated many families, and on that occasion I was able to trace the propagation very much to *mendicancy*, that degrading habit which, in spite of workhouses, still prevails to a very great extent throughout this part, and, I believe, the whole of Ireland. The subject was then brought under the notice of the local authorities here, but nothing effective was done to check the practice.

No one can deny, or shut his eyes to the fact, that Irish mendicants—sometimes in the shape of bundles of rags—going about from house to house, and often sitting down leisurely to rest and chat at the firesides of the peasantry, *must be* most effective media of contagion, and it would not be difficult to give instances when such diseases are clearly traceable to such sources. The peasantry themselves cannot be expected fully to apprehend the danger referred to, or if they did, to act on the apprehension by shutting their doors and refusing to encourage, or have any intercourse with, those who go about in this manner, "looking for their share," as they somewhat independently term their mode of living; because, to do so would seem, and leave them open to the charge of, inhumanity. Besides, there is a superstitious feeling that it is "unlucky" to send away a beggar without help, or even to keep him at the outside of the door. However creditable this may be to the hearts of the peasantry, it is the reverse of creditable to their heads, for many of those so

helped are plainly able to earn their own living if laziness would let them try; and if general opinion be correct, they live better than many of those who help them, by selling the potatoes, meal, &c., which they collect, and buying tea, sugar, and other luxuries.

So much for "mendicancy." Now for another cause of propagation of contagious disease; I mean national schools. In these the children and youth of the country are brought into close contact, sitting side by side, and it needs no argument to show the danger of this in times when such diseases are around. In point of fact, I have found members of families, when scarlatina existed, and who were afterwards themselves attacked, going daily to the national schools, mixing freely, and without suspicion, among the other pupils. Surely this is most dangerous, and ought to be subjected to some check. I have spoken to a Commissioner of National Education, and some others having more or less authority in the system, but without—apparently—being able to excite any very lively interest in their minds. Yet it must be allowed, I think, by any one soberly reflecting on the matter, that the health or lives of numbers of persons, especially the young and strong, are intimately concerned in the question. There is another aspect of the matter which deserves, and would perhaps more readily draw, the attention of the country than the foregoing, that is, the probable increment added to the poor-rates by the deaths, and consequent *pauperisation* of survivors, occasioned by those—to a great extent preventible—sources of fatal disease.

I am, sir, &c.,

Donegal. S. T. Haslett, M.D.

## AIDS IN FORCEPS DELIVERY.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—I wish to bring before the notice of those members of the profession who practise midwifery a simple plan, which I have found a useful help when delivering with forceps. The liability of the foot to slip while using that instrument, and thus depriving the operator of a good deal of support at the very moment when he most requires it, must have been experienced by others besides myself, and led me to design the simple "holdfast," which is thus constructed: I procure a small rectangular-shaped piece of sole-leather, with loop of strap attached to each side large enough to admit the toe of my boot. To the piece of sole leather I fasten with screws two ordinary cricket spikes, and, with left foot thus armed, press it firmly on the ground before taking my seat to operate. I find then I have a firm support, which gives me much additional confidence in making traction without the fear of slipping.

I have been so much pleased with the help I have thus derived that I venture to think it may prove equally useful to others, and trust this may be accepted as my excuse for publishing it.

Yours, &c.,

Alec Duke, L.R.C.S.I., L.K.Q.C.P.I.

## THE TITLE OF PHYSICIAN.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—I was greatly surprised and annoyed at being informed in your journal—a professional one—in its issue of the 4th inst., that I—with the class of practitioners to which I belong—have "no more right to call myself, or to be called, a physician, than the boy who carries out my medicines." On the same principle, Licentiates of Colleges of Surgeons have no right to call themselves, or to be called, *Surgeons*. The Belfast Dispensary District is served by ten medical officers; of these gentlemen, seven are qualified as Licentiates of Colleges of Physicians and of Surgeons. Is the Local Government Board, with the general public, to be told by a professional journal that such a large proportion of the medical officers of that important district do not hold qualifications which entitle them to either of the professional titles? I have always been most particular to assume no professional title other than that which I thought described me properly, and so I have called myself a "Physician and Surgeon." As to qualifications, the title of Physician *must* be restricted to Doctors or Bachelors of Medicine, to Fellows, Members, or licentiates of the College of Physicians. As to practice, I cannot see that a gentleman qualified in any way as described has no right to the professional title should he *not* restrict himself to the physician's specialty. Nor can I see, in the cases of Masters of Surgery, of Fellows, Members, or Licentiates of Colleges of Surgeons, that they have no right to the title of surgeon should they *not* restrict themselves to surgery as a speciality. Now I presume that qualifications, and the class of practice engaged in, are the only circumstances which affect the right to these professional titles. You appear to be very anxious that "gentleman of the press" should not "honour" medical practitioners with titles "to which they have no claim." Now it is not unreasonable that a subscriber to your journal, affected by the remarks in the leader to which reference has been made, and probably representing a large number of your subscribers, should request you to inform the public as to the class of practitioners to whom in your opinion the titles of physician and of surgeon should be restricted. In professional, as in social, life, people generally find their own level. No good—but on the contrary, a vast amount of mischief—arises in social life from interference with this natural law. I think the same is likely to prove true of interference with it in professional life.

I am, Sir, yours, &c.,

Robert A. Newett,
Licentiate, Royal Colleges of Physicians and Surgeons, Edinburgh.

Ligoniel, near Belfast,
June 12, 1879.

[A reply to this letter is given in our editorial columns, under the heading of "The Title of Physician."—Ed.]

# Obituary.

## DR. WYLIE, OF ERROL.

This well-known and eminent practitioner died at his residence in Errol, on the 16th inst., in the 70th year of his age. He had been indisposed for a considerable time. Some days previously it had been observed that his strength was giving way rapidly, and the gravest fears were apprehended. Throughout the whole Carse of Gowrie he was greatly respected, and so high a reputation did he possess as a skilful practitioner, that there are few families in the Carse who will not feel his death almost as a personal loss. His advice was sought and valued far beyond the sphere of his immediate practice. To the poor as well as the rich he was equally attentive, and the kindness he invariably showed to all earned for him not only their heartfelt gratitude, but their affectionate esteem. He was admitted a Member of the Royal College of Surgeons of England in 1831. In private life he was a genial and true friend, and possessed a very large circle of acquaintances, by whom his removal will be deeply lamented.

## DR. BAXTER, OF DUNDEE.

Dr. P. M. Baxter, a highly respectable medical practitioner, died in Dundee on the 16th inst. He took the License of the Royal College of Surgeons of Edinburgh in 1856, and afterwards settled in Dundee, where he gained a large practice. He had been for twenty years visiting surgeon to the Dundee Poor-House. For a considerable time he had been in failing health. His death is very much regretted by his brethren, and by a very wide circle of friends and acquaintances.

# Medico-Parliamentary.

## HOUSE OF COMMONS.—Thursday, June 19th.

AMBULANCE ARRANGEMENTS.

Mr. E. Noel asked if it was not desirable to make arrangements which would prevent wounded soldiers being dependent for aid upon voluntary associations.

Colonel STANLEY.—It is my duty to state that, so far as I am aware, the arrangements for the care of the sick and wounded soldiers now serving in South Africa have been properly attended to. So far as I am informed, every arrangement has been made for their proper comfort. I have not thought that it would be wise, however, to make that a ground for discouraging the charitable feeling which has appeared to prevail amongst many classes of people, who have been anxious to contribute from their private means assistance to those who were invalided or sick.

MONDAY, JUNE 23RD.

QUEEN'S COLLEGES AND QUEEN'S UNIVERSITY, IRELAND.

SIR H. SELWIN-IBBETSON, in reply to Mr. O'Donnell, said that there would be no objection to give some further details of the items of expenditure with regard to the Queen's Colleges, Ireland; but with regard to the Queen's University, the hon. member would find in the estimates all reasonable explanation given there of that vote.

POOR-LAW MEDICAL RELIEF IN SCOTLAND.

THE Chancellor of the Exchequer, in reply to Sir W. Cuninghame, said that without legislation it would be impossible to put medical relief on the same footing in the two countries.

## COLLEGE OF SURGEONS OF ENGLAND.

THE election of members of Council will take place on the 3rd July. Four vacancies have been declared, for which there are six candidates. Three members of the Council, Mr. Le Gros Clark, Mr. Spencer Wells, and Mr. George Critchett, retire by rotation, and the fourth vacancy is due to the death of Mr. Hilton.

The candidates for the vacant seats are Mr. Spencer Wells, who seeks re-election, Messrs. Barwell, Thomas Bryant, John Wood, Henry Power, and Jonathan Hutchinson. As regards the candidate seeking re-election, it is only fair to remark that the Vice-Presidency is acquired by seniority of membership on the Council. This honour follows re-election, and if any retiring member has fairly performed his duties during his first term of office, it is only just that he should be re-elected.

## REGISTRATION OF IRISH STUDENTS.

THE system of registration of students under the General Medical Council being in Ireland so unsatisfactory, and so little regarded, the Council of the Royal College of Surgeons in Ireland, in order to ensure that students shall be entered for study at the proper date, have decided to revert to the enforcement of a bye-law of the College, which, on the establishment of a students' register, had been allowed to fall into abeyance. The Council has therefore resolved, "That the bye-law which enacts that 'professors and lecturers are required to transmit to the College, on or before the 25th of November in each year, returns of the names of the pupils who shall have entered to attend, and are then actually attending, their respective lectures or demonstrations,' be henceforth enforced."

We heartily approve of this action of the Council, which is animated by the praiseworthy desire to make the attendance of the student on his courses of study perfectly *bona fide*. But it is right to point out that the arrangement is only half satisfactory, and that the College sacrifices something in adopting it. The effect of this resolution will be that all students who are duly entered previous to the 25th of November in each year, will be able to present their certificates to the College. Those who are now accepted by schools in December, January, or March may continue to be accepted still, but they will not be able to present themselves to the Irish College, because their names will not appear on the entry list of the year. This will, however, not prevent them going to Scotland or elsewhere and offering their certificates, which, being dated for the beginning of the session and not for the real date of entry, will be accepted *nem dis.*

It is an illustration of the effect of the "recommendation" policy of the General Medical Council that licensing bodies are driven to such shifts to secure that good faith in medical education which the Council is charged to provide, and by permitting student registration to be ignored omits to do so.

## ETHER INHALATION.

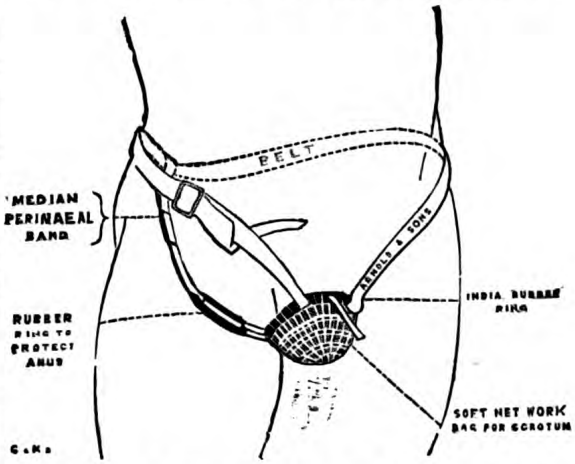
ON Tuesday, the 10th inst., Mr. B. Wills Richardson substituted, in the Adelaide Hospital, during an excision of the hip by Mr. Barton, a sailor's ordinary india-rubber hat for the felt hat ether inhaler he described at the meeting of the Surgical Society of Ireland on the 19th March last, with the view of still further lessening ether waste. The ether acted rapidly and but little was used.

DR. STEPHENSON, of Dublin, has been appointed medical adviser to the Dublin branch of the Scottish Metropolitan Insurance Company, *vice* Dr. B. F. McDowel, deceased.

# Novelties.

## AN IMPROVED SUSPENSORY BANDAGE.

By CHAS. B. KEETLEY, F.R.C.S.
Assistant Surgeon to the West London Hospital.



THE common suspensory bandage has these disadvantages. (1.) If it is not fitted with a perineal band, the genital organs are pulled as far forwards as to cause an unsightly prominence beneath the trousers. (2.) If it has the ordinary perineal band, the anus gets chafed. (3.) The tape in the hem round the margin of the bag

chafes and cut. (4.) The perforations in the material of the bag are too fine for ventilation, consequently the bag becomes soaked with perspiration. (5.) The hole for the penis is unnecessary, and only serves to let one testical occasionally herniate through it. The bandage I wish to bring under notice is contrived to obviate the above objections. A median perineal band holds the genitalia well back. An india-rubber ring in this band prevents it from chafing the anus, and the anus from soiling it, another india-rubber ring takes the place of the piece of tape above referred to. The bag is hand-made, knitted, and very open in its network, and the penis is simply allowed to hang over the front of the bag. The contrivance has been freely tried in cases of gonorrhœa, orchitis, varicocele, relaxed condition of the genitalia attended by hypocondriasis, and in other affections of those parts, and found to answer perfectly. Messrs. Arnold and Sons, of West Smithfield, make the appliance in three sizes, at the price of the old bandage.

## Sanitation in the Southern States of America.

JUDGING from some remarks in the *North Carolina Medical Journal*, some of our American cousins have still much to learn in the way of practical sanitation. The city of Wilmington is, says the writer, no doubt above the general average of Southern cities in sanitary condition, but in a previous number of the above journal, it was stated that in the city "there was one well two feet from the privy, two wells four feet from the privy, thirty-three wells ten feet from the privy, two hundred and twenty wells from twenty to thirty feet!" The soil, moreover, upon which Wilmington is located, is "nearly as white as the sea-shore, and as permeable!"

## Use of Chloroform in Diseases of the Heart.

ON this subject M. Vergely, of Bordeaux (*La France Médicale*), remarks that there is a difference of opinion, some asserting that chloroform is very useful, and others that it does harm in affections of the heart. In M. Vergely's memoir, to which M. Dieulafoy has recently drawn the attention of the Societé Médicale des Hôpitaux, three principal points are established. 1. That the existence of heart disease does not contra-indicate the use of anæsthetics. 2. That chloroform is a sedative in this class of diseases. 3. That it should be used with discretion. In some cases of severe palpitation chloroform may be successfully administered. Also in some cases of dyspnœa and palpitation arising from mitral insufficiency, either alone or conjointly with hypodermic injections of morphia. M. Vergely has also given it without any accident in angina pectoris, and in certain other affections of the heart characterised by dyspnœa and palpitation. From inquiries he has made into the literature of the subject, he concludes that this agent has been employed too timidly and unsystematically.

## NOTICES TO CORRESPONDENTS.

☞ CORRESPONDENTS requiring a reply in this column are particularly requested to make use of a *distinctive signature or initials*, and avoid the practice of signing themselves "Reader," "Subscriber," "Old Subscriber," &c. Much confusion will be spared by attention to this rule.

MR. PRIDGEN TEALE will please receive our best thanks.

MR. HOSFORD.—The insertion of your letter in our last was considered sufficiently explanatory without the aid of editorial comments. Our correspondent will oblige by addressing in future the Editor in his own division of the kingdom.

MR. HY. S.—The translation of Hackel's work is published by Kegan, Paul, and Co.

DR. GRIFFITH.—Communication "On the Unity of Poison of Scarlatina, Typhoid, Puerperal Fever, Diphtheria, and Erysipelas" received.

DR. TILT.—Communication "On Uterine Inflammation after the Menopause" received.

TABULAR ANALYSIS.—We have received an abstract of Dr. Guy's paper "On Tabular Analysis," read before the Statistical Society last week. As, however, it is not one of practical interest to our readers, and we are much pressed for space, we have been compelled to pass it by.

MR. PHILLIPS.—The gentleman mentioned in the House of Commons is not the well-known member of the profession of that name.

F.R.C.S. will find his question answered in our issue of last week.

OBSTETRICAL SOCIETY OF LONDON.—On Wednesday, July 2nd, at 8 p.m., no specimens will be exhibited. Adjourned discussion on the Forceps.

DR. CASSELLS, Glasgow.—Your translations are marked for insertion during *July*.

TO CONTRIBUTORS.—We regret the delay in the insertion of communications, necessitated by great press of matter. We have several times, during the present volume, given four pages extra in order to work off arrears, and have done the same again this week; we hope our friends will accept this as evidence of our desire to accommodate all.

### VACANCIES.

Birmingham, Children's Hospital.—Non-Resident Surgeon. Daily attendance required. Salary, £60, with partial board. Applications to the Medical Board.

Birmingham Queen's College.—Professor of Chemistry. Full particulars of the emoluments, duties, &c., of the Secretary, 21 Paradise Street, Birmingham.

Brecon Infirmary.—Resident House Surgeon. Salary commencing at £120. Applications to the Secretary on or before July 10.

City of London Union.—Assistant Medical Officer for the Infirmary. Salary, £100, with board and residence. Applications to the Clerk of the Guardians, 6 Bartholomew Close, E.C., before July 1.

Dudley, the Guest Hospital.—Resident Medical Officer. Salary, £120, with board. Applications to the Secretary on or before July 7.

King's College, London.—Professorship of Comparative Anatomy and Demonstrator in Physiology. Full particulars of the Secretary.

Oldcastle Union, Crossakiel Dispensary.—Medical Officer. Salary, £120, with fees, and £15 as Sanitary Officer. Election, July 4.

Sligo District Lunatic Asylum.—Assistant to the Resident Medical Superintendent. Salary, £100, with allowances. Election, July 2.

### APPOINTMENTS.

ANGOVE, E. S., L.R.C.P.Ed., M.R.C.S.E., Medical Officer for the Camborne District of the Redruth Union.

BATCHELOR, G. A., M.B., C.M., M.R.C.S., Assistant to the Medical Out-patient Department of the London Hospital.

CURTIN, P., L.R.C.S.I., Medical Officer to the Clane and Limahoo Dispensary, Naas Union.

DONOVAN, W., L.R.C.P., Medical Officer of Health for Whitwick Urban Sanitary District, vice W. Joyce, M.R.C.S.

JAMES, A., M.D., F.R.C.P.Ed., a Medical Officer to the New Town Dispensary, Edinburgh.

KER, H. R., L.R.C.P.Ed., M.R.C.S.E., Certifying Factory Surgeon for the District of Dudley.

MACLOUGHLIN, T. J., L.R.C.P.Ed., L.R.C.S.Ed., Medical Officer and Medical Officer of Health for the Clara Dispensary District of the Tullamore Dispensary Union, King's County.

MORTIMER, J., M.D., M.R.C.S., House Physician to the Wolverhampton and Staffordshire General Hospital.

RAYNER, A. C., M.R.C.S.E., Medical Officer and Public Vaccinator for the No. 2 District of the Preston Union.

RILEY, J. W., M.R.C.S.E., Medical Officer for the Heath Town District of the Wolverhampton Union, and Deputy Medical Officer to the Workhouse.

WINTER, A., M.R.C.S., L.K.Q.C.P.I., House Surgeon to the Wolverhampton and Staffordshire General Hospital.

ARMY MEDICAL DEPARTMENT.—The following were gazetted on Friday last: Surg.-Major W. T. Harding retires upon half-pay, with the honorary rank of Deputy-Surgeon-General; Surg.-Major F. Simpson retires upon permanent half-pay.

## Births.

DICKINSON.—On June 18, at High Street, Wandsworth, the wife of W. G. Dickinson, L.R.C.P., of a daughter.

FITZGIBBON.—On June 18, at 18 Lower Fitzwilliam Street, Dublin, the wife of Henry Fitzgibbon, M.D., of a daughter.

MCBRIDE.—On June 20, at Glenview, Bath, the wife of Fleet-Surgeon A. McBride, M.D., of a daughter.

ROBERTSON.—On June 21, at Moldgreen, Huddersfield, the wife of David Robertson, M.D., of a son.

## Deaths.

COURTNEY.—On June 20, at Walberton, Sydney Courtney, F.R.C.S. formerly of Leatherhead, aged 75.

FOX.—On June 17, at Broughton, Winchester, Luther Owen Fox, M.D., F.R.C.S., aged 67.

GILSON.—On June 8, at Chelmsford, John Thomas Gilson, F.R.C.S.E., aged 76.

HARMER.—On June 15, Winifred Alice, fourth daughter of W. M. Harmer, F.R.C.P., &c., Physician-Superintendent, Hawkhurst Asylum, aged 3 years.

HEDLEY.—On March 14, at Sale, Gippsland, Australia, G. Dixon Hedley, M.D., aged 62.

PERRY.—On June 7, at Surbiton, George John Perry, M.R.C.S., of Melksham.

WILSON.—On June 14, at North Frederick Street, Dublin, Richard F. Wilson, L.R.C.P.Ed.

WIMBLE.—On June 19, at The Rectory, East Malling, Kent, Frederic Wimble, M.R.C.S., aged 72.

# IRISH POOR-LAW INTELLIGENCE.

## THE HEALTH OF DUBLIN FOR THE QUARTER

*Ending Saturday, March* 29, 1879.

*Births.*—In the Dublin district the number of births registered during the quarter amounted to 2,490, being equal to an annual ratio of 1 in 31·7 in every 1,000 of the population, There was registered in London during the same period an annual birthrate of 37·8, in Glasgow 35·6, and in Edinburgh 32·9.

*Deaths*—.The number of deaths registered in the Dublin registration district during the quarter amounted to 3,395, affording an annual ratio of 1 in 43·2 in every 1,000 of the population ; the average number in the first quarter of ten years was 2,507, equivalent to an annual mortality of 31·9 per 1,000 persons. Omitting the deaths (122) of persons admitted into public institutions from localities outside the district, the rate for last quarter was 41·6 per 1,000.

The number of deaths of inhabitants of that portion of the city north of the Liffey registered last quarter was 1,140, affording an annual mortality of 42·2 in every 1,000 of the population ; and the number in that portion south of the river was 1,618, or 47·1 in every 1,000 of the population. In the suburbs of Rathmines, Donnybrook, Blackrock, and Kingstown, the number of deaths registered was 515, being equal to an annual death-rate of 29·7 in every 1,000 of the population. The death-rate of London during the same period was 27, in Glasgow 26·5, and in Edinburgh 21·8, in every 1,000 of the estimated population.

*Diseases.—Dublin Registration District.*—During the quarter there were 670 deaths from zymotic diseases registered, being 214 more than in the preceding three months, and 222 over the average mortality from these causes in the first quarter of the last ten years. Exclusive of 26 deaths of hospital patients, admitted from without the Dublin registration area, the seven principal zymotic diseases caused 567 deaths, equivalent to a mortality of 7·2 per 1,000 inhabitants. The deaths in this group consisting of 239 from small-pox, 63 from measles, 80 from scarlet fever, 17 from diphtheria, 25 from whooping-cough, 113 from fever (23 typhus, 79 typhoid, and 11 simple continued fever), and 30 from diarrhœa.

There were 251 deaths from small-pox registered, 86 of which were recorded in the first four weeks of the quarter, and 60 in the last four weeks, showing that happily there was a decline of the disease in the closing weeks of the quarter. As many as 165 of the deaths from small-pox are chargeable to the South City Districts, where throughout the continuance of the epidemic by far the greater part of the mortality has occurred, 54 are chargeable to the North City Districts, 12 to Rathmines, 7 to Donnybrook, and 1 to Kingstown.

The returns from the various Dublin hospitals show that at the close of the December quarter there were 122 small-pox patients under treatment ; during the quarter now ended, 758 new cases were admitted (an increase of 292 compared with the preceding three months), 564 patients were discharged, and 199 died, leaving 117 in hospital on Saturday, 29th March. The highest weekly number of new cases admitted during the last quarter was 95 in the week ending 11th January, and the lowest 23 in the last week of the quarter.

Owing to the severity of the weather during the past three months diseases of the respiratory organs proved very fatal ; they amount to 1,056, being 370 over the number in the preceding quarter, and 428 over the average for the corresponding quarter of the ten years 1869—78. The deaths from these diseases (which are equal to 31·1 per cent. of the total deaths from all causes) include 834 from bronchitis, 129 from pneumonia, 9 from pleurisy, 7 from laryngitis, 3 from asthma, and 74 from lung disease undistinguished.

There were 195 deaths of children from convulsions, being 20 per cent. of the deaths from all causes amongst children under five years of age.

One hundred and twenty-six deaths resulted from heart disease, 7 from aneurism, and 2 from pericarditis.

Paralysis caused 81 deaths, apoplexy 33, cephalitis 23, insanity 13, epilepsy 13, "brain disease" 31, "liver disease" 35, jaundice 3, hepatitis 2, nephria 13, nephritis 3, cystitis, 3, and kidney disease undistinguished 19.

Phthisis proved fatal in 278 instances, or 8 per cent. of the total deaths, mesenteric disease in 37, hydrocephalus in 50, scrofula in 24, cancer in 32, and gout in 7.

Sixty-seven accidental deaths, and 2 cases of suicide were registered.

Excluding 122 deaths in public institutions not chargeable to the Dublin Registration District, the number of deaths registered during the quarter was 3,273, being equal to an annual mortality of 41·6 per 1,000 of the population, the deaths from the seven principal zymotic diseases representing an annual rate of 7·2 in every 1,000 persons. The annual rates represented by the deaths from all causes in the several registrars' districts range from 22·2 per 1,000 inhabitants in Blackrock to 61·5 per 1,000 in No. 1, South City (Meath Street) District. The annual rates represented by the deaths from the seven principal zymotic diseases vary from 3·7 per 1,000 inhabitants in Kingstown to 15·7 per 1,000 in No. 1, South City (Meath Street) District, the deaths in the last-named district including 38 from small-pox, 29 from measles, 24 from scarlatina, 15 from fever, and 7 from diarrhœa. In No. 3, South City (Peter Street) District, the annual zymotic rate represented was 8·5 per 1,000 persons, the deaths including 51 from small-pox, 14 from fever, and 7 each from measles and scarlatina, and in No. 2, South City (High Street) District, in which small-pox caused 32 death, scarlatina 5, and fever 9, the zymotic rate was 7·6 per 1,000.

The total death-rate for the city was 45·0, and for the suburbs 29·7 per 1,000 inhabitants ; the rate represented by deaths from the seven principal zymotics being 8·1 per

1,000 inhabitants in the city (6·4 on the north side, and 9·5 on the south), and 4·2 per 1,000 in the suburbs.

*Provincial Town Districts.* — The respective annual death-rates represented by the deaths registered during the quarter, in the seven provincial town districts included in the weekly returns, are :—Belfast, 40 per 1,000 of the population of 1871 ; Cork, 31 per 1,000 ; Limerick, 46 ; Londonderry, 25 ; Waterford, 26 ; Galway, 35 ; and Sligo, 29 per 1,000.

Fifteen deaths from small-pox were registered in Galway during the first month of the quarter, but none since that date.

In Belfast the annual rate represented by deaths from the seven principal zymotic diseases registered during the quarter was 5·5 per 1,000 of the population in 1871, or, allowing for increase since that year, 4·4 per 1,000. The principal mortality in this class was caused by fever, from which 76 deaths resulted ; whooping-cough caused 63 deaths, scarlatina 53, diarrhœa 46, measles 8, and diphtheria 5.

In Limerick whooping-cough proved fatal in 40 instances, diarrhœa in 21, and fever in 5.

The annual rate represented by the deaths from the seven principal zymotic diseases registered in Cork was 1·7 ; in Limerick, 6·0 ; in Londonderry, 1·9 ; in Waterford, 1·2 ; in Galway, 4·3 ; an in Sligo, 2·5.

## WATERFORD UNION.

### PAYMENTS TO MEDICAL OFFICERS.

" Local Government Board, Dublin, 6th June.

" SIR,—The Local Government Board acknowledge the receipt of the minutes of the proceedings of the guardians on the 28th ult, containing a resolution directing that the expenses in connection with the appointment of a temporary medical officer, and also the amount of the superannuation allowance to Dr. Elliott, be included in the returns of medical and educational expenses to the 25th March last ; and in reference thereto, the Board desire to state that there is no provision in the Parliamentary grant for the payment of temporary substitutes for medical officers, nor of the superannuation allowances to medical officers.—By order, " B. BANKS."

Mr. Fisher moved that a copy of that letter be sent to the city and county members, with a request that they would try and get these payments put on the list of moneys to be paid out of the Parliamentary grant.

## DEATH RATE OF LIMERICK.

DR. BARRY reported that the death-rate of the city was for the last week 30 per 1,000 of the population.

Mr. Hastings said that he could not rely on the return unless the names of the persons reported to have died were given. He moved that the list of the names be given.

Dr. Barry, in reply to Mr. Hastings' suggestion, said that it was not his duty to give the names of the people who are returned in the list, nor was it his duty to give the place of residence either. If the names of the persons reported in the list were given their houses would be reported to be infected with disease ; the result of which would be that the landlords would cast the blame on him for not having their houses tenanted ; the landlords would also say that they were injuring their property by giving out such reports. If the board would look upon the matter in that light it would see the difficulty that attended such a movement.

Mr. M'Namara seconded the resolution. The death-rate of the city was very large and had created considerable excitement, not alone in the city, but also outside the city. In Limerick there is a death-rate larger than any other city in the United Kingdom. Is not that so, Dr. Barry ?

Dr. Barry—It is. The death-rate of Limerick has been 30 per 1,000 of the population during the last three months.

Mr. M'Namara—Persons having friends are excited about this reported death-rate, and the fact of the matter is that the very persons who are paying the rates of the city should have an account of this exaggerated death-rate.

Dr. O'Sullivan handed in the following amendment :—" That we carry out the suggestion of the superintendent medical officer of health, Dr. Barry, without giving the names of the dead persons."

A poll was then taken. For the resolution, 3 ; for the amendment, 3 ; did not vote, 1. The matter fell through.

The following notice of motion was put in :—" That we call upon the Local Government Board to direct a sworn inquiry into the working of the Sanitary Act in Limerick."

## SLIGO UNION

### PAYING DOCTORS' SUBSTITUTES.

THE Chairman read the following letter :—

" *To the Sligo Guardians.*

" GENTLEMEN,—Be good enough to let me have a cheque for account furnished some time since, amounting to £8 8s., for my professional services while in charge of the Collooney dispensary district on last February and March, under your sanction, the performance of which duty has been duly certified by that committee.

" I am, gentlemen, your obedient servant,

" ST. GEORGE ROE."

Chairman.—We had passed a resolution previously that any doctor going on leave, except he went on sick leave, should pay his own substitute. It was discussed here before whether we would make an exception in the case of a man going to get married.

Mr. Cogan—I am afraid the members of the committee will have to pay it themselves, for the guardians will not pay it.

Chairman—I'll do what the board directs. We have already given a refusal to a similar application.

Mr. Cogan was afraid the next thing would be an attorney's letter.

The application of Dr. Roe was refused.

## ABBEYLEIX UNION.

### SANITARY DUTIES.

READ letter from Dr. Hanrahan, containing a special fortnightly report of his proceedings under the sanitary laws, in compliance with a resolution passed at the last meeting of the board. Dr. Hanrahan stated that he was not aware that it was the duty of the sanitary officer to make reports of this kind.

A special fortnightly report was received from Dr. Stoney, sanitary officer of the Abbeyleix dispensary district.

The executive sanitary officer also sent in a special report of his proceedings during the past fortnight under the sanitary laws.

Dr. Palmer, medical officer of the Durrow dispensary district, sent in a report on the ordinary printed form.

Mr. Caldbeck said that they should come to an understanding with their medical officers if they were asking them to do too much. But when the guardians fixed the remuneration of the sanitary officers it was not known what those officials would have to do ; and when it was found that from month to month nothing was done, the peopie began to inquire why the additional charges entailed by these salaries were imposed on them. Their medical officers seemed to be at war with them, as some of them had not sent in reports. He inquired of Dr. Burke

as to what steps they should take if the medical officers should refuse to comply with the resolution of the board.

Dr. Burke—All I can say is, that it is their duty to comply. Some of your medical officers appear to have complied with your request, and I would suggest that the medical officers should be communicated with and their attention drawn to the resolution.

It was ordered that the medical officers should be written to, and their attention should be drawn to the resolution.

Dr. Burke remarked that it struck him some of the sanitary officers sent in reports every fortnight.

The Clerk said they sent in the ordinary reports on the printed form, but what was required was a special report. He read a resolution which called upon the medical officers to send in to the board every fortnight a report of their proceedings under the sanitary laws.

Dr. Burke said he would look upon the ordinary reports read by the clerk as complying with the resolution.

[We are able to state that the L.G.B. has ruled, in another instance, that it is *not* the duty of the medical sanitary officer to make such reports as those indicated above, and that, if made, the officer may demand special payment. Therefore the inspector's opinion herein expressed is at variance with the former pronouncement of his superiors.—Ed. M. P. & C.]

## PARSONSTOWN BOARD OF GUARDIANS.

### THE INSPECTORIAL DUTIES OF SANITARY OFFICERS.

The Clerk read the following :—

"*To the Board of Guardians, Parsonstown Union.*

"Gentlemen,—Mr. Dooly has called upon me to ask whether I will refuse to see if notices for the removal of nuisances have been complied with. I do not consider that it would be courteous to you were I to attempt to define for myself the duties of my office by a refusal to perform any service required of me by you. I prefer to submit my view of the case to you in order that you or the Local Government Board may decide who is the proper officer to discharge the duty.

"The Local Government Board, in their communication to me of 29th November, 1878, a copy of which was forwarded to you, state 'that the duty of seeing that the orders of the sanitary authority are complied with rests with the executive sanitary officer, who in practice generally avails himself of the sanitary sub-officers in ascertaining the facts of the case.' I have not received any notices since the receipt of this letter, and was not aware that there was any objection raised by the sub-sanitary officer until I saw the correspondence he had with the Local Government Board reported in the newspaper.

"I would respectfully place the following arguments before you in support of the position that the medical officers of health should not be required to see whether the notices have been complied with. It is clear from the Act that the medical officer of health is not an inspector of nuisances, that being the title and definition of the duties of the sub-sanitary officer. The duty of the medical officer of health is to determine whether anything reported to him by the inspector of nuisances as a nuisance is really such, and to recommend the steps to be taken for its removal. Now, I submit that, as the law does not contemplate inspectorial duties by the medical officer of health for the discovery of a nuisance, neither does it contemplate the performance of such duties for the discovery of its removal. Again, in section 258 of the Act, which defines the assistance which is to be given by sanitary officers in cases of prosecution, it is expressly stated that the medical officer of health shall receive remuneration for the time so occupied. I would argue from this that the ordinary duty of the medical officer of health is to determine what are nuisances, and to advise the proper means for their removal, and that any other services he is called on to perform are to be paid for.

"It has been stated that there would be no use in the inspector of nuisances reporting that the orders of the sanitary authority have been disregarded, as his testimony would not be taken as a witness; but this is an utter confusion of the whole matter. The medical officer of health gives a recommendation, on which is based a definite order from the sanitary authority to remove a dung heap, fill up a cesspool, or make a drain. The inspector of nuisances is a perfectly competent witness as to whether this has been done or not. The medical officer of health is summoned, not to prove that the dung heap or cesspool is *there*, but that *its being there is a nuisance and injurious to health.*—I am, yours, &c.,

"A. W. Wallace.

"Parsonstown, 6th June, 1879."

Mr. Woods proposed the insertion of the letter on the minutes, so that the whole text might be seen by the Local Government Board, who would probably then decide whose duty it was.

While the minute was being prepared, search was made through a file of correspondence, and the following letter bearing on the subject from the Local Government Board found under date 4th June, 1875 :—

"Sir,—I am directed by the Local Government Board for Ireland to acknowledge the receipt of your letter of 1st inst., and in reply to state that there is no regulation requiring sanitary officers to revisit or certify as to the abatement of a nuisance, and the Local Government Board think that in ordinary cases the subsequent inspection should be made by the sanitary sub-officer as regards nuisances reported by the sanitary officer or by himself; but if proceedings at law should become necessary, the Board are of opinion that the sanitary officer should attend, and assist by his evidence in the prosecution, and in cases of this nature it would be his duty to visit a second time the premises where the nuisance had been reported by him to exist, if required to do so by the sanitary officer. The Local Government Board desire, at the same time, to refer to the terms of the sanitary order of the 9th September last, under which every sanitary officer, as well as sanitary sub-officer is required to attend, and assist in all proceedings in which his attendance or assistance may be required. The Board would not fail to take serious notice of an omission on the part of any of the officers to comply with the order of the sanitary authority in the above respects."

Mr. Woods said the letter of 1875 showed that the sub-sanitary officer ought to revisit the place, and if there was any need for calling in the sanitary officer for purposes of prosecution that was the time for the doctor to be called upon to see it.

## CHLORAL AS A REVULSIVE.

Dr. Peyraud states (in the *Bulletin de Therap.*) that chloral made into a mass with tragacanth, spread on paper or cloth, and applied to the skin, will produce a blister without pain. Applied as a powder on cotton it causes burning pain. By the former method a portion is absorbed and sleep produced. Its action is not quite as certain as that of cantharides, but as a mild revulsive and agreeable vesicant its rction is very agreeable.

## TO READERS.

The Editor will feel especially obliged by receiving copies of newspapers which contain any Poor-law or other intelligence of medical interest, in order that he may, if fit, republish it for the benefit of the readers of the *Medical Press.* Although twenty-one of the leading Irish newspapers are received at the Irish office, many things may escape notice which are deserving of attention. Newspapers should be marked, and addressed to Dr. Jacob, at the Dublin offices of this paper.
